Hearing of the necessity for such terrible dogs, you would imagine, especially after my account of the "*faco-cutting-man* with the iron-clasp," that Munich was a dreadful place, and that its inhabitants are beset by dangers dire. But that is anything but the truth, speaking from our experience. For my part, I think that all these suggestions of horror only belong to the approach of long winter evenings, and are as much a sign of the season as the number of strange winter garments that you meet in the streets. I wish you could have seen the pair of long, grotesque, crimson leather boots which we met to-day!—this style of boots, though generally made of untanned leather, is much affected by the students. I wish, too, you could have seen the tall, shadowy figure of a student, arrayed in a long grey cloak, with a painted hood standing up in wizard or "*Mother-Red-Cap*" style, on his head! It was a misty afternoon, just beginning to grow dark, as he came upon us at the abrupt turning of a street; we felt that he was a shadow—a creature of the mist. And it was all the more fantastic as we were just passing, or rather had just passed, the enchanted-looking red, gothic palace of King Ludwig, which in the mist, and with lights gleaming from its windows, seemed to glow like a burning palace of enchantment; the red colour through the mist making the whole building appear to be on fire—in a dull glow.

These hooded cloaks are a great rage here among the young men and lads; youths of twelve and fifteen have gay ones; outside grey or drab, with linings of crimson or blue—they are just like women's cloaks;—the students generally have darker colours, but their hoods generally gaily lined. If a man does not wear a hooded cloak, he wears one with a large cape, which he flings gracefully over his shoulders, producing very effective drapery; or if he does not sport an ample cloak, or a cloak of any kind, he will wear a great loose coat, with the sleeves uselessly dangling down at his sides or floating foolishly behind him. You never, by any chance, happen in Munich to see a man wearing a great coat, as any thing but a cloak.

There is nothing very peculiar about the

winter-dresses of the ladies. Of course, among the unbonneted class, you notice, with the damp, cold weather, a great increase of white bound-up heads, telling of toothach!

I must not, however, forget the garment of boards and planks now worn by all the fountains, as well as by the statue of the youth at the entrance of the English garden, who, with outstretched hand, invited us so pleasantly all summer and autumn to wander away among the trees. All now are boarded up in huge wooden cases, and thus they will remain until the spring.

As yet the weather is not very cold, although there has been snow for some weeks. About Christmas, I suppose, the bitter winter frosts will commence. One little thing peculiar to the winter here I greatly admire: you see long rolls of green moss laid inside almost all the windows, to keep out the draughts of cold air. The moss looks pretty and fresh; and you see peasants bringing in loads of these moss-wreaths every day into the city. I need not say that the shops are very gay with Christmas presents, and that everybody is preparing for Christmas trees.

So much for the December features of this cheerful little city.

A METAPHYSICAL MYSTERY.

I HAD a strange adventure once. Let me premise that I am somewhat sensitive (or, as my friends call it, "fidgetty") and somewhat, also, speculative (which the same gentlemen call "dreamy").

It was summer-time. I had been walking in the Regent's Park, and had been taking an economical view of that small section of the zoological specimens which can be seen without entering the gardens. They were romping about, and showing themselves, without any reference to the interests of the proprietors. Presently, I sat, or rather lay down, towards four o'clock, on a bench, and began reading a volume which I carried with me. It was a volume of SPINOSA—that famous philosopher, whose favourite amusement (as his biographer Colerus tells us) was to watch spiders in their web—and who certainly seems to have had, in doing so, a prophetic eye to the perplexities of his students. I took a turn at the Ethics, and was musing on the difference between "substance" and "attributes," when (the day being warm) I fell asleep.

I must have been asleep some time, when I felt myself roused by a touch on the shoulder. My book had tumbled on the grass; the air was a little chilly; an elderly gentleman of very respectable appearance was beside me. He bowed civilly, picked up my book for me, and said, "They're going to shut up, Sir."

"Oh,—indeed!" I replied. "I'm much obliged to you."

I jumped up, and we moved towards Gloucester Gate.

"So, you are fond of that philosopher, Mr. —"

"My name is Herbert," I said.

"Mr. Herbert. I have always considered with reference" —

And here the elderly gentleman went off into a disquisition on the subject. A quotation from a favourite author is always to me a kind of letter of introduction. We got very friendly. After a little while, as we were drawing near Acacia Road, (he having stopped—purchased an apple at a stall—cut off an end of it—and put it in his pocket) he suddenly said, "Come and dine with us on Tuesday, at 40, Beaver Street, Beaver Square, —six o'clock."

"You're very good," I said; "certainly——"

I was going to have said something farther, when he suddenly shook hands—cried "Six—remember!"—turned a corner, and was off.

"Well," I soliloquised, "a clever old man—awfully courteous! Yes, I certainly will dine on Tuesday with Mr. —"

Whew! Here was a surprise. I did not know my entertainer's name! Thanks to my confoundedly "speculative" tendencies, I had never thought of asking that. I went off next day, and consulted a directory. "Beaver Street, 40," was there found as a local habitation belonging to the name of "Hoggles." "Ah," I thought, "odd name, but very lucky I found it out."

Tuesday came. I dressed and reached Beaver Street in due time. The door was opened by a livery servant.

"Mr. Hoggles in?" I said enquiringly.

"Yes, Sir. The man looked surprised, and moved along the passage and called out loudly "Mr. Hoggles! you're wanted."

My heart sank within me as a third-set individual, in a paper cap, came up stairs from below and presented himself, saying, "I'm landlord of this house, Sir—do you want me?"

Clearly, then, my friend was a lodger; but what was his name? I paused.

"Is Mr. —"

I was in hopes the confounded servant would anticipate the name, and all would be right. But no; he waited silently.

Luckily, at that moment, the real old gentleman showed himself on the stairs, and said, "Come up, Mr. Herbert; you're in very good time."

I would have given the world just to say, "Who the deuce are you?" But he marched me up into a very fine room on the first floor, where the cloth was laid for dinner, and with a simple "My daughter, Mr. Herbert," introduced me to a young lady there. I felt very like Linnaeus just discovering a new and unnamed flower when I bowed to that damsel, and reflected on my utter ignorance of her titles. There was a sort of melancholy about her look that, somehow, prepossessed me, and she looked somewhat inquisitively at me, which I confess made me feel rather uneasy.

The old gentleman brought a book from a

side table and put it into my hand. "It is the Jena edition," he said. It struck me that his name might be in the title-page. I glanced at it. No! There was "From the author" there, however—the author having been dead nearly two hundred years! I thought this was a joke—the offspring of that queer jocosity which so often belongs to enthusiasm. Accordingly I smiled. He took away the book somewhat abruptly, and put it down again.

The dinner made its appearance. "Ah," I thought, as I surveyed the viands, "I know your names, my friends. You are cod—you are mutton. Could I only know those of my entertainer!" I foresaw that I should presently have to take wine with one of them. Then, again, I was constantly obliged to keep my eyes upon each; for if I wanted to call their attention, how do so, if I didn't know their name?

Dinner went on. I happened to make some observation to the daughter. The old gentleman looked up—"Eh?"

"I beg your pardon," I said, "I was speaking to Miss — (that terrible pause again!) to your daughter."

I glanced at the end of a fork, in a knowing way, soon after this. There was a chance of an initial there, at all events. But no; he must needs have a crest! How I abominated his barbarous ancestral pride! It was a stag. Everybody carries a stag. Had it been a pelican with young, which a certain great family (with the same sucking propensities, no doubt) carries, I might have guessed that he was one. As ill-luck would have it, he observed my glance at the stag.

"It is a pretty crest, is it not, Mr. Herbert?"

"Very," said I; and then I thought I had hit on something very ingenious. So I went on carelessly, "Do all your name bear the same?"

"Except the Devonshire ones—for they vary the name a little," answered the daughter. Doubtless she took it, as a matter of course, that I knew their name. I grew morbid. What right had I to be eating this old gentleman's dinner, when I was a perfect stranger to him?

Lucky Devonshire people, thought I, who know what the name is! "Ah," I resumed, "they called themselves—" (what a pause that was!)

"They add an 'i,'" she said, quietly.

"Add an 'i,'" I thought. Where, and how? Was the name Tomkins, and had the Devonshire people Italianised the patronymic into Tomkinsi? I had a vague idea of getting up a quarrel with the old gentleman, and compelling him to give me his card. That would bring the affair to a crisis, at all events! Meanwhile, dessert was put on the table. I saw that it would be at once ill-bred and dull to harp upon names any longer, so was preparing to resign myself to fate, when the old gentleman, arousing himself from an abstracted muse, said, "Pray, what do you think of the doctrine of psychosia?"

I drew myself up for a slight profusion, when, to my astonishment, the daughter suddenly rose, and said, coaxingly, "Well, never mind, Papa, to-night. Mr. Herbert knows it all."

I looked at her with calm surprise. She moved round towards me, and whispered, "Well, Sir, if you don't think there is any danger of over-excitement—"

There was a decided probability of my over-excitement ending in my temporary insanity, I could plainly see. I held my tongue; and what did the old gentleman do, but coolly begin a metaphysical harangue—the end and upshot of which was, that he was the temporary embodiment of the luminous intellect of Benedict de Spinoza!

"That's your name, is it, Sir?" said I, "I'm delighted to hear it." Here I jumped up. "Monsieur de Spinoza, permit me to wish you good evening!"

There suddenly occurred to me Dugald Stewart's observation, that a tendency to insanity may often be combined with high metaphysical acumen—and that the united phenomena precisely accounted for the whole proceedings of my eccentric friend. He evidently considered me, however, a firm believer in his theory about himself; while his daughter as evidently considered me a professional gentleman, who had been sent by one of the family to observe his present condition.

What to do! I heartily wished the old man at his original Amsterdam. It seemed likely that his aberration was recent and temporary. Presently, he sank into a doze.

"Well, doctor," said the girl, in a low voice, "What do you think of his case? I admire the tact with which, during dinner, you avoided inciting him, by confining yourself in conversation to trifles."

This unconscious judgment on my conversation and its value was, of course, highly flattering. I was about to reply, when the servant entered with—a census paper to be filled up.

"Now," I reflected, with a savage joy, "I shall know my friend's name at last. But how will he describe himself?"

"You had better write the name, and so on," said the girl, half-smiling. "Really, I ought not to laugh, but consider what Papa might write! Pray do it while I leave you for a minute."

So here was I, in the crisis of my fatal ignorance at last! I could not fill it up, of course—and let me tell you, my dear expectant reader, with every wish for your curiosity, that you are the proper person—to FILL UP THE CENSUS RETURN!

Nearly ready (with a copious Index.) Price Three Shillings.

HOUSEHOLD WORDS.

A WEEKLY JOURNAL:

CONDUCTED BY CHARLES DICKENS.

N^o. 42.]

SATURDAY, JANUARY 11, 1851.

[PRICE 2d.]

RAILWAY STRIKES.

EVERYTHING that has a direct bearing on the prosperity, happiness, and reputation of the working-men of England should be a Household Word.

We offer a few remarks on a subject which has recently attracted their attention, and on which one particular and important branch of industry has made a demonstration, affecting, more or less, every other branch of industry, and the whole community; in the hope that there are few among the intelligent body of skilled mechanics who will suspect us of entertaining any other than friendly feelings towards them, or of regarding them with any sentiment but one of esteem and confidence.

The Engine Drivers and Firemen on the North Western line of Railway—the great iron high-road of the Kingdom, by which communication is maintained with Ireland, Scotland, Wales, the chief manufacturing towns of Great Britain, and the port which is the main artery of her commerce with the world—have threatened, for the second time, a simultaneous abandonment of their work, and relinquishment of their engagements with the Company they have contracted to serve.

We dismiss from consideration, the merits of the case. It would be easy, we conceive, to show, that the complaints of the men, even assuming them to be beyond dispute, were not, from the beginning of the manifestation, of a grave character, or by any means hopeless of fair adjustment. But, we purposely dismiss that question. We purposely dismiss, also, the character of the Company, for careful, business-like, generous, and honourable management. We are content to assume that it stands no higher than the level of the very worst public servant bearing the name of railway, that the public possesses. We will suppose MR. GLYN'S communications with the men, to have been characterised by overbearing evasion, and not (as they undoubtedly have been) by courtesy, good temper, self-command, and the perfect spirit of a gentleman. We will suppose the case of the Company to be the worst that such a case could be, in this country, and in these times. Even with such a reduction of it to its lowest

possible point, and a corresponding elevation of the case of the skilled Railway servants to its highest, we must deny the moral right or justification of the latter to exert the immense power they accidentally possess, to the public detriment and danger.

We say, accidentally possess, because this power has not been raised up by themselves. If there be ill-conditioned spirits among them who represent that it has been, they represent what is not true, and what a minute's rational consideration will show to be false. It is the result of a vast system of skilful combination, and a vast expenditure of wealth. The construction of the line, alone, against all the engineering difficulties it presented, involved an amount of outlay that was wonderful, even in England. To bring it to its present state of working efficiency, a thousand ingenious problems have been studied and solved, stupendous machines have been constructed, a variety of plans and schemes have been matured with incredible labour: a great whole has been pieced together by numerous capacities and appliances, and kept incessantly in motion. Even the character of the men, which stands deservedly high, has not been set-up by themselves alone, but has been assisted by large contributions from these various sources. Without a good permanent way, and good engine power, they could not have established themselves in the public confidence as good drivers. Without good business-management in the complicated arrangements of trains for goods and passengers, they could not possibly have avoided accidents. They have done their part manfully; but they could not have done it, without efficient aid in like manifold sort, from every department of the great executive staff. And because it happens that the whole machine is dependent upon them in one important stage, and is delivered necessarily into their control—and because it happens that Railway accidents, when they do occur, are of a frightful nature, attended with horrible mutilation and loss of life—and because such accidents, with the best precautions, probably *must* occur, in the event of their resignation in a body—is it, therefore, defensible to strike?

To that, the question comes. It is just so narrow, and no broader. We all know, perfectly well, that there would be no strike, but

for the extent of the power possessed. Can such an exercise of it be defended, after due consideration, by any honest man?

"We firmly believe that these are honest men—as honest men as the world can produce. But, we believe, also, that they have not well considered what it is that they do. They are laboriously and constantly employed; and it is the habit of many men, so engaged, to allow other men to think for them. These deputy-thinkers are not always the most judicious order of intellects. They are something quick at grievances. They drive Express Trains to that point, and Parliamentary to all other points. They are not always, perhaps, the best workmen, and are not so satisfied as the best workmen. They are, sometimes, not workmen at all, but designing persons, who have, for their own base purposes, immeshed the workmen in a system of tyranny and oppression. Through these, on the one hand, and through an imperfect or misguided view of the details of a case on the other, a strike (always supposing this great power in the strikers) may be easily set a going. Once begun, there is aroused a chivalrous spirit—much to be respected, however mistaken its manifestation—which forbids all reasoning. "I will stand by my order, and do as the rest do. I never flinch from my fellow-workman. I should not have thought of this myself; but I wish to be true to the backbone, and here I put my name among the others." Perhaps in no class of society, in any country, is this principle of honour so strong, as among most great bodies of English artisans.

But, there is a higher principle of honour yet; and it is that, we suggest to our friends the Engine Drivers and Firemen on the North Western Railway, which would lead to these greater considerations. First, what is my duty to the public, who are, after all, my chief employers? Secondly, what is my duty to my fellow workmen of all denominations: not only here, upon this Railway, but all over England?

We will suppose Engine Driver, John Safe, entering upon these considerations with his Fireman, Thomas Sparks. Sparks is one of the best of men, but he has a great belief in Caleb Coke, of Wolverhampton, and Coke says (because somebody else has said so, to him) "Strike!"

"But, Sparks," argues John Safe, sitting on the side of the tender, waiting for the Down Express, "to look at it in these two ways, before we take any measures.—Here we are, a body of men with a great public charge; hundreds and thousands of lives every day. Individuals among us may, of course, and of course do, every now and again give up their part of that charge, for one reason or another—and right too! But I'm not so sure that we can all turn our backs upon it at once, and do right."

Thomas Sparks inquires "Why not?"

"Why, it seems to me, Sparks," says John Safe, "rather a murdering mode of action."

Sparks, to whom the question has never presented itself in this light, turns pale.

"You see," John Safe pursues, "when I first came upon this line, I didn't know—how could I?—where there was a bridge and where a tunnel—where we took the turnpike road—where there was a cutting—where there was an embankment—where there was an incline—when full speed, when half, when slacken, when shut off, when your whistle going, when not. I got to know all such, by degrees; first, from them that was used to it; then, from my own use, Sparks."

"So you did, John," says Sparks.

"Well, Sparks! When we and all the rest that are used to it, Eugene Drivers and Firemen, all down the line and up again, lay our heads together, and say to the public, 'if you don't back us up in what we want, we'll all go to the right-about, such a-day, so that Nobody shall know all such'—that's rather a murdering mode of action, it appears to me."

Thomas Sparks, still uncomfortably pale, wishes Coke of Wolverhampton were present, to reply.

"Because, it's saying to the public, 'if you don't back us up, we'll do our united best towards your being run away with, and run into, and smashed, and jammed, and dislocated, and having your heads took off, and your bodies gleaned for, in small pieces—and we hope you may!' Now, you know, that has a murdering appearance, Sparks, upon the whole!" says John Safe.

Sparks, much shocked, suggests that "it mightn't happen."

"True. But it might," returns John Safe, "and we know it might—no men better. We threaten that it might. Now, when we entered into this employment, Sparks, I doubt if it was any part of our fair bargain, that we should have a monopoly of this line, and a manslaughtering sort of a power over the public. What do you think?"

Thomas Sparks thinks certainly not. But, Coke of Wolverhampton said, last Wednesday (as somebody else had said to him), that every man worthy of the name of Briton must stick up for his rights.

"There again!" says John Safe. "To my mind, Sparks, it's not at all clear that any person's rights, can be another person's wrongs. And, that our strike must be a wrong to the persons we strike against, call 'em Company or Public, seems pretty plain."

"What do they go and unite against us for, then?" demands Thomas Sparks.

"I don't know that they do," replies John Safe. "We took service with this company, as Individuals, ourselves, and not as a body; and you know very well we no more ever thought, then, of turning them off, as one man, than they ever thought of turning us off as one man. If the Company is a body, now,

it was a body all the same when we came into its employment with our eyes wide open, Sparks."

"Why do they make aggravating rules then, respecting the Locomotives?" demands Mr. Sparks, "which, Coke of Wolverhampton says, is Despotism!"

"Well, anyways they're made for the public safety, Sparks," returns John Safe: "and what's for the public safety, is for yours and mine. The first things to go, in a smash, is, generally, the Engine and Tender."

"I don't want to be made more safe," growls Thomas Sparks. "I am safe enough, I am."

"But, it don't signify a cinder whether you want it or don't want it," returns his companion. "You must be made safe, Sparks, whether you like or not,—if not on your own account, on other people's."

"Coke of Wolverhampton says, Justice! That's what Coke says!" observes Mr. Sparks, after a little deliberation.

"And a very good thing it is to say," returns John Safe. "A better thing to do. But, let's be sure we do it. I can't see that we good workmen do it to ourselves and families, by letting in bad un's that are out of employment. That's as to ourselves. I am sure we don't do it to the Company or Public, by conspiring together, to turn an accidental advantage against 'em. Look at other people! Gentlemen don't strike. Union doctors are had enough paid (which we are not), but *they* don't strike. Many dispensary and hospital-doctors are not over well treated, but *they* don't strike, and leave the sick a groaning in their beds. So much for use of power. Then for taste. The respectable young men and women that serve in the shops, *they* didn't strike, when they wanted early closing."

"All the world wasn't against *them*," Thomas Sparks puts in.

"No; if it had been, a man might have begun to doubt their being in the right," returns John Safe.

"Why, you don't doubt *our* being in the right, I hope?" says Sparks.

"If I do, I an't alone in it. You know there are scores and scores of us that, of their own accord, don't want no striking, nor anything of the kind."

"Suppose we all agreed that we was a prey to despotism, what then?" asks Sparks.

"Why, even then, I should recommend our doing our work, true to the public, and appealing to the public feeling against the same," replies John Safe. "It would very soon act on the Company. As to the Company and the Public siding together against us, I don't find the Public too apt to go along with the Company when it can help it."

"Don't we owe nothing to our order?" inquires Thomas Sparks.

"A good deal. And when we enter on a strike like this, we don't appear to me to pay

it. We are rather of the upper sort of our order; and what we owe to other workmen, is, to set 'em a good example, and to represent them well. Now, there is, at present, a deal of general talk (here and there, with a good deal of truth in it) of combinations of capital, and one power and another, against workmen. I leave you to judge how it serves the workman's case, at such a time, to show a small body of his order, combined, in a misuse of power, against the whole community!

It appears to us, not only that John Safe might reasonably urge these arguments and facts; but, that John Safe did actually present many of them, and not remotely suggest the rest, to the consideration of an aggregate meeting of the Engine Drivers and Firemen engaged on the Southern Division of the line, which was held at Camden Town on the day after Christmas Day. The sensible, moderate, and upright tone of some men who spoke at that meeting, as we find them reported in *The Times*, commands our admiration and respect, though it by no means surprises us. We would especially commend to the attention of our readers, the speech of an Engine Driver on the Great Western Railway, and the letter of the Enginemen and Firemen at the Bedford Station. Writing, in submission to the necessities of this publication, immediately after that meeting was held, we are, of course, in ignorance of the issue of the question, though it will probably have transpired before the present number appears. It can, however, in no wise affect the observations we have made, or those with which we will conclude.

To the men, we would submit, that if they fail in adjusting the difference to their complete satisfaction, the failure will be principally their own fault, as inseparable, in a great measure, from the injudicious and unjustifiable threat into which the more sensible portion of them have allowed themselves to be betrayed. What the Directors might have conceded to temperate remonstrance, it is easy to understand they may deem it culpable weakness to yield to so alarming a combination against the public service and safety.

To the Public, we would submit, that the steadiness and patriotism of English workmen may, in the long run, be safely trusted; and that this mistake, once remedied, may be calmly dismissed. It is natural, in the first hot reception of such a menace, to write letters to newspapers, urging strong-handed legislation, or the enforcement of pains and penalties, past, present, or to come, on such deserters from their posts. But, it is not agreeable, on calmer reflection, to contemplate the English artisan as working under a curb or yoke, or even as being supposed to require one. His spirit is of the highest; his nature is of the best. He comes of a great race, and his character is famous in the world.

If a false step on the part of any man should be generously forgotten, it should be forgotten in him.

THE OTHER GARRET.

In the year 1846, finding myself out of employment, I happened to hear that there was a demand in Paris for workmen in my business. I understood the French language, and had no family ties to keep me in London; so I packed up all my worldly goods, and with a few pounds in my pocket, proceeded to the gay capital. I hired a single chamber on the second floor of one of the enormous "hotels garnis," or furnished houses, in the Rue du Faubourg Poissonnière; and the next day went out to seek employment. I had two letters of introduction to masters—one directed to the Rue St. Martin, where I proceeded first. The employer received me kindly, but said that he had then no need of workmen. The second gave me the same answer, but added that if in six weeks' time I were not engaged, he should certainly be in a condition to employ me. A month passed and left me still idle. I found that I had been misinformed as to the demand for workmen; or else, that the state of things had changed since the date of my information. I began to think of returning to London, before my stock of money became too low to enable me to do so; but, by a strange fate, I was positively without a friend or relative in England; and, if I returned, I did not see that I should greatly improve my prospects. On the other hand, the house in the Faubourg St. Antoine had assured me that I should be engaged there in another fortnight. I resolved to stay. I saw my money dwindle down to the exact sum which would take me back to London. I hesitated—but at last spent a portion, with the resolution of a man who burns his boat upon the shore to give himself the courage of desperation. Meanwhile I renewed my search, but still without success; till, at last, the day came when I was to present myself at the manufactory in the Rue St. Antoine. The aspect of the workshop, and the countenance of the master, were sufficient answer. I left the house with a heavy heart—my last and most confident hope was gone in an instant! I was without friends—almost without money, or the means of getting it; and as effectually cut off from my own country as if I had been in the heart of Siberia. I had no spirit to renew my search that day. I took my small loaf and cheese, and with a book in my hand sat in the gardens of the Luxembourg till the light failed. I returned home, and entering at the lodge, asked to speak with the porter's wife, of whom I had hired my room. At the same time, a young woman lodging in the same house came in and asked if there were a letter for her. The landlady gave her one, and she broke open the seal and began to read it eagerly. I

felt some degree of shame to speak of my business in the presence of a stranger; but the young lodger was absorbed in reading her letter, and showed no signs of departing.

"I wished, Madame Mallet, to ask if you had another room to let, which I might exchange for my own."

"Oh yes—Monsieur would like one better furnished; one on the first floor, perhaps. Well, I must say Monsieur is not lodged very comfortably; but however, for six francs a week, I am sure Monsieur would not find a nicer lodging in all Paris."

"No, Madame Mallet, it is not *that* which I want. I simply wished to know if you had another room unoccupied, at a lower rent than my own."

"Why yes," replied she, in a less respectful tone—"if you wish for one cheaper, you must be content to climb up to the top floor, where I have a little room, not very elegantly furnished, as a matter of course, at four francs per week. This young person occupies the other garret, which she will tell you is pretty comfortable."

The young woman raised her eyes from the letter and murmured, timidly, that she was quite satisfied with it.

I observed her as she spoke. She was certainly far from being handsome, but her dress though plain was neat and graceful. There was, moreover, an expression in her face of meek humility, the result perhaps of a consciousness of her want of beauty. On that account she had, I thought, experienced neglect, perhaps harsh treatment, and had become timid and retiring, never forgetting her defects.

"Monsieur can walk up, and see his new room if he pleases," added Madame Mallet—"or, as it is quite ready, he has nothing to do but to carry up his box."

She took the light, and I followed. My near neighbour wished me good night upon the landing, and I entered my new abode. The room was small, and paved with red tiles. It contained simply a bed, two chairs, and a table, and on the walls a few Catholic pictures.—The house, like most of the "hotels garnis" in the suburbs of Paris, was a great building, forming three sides of a square yard planted with trees. My window looked out upon this yard. I sat myself down and began to reflect upon my position. My money, if I lived the life of a hermit, would not last me more than three weeks. I might then, perhaps, sell a few books, which I had brought with me—the only consolation to which I could turn in my trouble; I had also a ring which my mother had given me, and which I had resolved never to part with.

I continued to seek employment and to live with the most rigid economy; but, at length, I found myself without a sou. I took my books and sold them for a few francs at one of those innumerable book stalls that line the quays of the Seine. When this money

was gone I sat down in despair, with my face between my hands. I had no further resource but my mother's ring, and this I was determined to keep. The day passed away and I tasted no food. The next day I fasted also. I was determined, if at length I gave way to hunger, at least not to do so without such a struggle as should console me in after-times for breaking my resolution. The sun shone brightly that day, and I heard my neighbour singing with her window open, where I had often seen her, above the trees. I went to bed early to forget the pangs of hunger, but I could not sleep. A gnawing in the stomach, accompanied by heat and thirst, kept me awake till the light streamed in through the long narrow windows. Then I heard my neighbour again moving briskly in the next apartment. Presently I heard her open and fasten back the long wooden screens or jalousies, which close from the outside of all the windows in Paris. Then, like a bird at the sight of a fine morning, she began to sing again, till the day grew more advanced, and I heard the noise of people in the street. She descended the stairs, and I saw her cross the yard, with her graceful little cap, which all French women wear in the morning, and carrying in her hand a basket of woven straw, such as the French prisoners made and sold in England at the time of the last war.

I could hardly stand for faintness; I waited till I thought it late enough to find some jeweller's shop open, and then, taking my ring, I crept down stairs noiselessly, as if I were about to do some shameful deed. Oh, how happy and gay seemed everything in the streets compared with me! The sun shone, and the air was so calm and clear, and the faces of the people so cheerful, as they passed to and fro under the long lines of trees upon the Boulevards. I soon found a goldsmith, where I offered my ring. The man eyed me attentively for a moment, for there was something suspicious in coming to sell a ring at that early hour. However, he seemed satisfied with my appearance, and having examined the stone, and tested the gold with aqua-fortis, he offered me sixty francs—I believe two-thirds of its value—but I accepted them and departed.

The occupant of the "other garret" seemed to haunt me. I met her as I crossed the threshold of the jeweller's door, returning with her little basket full—a long loaf and a melon forcing up the lid. I bid her good morning, and passed on. I entered a Restaurant, and asked for breakfast, of which I ate heartily, though I was careful not to eat too much, after my long fast. But, in spite of my precautions, I felt extremely ill. My eyes were glazed; my lips (as I saw in the glass) were black and parched, and I trembled from head to foot. I do not remember how I spent that day, but all night long I lay in bed, burnt up with fever, and haunted by wild dreams.

Sometimes I seemed to walk between high leaning walls, that threatened to topple down and crush me; and I quickened my pace to escape from them, but their length was interminable. At others, I climbed in darkness up a spiral staircase to the roof of some great cathedral; I heard the rolling of organs, like low thunder; I climbed, and climbed, fearing to be stifled, till, at length, I issued on the roof; and looking down from the dreadful height, I saw a great city spread below, and far away broad fields, and hill tops crowned with windmills. A fear of falling took hold of me, but I could not recede; and I called aloud for some one to come and drag me back to the little door. Then, perplexed with the sudden change, and asking myself whether I dreamed or not, I stood in a level country, where there were long broad ditches, filled with flags and bulrushes, and bordered by stunted willows. Here and there was a stagnant pond, its scummy surface shot with purple and green, its long feathered grasses haunted by splendid dragon-flies; for it was a deep still noontide, and a blue and dazzling sky shut in all that broad landscape. And, although I had thought myself the only living being there—and although my mother had been dead for many years—I turned round, and found her standing by me without surprise. She bade me go with her, and see what she would show me. Soon we stood upon a wide road, and, as I guessed, upon the outskirts of a great city, for I heard a noise of a multitude far off. Presently we entered the city by a gate; and we looked down a broad street, lined on each side with temples, and great houses—an endless line of pillars, for the street seemed to traverse the whole city; and at the bottom, far away, we saw blue mountains stretching out into the sky. We walked towards them—a great crowd accompanying us—till we issued by another gate, and saw the fields again. It suddenly grew dark; but the crowd continued to pour outward by the city gates. After a long time of darkness, I looked up, and saw a faint flush of light around the horizon; and as it grew not only in the east, but in the west, and in every direction, I saw the edges of hills, and the spires of fir plantations against the sky—I said, "It is not the daybreak, but the coming of a great wonder." And I heard my mother's voice, saying, "Fear nothing; you have kept the ring I gave you, and your love for me shall wipe out many sins." Then a great fear seized me, and I called upon her by name, and would have held her by her garment, but she was gone. Meanwhile, I prayed upon my knees, and I heard the stir of the voiceless multitude around me, and the light increased, and I fell upon my knees and wept.

I do not know who found out first that I lay ill. Throughout the next day, I was half-awake, with a consciousness of some one moving in the room; and in the evening, a

doctor came to me; perhaps he had been before, but I had no memory of it. He gave me medicine, which I took without inquiry, and another night passed in a calmer sleep. When I woke again, I felt better. There was daylight in the room. I stretched my hand out to draw aside the curtain of my bed, when, to my astonishment, I saw upon my finger the ring which I had sold to the jeweller. I pulled it off, and examined it. There was no doubt of its identity. I tried to recall the events of the last two days. Was this, then, only a part of the terrible dreams which had oppressed me? No. I remembered too well the days of my poverty and hunger; the long struggle with myself, and the final yielding; the shop on the Boulevard where I had sold my ring, and the Restaurant where I broke my fast. I thrust my hand under my pillow, and drew forth my money, the surest proof that I was not deceived. However, I pushed aside my curtains, to assure myself that I was at home, in my own bedroom, when, to my surprise, there was my next room neighbour sitting near my window, busily working upon a little cap. The table was drawn up to her side, and upon it was some lace and ribbon. She plied her needle briskly for awhile, without observing me, and then held the cap out at arms' length, and eyed it like a connoisseur. Then she worked a minute or two longer, and again she held it out, when, suddenly holding it sideways, she saw me looking at her.

"Does Monsieur want anything?" she asked.

"Yes," said I, "I wish to know the name of my unknown friend, who has restored to me a ring, given to me by my mother dying, and which I would have guarded as my life, but that I was compelled to sell it for bread, two days ago. I cannot guess what being has done this. I have no friend in Paris, and I have not spoken of this to a soul. But I entreat you, if you know, not to conceal the name, that I may bless it to my latest hour."

"By-and-by, Monsieur shall know all; but at present —"

"Nay," I interrupted, "I entreat you to tell me; but why should I doubt? It can be no other than yourself; and yet, I cannot tell why you should interest yourself thus for a stranger and a foreigner."

"But would not Monsieur have done an equal kindness for a stranger?—There," she exclaimed, suddenly checking herself, "the secret which I meant to keep is told. Mons. Gallart, the curé, always said I was a silly thing."

"But why wish to conceal so good an action?"

"I do not know, except that I should have liked to wait till you were rich enough to repay me. Now you will tease yourself about the money, though I am sure I do not want it. I never should have had it, but for Mons. Gallart, the curé; for, you see, I never thought of saving money. I used to buy every week

a new cap, and now and then a new dress, till, one day, Mons. Gallart overtook me in the meadow coming from mass; for I had loitered by the way. And he spoke to me about youth, and how soon it was flown, and asked me if I had ever considered that, one day, I should be no longer young and strong. And I said I had; but it seemed that so many long years must pass away before that time came. He told me that he himself thought like me once, but that now his hair had grown grey; he looked back, and saw how quickly a man glides from youth to age. 'Besides,' he said, 'you may be taken ill, and you have not a friend in the world, excepting me; and I am poor. Would it not be well to try and save a little money? Indeed,' he said, 'I would not ask you to forego one pleasure, if I did not think it might spare you some future pain.' And so he talked to me in this way as we walked, arm in arm, along the footpath through the fields, till we came to the road to Neuilly; and then he blessed me, and bid me good-bye, and returned across the fields. And all the way home I thought upon his words, and resolved to buy fewer caps and dresses; and now that is a year ago, and I had saved a hundred francs, and next Sunday I would have taken them to mass with me, and waited for him again in the churchyard, and have shown him how I minded what he said, and have asked him what to do with all my money."

"And you give up this pleasure for my sake?"

"Nay, Monsieur—to what better use could he tell me to employ it? I am not grown old yet. I am not ill—I had no use for it."

"God bless you," I exclaimed, "I hope soon to repay you the money; though the debt of gratitude I owe you I can never do away. But how did you learn that I had sold this ring, and where?"

"Oh, I partly guessed it, as you shall hear. Madame Mallet came to my room door; and said you were very ill; and asked me to come and watch you while she fetched a doctor. I came in and sat by the bedside till the doctor came, and saw you were in a high fever, and in great danger, and you ought not to be left alone. So I offered to sit by you, for, you see, I can work here as well as in my own room; for I lose no time. Madame Mallet offered also; and we agreed to attend upon you by turns. And when I was left alone, and you were asleep, and dreaming, I heard you talking of a ring, and entreating some one to keep it for you till you came again, and bought it with a hundred times its value. Then you sobbed, and spoke rapidly in a language that I did not understand. Suddenly I remembered meeting you at the jeweller's door the day before; and I said to myself, he has been compelled to sell a keepsake; and this it is that preys upon his mind, and makes him ill. And I thought of my money, and blessed the good old curé, whose advice

had enabled me to help you. In the morning, I went out as usual with my basket, and found again the shop upon the Boulevard Montmartre. I asked if some one had not sold a ring there early on the day before. The man answered yes. I told him that you wished to buy it again, and he said you could have it for eighty francs. So I paid him the money and brought the ring away. And then I thought how surprised and delighted you would be to find it on your finger on awakening: so I contrived, when your hand was stretched out upon the coverlet, to put it on without disturbing you."

My eyes were filled with tears at the thought of so much simplicity and goodness. I would have said a hundred things, but I could not find a word to utter. I wished that she had been an English woman, that my emotion might speak, without constraint, its natural language. She saw me striving to speak and stopped me.

"You must not talk," she said. "The doctor cautioned me, above all things, not to let you talk or be excited; and here I have been chattering more than an hour, and forgetting that I ought to go out to market."

So saying, she put on her cape, and taking her basket, went out and shut the door noiselessly behind her.

I lay in bed a fortnight; and every day she sat with me, and chatted. The constant attendance was no longer necessary, but I begged her to stay with me by day. As I grew better the restraint diminished, and all her natural cheerfulness began to show itself. Her little rounded figure glided about the room with all the lightness of a fawn. Sometimes she sat singing, and working, as in her own room, and then would check herself, and say that it made my head ache; till I begged her to go on.

One day I said to her, 'You have never told me your name.'

"Aimée: and yours?"

"'William Arnot,' said I, shearing myself of the final consonant to suit her French ear—"in French, Guillaume Arnot. It is not so pretty a one as yours, which makes you always beloved," said I, playing upon the word.

"Nay, excepting M. Gallart, I do not know a single being whom I can call my friend."

"And how is this," I asked—"you, who are so kind and good?"

"'I never knew my mother,' she replied. 'My father was a vinegrower in a little village in Lorraine; and M. Gallart was the curé there at the time. I had a sister, who was very beautiful; and M. Gallart taught us both to read and write, and to understand the best writers, whose works he lent us from his library. But my sister was proud, and never loved me much; and when she married a rich man, and went to Paris to live, she thought of us no more. I forgave all this: but when my father lay ill, and his farm had gone to ruin, we wrote to her in vain.

When he died, and we wrote to her again, and had no answer; I thought I never could forgive her while I lived. The good old curé had been removed to the parish of St. Etienne, where he preaches now, some time before my father died; but he came to me as soon as he received the news, and arranged my father's funeral. Afterwards, as I had no relatives in the village, M. Gallart took me to Paris with him, and placed me with Madame Armonville, a milliner in the Rue Richelieu; where I learnt how to earn my living. I have never seen my sister since I have been here: but once, soon after I came to Paris, I passed by her house. I saw the windows brilliantly lighted, and I heard music. They had a party there that night. I stood looking up at the windows, and crying bitterly. I would have given all that I possessed to see my sister once more, if only for a moment, to have reminded her of the days we spent together in our childhood. But I was afraid of being driven from the door if I rang, and so I passed on, and never went that way again. That is my history, Monsieur."

"It is very sad," I said. "I will not tell you now, by what strange order of events I also am friendless in the world. Some other time I will tell you all. Your story has made me sad, and I do not like to dwell upon the past. Let us rather look forward to the future, and, like brother and sister, resolve to help and cherish one another while we live."

I took her hand and pressed it in my own. I spoke hurriedly and earnestly, for I felt most deeply every word I uttered. A new source of life had sprung up in my heart. I forgot how little I was in a condition to help her—poor and wretched as I was. The sight of such a noble creature, despised and ill-treated by the world, preserving all her hope and cheerfulness, and seeking only to do good to others, had made me a new man. All life stood out before me with another aspect. I felt a stronger faith than ever I had known before, that all the evil in the world, the thought of which had long haunted and perplexed me, will one day vanish like a mist, and show the beauty of God's purpose hid within. I was so happy, and so filled with hope, that I thought I felt the near approach of better days: and indeed from that time, the current of my fortune ebbed and turned.

At the end of three weeks I was so far recovered as to leave the house and renew my search for employment. I found a great change had taken place since I had kept my room. In every trade there seemed to be new life; and, in a few days, I was engaged in a manufactory in the Rue St. Denis. My employer was pleased with my work, and paid me well. My first care was to repay my friend the money which I owed her. She arranged to visit the curé on the following Sunday, and show him her money, as she had originally intended. I offered to accompany her.

There are but few days in our lives which are not forgotten as soon as passed. The fête days in the calendar of our existence are few and far apart. Yet, sometimes, we come to a day which never passes from our memory till we die. Everything we thought and did upon that day comes back to us afterwards, when the eye is filmed with thought, and all the present is forgotten for awhile. This Sunday will live for ever in my memory, one of the foremost of such happy days. We rose early, and went out of Paris by the Barrière de l'Etoile. It was a still, cool autumn morning. The mist that lingered still when we set out, had wholly passed away, and left a heavy dew upon the leaves, and laid the dust upon the roads. We turned off from the highway after awhile, and took a footpath across the meadow till we came to a deep valley, and stood still to look around us for a time. Behind us we saw the towers and triumphal arches of Paris—the white houses of the outskirts sprinkled, far and wide, among the trees. But below it was a quiet landscape. One side of the valley was ploughed up to the borders of a wood. In the hollow stood the old church where we were going, ivy-covered, with a square tower. Behind flowed the Seine, and, farther still, the forest, called the Bois de Boulogne, piled up into the sky its masses of innumerable tints. We descended and entered the church. We were late, for we had lingered long to look upon that scene. My friend touched the incense-brush, which was presented to her at the door, but I did not. There was chaunting as we entered; but presently the curé mounted the pulpit and began to preach. He was a fine tall old man. His hair was grey, but he was not bald. His face was benign and placid, though, at times, it wore a somewhat careworn expression, and his forehead was planted deep with wrinkles. I listened with delight to his discourse, which seemed to harmonise with the mood wrought in my mind by the calm autumnal day, and the sight of that still country; for he preached not of dogmas, or of articles of faith, but of charity and love to all mankind.

We waited for him in the churchyard, and when the whole of the congregation had left the church, and the footpaths were dotted with them in their neat attire, the curé issued from the door, and the sexton fastened the great bolts behind him. Aimée ran to meet him, and he kissed her on the forehead, and turning towards me, said, "So you have found a new friend."

"No, Monsieur," said I, taking off my hat with a feeling of reverence, "say, rather, that I have found a new friend; for to her I owe my life and peace of mind, and as yet I have not found occasion to make her a return."

She looked confused; but the curé patted her on the head, and begged me to walk beside him and tell him how this was. He walked between us in his silken gown, tied

with a girdle at the waist, and with his head uncovered, while I related to him all my story. She hung down her head, but the old man raised it up, and kissed her on the forehead once again. And he begged us to come home and dine with him with so much earnestness that we complied. I half-guessed his reason. He had eyed me at first with the anxiety with which a father scrutinises the lover of his child, and he wished to have me longer with him that he might judge me better. We talked together all the afternoon, but Aimée sat in silence, listening to our words. The discourse of the old man was full of deep and practical philosophy. It was the language of a man who had grown weary in seeking, in the eternal ebb and flow of history, the tendency of life, and had fallen back upon the present, and a good and holy life, as the only certain things which man can hold. In the evening he accompanied us back to the church, where we left him, and took our way homewards. We looked back again from the hill top, and saw the sun about to sink into the forest, and a level shaft of light shot across all that golden sea of leaves. It was dusk when we returned. A few days afterwards she received a letter from the old man, as she was accustomed to do at certain intervals. He spoke favourably of me amongst other things, but cautioned her to avoid, not only evil, but the appearance of evil, that so she might escape the scandal of the world.

The church was too far for her to visit regularly. But after she had been to mass, we went together every Sunday to St. Cloud or Asnières, or some other village in the environs. The fine weather lingered still. The trees under our window were nearly bare, and the vine against the house had begun to shed its stalks: but in the country the trees were still thick with leaves, for there had been no wind. The mornings became more misty, but at midday the sun was warm. It seemed the winter never would come—such a golden calm had fallen on the earth; till one morning, while we talked still of country rambles, I looked out of my window and saw the snow-flakes falling in the street. Then came the winter nights, and how to pass them? We could sip no longer our coffee on the Boulevards, sitting at the little green table under the trees. Sometimes, we played at chess, which I had taught her; and twice we went to the theatre together. But this was not enough. One day I asked her if she would like to learn English, and she said "Yes," and promised to take pains to learn. I bought a little grammar, and began. The curé had taught her well the principles of grammar, so that she quickly comprehended the rules. She applied herself with unwearied industry;—even while she worked, she had her grammar open before her, conning the rules, and learning them by heart; and at night I read with her, and

explained the words and peculiarities. At the end of five months, she could read it pretty well, and began to try to speak. There was something so simple in her foreign accent and her literal translations of the idioms of her own language, that I could not help laughing. But she was not discouraged, but would laugh too, and ask me to explain her error, and promise to speak better by-and-by.

The summer came again, and I worked early and late: for we were very busy. It happened, at that time, that we had some work to execute near Orleans; and a little troop of workmen was to be sent there, to stay for a couple of months. The master selected me to superintend them. The choice was a mark of confidence, and I could not refuse to go. I told my friend of it in the evening. I was to leave Paris on the Monday following, and the day previously, we arranged to visit the old curé once again.

Yet another day, which will linger in my memory till I die!—the brightest of those happy days! We went out earlier this time. It was the first of June—a fine clear morning. A gentle rain had fallen in the night, and everything looked fresh and green. We walked along the borders of the wood, and heard the blackbird, hidden in the leaves, sing out, and stop: and then, there was a dead silence: till another answered, deeper in the woods. I had never seen her dressed so prettily before. She wore a dress of gray merino, and a cape of the same stuff. Her cap was of lace, and pale blue ribbon. We did not speak often. I thought of separation on the morrow; and at every step I seemed to shrink from it more. Afterwards, we went to St. Cloud, which was not far. And all this time I had never spoken to her of anything but friendship, nor ever whispered to myself how much I loved her. My love had been too pure to know itself. We wandered in the park till it was time to go, and still we lingered. We sat down upon a seat, beneath great oaks; and then, when the hour grew nearer, when we were to part, I felt more deeply still how all my soul was bound to her. I could not leave her till I told her all.

Eight weeks passed slowly in the old city of Orleans; but every day I wrote to her, and she replied—the solace of our solitary nights. She told me, in her innocence of heart, how she had loved me ever since the day we went to see the curé in the valley; and how she had feared that I should never love her as she loved me; for “you alone” she said, “could unseal my lips, and but for you I never could have spoken out, and eased my heart.” At length, I returned. Then came our marriage morning. We invited no strange faces. We went about—on foot; because it awakened pleasing recollections. There were some signs in her attire which might have told it was her marriage day, but it was, withal, so plain, that we escaped all observation. The sister of

M. Gallart served as bridesmaid, and the sexton signed the book.

Afterwards, the old man walked with us, and talked to her of other days; until we came again to the gate that opened into the high-road. Then, he blessed us again, and looked after us until we were gone. And, hand in hand, alone, we took our way together; but all our Eden lay before us in the days to come.

God bless the other garret! I found my Eden there, and it abides with me.

EFFORTS OF A GENTLEMAN IN SEARCH OF DESPAIR.

MR. BLACKBROOK lived in a world of his own. It was his pleasure to believe that men were phantoms of a day. For life he had the utmost contempt. He pronounced it to be a breath, a sigh, a fleeting shadow. His perpetual theme was, that we are only here for a brief space of time. He likened the uncertainty of existence to all the most frightful ventures he could conjure up. He informed timid ladies that they were perpetually on the edge of a yawning abyss; and warned little boys that their laughter might be turned to tears and lamentation, at the shortest notice. Mr. Blackbrook was a welcome guest in a large serious circle. From his youth he had shown a poetic leaning, of the most serious order. His muse was always in deep mourning—his poetic gum oozed only from his favourite graveyard.

He thought “L’Allegro” Milton’s worst performance; and declared that Gray’s “Elegy in a Country Churchyard” was too light and frivolous. His life was not without its cares; but, then, he revelled in his misfortunes. He was always prepossessed with a man who wore a hatband. The owl was his favourite bird. A black cat was the only feline specimen he would admit to his sombre apartment; and his garden was stocked with yew-trees. He revelled in the charm of melancholy—he would not, if he could, be gay. His meditations raised him so great a height above his family, that little sympathy could exist between them. Eternity so engaged him, that his brothers and sisters—mere phantoms—did not cost him much consideration. His youthful lines to the Owl, in the course of which he called the bird in question “a solemn messenger,” “a dread image of the moral darkness which surrounds us,” “a welcome voice,” and “a mysterious visitant,” indicated the peculiar turn of his mind. His determination to be miserable was nothing short of heroic. In his twenty-second year a relation left him a modest fortune. His friends flocked about him to congratulate him; but they found him in a state of scraphic sorrow, searching out a proper rhyme to the urn in which he had poetically deposited the ashes of his benefactor. On looking over the lines he had

distilled from his prostrate heart, his friends, to their astonishment, discovered that he had alluded to the bequest in question in the most contemptuous strain:—

Why leave to one thy velvet and thy dress,
Whose wealth is boundless, and whose velvet's
moss!

So ran his poetic commentary. His boundless wealth consisted of intellectual treasures exclusively, and the sweet declaration that moss was his velvet, was meant to convey to the reader the simplicity and Arcadian nature of his habits. The relation who had the assurance to leave him a fortune, was dragged remorselessly through fifty lines as a punishment for his temerity. Yet, in a fit of abstraction, Mr. Blackbrook hurried to Doctors' Commons to prove the will; hereby displaying his resignation to the horrible degree of comfort which the money assured to him. It was not for him, however, to forget that life was chequered with woe, that it was a vale of tears—a brief, trite, contemptible matter. The gaiety of his house and relations horrified him; they interfered, at every turn, with his melancholy mood. He sighed for the fate of Byron or Chatterton! Why was he doomed to have his three regular meals per diem; to lie, at night, upon a feather-bed, and the recognised layers of mattresses; to have a new coat when he wanted one; to have money continually in his pocket, and to be accepted when he made an offer of marriage? The fates were obviously against him. One of his sisters fell in love. How hopefully he watched the course of her passion! How fondly he lingered near, in the expectation—the happy expectation—of a lovers' quarrel. But his sister had a sweet disposition—a mouth made to distil the gentlest and most tender accents! The courtship progressed with unusual harmony on both sides. Only once did fortune appear to favour him. One evening, he observed that the lovers avoided each other, and parted coldly. Now was his opportunity; and in the still midnight, when all the members of his household were in bed, he took his seat in his chamber, and, by the midnight oil, threw his soul into some plaintive lines "On a Sister's Sorrow." He mourned for her in heart-breaking syllables; likened her lover to an adder in an angel's path; dwelt on her quiet grey eyes, her stately proportions, and her classic face. He doomed her to years of quiet despair, and saw her fickle admirer the gayest of the gay. He concluded with the consoling intelligence, that he would go hand in hand with her along the darkened passage to the grave. His sister, however, did not avail herself of this proffered companionship, but chose rather to be reconciled, and to marry her lover.

Mr. Blackbrook found some consolation for this disappointment in the composition of an epithalamium of the most doleful character on the occasion of his sister's marriage, in the

course of which he informed her that Jove's thunderbolts might be hurled at her husband's head at any period of the day; that we all must die; that the bride may be a widow on the morrow of her nuptials; and other equally cheerful truths. Yet at his sister's wedding-breakfast, Mr. Blackbrook coquetted with the choice parts of a chicken, and drowned his sorrow in a delectable jelly.

When for a short time he was betrayed into the expression of any cheerful sentiment, if he ever allowed that it was a fine day, he quickly relapsed into congenial gloom, and discovered that there might be a thunderstorm within the next half-hour. His only comfort was in the reflection that his maternal uncle's family were consumptive. Here he anticipated a fine field for the exercise of his poetic gifts, and, accordingly, when his aunt was gathered to her forefathers, her dutiful nephew laid a sheet of blank paper upon his desk, and settled himself down to write "a Dirge." He began by attributing all the virtues to her—devoting about six lines to each separate virtue. Her person next engaged his attention, and he discovered, though none of her friends had ever remarked her surpassing loveliness, that her step was as the breath of the summer wind on flowers (certainly no gardener would have trusted her upon his box-borders); that she was fresh as Hebe (she always breakfasted in bed); that she had pearly teeth (her dentist has maliciously informed us that they were made of the very best ivory); and, finally, that her general deportment was most charming—so charming that Mr. Blackbrook never dared trust himself in her seductive presence. Having proceeded thus far with his melancholy duty, the poet ate a hearty supper of the heaviest cold pudding, and—we had almost written—went to bed—but we remember that Mr. Blackbrook always "retired to his solitary couch." He rose betimes on the following morning, looking most poetically pale. His dreams had been of woe, and darkness, and death; the pudding had had the desired effect. Again he placed himself at his desk, and having read over the prefatory lines which we have endeavoured to describe, he threw his fragrant curl from his marble forehead, and thought of the funeral pall, the darkened hall,—of grief acute, and the unstrung lute. He put his aunt's sorrowing circle in every possible position of despair. He represented his surviving uncle as threatening to pass the serene portals of reason; he discovered that a dark tide rolled at the unhappy man's feet; that the sun itself would henceforth look dark to him; that he would never smile again; and that, in all probability, the shroud would soon enwrap his manly form. He next proceeded to describe minutely the pearly tears of his cousins, and the terrible darkness that had come over their bright young dreams. An affecting allusion to his own unfathomable grief on the occasion, was concluded by the

hope that he might soon join his beloved aunt, though he had never taken the least trouble to pay her a visit while she lived in St. John's Wood. This touching dirge was printed upon mourning paper, and distributed among Mr. Blackbrook's friends. The death of an aunt was an affecting incident, but still it fell short of the brink of despair. Mr. Blackbrook's natural abiding-place was the edge of a precipice. His muse must be fed on heroic sorrows, hopeless agony, and other poetical condiments of the same serious nature. The course of modern life was too level for his impetuous spirit; but in the absence of that terrible condition to which he aspired, he caught at every incident that could nerve the pinion of his muse for grander flights. A dead fly, which he found crushed between the leaves of a book, furnished him with a theme for one of his tenderest compositions. He speculated upon the probable career of the fly,—opined that it had a little world of its own, a family, and a sense of the beautiful. This effusion met with such fervent praise, that he followed it up by "Thoughts on Cheese Dust," in which he dived into the mysteries of these animalculæ, and calculated the myriads of lives that were sacrificed to give a momentary enjoyment to the "pampered palate of man." His attention was called, however, from these minor poetic considerations, to a matter approaching in its gravity to that heroic pitch of sorrow which he had sought so unsuccessfully hitherto.

His cousin was drowned by the upsetting of a pleasure-boat. At such a calamity it was reasonable to despair—to refuse comfort—to leave his hair uncombed—to look constantly on the ground—to lose all appetite—to write flowing verse. Mr. Blackbrook entered upon his vocation with a full sense of its heroism. At least one hundred lines would be expected from him on so tremendous an occasion. The catastrophe was so poetical! The sea-weed might have been represented entangled in the golden tresses of the poor girl, had the accident happened only a little nearer the Nore; and the print of her fair form might have been faintly traced upon "the ribbed sea-sand." This was unfortunate. In reality the "melancholy occurrence" took place at Richmond. Mr. Blackbrook began by calling upon the willows of Richmond and its immediate vicinity to dip their tender branches in the stream in token of their grief. Mr. Blackbrook, felicitously remembering that Pope once lived not far from Richmond, next invoked that poet's shade, and begged the loan of his melodious rhythm. But the shade in question not answering to the summons, all that remained for the sorrowing poet to do was to take down his dictionary of rhymes, and tune his own lyre to its most mournful cadences. He set to work. He called the Thames a treacherous stream; he christened the wherry

a bark; he declared that when the pleasure-party embarked at Richmond Bridge, Death, the lean fellow, was standing upon the beach with his weapon upraised. Asterisks described the death; and some of his friends declared this passage the best in the poem. He then went on to inform his readers that all was over; but by this expression the reader must not infer that the dirge was brought to a conclusion. By no means. Mr. Blackbrook had made up his mind that his state of despair required at least one hundred lines to give it adequate expression. He had devoted twenty to the death of a fly—surely, then, a female cousin deserved one hundred. This logical reflection spurred him on. He pulled down the blinds, and in a gloom that suited well with his forlorn state of mind, he began a picture of his condition. With the aid of his dictionary, having asserted that the shroud enwrapped a cousin's form, he reflected that he envied the place of the winding-sheet, and was jealous of the worms. He felt that he was warming into his subject. He tried to think of the condition in which the remains of his relative would speedily be; and having carefully referred to an eminent medical work as to the length of time which the human body requires to resolve itself into its original earth, (for he was precise in his statements,) he proceeded to describe, with heart-rending faithfulness, the various stages of this inevitable decay. That was true poetry. He declared that the worm would crawl upon those lips that the lover had fondly pressed, and that the hand which once touched the harp so magically was now motionless for ever. Having brought this tragic description to a conclusion, he proceeded to number the flowers that should spring from his cousin's grave, and to promise that

— from year to year,
Roses shall flourish, moistened by a tear.

This vow evidently eased his heart a little, and enabled him to conclude the poem in a more cheerful spirit. He wound up with the reflection, that care was the lot of humanity, and that it was his duty to bear his proportion of the common load with a patient though bruised spirit. He felt that to complete his poetic destiny he ought to wander, none knew whither, and to turn up only at most unseasonable hours, and in most solemn places. But unhappily he was informed that it was necessary he should remain on the spot for the proper management of his affairs. Fate would have it so. Why was he not allowed to pursue his destiny? He was one day mentally bewailing the even tenour of his way, when a few kind friends suggested that he should publish his effusions. At first he firmly refused. What was fame to him—a hopeless, despairing man on the brink of the grave! His friends, however, pressed him in the end into compliance;

and in due time Mr. Blackbrook's "Life-Drops from the Heart" were offered to the public for the price of ten shillings—little more than one shilling per drop.

An eminent critic wrote the following opinion of our friend and his poetry:—

"We notice Mr. Blackbrook as the representative of a school—the Doleful School. He draws terrible pictures; but what are his materials? He does not write from the heart, inasmuch as if he really felt that incessant agony, which is his everlasting theme, we should find in his performances some original imagery—something with an individual stamp. We rather hold Mr. Blackbrook to be a very deliberate, vain, and calculating being, who takes advantage of a domestic calamity to display his knack of verse-making; who composedly turns a couplet upon the coffin of his mistress; whose sympathy and sensibility are only the ingenious-masks of inordinate self-esteem. His view of the poetic is only worthy of an undertaker. He sees nature through a black-crape veil. He describes graves with the minuteness of a body-snatcher; and when he would be impressive is disgusting. You see the actor, not the poet. He admits you (for he cannot help it) behind the scenes. His rhymes are not the music of a poetic faculty; but rather the jingle of a parrot. He is one of a popular school, however; and while the public buy his wares, he will continue to fashion them. Materialist to the back-bone, he simpers about the littleness of human dealings and human sympathies. He who pretends to be melted with pity over the fate of a fly, would use his mother's tombstone as a writing-desk. He deals in human sorrow, as his baker deals in loaves. Nervous down-agers, who love tears and 'dreadful descriptions;' who enjoy 'a good cry;' and who have the peculiar faculty of seeing the dark side of everything, enjoy his dish of verses amazingly. To sensitive young ladies there is a terrible fascination in his inventories of the tomb and its appendages; and children are afraid to walk about in the dark, after listening to one of his effusions. The followers of his school include one or two formidable young ladies, who enter into descriptions of death—that is to say, the material part of death—with a minuteness that must excite the envy even of the most ingenious auctioneer. When bent upon a fresh composition, these terrible young poetesses, having killed a child, proceed to trace its journey to the tomb—its return to earth. How they gloat over the dire changes!—how systematically the painful portrait is proceeded with! In this they rival Chinese artists. And people of ill-regulated sympathy, who, containing within them all the elements of spiritual culture, are yet affected only by sensual appeals, regard these doleful effusions as the outpourings of true human suffering.

Mr. Blackbrook and his disciples are hap-

less materialists, verse-makers without a sense of the beautiful. They are patronised by those to whom they write down; and the effect of their lucubrations is to enchain the imagination, to debase the moral capacity, to weaken that spiritual faith which disdains the horrors of the churchyard. Mr. Blackbrook's adventures in search of despair were undertaken, to our mind, in a cold-blooded spirit. A resolute determination to discover the gloomiest phase of every earthly matter, a longing for the applause of a foolish clique, and a confused idea that Chatterton was a poet because he perished miserably, while Byron owed his inspiration to his domestic unhappiness—make up that picture of a verse-writer which we have endeavoured to delineate. When extraordinary vanity is allied to very ordinary ability, the combination is an unwholesome, ascetic, weak and deformed mind:—such a mind has Mr. Blackbrook. He endeavours to drag us into a vault, when we would regard the heavenly aspect of death. Ask him to solve the great mystery, and he points to the fading corpse. His tears suggest the use of onions; and his threats of self-destruction, remind us of the rouge and Indian ink of an indifferent melo-dramatic actor. We have no respect for his misfortunes, since we find that he esteems them only as opportunities for display; we know that despair is welcome to him. He turns his back to the sun, and rejoices to see the length of shade he can throw upon the earth. Nature to him is only a vast charnel-house—so constructed that he may sing a life-long requiem. He would have us journey through life with our eyes fixed upon the ground, scenting the gases of decay. But wiser men—poets of the soul—bid us look up to heaven, nor disdain, as we raise our heads, to mark the beauty of the lily—to gather, and with hearty thanks, the fragrance of the rose."

A WINTER SERMON.

Thou dwellest in a warm and cheerful home,
Thy roof in vain the winter tempest lashes;
While houseless wretches round thy mansion roam,
On whose unshelter'd heads the torrent plashes.

Thy board is loaded with the richest meats,
O'er which thine eyes in rapt languor wander;
Many might live on what thy mastiff cats,
Or feast on fragments which thy servants squander.

Thy limbs are muffled from the piercing blast,
When from thy fireside corner thou dost sally;
Many have scarce a rag about them cast,
With which the frosty breezes toy and dally.

Thou hast soft smiles to greet thy kiss of love,
When thy light step resounds within the portal;
Some have no friend save Him who dwells above,
No sweet communion with a fellow-mortal.

Thou sleepest soundly on thy costly bed,
Lull'd by the power of luxuries unnumber'd,
Some pillow on a stone an aching head,
Never again to wake when they have slumber'd.

Then think of those, who, form'd of kindred clay,
Depend upon the doles thy bounty stateth;
And God will hear them for thy welfare pray—
They are His children, though in rags and tatters.

LIGHTHOUSES AND LIGHT-BOATS.

WHEN the winter fire blazes redly on the curtains, and the happy faces assembled in the room; when the table is spread, and the sofa "wheeled round," and the whistling wind is heard without, rising to a gale,—then may we well, as we often do, bethink ourselves of the many anxious eyes out at sea, which are strained to catch a glimpse of the well-known "light" that befriends the sailor on his pathless journey.

Our coast is so well furnished with light-houses, that this is the first of our arrangements which strikes foreigners with admiration as they approach our shores; but so dangerous is the whole navigation, so beset with rocks, quicksands, sunken ledges, howling forelands, "and hollow crescents full of gathered blasts," that the sudden withdrawal of a single "light" from an important position would, in all probability, be the cause of hundreds of shipwrecks in a single night.

When there is a brisk wind, and the night thick and hazy, with what straining eyes do men at sea continue to gaze in the direction where the hoped-for light is expected—and, how often, in the wrong direction! In small merchant crafts—a schooner, for instance—when the number of hands amounts but to the master, the mate, one man, and a cabin-boy, and his other "appointments," in the way of charts, and compasses, and anchors, is in the same poor condition; how exciting a time is that, when the "light" which, according to his calculation, ought to be visible, is nowhere apparent—his vessel running fast through the water—the wind getting up, perhaps to a gale, and his top-gallant sail has to be suddenly taken in, and his top-sail reefed! But, where is the light!—the master and the mate cannot see it below; can the man or the boy aloft see any signs of it!—No, neither. Can the wet and shivering passenger, who had "turned in," but has come on deck, in his drawers, to get in everybody's way—can he see anything of the light which ought to be somewhere out there? No; he sees nothing but haze and mist; and, in fact, his eyes are full of salt spray. Down rushes the master through the little hatchway, and after him hurries the passenger, with a vague no-notion of helping him, he knows not how, to do he knows not what. The candle has got upset, and all is darkness below. The lucifer-box, of course, is not in its place—it has been upset—the matches are lying about on the wet floor of the cabin, and are bent and broken in the vain attempt to ignite them. Now, the cabin-boy comes down, and, after his head has been well "clouded" in the dark, he, at length, bellowingly produces a light,

by some inconceivable process, and the shapeless mash of trodden candle is stuck upright, somehow, and the wick lighted. The chart is snatched from the locker—such a chart!—all dirty, greasy, tar-bethumbed, torn, tattered, and begrimed—and over this the captain lies flat, with his nose almost touching it, and seeming to assist his search quite as actively as the brown damp finger with which he goes poking and pointing over the paper. He finds soon enough the dreaded Goodwin Sands—and, he finds the North Foreland Lighthouse—on the chart; and, according to his "reckoning," he ought now to see the "light"—but where is it? He rushes up on deck. It is not yet visible. Can he see the gleam of the Light-boats off the Goodwins? No—no signs of them. He stares into the compass-box, and alters the vessel's course, in alarm—and down again he comes, almost headlong, to work his reckoning over again; and again to throw himself with his elbows on the ragged chart, holding a bit of candle in his fingers which he has snatched out of the candle-stick, and dropping the grease all over St. George's Channel—till the voice of the mate, on deck, gladdens his ears with the tidings that the "light" is visible—the "bearings" as they had calculated—and all right. The passenger runs up on deck, and, shivering, in his half-attached fluttering habiliments, descends, with joy, the large steady "light" of the North Foreland, which forces its beaps through the mist, and tells them all they want to know of their position.

Next morning the passenger, to his great content, was landed; and after he had refreshed himself during some days (and of all passengers that need a little solace, on landing, the passenger of a merchant schooner needs it as much as any,) he felt a strong desire to examine closely the arrangements of the "light," which had been such a source of anxiety, and subsequent congratulation, out at sea. He accordingly drove over to the North Foreland Lighthouse—and was refused admittance. He drew out his purse; but was requested to put it in his pocket again, and go home.

Thus disappointed and admonished, the visitor retraced his steps, and after mature consideration, addressed a polite note to the proper authority at Ramsgate. From this gentleman he received an order of admission, and the same evening he betook himself again to the North Foreland.

The walk being gradually up-hill, all the way, and including a bend in the road, there was no sign of the "light," till on a sudden turn it was discovered in all its beaming attitude. Observing it now more narrowly as he approached, the visitor perceived that the glass-house, on the top of the tower, (sometimes called the "lanthorn," and, in its shape, closely resembling an observatory,) had two front-faces, so to speak; the lamps being arranged upon an obtuse angle—one set of

them facing up-channel, and one down-channel—but the power of the whole would also be visible for a considerable extent, horizontally, out at sea. On passing near the tower, the individual lamps and reflectors are visible in each face, or set; but at sea this individuality is all merged in a general effect.

Knocking at the door of the entrance, at the base of the tower, and producing his 'order,' our visitor was at once admitted to a little stone ante-room, where the paper underwent a careful scrutiny. Its authenticity being ascertained, he was conducted onwards, and upwards, admiring as he went the various utensils and apparatus that were hung upon walls or deposited on shelves—oil cans, oil measures, spare reflectors, cotton for wicks, glass lamp-chimneys, leathers, cloths, spare window-panes, storm-plates, chamois-skins, bottles of spirits of wine, and many odd-shaped things in shining copper, brass, glass, zinc, iron or tin. Likewise, a thick woollen night-cap, standing upright in a dark corner, and having a thoughtful appearance.

The visitor now found the stone stair-case, he was ascending, had become much narrower, and he was cautioned not to speak loud or be otherwise noisy, lest he should wake the head light-keeper, who had gone to bed early, as it was his turn for the next watch. The visitor, therefore, with a softened boot, and a face of increased seriousness, renewed his toiling ascent between the narrow, spiral, white, vault-like stone walls, leading up to the "light-room," at the summit of the tower.

"Hush!" murmured the light-keeper every now and then, by way of preventing the visitor from speaking. All was silent, with the exception of the hollow sound of the ascending footsteps.

At length, after a wearisome spiral journey, the broad landing-place below the light-room was attained. Several more steps led up to a dusky closed door, that had an ominous appearance—as of the entrance to a chamber of mysterious treasures, at the top of a tower in some eastern tale. The visitor thought he could distinguish a bright gleam, edging the bottom of the door. Being told to ascend, he prepared his mind, and did so;—then laying his hand with becoming awe upon the door, he slowly pushed it open.

He found himself in a small chamber full of light, in shape very much like a hand-frame for cucumbers, only taller. Upon a platform of bright copper, about four feet high, stood the back part of an apparatus, on which were arranged a series of lamps, each having a glass chimney over it, and a reflector behind it, circular, concave, larger than the top of the largest warning-pan, made of copper at the back, with a pure silver face, and polished, in this face, to the highest degree of brilliancy, so that it could not be looked at directly in front. The lamps and reflectors were ranged in a double row, and behind each were pipes, and other apparatus,

for a constant, graduated supply of oil; for air-currents, smoke-tubes, &c. The copper platform was of semicircular shape, and broad enough to admit of one person at a time walking in front of the lamps, between them and the glass window. The visitor was now informed that he might do this. After a little hesitation, with a reverential foot he accordingly ascended a few steps at one side, and made a slow and cautious passage in front of the lamps with their great, glaring, silver, planet-eyes of reflectors, that made him contract his body to its most attenuated dimensions, and gaze upon its dense bit of darkness with a strange recollection of the story of the fly that got into the philosopher's microscope. He felt like that fly, and was heartily glad to arrive at the other end of the platform, and humbly descend the steps. He had scarcely done so, when *buff* came something against one of the windows, and fell outside! The window being of thick plate-glass, no injury was done, but the new-comer, whatever it was, had evidently got the worst of it.

A little balcony runs outside the window, into which the visitor now went, and there he found—lying flat on its back—wings expanded—beak open—and dead—a huge muffed owl! "Ah," said the light-keeper, "our gun can reach further out to sea, and over land, than any you can handle. We often have this balcony strewn with sea gulls and other birds that have struck themselves dead. In the game season, lots of partridges, and pheasants too, fly at the light—they can't resist it—and most of them are killed, or taken. Sometimes we find nearly a bushel of larks lying all about."

The visitor fell into a train of reflections on these fatal instances of irresistible attraction, which lasted him all the way down stairs, and after he had left the lighthouse; in which meditation there passed in rapid succession before his imagination, numerous flights of poems about the moth and the candle; and Cupid and Psyche (specially Psyche); and sea-birds rushing across the homeless brine to El Dorado, and finding Death; and Antony and Cleopatra; and Icarus; and Macbeth; and Napoleon; and wild-ducks; and partridges—many of them roasted—and owls, whom nobody can eat; and sailors' night-telescopes; and Horrick's songs about birds, and his own bird-like songs; and Shelley's exquisite Ode to a Skylark. By this time the visitor found himself on the verge of the cliff, and his steps were, luckily, stopped at the same time with his train of reflections.

But although to a sailor anxiously "shooting" the dark horizon with his night-glass, the interest in all lighthouses is nearly the same, and varies only with the circumstances of the moment, to a passenger the interest in any fixed "light" is seldom to be compared to that which his experiences in watching the appearance and disappearance of a revolving light—suppose a dark night, with few

stars out, and those none of the freshest-looking; you stare through the thick' air and mist towards the horizon, which is all gloom. Presently there emerges from this vaporous gloom, at a great distance, a faint red orb, which gradually attains its full disk, and then declines, and disappears. It has been visible half a minute. All is darkness again for about two minutes—and then it appears again, and disappears, with the same planetary effect, as before. Sometimes a revolving "light" alternates a red "light" and a white one; sometimes two red and one white,—and so on.

The machinery for the revolving "lights," as may readily be supposed, is far more complicated than that which exhibits the fixed "light"; but all these differences fade to nothing, in comparison with the scientific complexities of the different optical systems employed in obtaining the largest amount and the purest degree of light. A very concise account of these, simplified as much as possible, is all we can venture to offer.

A lamp constructed of a simple burner, would send forth scattered rays, illuminating parts not needed, and wasting many rays, upward, into the sky, and also below the plane of vision of those out at sea. To correct this, reflectors are employed, by means of which, according to laws which cannot here be discussed, the rays are concentrated and thrown in the greatest strength towards given points on the horizon. The amount of luminous effect, produced by reflectors in fixed "lights," has been ascertained to be about three hundred and fifty times greater than can be obtained from the unassisted flame; and for those larger ones, which are used in revolving "lights," about four hundred and fifty times greater. These calculations, however, will vary with the distances at which the observations are taken.

The manufacture of these reflectors is a very nice and curious process. It is described at considerable length, and with great clearness, by the engineer to the Board of Northern Lighthouses (Mr. Alan Stevenson), to whose excellent Rudimentary Treatise we are much indebted.

In Lighthouses of the first class, the reflectors are made of sheet copper, thickly plated inside with silver. They are moulded to a paraboloidal form by a delicate and laborious process of beating with mallets and hammers of various forms and materials. They are frequently tested during the operation, by a gauge applied to the back, and another to the concave face. After the face has received its last polish, it is tested by placing a burner in the focus, and measuring the strength of the light at various points of the reflected conical beam. The flame generally used is derived from an Argand fountain-lamp.

The system of lights just described is called the "catoptric." It includes nine distinct

tions; viz, the fixed; the revolving white; the revolving white and red; the revolving red with two whites; the revolving white with two reds; the flashing; the intermittent; the double fixed light; and double revolving white light.

The first exhibits a fixed and uniform appearance. The revolving light is produced by the revolution of a frame with three or four sides, having reflectors ranged on each side. The succession of red and white lights is obviously caused by the revolution of a frame presenting different lights on each side, according to arrangement—and carefully marked on the sailors' charts. The flashing light is produced in the same manner as the revolving; but having a different disposition of the mirrors, and a greater quickness of the revolution, which produces the effect of a flash in the darkness once in about five seconds of time. It is very useful, from its striking difference to other lights. The intermittent light bursts suddenly into view, continues steady for a short time, and then suddenly disappears. The different colours are produced by interposing coloured media, which generally absorbing nearly five-sevenths of the whole light, they cannot be seen from so great a distance as the white. The French tried red glass, which absorbs only four-sevenths of the light; but a greater improvement has been made in the Scotch Lighthouses, by using chimneys of red glass instead of placing coloured media in front of the reflectors.

Coloured lights are only used for the necessity of variety. Next to the white in power is the red. The green and the blue are seldom used, except as pier and harbour lights, where distance is not required, because these colours absorb nearly all the rays.

But the different effects previously enumerated, are not accomplished by one system of optics. Great and various have been the studies of lighthouse opticians, and innumerable the experiments that have been made to produce all the varieties now in use. We have spoken of the catoptric, or reflecting system; but to Condorcet belongs the merit of having suggested the dioptric, or refracting, system, which was afterwards reduced to practice by Fresnel. By the adoption of lenses, he not only accomplished the effect of flashing lights, but finally devised a new distinction of light, viz a fixed light, varied by flashes. The great lamp, which has four concentric burners, is also of very peculiar construction, and was made to burn in the great Lighthouse, called the Tour de Corduan, during seven hours, without snuffing or having the wicks raised. Subsequently, the same kind of lamp has been known to burn, untouched, in some of the Scotch Lighthouses, for the extraordinary period of seventeen hours.

Into the intense complexities of catoptric, dioptric, dia-catoptric, and cata-dioptric com-

binations, we dare not venture, nor into their relative merits. Of the comparative practical advantages of the two great systems, we shall merely say that the dioptric system provides a light four times more powerful; while the catoptric system insures a more certain exhibition of the light. The accidental extinction of one of the lamps in the catoptric light, leaves only a fraction of the horizon without light; whereas the extinction of the one great lamp of the dioptric light, deprives the whole horizon of light. Nevertheless, when the great rarity of such an accident as the extinction of this one great lamp is considered, together with its far greater economy in oil (being above one hundred and forty pounds a-year less than the other system of lighting), with some further advantages, the preference is generally given by lighthouse opticians to the dioptric system.

It is obvious that the method of furnishing light to the light-boats, or floating-lights, must be a simpler process than those which have just been described. The term "lantern" is appropriate enough here; since the apparatus does actually consist of a large octagonal lantern of copper framework and plate-glass, protected outside by some wire-work, and fixed at a mast-head. They are fitted with eight argand lamps, and parabolic reflectors. A very strange appearance these boats present, of which the heavy, Indian-red, floating strong-box, with an ~~orange~~ gone to seed sticking out of the lid, and called the "Nore," may be considered as a first-rate specimen. These light-boats are of the greatest service; in fact they are obviously indispensable to safe navigation.

There are various positions of danger which ~~are~~ beyond the reach of lighthouses. Sandbanks, ~~for instance~~, where the erection of any solid structure is impossible, are often the sites for mooring light-boats. The annual expense of maintaining a light-boat, including the wages and victualling of the crew, eleven in number, is, on an average, one thousand pounds: and the first cost, of such a vessel, fitted completely with lighting apparatus, masts, moom-anchors, cables, &c., is nearly five thousand pounds.

Many interesting particulars belong to the building of lighthouses. Events occur, which are not only as exciting as they are arduous and interesting, but which cannot occur to any other kind of erections,—even to the very disheartening circumstance of a rough stormy night sometimes sweeping away a whole twelvemonth's, perhaps years, of constant labour and hardship. The narratives of several of these are among our most interesting nautical records.

For architectural grandeur, Mr. Alan Stevenson declares the Tour de Corduan to be the noblest edifice of the kind in the world. It is situated on an extensive reef at the mouth of the river Garonne, and serves as a guide to the shipping of Bordeaux and

the Languedoc Canal, and indeed to all that part of the Bay of Biscay. It was founded in the year 1584, but was not completed till 1610, under Henri Quatre. The building is one hundred and ninety-seven feet in height, and consists of a pile of masonry, forming successive galleries, enriched with pilasters and friezes, and rising above each other with gradually diminished diameters. These galleries are surmounted by a conical tower, which terminates in the lantern. Round the base is a wall of circumvallation, in which the light-keeper's apartments are formed; the wall serving also as an outwork of defence by receiving the first shock of the waves. The tower itself contains a chapel, and various apartments, and the ascent is by a spacious staircase.

The first light exhibited in the Tour de Corduan was obtained by burning billets of oak wood in a chamber at the top of the tower. A rude reflector, in the form of an inverted cone, was afterwards added to prevent the loss of light which escaped upwards. About the year 1780 M. Lenoir was employed to substitute paraboloidal reflectors and lamps; and in 1822 the "light" received its last improvement by the introduction of the dioptric instruments of Augustin Fresnel.

Smeaton's Narrative of the Lighthouse on the Eddystone Rocks is full of interest. These rocks ~~are~~ upwards of nine miles distance from the Ram-Head on the coast of Cornwall; and from the small extent of the surface of the chief rock, and its exposed situation, the construction of the lighthouse was a work of the greatest difficulty. The first erection was of timber: it was designed by Winstanley, and commenced in 1696. It was soon found, however, that the sea rose to a much greater height than had been anticipated; so much so, it is said, as to bury under water the lantern, though this was sixty feet above the rock. Winstanley was, therefore, under the necessity of enlarging the tower and carrying it to a greater height. He raised it to one hundred and twenty feet, which was too high for its strength to bear. In November, 1703, considerable injury had been received, and Winstanley went there in person, accompanied by his workmen, and proceeded to institute the repairs. On the 26th of that month, a storm arose, so violent, that it carried away the whole edifice, with poor Winstanley and all his workmen, every one of whom perished.

The loss of this "light" speedily led to a yet more numerous loss of lives. The "Winchelsea" man-of-war was wrecked on the Eddystone Rocks, and nearly all her crew perished. Three years were allowed to elapse after this melancholy and unanswerable evidence of the necessity for a "light," before the Trinity House could obtain a new act of Parliament to extend their powers (so writes Alan Stevenson); but whether the delay rested most with the Government or the

Trinity House, it was not till July 1706 that the construction of a new lighthouse was commenced. It was under the direction of Mr. John Rudyerd, of London. The tower was entirely of timber, and ninety-two feet high. The edifice was finished, and the new light first shown on the 28th of July, 1708. It continued to be regularly exhibited during forty-seven years, when it accidentally took fire, and being formed of such combustible materials, the whole fabric was destroyed A.D. 1755.

As it was quite evident that a "light" was absolutely necessary at this spot, and—strange to relate—as the "authorities" had now really learned some wisdom by experience, preparations were immediately made for the erection of another lighthouse. On the 5th of April, 1756, Smeaton first landed on the rock, and prepared for the erection of a lighthouse of stone. He arranged for the foundation by cutting the surface of the rock into regular horizontal benches, and into these the foundation stones were to be carefully dovetailed or notched. The first stone was laid in 1757. The tower measures sixty-eight feet in height, and twenty-six feet in diameter at the level of the first entire course; and the diameter, under the cornice, is fifteen feet. The whole is a work of extreme ingenuity to obtain the greatest amount of resistance, and unites the two great principles, *viz.* of strength and weight—or *cohesion* and *inertia*. The first twelve feet of the tower form a solid mass of masonry, and the stones of which it is composed are united by means of stone joggles, dovetailed joints, and oaken trenails. All the floors of the edifice are arched. The "light" was first exhibited on the 16th of October, 1759; but such was the condition of lighthouse apparatus here, at this time, (though Argand's invention was known in 1784, and paraboloidal mirrors were used in the "lights" at Bidstone and Hoylake still earlier) that a feeble illumination from tallow candles was the only benefit derived from this noble structure. "In 1807," continues Mr. Alan Stevenson, "the property of this lighthouse again came into the hands of the Trinity House, at the expiration of a long lease,"—during which, we may infer, that it had been let to some very unworthy parties, who, regardless of shipwrecks and loss of life, starved the light and pocketed the fees. After this, argand burners, and paraboloidal reflectors of silvered copper, were substituted by the Elder Brethren for the jobbery of the felonious mutton dips.

Inch Cape, or Bell Rock, is a dangerous reef on the coast of Scotland, where in former days so many vessels were wrecked, that the Abbot of Aberbrothwick caused a float to be fixed upon the rock, with a large bell attached to it, so arranged that the swinging motion of the waves should cause it continually to toll, and more, especially in very rough weather. Southey's ballad of "Sir Ralph the Rover" is

founded on this story. Many shipwrecks occurred herein more recent times; among others, that of the "York," seventy-four, which was lost with all her crew. A beacon of spars was then erected by Captain Brodie; but it was soon washed away. A second beacon was set up, and speedily disappeared. After a considerable time the Commissioners of Northern Lighthouses brought a bill into Parliament (in 1802) for power to erect a lighthouse on this rock. The bill passed into law in 1806 (no hurry, gentlemen—pray never think of hurrying yourselves,) and in August, 1807, Mr. Robert Stevenson landed with his workmen, and commenced the work by preparing the rock for the erection of a temporary pyramid, on which a barrack-house was to be placed for the reception of the workmen. As the rock was only dry for a few hours at spring-tides, the men had to retreat to a vessel moored off it, while these operations were being carried on. After many accidents, and one narrow escape of the loss of the engineer and thirty-one workmen, by the rising of the tide upon the rock, when the attending vessel had broken adrift, the lighthouse was completed, in 1810. "The Bell Rock Tower is one hundred feet in height, forty-two feet in diameter at the base, and fifteen at the top. The door is thirty feet from the base, and the ascent is by a massive bronze ladder. The 'light' is a revolving red and white light; and is produced by the revolution of a frame containing sixteen argand lamps, placed in the foci of paraboloidal mirrors, arranged on a quadrangular frame, whose alternate faces have shades of red glass placed before the reflectors, so that a red and white light is shown successively. The machinery which causes the revolution of the frame containing the lamps, is also applied to tolling two large bells, in order to give warning to the mariner of his approach to the rock in foggy weather." To see this huge tower, with his two different coloured eyes, as they emerge through the fog, while his heavy bells keep up their tolling monotony, has all the grim effect in which old romances so much delight.

The Carlington lighthouse, on the coast of Ireland, is a very fine structure. It is one hundred and eleven feet in height. Very arduous efforts were required for its erection, as the foundation had to be laid in the rock, twelve feet below the level of high-water. It was designed by Mr. George Halpin, Inspector of the Irish Lights.

One more Lighthouse must close our descriptions. Its erection was attended with many vicissitudes.

For the following account, we are indebted to Mr. Alan Stevenson's Rudimentary Treatise, previously quoted, the author having, in this instance, been the architect and engineer.

The Skerryvore Rocks, which lie about twelve miles W. S. W. of the seaward point of the Isle of Tyree, in Argyllshire, were long

known as a terror to sailors, owing to the numerous shipwrecks, fatal alike to the vessels and their crews, which had occurred in their neighbourhood. A list, confessedly incomplete, enumerates thirty vessels lost in the forty years preceding 1844. Many others had doubtless occurred, of which no report had been, or could have been, rendered. The Commissioners of the Northern Lighthouses had, for many years, entertained the project of erecting a lighthouse on the Skerryvore; and, with this object, had visited it, more especially, in the year 1814, in company with Sir Walter Scott, who, in his *Diary*, gives a graphic description of its inhospitable aspect. It was not until the year 1834, when a minute survey of the reef was ordered by the Board—(had they fallen asleep during the intermediate years?)—that the idea of undertaking this formidable, but necessary, work was entertained.

The reef is composed of numerous rocks, worn smooth as glass in some places, by the incessant play of the water; in others, presenting rugged humps and gullies. The cutting of the foundation for the tower in this irregular flinty mass occupied nearly two summers; while the blasting of the rock, in so narrow a space, without any shelter from the risk of flying splinters, was attended with much hazard. A steam-tug was built to transport the workmen and their building materials, and also for them to sleep in, as a floating-barrack. She ran many perilous risks in her precarious moorings. At length, in 1838, a wooden barrack was erected on the rock.

In the November following, a great gale arose, which tore up and swept away the barrack, leaving nothing to denote its site but a few broken and twisted iron stanchions, "and attached to one of them a portion of a great beam, which had been so shaken and rent, by dashing against the rocks, as literally to resemble a bundle of laths." Thus, in one night, the traces of a whole season's toil were obliterated, and, with them, the hopes of the men for a dwelling on the rock, instead of on board the tug, where many of the workmen suffered constant miseries of sea-sickness.

A second barrack was eventually erected in a less exposed place, and of additional strength, and this was found sufficiently stable to brave the storm. But, what an abode!—and, above all, for men comparatively unused to the sea. Let the engineer describe it in his own words:—

"Perched forty feet above the wave-beaten rock, in this singular abode, the writer of this little volume, with a goodly company of thirty men, has spent many a weary day and night, at those times when the sea prevented any one going down to the rock, anxiously looking for supplies from the shore, and earnestly longing for a change of weather favourable to the recommencement of the works. For miles around, nothing could be seen but white foaming breakers, and nothing

heard but howling winds and lashing waves. At such seasons much of our time was spent in bed; for there alone we had effectual shelter from the winds and the spray, which searched every cranny in the walls of the barrack. Our slumbers, too, were, at times, fearfully interrupted by the sudden pouring of the sea over the roof, the rocking of the house on its pillars, and the spouting of water through the seams of the doors and windows; symptoms which, to one suddenly aroused from sound sleep, recalled the appalling fate of the former barrack, which had been engulfed in the foam not twenty yards from our dwelling, and for a moment seemed to summon us to a similar fate. On two occasions, in particular, those sensations were so vivid as to cause almost every one to spring out of bed; and some of the men fled from the barrack by a temporary gangway, to the more stable, but less comfortable, shelter afforded by the bare wall of the lighthouse tower, then unfinished, where they spent the remainder of the night in the darkness and the cold."

The Skerryvore Lighthouse was at length successfully completed. The height of the tower is one hundred and thirty-eight feet, six inches. It contains a mass of stone work of more than double the quantity of the Bell Rock, and nearly five times that of the Eddystone. The entire cost, including steam-tug and the building a small harbour at Hynish for the reception of the little vessel that now attends the lighthouse, was eighty-six thousand nine hundred and seventy-seven pounds. The light is revolving, and reaches its brightest state once every minute. It is produced by the revolution of eight great annular lenses around a central lamp with four wicks, and belongs to the first order of Fresnel's system of dioptric lights. It can be seen from a vessel's deck at the great distance of eighteen miles.

The number of Lights—fixed, floating, and harbour lights—in England, is one hundred and seventy-five. In Scotland, sixty-seven. In Ireland, sixty. Making a total number of three hundred and two "Lights" in the United Kingdom. Of these, one hundred and twenty-one are public coast "lights;" twenty-nine floating "lights;" and one hundred and fifty-two local and harbour lights.

In thus reviewing a system of coast-lights so admirably organised and so efficiently worked, it is with very great regret that we touch upon some of its financial arrangements, which appear to be open to severe strictures. France, America, Russia, and Prussia, support the "lights" upon their respective coasts out of the funds of the state; but in England, while the benefit of the "lights" is shared by the whole British Navy and the community at large, the entire burden of the taxation falls exclusively upon the merchant and the ship-owner. The tax, moreover, is levied in an arbitrary sort of way, often unjustly, and always unequally. The officer calculates the number of "lights" a vessel has passed in her passage, and charges accordingly, but by no clearly defined rule. Some vessels always

pass and repass the lighthouses by day, yet are charged the same. A small vessel, for instance, belonging to the Edinburgh and Dundee Steam Company never passes by night at all, and it was found that, in 1843, the amount paid by that vessel for "lights" which she never saw, or had occasion to see, amounted to several hundred pounds in forty-nine weeks. The rule for levying the tax is also unfair; the dues are not charged on the tonnage actually carried, but on the whole tonnage the vessel could carry if she were full. This falls particularly hard upon small coasters, which, if they have a full cargo to London, can afford it; but as they can seldom obtain a full one in returning, and half a cargo would not enable them to defray the "light dues," they are generally obliged to refuse anything short of a full cargo, and return in ballast. Again, to show the inequality of the taxation, let us observe that a ship trading to the East Indies or to China, carrying a large freight, occupies about a year on the voyage out, and pays only a few of the "lights" twice during that time; while a coaster, which is constantly passing the lighthouse on her voyage, by day as much as by night, and carries but a comparatively small freight, pays, each time she passes a "light," a sum which in the aggregate frequently amounts to as much as five or six per cent. on the gross freight, and sixty per cent. upon the net profits of the ship. "In the years 1843 and 1844, the Trinity House received," says Mr. William John Hall, "from the coasting trade, one hundred and twenty-six thousand, six hundred and seventy-three pounds; while the over-sea British trade of millionaires and others paid only ninety-seven thousand, four hundred and fifty-four pounds, and foreign ships only thirty-three thousand, six hundred and forty-eight pounds." It hence appears that the tax presses unequally, and most onerously on the great mass of commercial industry in the home trade.

"In 1841," continues Mr. William John Hall, "the Trinity Board received for their 'lights,' the sum of one hundred and forty-four thousand, nine hundred and fifty-four pounds; and the commission on collection was five thousand six hundred and sixty pounds; leaving a net revenue of one hundred and thirty-nine thousand, two hundred and ninety-four pounds. To this surplus must be added three thousand and eighty-five pounds for buoyage and beaconage charges. After deducting the expenses of maintenance of 'lights,' salaries, charges, &c., &c., there still remained a surplus of thirty-eight thousand three hundred and sixty-four pounds, to which must be added rents of estates, dividends on stock, and other things, bringing the amount up to forty-seven thousand, two hundred and twenty-five pounds. And the way in which it is expended is stated to be—pensions to poor and aged seamen, twenty-nine thousand

and sixteen pounds"—(compare this sum with the Pension List ostensibly devoted to literature, science, and art!)—"charges of house and office on Tower Hill, one thousand four hundred and eighty-six pounds; salaries to Elder Brethren, seven thousand pounds; dinners, two thousand two hundred and ninety-three pounds"—(ahem!)—"salaries, allowances, postages, &c., &c., &c."

The foregoing statements are derived from a printed "Letter to the Queen's Most Excellent Majesty," signed "William John Hall, Custom-House Quay, May 5th, 1847." It goes into many estimates and details, the truth or fallacy of which ought to be closely looked into. Though many of the writer's arithmetical calculations are confused by obvious misprints of figures, most carelessly left uncorrected, his arguments are worthy of great attention. It is but justice to add, that amidst all his charges of injustice, extravagance, and jobbery, he still bears unequivocal testimony to the "brilliance and efficiency of the Lights."

THE CORAL FISHERY IN THE MEDITERRANEAN.

ONE fine morning, in the early spring, I was standing on the "Marina" of the Island of Capri, when the market barks were leaving for Naples. The people were descending the heights, laden with wine and oil, and other produce of the country, for the market of the capital, and what between the directions given for the sale of these articles, and commission for purchases in the great world, there was a bustle and a shouting which gave an uncommon appearance of activity to this usually quiet spot. At the last moment a new and painful variety was given to the scene, for a crowd of men and women might be seen coming down the rocky staircase of Ani Capri, the latter carrying boxes on their heads, and the other paraphernalia of those who were about to enter on a long voyage, whilst the men were lounging on before, spiritless and silent. How bitterly the poor women wept! I thought their very hearts would break; and, though no tears dimmed the eyes of their sterner companions, there was an assumed indifference, and, at intervals, an awkward attempt at gaiety, which but too clearly indicated that there was grief in their hearts. "What," said I to a fisherman, who was standing near me, "is the meaning of all this sorrow?" "Eccellenza," replied he, "these men are about to leave for the Coral Fishery; and those who accompany them are their wives, or mothers, or 'spouse.' Poveri Giovani!—there is a hard lot, indeed—for the next six or seven months they will have to work like dogs, and live upon bread and water. Before I would bring up a son of mine to this trade, I would rather follow him to Campo Santo!" The whole scene and the answer of my mariner interested me so much

that, seating myself on the beach, I got into conversation with him, and elicited all the information he could give me; this I have added to, much that I have collected from other sources, and thrown into the following paper.

The principal ports in the Mediterranean which send out vessels for this Fishery are Genoa, Leghorn, and Torre del Greco, about eight miles from Naples; and, as it was not far from this Port that my attention was first awakened to the subject, I shall confine myself to the trade as it is carried on there. The hardest service in which the sailor can be engaged, it is either a school for the young or the last resource of the poor and desperate; and, early in the year, numbers of these two classes, from every village on the coast, go over to Torre to engage themselves, and take their Caparra—alas, that Caparra!—(a portion of their pay); it is the price of slavery for the next six or eight months; and, once that it has crossed the palm, as well might a Virginian slave endeavour to throw off his servitude as one of these poor Coral fishers redeem his liberty. I have known many a poor fellow repent the step, and hide himself as the time of his suffering approaches; but sure is he to be hunted down, and brought back with the same rigour as a deserted recruit. And what is the temptation to bind themselves to such a fate? A paltry sum of from twenty to forty ducats—that is, from three to seven pounds. "A larger sum than we can earn in any merchant service," said a Coral fisher to me. And what is the treatment which they receive, and the nature of the service they enter upon? This I shall describe in detail; and then think, ye beauties, with what toil and suffering ~~have~~ been purchased the glowing ornaments which adorn your snowy bosoms. As the time for starting approaches, all who have received the Caparra, and, what is worse too, spent it, go down to Torre, and get the remainder of their paltry pay.

The scene which I witnessed in the Island of Capri, in the month of March, is the pattern of many others occurring at the same time all round the Bay of Naples; and nothing have I ever witnessed more touching or picturesque than the sorrow of those rude children of Nature. "My son," said an aged mother, "may God bless you! may the Madonna accompany you!" and she laid her hand upon his head, whilst the son knelt down, and took her other hand in his, and kissed it, the very extent of the affection which an Italian exhibits for a parent. Close by stood the "fidanzata," overwhelmed with grief, yet, from the reserve of custom, not making any open show of it. Several who were wives, too, were there; but they were of good courage, as they were going to accompany their husbands to Torre to bid them a last farewell, and receive—I had almost said the price of their blood—to keep their houses together, whilst they were at sea.

At the Port of Torre del Greco, a little fleet is assembled, each of from seventeen to twenty tons, and carrying from eight to twelve men. One portion of the fleet is destined for the Barbary Coast, another for that of Sardinia, and some visit other parts of the Mediterranean. Vows have been made to the Madonna, to the Patron Saints, and masses said. Every bark has received the priestly benediction. The church bells are ringing, and continue to do so until the fleet is leaving the shore, whilst this sweet harmony of sounds is increased by a beating of tambours, the sounding of a hundred tofi (conch shells), and other instruments of a similar character. In short, it is made rather a festive scene, too much grief being supposed, perhaps, to bring a "cattiv' augurio" (ill-luck); yet many a heavy heart is hidden by a shining face. Women, of course, are there; for in what situation in which human sympathies are greatly excited, are they ever absent? and the part which they take, was to me perfectly new. As each bark lifted its anchor, and glided off, a group of women gave expression to their grief, mingled with benedictions and "auguri" for good success: "May she sail like a bark of the angels!" and throwing sea-water and sand after it, again they cry, "May she abound as the sea, and the sands of the sea!" The last bark lifts its anchor, and now they are all fairly off, and many an eye all round the coast is on the stretch to catch a last glimpse of the sails which are bearing their social treasures to that Ultima Thule of the poor people—the coast of Barbary.

On the arrival at their several destinations, the captain lands and leaves his papers with the authorities, not unaccompanied by a present for the Consul; for before the season breaks up, the captain may want justice for himself, or the liberty of oppressing his crew, and a *douceur* to the great man is remembered with gratitude, and covers a multitude of sins. Each bark, too, pays on the Sardinian Coast, for medicine and medical attendance, seven piastres; whilst on the African coast, belonging to the French, a hospital is established where advice is given gratuitously; on both stations eleven piastres are demanded for custom-house dues and the examination of papers. There is another payment to be made, later, though I speak of it here, in the form of a tax for the privilege of fishing in those waters; on the Sardinian coast amounting to sixteen piastres for every boat, on the French African coast to one hundred and eight piastres, being just one half of what was demanded formerly; and a very sure and knowing way the authorities have of collecting it. When the season is half over, a vessel is sent out from Torre laden with fresh supplies of food and rope; the coral barks then push in to meet it, when their stock of coral is seized and detained in the custom-house until the tax has been paid; on the demand being satisfied, the supplying

vessel receives all the coral that has been taken, and bears it back to Torre.

All preliminaries being settled, and the boats being numbered, without which they would be seized and confiscated, away they push, and commit their fortunes to the deep. When well supplied, each boat will have on board about twenty cantari of hemp (a cantaro amounting to nearly two hundred pounds), with which the sailors make the nets on the voyage. The net, which is made with very wide meshes and very loose in the texture, is generally about eighteen passi or yards long, and one wide; the wide part being let down perpendicularly in the sea in order that the coral rock may be better embraced by the length. The fishing machine, however, which is employed, consists of five nets, which are arranged as follows:—Two sticks, of the thick-

ness of a man's arm, and each about two feet and a half (five palmi) in length, are fastened together in the form of a cross, as in the figure; to each of the extremities, A, B, C, D, is attached a net such as I have described, and the length lying, of course, much in folds. Under the centre, E, is attached a stone of, perhaps, seventy pounds weight, and to the same point is attached also another net. The rope, F, communicates with the boat, and is stretched across the thigh of a man, which is covered with a thick piece of leather. Let us then suppose that the boat has arrived at the given spot. The nets are thrown in, and away goes the vessel before the wind, or propelled by the oar until they have laid hold of a rock. Woe be to the man who holds the rope if he gives not immediate notice of the net having "caught" the reef, so that more rope may be let out, otherwise he is thrown into the sea, or, as I have heard in many cases, his thigh is cut through to the bone, so violent is the check and so great the tension. Then "comes the tug of war," the whole crew are called upon for a long pull, a strong pull, and a pull altogether, until by main force they break off pieces of the coral reef, which derive their value from their weight and colour. Jet black and rose-colour corals are the most esteemed, although a deeper red, white, and a dark dirty grey abound. The last is rarely sold, being considered nearly valueless. The rose-colour coral will sell at from twenty to one hundred piastres, or three pounds ten shillings to seventeen pounds the rotolo of thirty-three ounces according to the weight.

"Oh, Signore, quant' è bell' a vederé!" said a coral fisher to me only that morning, "What a beautiful sight it is when the coral is drawn up out of the sea!" Up comes the long branches like the boughs of a tree, or sometimes in great thick pieces. Last spring we were a hundred barks pulling away at one reef, and

up came our nets with a rock in the midst; the upper part was covered with plums, and pears, and grapes; for your Eccellenza knows that the sea has its fruits as well as the land; and underneath the rock was the coral. It was a beautiful sight to see; besides, we are all better treated by the captain when we have a good draw; and we gave a shout of joy."

The coral, I am told, is found at a depth varying from about eight to thirty-four fathoms, and the best is near the surface: that of Sardinia, too, is preferred, and the coral on the Barbary coast. Sometimes a piece will be taken so large as to be beyond all price. One boat, for instance, has this season taken seven branches, of the weight, respectively, of two rotoli, one and a half rotolo, one rotolo, and a half rotolo, and downwards. These seven branches were valued to me at one thousand ducats, and another such a pull would make a tolerable voyage.

What strikes one as remarkable is, the rapid growth and formation of these Coral beds. "Year after year have we fished away on the same spots, and yet on each returning season we find an abundant supply. Sometimes beds that we have left small, have, in one winter, grown up to a large size." Such is the account the fishers give. Much uncertainty, however, prevails as to the remunerating profits of the voyage; the pieces brought up may be very small, or an inconsiderable quantity may be taken; the nets may be broken or lost; and, lastly, the vessel itself may be lost, not an unfrequent occurrence; for every year the sad intelligence arrives of the loss of a coral bark, or more; so constant is the exposure, and so great the danger incurred. Let us suppose that only one hundred vessels a year leave Torre for this trade—and there are near two hundred—and we shall perceive of how much importance this trade is to a small town. No wonder masses are said and benedictions uttered; for where the treasure is, there will the heart be also.

But how great are the hardships of the service, and how much suffering is inflicted by the cruelty and brutality of the captains? In the first place, repose is unknown upon these vessels; for three weeks, or even a month, at a time, if the weather be favourable and the sea kind, they keep out at sea, like the "Flying Dutchman," ever on the run, and the nets ever dragging until they lay hold of a rock, when in they are hauled and again re-cast, unless they are broken. For the whole crew, therefore, there is never entire repose; and on some boats not even is the relay system adopted, either because of the brutal character of the captain, or the shortness of hands. The consequence is, that on such vessels sleep is indulged in by theft, by snatches; and I have heard of some who had almost acquired a habit of working and

sleeping at the same time. Alas, poor fellows!—many is the man who pays the price of health and life for such ceaseless and exhausting work as this is; and many is the wretched sailor who returns to his native village too happy to breathe out his last breath in the bosom of his mother or his wife, the victim of consumption and malaria. Nor is the diet such as to recruit a system thus worn out; for, with occasional exceptions, bread and water is their fare till they return, the water often being in such a state that, as many of the sailors have said to me, “we are obliged to drink it through our teeth.” Of the treatment which those men receive it is almost superfluous to speak; slaves, in point of fact—as slaves they are treated. “We forget our own names from the time we enter the service,” have they said to me; “the most disgusting sobriquets being applied to us, accompanied by the frequent use of the rope’s-end.” I have heard, too, of special acts of brutality, so revolting and horrible that I should fear the imputations of exaggeration were I to relate them.

The crews are engaged to 20th September for the Barbary fishers—and 2nd October for Sardinian fishers; or, in the language of the country, the Fêtes of San Michael, and of the blessed Madonna del Rosario. And never, surely, did the saints appear so amiable as when putting a term to such labour and suffering. On these nights every net is raised, and every hand is still. What matters it to them if the most tempting branches of coral are glowing beneath them? nothing would induce them to give another pull, even if there was a promise of drawing two thousand ducats. They are free again, and nothing can be got in competition with that delicious rest. How sweet their dreams that night! Rest, rest, rest, and liberty for four months to come! Rough and degraded, too, as they are, by continual ill-treatment, they have their affections and attachments, strong and glowing as are those of the daintiest and proudest of the land; and the “cara sposa” and the “cambino,” chuckling and crowing, come and visit them in their slumbers on the vigils of those blessed days.

The sails are set, and away they glide into port. Their passports *visé*, and their papers signed, homewards they turn their happy faces. I have mingled with many a group on the cliffs around the lovely Bay of Naples, as these vessels were flying through the storm, and listened to their exclamations with no slight interest. “Will Giuseppe be on board that vessel, or has Giovanni yet entered port?” And the call comes at length, and their hearts are leaping with joy, and their eyes are glistening with tears, as they once more go to Torre, not to bid farewell, but to welcome their hope and their support after the dangers and privations of so many months. In many a village church on the following Sunday, there is a

brilliant display of finery—those young men grouped together near the altar are some of the coral fishers. I know them by their new crimson sashes and the glowing Phrygian caps. I fancy, too, that I can detect here and there a new gown, and a new pair of earrings, as brilliant as pearls can make them, with a bit of green glass in the centre, as though they would wear emeralds as well as their betters. Well, well! let them indulge their innocent vanity. I like some degree of it in the poor; it is the guarantee of self-respect: besides, who on such an occasion as this would find it in his heart to carp or censure? All now is joy and merriment; and there is feasting and dancing, and the tambour summons all to the gay and graceful Tarantella; and the bread, and the water, and the rope’s end, and the savage roaring of the waves—all, all, are forgotten in the pleasures of that delightful hour. It is a blessed thing to gaze on such a scene as this, and think that even amid the labour and sorrow, God has still provided their moments, aye, and hours, of enjoyment for the poor! Let man be careful not to curtail their innocent relaxations. I would not have the weight of such a sin upon my conscience.

How are these poor fellows to live for the next four months! Scarcely has any one of them a grain in his pocket. Receiving their money by anticipation, the usual consequence has followed. Even a small sum of money can never, they think, be exhausted; and with this wise reflection, rotolo after rotolo of macaroni has been devoured, and caraffas of wine without number have been swallowed;—besides, who cares for saving? will not the same sum be coming in January? Thus the Coral fishers are amongst the most reckless and improvident class of sailors, depending always upon credit, which they get at Jew’s interest, and with great facility—their means being as sure as those of expectant heirs. In every place where these men abound, are to be found shopkeepers who supply them with everything they want, and lose no opportunity of encouraging extravagance: a good score is thus run up, and as benevolence must be presumed always to have its reward, fifty per cent profits at least are always laid on. Pay-day comes at last; and down go the sailors to Torre del Greco, accompanied by their friends the shopkeepers, who stick to them like leeches; application is made to the masters to stop the wages: then some difficulties arise, and amidst brawling and extortion, and recrimination, the curtain drops. I never knew a Coral fisher well off.

Coral is, to the animal which forms it, what the shell is to the snail; it is the nest or crust of a certain species of sea-worm. It is multiplied with extraordinary rapidity by the little animals, and grows on rocks, or on any solid sub-marine body, in a shrub-like form; and although it is produced at from ten to a

hundred fathoms below the surface, yet the penetration of the rays of the sun are necessary to its increase.

THE STORY OF FINE-EAR.

TEN or twelve years ago, there was, in the prison at Brest, a man sentenced for life to the galleys. I do not know the exact nature of his crime, but it was something very atrocious. I never heard, either, what his former condition of life had been; for even his name had passed into oblivion, and he was recognised only by a number. Although his features were naturally well formed, their expression was horrible: every dark and evil passion seemed to have left its impress there; and his character fully corresponded to its outward indications. Mutinous, gloomy, and revengeful, he had often hazarded his life in desperate attempts to escape, which hitherto had proved abortive. Once, during winter, he succeeded in gaining the fields, and supported, for several days, the extremity of cold and hunger. He was found, at length, half frozen and insensible under a tree, and brought back to prison, where, with difficulty, he was restored to life. The ward-master watched him more closely, and punished him more severely by far, than the other prisoners, while a double chain was added to his heavy fetters. Several times he attempted suicide, but failed, through the vigilance of his guards. The only results of his experiments in this line were an asthma, caused by a nail which he hammered into his chest, and the loss of an arm, which he fractured in leaping off a high wall. After suffering amputation, and a six months' sojourn in the hospital, he returned to his hopeless life-long task-work.

One day, this man's fierce humour seemed softened. After the hours of labour, he seated himself, with the companion in misery to whom he was chained, in a corner of the court; and his repulsive countenance assumed a mild expression. Words of tenderness were uttered by the lips which heretofore had opened only to blasphemy; and with his head bent down, he watched some object concealed in his bosom.

The guards looked at him with disquietude, believing he had some weapon hidden within his clothes; and two of them approaching him stealthily from behind, seized him roughly, and began to search him, before he could make any resistance. Finding himself completely in their power, the convict exclaimed: "Oh, don't kill him! Pray, don't kill him!"

As he spoke, one of the guards had gained possession of a large rat, which the felon had kept next his bosom.

"Don't kill him!" he repeated. "Beat me; chain me; do what you like with me; but don't hurt my poor rat! Don't squeeze him so between your fingers! If you will not give him back to me, let him go free!"—

And while he spoke, for the first time, probably, since his childhood, tears filled his eyes, and ran down his cheeks.

Rough and hardened men as were the guards, they could not listen to the convict, and see his tears, without some feeling of compassion. He who was about to strangle the rat, opened his fingers and let it fall to the ground. The terrified animal fled with the speed peculiar to its species, and disappeared behind a pile of beams and rubbish.

The felon wiped away his tears, looked anxiously after the rat, and scarcely breathed until he had seen it out of danger. Then he rose, and silently, with the old savage look, followed his companion in bonds, and lay down with him on their iron bedstead, where a ring and chain fastened them to a massive bar of the same metal.

Next morning, on his way to work, the convict, whose pale face showed that he had passed a sleepless night, cast an anxious, troubled glance towards the pile of wood, and gave a low, peculiar call, to which nothing replied. One of his comrades uttered some harmless jest on the loss of his favourite; and the reply was a furious blow, which felled the speaker, and drew down on the offender a severe chastisement from the taskmaster.

Arrived at the place of labour, he worked with a sort of feverish ardour, as though trying to give vent to his pent-up emotion; and, while stooping over a large beam, which he and some others were trying to raise, he felt something gently tickle his cheek. He turned round, and gave a shout of joy. There, on his shoulder, was the only friend he had in the world—his rat!—who, with marvellous instinct, had found him out, and crept gently up to his face. He took the animal in his hands, covered it with kisses, and hid it within his nest, and then, addressing the head gaoler, who happened to pass by at the moment, he said:

"Sir, if you will allow me to keep this rat, I will solemnly promise to submit to you in everything, and never again to incur punishment."

The ruler gave a sign of acquiescence, and passed on. The convict opened his shirt, to give one more fond look at his faithful pet, and then contentedly resumed his labour.

That which neither threats nor imprisonment, the scourge nor the chain, could effect, was accomplished, and rapidly, by the influence of *love*, though its object was one of the most despised amongst animals. From the moment when the formidable convict was permitted to cherish his pet night and day in his bosom, he became the most tractable and well-conducted man in the prison. His Herculean strength, and his moral energy, were both employed to assist the governors in maintaining peace and subordination. Fine-Ear, so he called his rat, was the object of his unceasing tenderness. He fed it before he tasted each meal, and would rather fast

entirely than allow it to be hungry. He spent his brief hours of respite from toil in making various little fancy articles, which he sold, in order to procure dainties which Fine-Ear liked,—gingerbread and sugar, for example. Often, during the period of toil, the convict would smile with delight when his little friend, creeping from its nestling place, would rub its soft fur against his cheek. But when, on a fine sunshiny day, the rat took up his position on the ground, smoothed his coat, combed his long moustaches with his sharp nails, and dressed his long ears with his delicate paws, his master would testify the utmost delight, and exchange tender glances with the black, roguish eyes, of Master Fine-Ear.

The latter, confiding in his patron's care and protection, went, came, sported or stood still, certain that no one would injure him; for to touch a hair of the rat's whisker would be to incur a terrible penalty. One day, for having thrown a pebble at him, a prisoner was forced to spend a week in hospital, ere he recovered the effects of a blow bestowed on him by Fine-Ear's master.

The animal soon learned to know the sound of the dinner-bell, and jumped with delight on the convict when he heard the welcome summons.

Four years passed on in this manner, when one day poor Fine-Ear was attacked by a cat, which had found her way into the workshop, and received several deep wounds before his master, flying to the rescue, seized the feline foe, and actually tore her to pieces.

The recovery of the rat was tedious. During the next month the convict was occupied in dressing his wounds. It was strange the interest which every one connected with the prison took in Fine-Ear's misfortune. Not only did the guards and turnkeys speak of it as the topic of the day, but the hospital nurses furnished plasters and bandages for the wounds; and even the surgeon condescended to prescribe for him.

At length the animal recovered his strength and gaiety, save that one of his hind paws dragged a little, and the cicatrice still disfigured his shin. He was more tame and affectionate than ever, but the sight of a cat was sufficient to throw his master into a paroxysm of rage, and, running after the unlucky puss, he would, if possible, catch and destroy her.

A great pleasure was in store for the convict. Thanks to his good conduct during the past four years, his sentence of imprisonment for life had been commuted into twenty years, in which were to be included the fifteen already spent in prison.

"Thank God!" he cried, "under His mercy it is to Fine-Ear I owe this happiness!" and he kissed the animal with transport. Five years still remained to be passed in toilsome imprisonment, but they were cut short in an unlooked-for manner.

One day, a mutinous party of felons suc-

ceeded in seizing a turnkey, and having shut him up with themselves in one of the dormitories, they threatened to put him to death if all their demands were not instantly complied with, and a full amnesty granted for this revolt.

Fine-Ear's master, who had taken no part in the uproar, stood silently behind the officials and the soldiers, who were ready to fire on the insurgents. Just as the attack was about to commence, he approached the chief superintendent, and said a few words to him in a low voice.

"I accept your offer," replied the governor: "Remember, you risk your life; but if you succeed, I pledge my word that you shall be strongly recommended to the government for unconditional pardon, this very night."

The convict drew forth Fine-Ear from his bosom, kissed him several times, and then placing him within the vest of a young fellow-prisoner with whom the rat was already familiar, he said in a broken voice:—

"If I do not return, be kind to him, and love him as I have loved him."

Then, having armed himself with an enormous bar of iron, he marched with a determined step to the dormitory, without regarding the missiles which the rebels hurled at his head. With a few blows of his bar, he made the door fly open, and darting into the room, he overturned those who opposed his entrance, threw down his weapon, and seizing the turnkey, put him, or rather flung him, out safe and sound into the passage.

While in the act of covering the man's escape from the infuriated convicts, he suddenly fell to the ground, bathed in blood. One of the wretches had lifted the iron bar and struck down with it his heroic comrade.

He was carried dying to the hospital, and, ere he breathed his last, he uttered one word—it was "Fine-Ear!"

Must I tell it? the rat appeared restless and unhappy for a few days, but he soon forgot his master, and began to testify the same affection for his new owner that he had formerly shown to him who was dead.

Fine-Ear still lives, fat, and sleek, and strong; indeed, he no longer fears his feline enemies, and has actually succeeded in killing a full-grown cat and three kittens. But, he no longer remembers the dead, nor regards the sound of his master's number, which formerly used to make him prick up his ears and run from one end of the court to the other.

Does it only prove that rats, as well as men, may be ungrateful? Or is it a little illustration of the wise and merciful arrangement, that the world must go on, die who will?

HOUSEHOLD WORDS.

A WEEKLY JOURNAL.

CONDUCTED BY CHARLES DICKENS.

NO. 43.]

SATURDAY, JANUARY 19, 1851.

[PRICE 2d.]

THE PRIVATE HISTORY OF THE PALACE OF GLASS.

ON New Year's Day in the year 1637, a traveller was proceeding, in a native boat, on a difficult exploration up the river Berlice in Demerara, when, on arriving at a point where the river expanded and formed a currentless basin, his attention was attracted to the southern margin of the lake by an extraordinary object. He caused his crew to paddle quickly towards it. The nearer he approached, the higher his curiosity was raised. Though an accomplished botanist, and especially familiar with the Flora of South America, he had never seen anything like it before. It was a Titanic water-plant, in size and shape unlike any other known plant. "I felt as a botanist," says Sir Robert Schomburgk "and felt myself rewarded! All calamities were forgotten. A gigantic leaf, from five to six feet in diameter, salver-shaped, with a broad rim, of a light-green above, and a vivid crimson below, rested upon the water! Quite in character with the wonderful leaf was the luxuriant flower, consisting of an immense number of petals, passing in alternate tints from pure white to rose and pink" [and, in some instances, measuring fifteen inches across]. "The smooth water was covered with blossoms, and, as I rowed from one to the other, I always observed something new to admire."

Such flowers Polyphemus must have gathered for Galatea's nosegay; but Sir Robert Schomburgk, not content with mere flowers, dug up whole plants; and sent first them, and, afterwards seeds, to England, where the magnificent lily was named the "Victoria Regia." After some unsuccessful attempts, the task of forcing it to blossom in an artificial climate, was confided to Mr. Paxton, the celebrated horticulturist of the Duke of Devonshire's celebrated Chisworth.

Mr. Paxton—a man of high scientific attainments—is not a mere academic *savant*. His Alma Mater is Nature. When the Victoria Regia was to be flowered, Mr. Paxton determined to imitate Nature so closely as to make that innocent offspring of the Great Mother fancy itself back again in the broad waters and under the burning heats of British Guiana. He deceived the roots by imbedding them in

a hillock of burned loam and peat; he deluded the great lubberly leaves by letting them float in a tank, to which he communicated, by means of a little wheel, the gentle ripple of their own tranquil river; and he coaxed the flower into bloom by manufacturing a Berbician climate in a tiny South America, under a glass case.

With that glass case our history properly commences. In imitation of a philosophic French Cook, who began a chapter on stewed-apples with an essay on the Creation, we have thought it wise to start with the parentage and gestation, before proceeding to the birth and development of the Great Giant in Hyde Park; for by a curious apposition, the first parent of the most extensive building in Europe was the largest known floral structure in the world. Although, co-relatively, they differ as widely as the popular disparity of St. Paul's and a China orange; yet the one proceeded from the other, as consequently as oaks grow from acorns.

Mr. Paxton had already effected many improvements in horticultural buildings; the workmanship of which has always been necessarily massive. With ~~the~~ conviction that glass houses are not Egyptian tombs built for darkness and eternity, he set about making them lighter than of old, both as regards actinism and architecture. He discarded as much as practicable all ponderous and opaque materials. He pared away all clumsy sash-bars, whose broad shadows robbed plants of the sun's light and heat during the best parts of the day; he abolished dirty and leaking overlaps, by using large panes, and inserting them in wooden grooves, rendered water-tight by a sparing use of putty. Lastly, finding, that into the ordinary sloping roof the sunbeams enter at an indirect and unprofitable angle, Mr. Paxton invented a horizontal glazing composed of angular ridges, the glass presenting itself to the sun's rays so as to admit them to the plants in a straight line at almost any time of day; but especially early and late.

In a green-house constructed with some of these improvements, and acclimated as we have already explained, a Victoria Regia was planted on the tenth of August, 1849. So well had everything been prepared for its reception, that it flourished as vigor-

it had been restored to its old soil and climate. Its growth and development were astonishingly rapid; for in the ninth of November a flower was produced, a yard in circumference! In little more than a month after, the first seeds ripened; some of them were sown, and on the sixteenth of February succeeding, young plants made their appearance. Success, however, brought a fresh embarrassment. The extraordinary lily obeyed Nature's law of development with such unexpected rapidity, that it outgrew the dimensions of its home in little more than a month. It therefore set Mr. Paxton a problem to solve; the formula of which was something like this:—Given, an exotic growing in a green-house, at the rate of six hundred and forty-seven square inches of circumference per diem required, in three months, a new house of dimensions proper for its maturity?

Mr. Paxton went to work; and, combining all his improvements in constructing green-houses with his special inventions for maturing the Victoria Regia, he very soon produced the "Q. E. D.," in the shape of a novel and elegant conservatory, sixty feet long by forty broad. This building became the immediate precursor of the gigantic structure in Hyde Park,—why necessitates a short explanation.

Among the many desiderata required for every kind of habitation—whether it be designed for plants or princes, for a pine-house or a palace, for the Victoria Regia, or for the enormous glass-case under which to collect the products of All Nations,—the most imperative conditions, after stability, are, perfect facilities for drainage and for ventilation; another, though scarcely subordinate proviso, is economy. The man who can construct a house, which shall repel external humidity, and allow of a constant and gentle change of atmosphere at any controllable temperature, and at the lowest cost consistent with durability, is, of course, the genius of builders. Now, in order to be economical, he must necessarily so manage, that each of his materials shall perform as many different functions as it is possible for it to perform effectually. If he build walls which answer for warmth and strength only, he add gutters for drainage, and if he call on Dr. Reid for ventilation, he may, probably, find a good habitation, but it will certainly be a costly, perhaps a clumsy one; and will turn out a very long job. Mr. Paxton, when he set about the new Victoria Regia house—guided by previous study and experience, and forced into new expedients by the peculiarities of the extraordinary tenant he was building for—had become a better economist. The result is, as shown in his latest effort—the great Building—that his walls and foundations are not simply walls and foundations, but ventilators and drains as well. His roofs are not simply roofs; but, besides being the most extensive of known sky-lights, are light and

heat adjusters. His eash-bars do not only hold the glass together, but are self-supporting, and his rafters form perfect drains for both sides of the glass,—for draining off internal, as well as external moisture, whilst the tops of the girders are conduits also. His floors are dust-traps, and aid in ventilation. Lastly, his whole building is, while in course of construction, its own scaffolding. Thus he saves time as well as money.

The Victoria Regia house, which combines most of the advantages above detailed, was finished in several weeks less time, and cost considerably less money, than the slenderest old-fashioned conservatory that has ever been built.

While Mr. Paxton was busy with this novel and model garden-house, a hot war was raging in London about the site for the new building for exhibiting specimens of the Art and Industry of all nations in 1851. Mr. Paxton is a reader of the "Times," and pursued with sympathising interest its fiercely-urged objections against the invasion of Hyde Park by armies of excavators, bricklayers, brick-smiths, and timber-fellers. The picture daily drawn of the tearing-up of fashionable roads by the carting of more bricks and mortar (for, mark, a temporary edifice) than the eternal Pyramids of Ghizeh consist of; the cutting down from one side of Rotten Row of its most cherished ornaments, the trees; the uncertainty of miles of brickwork being put together in time for sufficient consolidation to bear the weight of the tremendous iron dome designed to rest upon it; the impossibility of the entire mass of mortar and plaster duly drying:—All this, though occasionally overdrawn and exaggerated, presented a black perspective, which the means and appliances of the Victoria Regia conservatory would, thought its architect, considerably lighten, or altogether obviate. Every new thunderbolt from the newspaper *Tonans*, strengthened this notion in the projector's mind. All that was wanted, was a great many great lily-houses joined together. A multiplication of hands and of materials could be readily commanded, and no structure could be raised so quickly and so cheaply. The promenaders and neighbours of Hyde Park would be relieved of the incessant "click-click" of bricklayers' trowels, the maddening noise of the blacksmiths' riveting-hammers, and have perfect immunity from the hourly transit of bricks and scaffold-poles. The proposed edifice could be constructed at Birmingham, at Dudley, and at Thames Bank, "brought home" to Hyde Park ready-made, and put up like a bedstead. As to the trees: for a couple of hundred pounds Mr. Paxton would transplant them, and bring them back again at the end of the Industrial fair without injuring a single twig. And here we may remark, in passing, that, according to Horace Walpole, Mr. Paxton is half a century before his time in his large

transplanting operations. In August, 1748, the Twickenham Prophet wrote to his Cousin Conway, as a piece of extravagant fun—"I lament living in so barbarous an age, when we are come to so little perfection in gardening. I am persuaded that, a hundred and fifty years hence, it will be as common to remove oaks a hundred and fifty years old, as it is now to transplant tulip roots."

However, Mr. Paxton *could* do without moving the venerable wood "on the shortest notice" (as if it had been converted into household furniture before its time). If the Park authorities preferred, he would clap the trees, all standing, under his great glass case.

But, alas! feasible as the plan appeared, it was not to be thought of. The fiat of the Building Committee had gone forth. The competition of architectural skill invited by the authorities had not produced one available design. The first exhibition of the Industry of the Architects of all Nations had been pronounced a failure; and the fact of the Building Committee having invited tenders for the construction of a design of its own, shut out fresh competitors.

One day, however—it was Friday, the fourteenth of June—Mr. Paxton happened to be in the House of Commons conversing on this subject with Mr. Ellis, a member of it, who accompanied him to the Board of Trade to see what could be done. Then, nothing could be done; for Mr. Paxton (who is one of the busiest men in England—whose very leisure would kill a man of fashion with its hard work) was off immediately to keep a special appointment at the tubular bridge over the Menai. After his journey, the next morning, the conversation with his friend, the M.P., was clenched by another and more than usually powerful burst of thunder in that day's issue from Blackfriars. His mind was made up; and, "and," said the Duke of Devonshire, at a recent public meeting at Bakewell, "I never knew Mr. Paxton resolve to undertake what he did not fully accomplish." To have engagements for every day in the week in different parts of England and Ireland, together with the management of the estates at Chatsworth, did not much matter; there was still time to be found for concocting the plans and details of a few square acres of building. Tuesday morning, the eighteenth of June, found Mr. Paxton at Derby, seated—as Chairman of the Works, and Ways Committee of the Midland Railway—to try an offending pointman. This was the first *leisure* moment he had been able to secure since he resolved to plan the great building. At the end of the table stood the culprit; and, upon it, before the Chairman, was invitingly spread a virgin sheet of blotting-paper. As each witness delivered his evidence, Mr. Paxton appeared to be taking notes with uncommon assiduity; and when the case closed, one of his colleagues turned specially to him, saying,

"As you seem to have noted down the whole of the evidence, we will take the decision from you."

"The truth is," whispered the Chairman, "I know all about this affair already, having accidentally learned every particular last night. *This*," he continued, holding up the paper, "is not a draft of the pointman's case, but a design for the Great Industrial Building to be erected in Hyde Park."

The point-man was let off with a fine, and before evening the blotting-paper plan had found its way into Mr. Paxton's office at Chatsworth. By the help of that gentleman's ordinary assistants, elevations, sections, working details, and specifications were completed in ten days.

When he made his next appearance at the Derby station, at the end of that time, Mr. Paxton had the complete plans under his arm. There was not a minute to spare, for the train was on the point of starting, and the Royal Commissioners met the next morning; so, taking his dinner in his pocket, he entered a carriage. Here, to his extreme delight, he found one of the greatest and most influential engineers of the day—a member, moreover, of the Royal Commission—who was going to London by the same train.

"This is extraordinarily lucky!" he exclaimed; "for I want you to look over a few plans and a specification of mine."

Accordingly the plans were unrolled. "There they are," said the impromptu architect; "look them over, and see if they will do for the great building for eighteen hundred and fifty-one!"

"For what?" asked the engineer, looking at his friend with the serio-comic surprise of incredulity.

"I am serious."

"But you are too late; the whole thing is settled and decided."

"Well, just see what you think of them. I am very hungry, and if you will run them over while I eat my dinner, I'll not speak a word."

"Neither will I disturb you, for I must light a cigar;" and in spite of every regulation in that case made and provided, the engineer began to smoke.

There was a dead taciturnity; the Royal Commissioner went over the plans slowly and carefully; their originator narrowly watching their effect on his mind. It was an anxious moment for the one; for upon the opinion of the other no little depended. At first there was not much to augur from. The drawings were scanned with no more than business-like attention. No word of commendation was uttered; no sign of pleasure or surprise appeared. The smoke rose in regular wreaths; but, presently, they grew fainter and more intermittent, and by-and-by the cigar went out; yet the smoking was continued as vigorously as ever. The projector's hopes rose; his friend's attention

was evidently drawn into a vortex, for he went on during twenty minutes, puffing away at the effete weed, quite unconscious that it was extinguished! At length, gathering the unrolled papers up in a bundle, he threw them into the opposite seat, exclaiming—"Wonderful!—worthy of the magnificence of Chatsworth!—a thousand times better than anything that has been brought before us! What a pity they were not prepared earlier!"

"Will you lay them before the Royal Commission?"

"I will."

The value of this promise and of the favourable expression of opinion which would doubtless accompany its performance, will be best understood when we divulge to the reader (without, we trust, any loss of confidence) that the gentleman who made it was Mr. Robert Stephenson.

The next day tells a melancholy page in English history. It was Saturday, the twenty-ninth of June. The Royal Commission met, headed by Prince Albert. After the regular business of the Board was over, the Prince and Sir Robert Peel retired to one of the private parlours, and were some time engaged in earnest conversation. Mr. Stephenson's time was precious, for he had an appointment elsewhere. He was, in short, obliged to depart without an opportunity of placing Mr. Paxton's plans before his colleagues and the Prince. He delegated that office, however, to an able friend, Mr. Scott Russell, one of the Secretaries of the Commission.

Both Prince Albert and Sir Robert Peel gave great attention to the drawings, and the Prince signified his wish that Mr. Paxton should come to Buckingham Palace to explain the plans. Sir Robert Peel greatly admired the design for its unity and simplicity, remarking with pleasure, that if it were accepted, it would occasion the first great operation in the introduction of his own new tariff. Also, this was the latest connected mark which that great statesman was destined to utter. He almost immediately left Westminster Palace on horseback for an aim, was thrown on Constitution Hill, and three days afterwards had ceased to exist.

The Paxton scheme was referred to the Building Committee, which, in the regular routine of business, could not entertain it, having rejected all the designs it had invited for competition, and having devised a plan of its own. Nothing daunted, however, Mr. Paxton determined to appeal to a tribunal which (to borrow the tag of most modern comedies) is "never sought in vain, namely, to the British public! This he did by the aid of the woodcuts and pages of the "London Illustrated News." Never was an appeal more promptly or satisfactorily answered! The practicability, the simplicity, and beauty of the scheme convinced every member of

the many-headed court of appeal of its efficacy.

Meanwhile, the projector of the building waited on the projector of the entire Exhibition, Prince Albert, on another memorable morning—that of the Christening day of Prince Patrick. What passed need not be divulged, but the encouragement which it added to the expression of public opinion duly gathering strength, induced Mr. Paxton to decide on procuring a tender to be sent in to the Building Committee for his design. He therefore went straight to Messrs. Fox and Henderson, and these gentlemen immediately engaged to prepare a tender. It happened that the Building Committee in their advertisement had invited the candidates for raising their edifice, to suggest any improvements in it that may occur to them. This opened a crevice, into which Messrs. Fox and Henderson were able to thrust their tender for Mr. Paxton's plan. Seemingly, it was a tall thing, plus the plan—the suggestion desideratum they tendered for it is an improvement on the Committee's design.

Here a new world might be said to arise. It was now Saturday and only a few days more were allowed for receiving tenders. Yet let us not approximate estimates of pace could be found the great glass manometer, and in a matter of the north had to be consulted. This happened to be done by the third for it was the plan for Saturday on which the Sunday Standard had reached its crisis, and there was to be a delivery next day! Put in a country of electric telegraphs! and of indomitable energy and difficulties are unimpaired, and it is not the least of the marvels wrought in connexion with the great edifice, that by the aid of railway pencils and the electric telegraph, not only did all the gentlemen summoned out of Warwickshire and Staffordshire appear on Monday morning at Messrs. Fox and Henderson's Office, in Spring Gardens, London to centralise their several estimates to the tender for the whole, but, within a week, the contractors had prepared every detailed working drawing and had calculated the cost of every pound of iron of every inch of wood, and of every pint of glass.

There is no one circumstance in the history of the manufacturing enterprise of the English nation which places in so strong a light as this its boundless resources in materials, to say nothing of the arithmetical skill in computing at what cost, and in how short a time, these materials could be converted to a special purpose. What was done in those few days? Two parties in London, relying on the accuracy and good faith of certain iron-masters, glass-workers in the provinces, and of one master carpenter in London, bound themselves for a certain sum of money, and in the course of some four

months, to cover eighteen acres of ground, with a building upwards of a third of a mile long (1851 feet—the exact date of the year), and some four hundred and fifty feet broad. In order to do this, the glass-maker promised to supply in the required time, nine hundred thousand square feet of glass, (weighing more than four hundred tons) in separate panes, and these the largest that ever were made of sheet glass; each being forty-nine inches long. The iron-master passed his word in like manner to cast in due time three thousand three hundred iron columns, varying from fourteen and a half feet to twenty feet in length: thirty-four miles of guttering tube, to join every individual column together under the ground; two thousand two hundred and twenty-four girders (but some of these are of wrought iron); besides eleven hundred and twenty-eight bearers for supporting galleries. The carpenter undertook to get ready within the specified period two hundred and five miles of sash-bar; flooring for an area of thirty-three millions of cubic feet; besides enormous quantities of wooden walling, louvre work, and partition.*

It is not till we reflect on the vast sums of money involved in transactions of this magnitude, that we can form even a slight notion of the great, almost ruinous, loss a trifling arithmetical error would have occasioned, and of the boundless confidence the parties must have had in their resources and in the correctness of their computations. Nevertheless it was one great merit in Mr. Paxton's original details of measurement that they were contrived to facilitate calculation. Everything in the great building is a dividend or multiple of *twenty-four*. The internal columns are placed twenty-four feet apart, while the external ones have no more than eight feet (a third of twenty-four) of separation; while the distance between each of the transept columns is three times twenty-four, or seventy-two feet. This also is the width of the middle aisle of the building; the side aisles are forty-eight feet wide, and the galleries and corridors twenty-four. Twenty-four feet is also the distance between each of the transverse gutters under the roof; hence, the intervening bars, which are at once rafters and gutters, are, necessarily, twenty-four feet long.

There was little time for consideration, or for setting right a single mistake, were it ever so disastrous. On the prescribed day the tender was presented, with whatever imperfections it might have had, duly and irredeemably sealed. But, after-checkings, have divulged no material error. The result was, that Messrs. Fox and Henderson's offer for erecting the Paxton edifice proved to be the lowest practicable tender that was submitted to the Building Committee.

* The quantities and dimensions here quoted are those of the building as it now stands. They differ but slightly from Mr. Paxton's original specification.

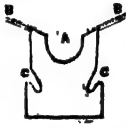

The public have long known what followed:—Mr. Paxton's Glazed Palace was eventually chosen unanimously; not only by the Building Committee but by the Royal Commission. Some modifications were, however, adopted. It was decided that the most revered of the trees were to be admitted into the Industrial building; and the central transept—the apex of whose curvilinear roof is one hundred and twelve feet from the ground—was contrived by Mr. Paxton for their inclosure. In August the space in Hyde Park was boarded in; and the first castings for the iron columns were delivered on the fourteenth of September. Yet, when these pages meet the reader's eye, the cheapest, most gigantic, and substantial structure ever dreamt of, will be nearly ready for decoration.

If for nothing else, this tremendous pile of transparency is astounding—for its cheapness. It is actually less costly than an agricultural barn or an Irish cabin! A division of its superficies in cubic feet by the sums to be paid for it, brings out the astonishing quotient, of little more than one half-penny (nine sixteenths of a penny) per cubic foot; supposing it to be taken down and returned to the contractors when the Exhibition is over. Or, if it remain a fixture, the rate of cost will be rather less than a penny and one twelfth of a penny per cubic foot. The ordinary expense of a barn is more than twice as much, or two-pence halfpenny per foot. Here are the figures:—The entire edifice contains thirty-three millions of cubic feet. If borrowed and taken down, the sum to be paid is seventy-nine thousand eight hundred pounds: if bought, to become a winter garden, one hundred and fifty thousand pounds.

The smallness of cost is due to the principle we have previously explained, each component of the building being endowed with more than one purpose. The six rows of columns are, as had been already said, not only props but drains. They are hollow, and into them the glass roof will deliver its collections of water. In the base of each column is inserted a horizontal iron pipe to conduct the drainage into the sewers. These strong tubes serve also as foundation; they are links that connect the whole of the three thousand three hundred uprights together. At the top, each column is fastened to its opposite associate by a girder, run up by means of a pole and pulley in a few minutes; and, once fastened, no other scaffolding is requisite for the roof which it supports. Thus, by means of the iron pipes below, and the iron girders above, the eighteen acres of structure is held from end to end so compact and fast that it becomes an enormous hollow cube, as immovable as if it were, instead, a solid cube dropped down beside Rotten Row by a gang of Titans.

The roofs—of which there are five, one to each aisle or corridor, the highest in the middle—play many parts. They are windows,

light, and heat-adjusters, rain conductors outside, and condensed moisture ducts within. They are interminable rows of roofing, so placed as to form in the aggregate a plane; in other words, they are parallel rows of the letter V done in glass, in endless ridges "long drawn out," thus:  The apex of each "ridge" is a wooden sash bar, with notches on either side for holding the sloping laths in which are fitted the edges of the glass. The bottom, or "furrow" bar—otherwise a rafter—is hollowed in the middle, to form a gutter, into which every drop of rain slides down from the glass, and passes through the transverse gutters into the hollow columns. These longitudinal gutters are formed at the tops of the girders; for the roof is self-supporting. This is not all: in converting a conservatory for plants into a resort for breathing beings, and a depot for articles emphatically "to be kept dry;" internal as well as external moisture must be drawn off: the breath of myriads of visitors, condensed against the glass, would otherwise return in continual Scotch mists. That difficulty partly dictated the A-like form of the ceiling. Mr. Paxton ascertained that vapours ascending to glass inclined to a slope of one foot in two feet and a-half, do not condense in separate drops and descend again, but slide down over the smooth surface. To receive them, therefore, he grooves each rafter under the inside of the glazing. Into these grooves the condensed breath of "all nations" will fall and be conveyed into the transverse gutters; thence through the columns into the jurisdiction of their honours the Commissioners of Sewers.

We subjoin a section of the rafter, to show the "Paxton gutter," and to glenish our explanation: A is the external gutter, B B the frames of the glass, C C the internal ducts.  These ingenious rafters are cut out of solid wood, in a machine (invented by the inventor of all the rest), with incredible rapidity. In order that there may be a fall for the water to run off, each rafter is slightly curved; and, to correct warping, a rod of iron, with nuts and washers at each end, forms the string of the bow, so as to regulate its deflexion. For this ingenious expedient Mr. Paxton has taken out a patent.

We must now give proof that the floor is a ventilator, and a dust-trap. It is laid four feet above the swart of the park. A series of subterraneous lungs are thus provided, and air is admitted to them, by means of leuvres, fixed in the outer walling of the building. These being made to open and shut like Venetian blinds, will admit much or little air, which gently passes through the seams of the open flooring, and circulates over the building. Finally, through the openings of the floor, the daily accumulations of dust will be swept into the space below by a machine,

which Mr. Paxton has invented for that purpose.

Enough has now been said to indicate rather than to describe how each part of the building "plays many parts," and how, consequently, incalculable saving has been effected in time and money. It is hardly necessary to repeat, that the interior of the edifice is the most expansive covered space in the world. That some idea may be formed of the excess of its capacity, we may mention, that the largest covered area in England is believed to be that of the Ravenhead Glass Works, at St. Helen's, in Lancashire, where the space roofed-in is three hundred and thirty-nine feet, by one hundred and five feet, or not one quarter so large as that section of Hyde Park which Mr. Paxton has glazed over.

That a Palatial Exhibition building, providing a total exhibiting surface of twenty-two acres, and affording space for *nine miles* of tables, shall have been put up in four months, for less than a penny farthing a cubic foot, would in itself make 1851 famous in the history of enterprise, if nothing else were to happen to stamp it as pre-eminently "The Industrial Year." From it will at least be dated a new era in building. In a communication from Mr. Paxton himself, which we are permitted to quote, he says:—

"When I consider the cheapness of glass and cast-iron, and the great facility with which they can be used, I have no doubt but many structures, similar to that at Darley,* will be attached to dwelling-houses, where they may serve as sitting-rooms, conservatories, waiting-rooms, or omnibus-rooms, if I may be allowed the expression. I am now, in fact, engaged in making the design for a gentleman's house to be covered wholly with glass; and when we consider that wherever lead is now used, glass may with equal propriety be substituted, I have every hope that it will be used for buildings of various conditions and character. Structures of this kind are also susceptible of the highest kind of ornamentation in stained glass and general painting. I am not without hope, however, that glass will become almost universal in its use, and that the system will be extended for manufacturing purposes, as well as general cemeteries, and also for horticultural buildings, so that even market-gardeners will advantageously apply it, in the growing of foreign fruit for the London markets. I even go so far as to indulge in the sanguine hope that agriculture will be ultimately benefited by the application of cast-iron and glass. In short, there is no limit to the uses to which they may be applied; and we may congratulate ourselves, that in the nineteenth century the progress of science, and the spirit of manufacturers, have placed at our disposal the application of materials which were unknown to the ancients, and thereby enabled us to effect

* A conservatory on the new plan, situated in a house of Mr. Paxton's, in Derbyshire.

such situations as would have been deemed impossible, even in the early part of the present century."

THE MODERN SOLDIER'S PROGRESS.

PART I.—INITIATION.

MAURICE SAVAGE was one of a family of seven children, whose parents were poor cottagers in Wiltshire, and lived—as poor cottagers contrive to live—on the lowest wages for the hardest labour. The father's strength and the mother's health failed them utterly before their eldest girl was twelve years old, and they both died within a few months of each other, leaving their family on the parish. Seven fresh inmates in one day were a serious pull on the funds of a union so heavily burdened with paupers as Wallington; but Mr. Broadcast, the overseer, was a man fertile in expedients and prompt in the execution of his plans; and before a week had gone by since he first heard the formidable announcement of "We are seven!" he had contrived to draft four out of the number in such a way as to relieve the parish from much of the threatened expense, and so to dispose of the others as to make it fall lightly on the rates.

The three eldest, who were girls, gave their unpaid services to neighbouring farmers, by whom they were employed chiefly in household work. Maurice, the fourth, was initiated also into the mysteries of a farmer's life; but as his age did not admit even of turnip-pulling, he began literally at the beginning and officiated for the first year or two as a scare-crow. In this capacity, when he didn't go birds' nesting, or blackberrying, or fall asleep—occurrences which were not rare—he figured with a certain degree of respectability. To trace his agricultural career through the several phases of cattle-driving, swine-tending, potato-digging, hay-making, sheep-washing, mowing and reaping, till he attained the dignity of a ploughboy doing a ploughman's work, would be beside the purpose of this narrative. We find him at eighteen years of age in the capacity just mentioned.

What Maurice longed for was to do as his elder sisters had done—get up to London. They had all found "places," and why should not he likewise? He did not aim at being a butler all at once, or even at the situation of a valet. But what he wanted was "to better himself," and he conceived that London was the best place for him to make the attempt in. He rose with the sun one fine summer's morning, and disregarding the formality of leave-taking, employed his legs to such good purpose, that before the sun set he was well-nigh fifty miles from Wallington, on his way to the golden metropolis. He had no bed to go to, and his supper was somewhat of the scantiest; but he had not been so tenderly nurtured as to make him think the lee of a haystack a very un-

comfortable couch, or a place of bread—the gift of a woman nearly as poor as himself—worse than nothing. He slept without nightmare, and rose sufficiently refreshed to enable him to look at the sixteen or twenty miles that yet lay before him as less than half a day's journey.

That half day's journey was got over, with a little limping, it is true, but still accomplished—and Maurice found himself in London, quite at liberty to select any employment that presented itself for his choice. But an awkward ploughboy, barely eighteen years old, is not exactly the person to find employment the moment he asks for it, in a city where, according to the popular belief, "one half of those who go out in the morning have no certain knowledge that they shall get a meal before they return at night."

He accordingly passed the first four-and-twenty hours of his visit to the metropolis, without food, or the slightest means of procuring it, and might have repeated the programme, to the catastrophe—starvation; but just as he was thinking whether it would not be as well to return to Wiltshire, chance threw him in the way of a recruiting party, very gaily decorated with ribbons of every hue, and having that devil-may-care expression on their countenances, which proves so irresistible both to youth and maiden. To encounter a young fellow like Maurice, with famine in his eyes, and thirst, long unslaked, on his dry lips—strong tokens of the ardent recruit—was a godsend to Sergeant Pike who commanded the party, and who, at the moment, was very much put to it to make up a batch of recruits. He accordingly invited Maurice to "step in" and "take a pot," to which bread and cheese were speedily added, and then, in military phrase, the Sergeant at once beat a retreat.

This gallant individual did not, it is true, find Maurice altogether unprepared for the proposition which he made him, to accept the short cut to fortune which is so obviously within the reach of every private soldier in the British army; for where is the country lad to be found, who has not indulged in the splendid vision, whether impelled towards it by the love of glory, or the perfidious conduct of "Nancy?" But the notion was too indistinct for any practical application, till the certainty of its realisation was set forth in the glowing language of Sergeant Pike. A few pints of beer, a red-herring, or "soger," as he facetiously called it, an exordium on the light, easy, "ge'll'm'y" duties of the soldier, a glass or two of hot whiskey and water, a brief allusion to the Duke of Wellington's career,—"his luck, you know, may be yours or mine to-morrow,"—and then came the inevitable shilling which, from a mere haw-buck, converted Maurice Savage into a full private in Her Majesty's service.

Medical inspection and attestation over, our Wiltshire recruit was forthwith despatched, with some ten or a dozen other aspirants for

they, under proper charge to the head-quarters of the regiment quartered at Manchester. A few years before the enlistment of Maurice Savage, a tedious, toilsome and comfortless march would have formed the introduction to his military duties, with amongst other evils, a facility for desertion, in the event of the hot fit having passed away; but the railway obviated all these inconveniences, and instead of being twelve days on the road, the journey was now performed in half as many hours; and the recruits arrived at their destination perfectly fresh, and quite of opinion that a soldier's life must be a pleasant one, since at the very outset they were allowed to ride in carriages!

This idea was slightly modified the next day, when they were formed into a squad, and the process of "setting-up" began. The first glance at a batch of recruits from an agricultural district, is not particularly re-assuring; to knead and mould the clods into shape, appears almost a hopeless undertaking, at least to the uninitiated; but Corporal Rattler was an experienced hand, and had dealt so much in stubborn materials, that the word "difficulty" found no place in his vocabulary. The men were there to be drilled and made soldiers of, and it was not his fault if he did not turn them out perfect. Corporal Rattler was a fine, soldierlike fellow, standing six-feet-one in his stockings, straight as an arrow, and flexible as an eel; he had "the gift of the gab" to a surprising extent, was "smart" in all his movements, and knew his duty thoroughly. There was only one drawback to his many qualifications, but that was a fatal one; he was given to drink. But for this propensity, he might long before have attained the rank of Sergeant-Major of the regiment, with a very fair prospect of a commission; but the canteen within the barrack-yard, and the public-houses outside, neutralised all his advantages, and got him so frequently into disgrace that advancement was out of the question, and the rank of Corporal, which he was allowed to hold, was solely for the purpose of giving him authority with the recruits he was employed to train. The kindest remonstrances, as well as measures of no slight severity, had been resorted to by the adjutant and the commanding officer, and no man was more penitent for his faults than Corporal Rattler, nor more prodigal of promises for future good-behaviour. But, unfortunately, the "invisible spirit" of drink overcame all, and instead of what he might have been—a model to imitate—he became an example to shun. No permanent command, involving a separate responsibility, was, therefore, ever entrusted to him; but his services were too valuable as a drill to admit of his being displaced in that capacity; and a constant supervision being at hand, no harm was likely to accrue from giving him such employment.

Corporal Rattler was a master of slang, and

had a happy manner of applying his jokes, which were a perfect comedy to every body but the individuals, the immediate object of them; and whether he was busy with his recruits, or taking a hand at "Fives" when parade was over, there was sure to be a large audience of men off duty,—and now and then an officer, a little apart from the rest,—to enjoy the fun. Maurice Savage was a frequent theme for Corporal Rattler's wit; his name lent itself to all sorts of allusions—none of them complimentary—and his personal appearance gave them additional point. The outline of the Corporal's tuition might run thus:

"Now then, Mister Savage,—we're not in the woods to-day! There's broad day-light upon us;—let's see if we can't teach you a little civi-li-sation! Up with your head,—nobody's a-goin' to take your scalp; straighten them knees, you shall go to prayers by-and-by, when your limbs is supple enough! don't clench your fists as if you'd got tommyhawks in 'em, Mister Savage! Shut that mouth! we didn't come on parade to catch flies;—we're not cannyballs, Mister Savage, we're not! Now then, hide that there belly! bellies ain't of no use in the army, besides being contrary to the articles of war. I shall have to keep you here till tattoo, though I suppose you're tattooed already, Mister Savage, &c., &c." with more of the same kind to an indefinite extent, indifferent enough to read, but sufficiently amusing to hear, when it served as a running commentary on the awkwardness of the young soldier.

By dint, however, of much drilling, this awkwardness gradually wore off, though the ordeal was severe for a youth, who was naturally disposed to prefer idleness to work, and who had entered the army for the purpose of "taking it easy." At daybreak the "*Réveille*" was beat—probably by Addison's spectral drummer—for unless he who did it, handled the drumsticks in his sleep, it was difficult to imagine that the regularity of the warning was not supernatural. At this sound there was an immediate stir in the barrack-room, and woe betide any lazy recruit who laid down his head for another "forty winks" to dream of the paternal pigsty, which haply he might never see again; the water for the morning ablutions would have been applied in so liberal a manner as at once to convince the dreamer that "cold pig" was a reality. To dress as quickly, but at the same time as carefully as possible, was the first thought, but before the toilet was quite finished each man made his bed after the military fashion, rolling up his pailasse, folding the bed-clothes separately and laying them on the top, with a prescribed neatness, which soon became habit; and then the iron bedstead itself was pulled out from the wall and turned over, giving room for the men to move, and allowing the air to circulate freely. Until practice had made him perfect, Maurice Savage found it no easy matter to be quite ready to fall in,

when, a second time, the drum beat for the "Assembly." He then scurried out to the parade, and took his appointed place in the squad; a minute inspection followed, by that awful inquisitor-general, the Sergeant-Major (a functionary who, in a moment of relaxation, permits the "non-commissioned" to call him "Major" only); and if a single button of his fatigue jacket were undone, if the buttons themselves were not as bright as rotten-stone could make them, if his forage cap were not put on at precisely the proper angle, if the clasp of his stock were dull or unfused, and if, moreover, he were not perfectly clean from head to foot, adieu, for that day at least, to all chance of recreation, unless he happened to take delight in confinement to barracks, with a few hours extra drill. But whether the drill were extra or regular appeared much the same sort of thing to Maurice Savage, for except during the brief period allotted for meals, his impression was that he was always at it. A vision of Corporal Rattler, with his sharp tones, and short flexible cane, was ever present to his imagination; and, to say the truth, it did not require any violent exercise of the imagination to conjure him, at any moment, before the unhappy recruits in all the physical identity of six-feet-one.

At length the goose-step was abandoned, the pacing-stick laid aside, and the time-keeping bullet returned, with the string attached to it, to Corporal Rattler's pocket. Maurice Savage had achieved the difficult arts of standing upright, of balancing himself—like a crane—on one foot, of stepping out fairly with a pointed toe and raised instep, of facing to all the points of the compass, by whole, half and quarter movements, of turning round upon himself—like the late Lord Londonderry—of keeping step without kicking his front rank man; of doing all, in short, that a soldier is made to do before arms are put into his hands. When these feats were accomplished, he was introduced to "Brown Bess," and many a weary hour he passed in that lady's society, acquiring a knowledge of the various purposes, ornamental as well as useful, to which the musket can be applied. Occasionally, when there was a demand elsewhere for Corporal Rattler's services, or when perchance, that worthy was himself under a cloud for "inebriation" (as the pompous Sergeant-Major, who never used any but the finest words, always called it), a Scottish instructor, one Sergeant Mac File, would inculcate the mysteries of the "Manual and Platoon." This transfer was not very favourable to the pupil's rapid progress; for whereas the word of command or instruction from Corporal Rattler, was always brief, clear and intelligible, that which fell from the lips of Sergeant Mac File, was shrouded by a dialect which kept the listener perpetually on the tenter-hooks, to understand him. Thus, in order to "present arms," a movement, not without grace or effect, when well executed,

Maurice was required to have his "Bally een, cheest advanced, coke-head appassie left grine, and lat the waight of the bodle rast upon the tace," a passage of arms which, for want of comprehending the language it was described in, he was far from rendering either graceful or effective. So, also, when he was told to mind his "prymin' and loddin' pesection," the instructions which were to render that position valuable, might have attained that object much sooner if there had been a dragoon at his elbow to translate broad Scots into honest Wiltshire. Under the auspices of Sergeant Mac File, a military education was the pursuit of knowledge under very great difficulties—under those of Corporal Rattler, difficulties existed, but they arose from the nature of the subject,—his system was explicit enough, and was enforced by methods, which needed no foreign interpretation.

The day, at last, came when the Mac File clog was no longer a stumbling-block, and Maurice Savage was reported fit for duty. Six months had greatly changed him, not only in his outward appearance, but in the "moral" of that individual. It is true he had still a red head, but it was clipped very close, and, in a manner, absorbed by the blaze of his regimentals; the number of freckles had not diminished beneath the influence of out-door exercise; but, while the hue of health was on his cheek, their presence was of little consequence, as the fac-simile of his countenance was not wanted to adorn a hair-dresser's shop. On the other hand, his features had begun to express some of the intelligence which was working within him, and the unguiliness, which had been a reproach, was quite gone,—thanks to the rough practice of Corporal Rattler, who treated his recruits much in the same way that Abernethy did his patients.

Maurice Savage, as we have already intimated, had not reclined upon a bed of down during the above-mentioned six months, neither had his couch been rendered uneasy by too many rose-leaves; but, if he slept hard, fatigue made his sleep a sound one; and, if he took more exercise than he had bargained for in the outset, the result was an appetite of the most enviable description—for it was one that was always satisfied. And this allusion brings us to a question of some interest with regard to the mode of living of thousands of our unmilitary countrymen, who have an equal stimulus to hunger with the soldier: equal—nay, better means of gratifying it; but who—not acting in concert, having, in short, no "mess"—eat their food in an ill-prepared state, with little profit to their health, and very little enjoyment.

"A shilling a-day"—says the old song—

"Is very good pay;
It's double a taster—
The King's a good master," &c. &c.—

and out of the shilling a-day rather more than two-thirds are deducted for the soldier's daily

But this sum, which we will call eightpence—the odd halfpenny in the stoppages being placed to the account of “washing”—provides him with everything he strictly requires in the way of meat; and an extra penny for “beer-money” supplies him with “drink.” This “eightpence” gives him a pound of good bread, half of which he eats at breakfast with a canteen-full of tea or coffee, according to the nature of the mess, and the other half he disposes of with his “pound of flesh,” which is not eaten after Shylock’s receipt, but rather more *à la Soyer*, in the shape of well-boiled meat and good soup, and accompanied by potatoes, onions, and other vegetable condiments. If anything remains out of the eightpence, which, when prices are high, is a somewhat rare occurrence, an evening repast of tea or coffee is added, with such a portion of bread as may have been saved from the preceding meals. That this meal ought not, however, to be a rarity, but a regular thing, will be admitted by all who consider that, unless he provides himself, the soldier has nothing to eat from one o’clock in the day till eight the following morning,—a fast of nineteen hours.*

The soldier’s dinner is, however, a good one, and ought to be so; for, besides that the provisions are always good, military cooks serve their apprenticeship to that as well as to other duties; two men per Company being off duty, for that purpose, at intervals long enough to give them some knowledge of the art. There are various superintendents to have an eye upon the cooks’ proceedings; the old hands who have dabbled in the mystery; the quarter-master serjeant, who weighs out the materials for it; and the officer of the day, who inspects the kettles before they are removed from the kitchens, besides attending *à lawards*, when the messes are actually served out, and ascertaining that all is right, by personal observation and particular inquiry.

With regard to a body of workmen in a factory, or other large establishment, why, we ask, should not some such system be adopted as prevails in the army? A quarter-master might easily be found to purchase provisions at wholesale prices; cooking places could always be obtained, and persons honest and skilful enough procured to prepare meals of an excellent description; and those at an individual cost far less than the daily outlay

of each workman who provides his own dinner how and where he can.

The dream of an easy life in the army had been almost dissipated by six months’ drill, but not quite. The comparative freedom which the old soldier enjoyed, was looked upon with envy and yearning by Maurice Savage, before his name was included in the roster of effective men. But when the experience of a few weeks had made it clear to him what a soldier’s life, even in “piping time of peace,” really was, he came to the conclusion that, one way or another, he was as much worked in his military capacity as if he had stuck to his bucolical pursuits, though the work was of a different description. Like the ploughman or the common labourer, his work was cut out for him as soon as he opened his eyes in the morning. Instead of a team of horses he had a set of accoutrements to look after, belts to pipeclay, pouch to polish, knapsack to pack, and arms to keep in order—a harder task at first than yoking boxer and badger. Instead of turning over a nine-acre field at his own clod-hopping pace, he had to traverse the same extent of ground in ordinary, in quick, in double, in every variety of “time,” with fourteen pounds’ weight of musket and bayonet on his shoulders, and more than double that load on his back in the shape of a full knapsack, folded great coat and canteen; in that condition, in short, which is known as being “in heavy marching order.” Not always, of course, but often enough to convince him that “playing at soldiers” was as serious a pursuit as whistling at the plough, let the clay-soil be as stiff as you please. Then there came guard-mounting—with breakfast between, where the full private had the advantage of the ploughman, if not in quantity, at all events in quality and comfort—but the duty involved in mounting guard, though not so laborious as carting manure, was more particular as well as more fragrant. A day’s work in the fields is, after all, but a day’s work, while mounting guard is an occupation which not only includes the day but the night also. To say nothing of the loneliness or remoteness of the post, the fact of being on sentry for eight hours out of the twenty-four, and half that time in the dark, under the heaviest penalty if sleep should be indulged in, was not so agreeable in practice, as turning in to the loft or flock-bed and snoring till daylight. When it happened also, from the nature of the garrison, the number of sick in hospital and other causes, that the troops have only three or perhaps two nights in bed, the pleasure of guard-mounting is not very greatly enhanced in the estimation of a heavy sleeper.

However, without pursuing the contrast between military and agricultural pursuits any further, it may be enough to say that Maurice Savage found that the former gave him quite as much to do as the latter, and

* We are glad to perceive (while this article was being written) that advantage has been taken of the existing low prices of provisions, and that the condition of the soldier serving in the Colonies, with regard to the stoppage exacted for his ration, has, very recently, been under the consideration of the Government, and that it is intended to reduce the rate from five-pence, at which it stands at present, to three-pence-halfpenny. The necessity for this step has been made apparent in the evidence taken before the Committee on Army and Ordnance Expenditure; and the effect of lowering the cost of the ration of one pound of meat and one pound of bread to three-pence-halfpenny, will be to leave to the soldier abroad eightpence-halfpenny, out of which he will provide himself with other articles of food conducive to his health and comfort.

"And I promised. All my being
Freely, firmly answered, yea!
Thus absolved, her angel-spirit,
Breathing blessings, passed away.

"Once more in the noisy, jostling
Human crowd; I seemed to stand,
Like to him who goes to battle,
With his life within his hand.

"All things wore a different aspect;
I was now mine own no more:
Pleasure, wealth, the smile of woman
All a different meaning bore.

"Thus I toiled—though young, not youthful,
Ever mingling in the crowd,
Yet apart: my life, my labour,
To a solemn purpose vowed.

"Yet even duty had its pleasure,
And I proudly kept apart;
Lord of all my weaker feelings;
Monarch of my subject heart.

"Foolish boast! My pride of purpose
Proved itself a feeble thing,
When thy uncle brought me hither,
In the pleasant time of Spring.

"Said he, 'Thou hast toiled too closely;
Thou shalt breathe our country air;
Thou shalt come to us on Sundays,
And thy failing health repair.'

"Now began my hardest trial.
What had I with love to do!
Loving thee was sin 'gainst duty,
And 'gainst thy good uncle too!

"Until now my heart was cheerful;
Duty had been light till now.
—Oh that I were free to woo thee;
That my heart had known no vow!

"Yet, I would not shrink from duty;
Nor my vow leave unfulfilled!
—Still, still, had my mother known thee,
Would she thus have sternly willed!

"Wherefore did my angel-mother
Thus enforce her dying prayer?
—Yet what right had I to seek thee,
Thou, thy uncle's wealthy heir!

"Thus my spirit cried within me;
And that inward strife began,
That wild warfare of the feelings
Which lays waste the life of man.

"In such turmoil of the spirit,
Feeble is our human strength;
Life seems stripped of all its glory:
—Yet was duty lord at length.

"So at least I deemed. But meeting
Towards the pleasant end of May
With thy uncle, here he brought me,
I who long had kept away.

"He was wilful, thy good uncle;
I was such a stranger grown;
I must go to hear the reading
Of a ballad of his own.

"Willing to be won, I yielded.
Canst thou not that eve recall,
When the lilacs were in blossom
and the sunshine lay o'er all!

"On the bench beneath the lilacs,
Sate we; and thy uncle read
That sweet, simple, wondrous ballad,
Which my own heart's woe portrayed.

"'Twas a simple tale of nature—
Of a lowly youth who gave
All his heart to one above him,
Loved, and filled an early grave.

"But the fine tact of the poet
Laid the wounded spirit bare,
Breathed forth all the silent anguish
Of the breaking heart's despair.

"'Twas as if my soul had spoken,
And at once I seemed to know,
Through the poet's voice prophetic,
What the issue of my woe.

"Later, walking in the evening
Through the shrubbery, thou and I,
With the woodlarks singing round us,
And the full moon in the sky;

"Thou, my Ellen, didst reproach me,
For that I had coldly heard
That sweet ballad of thy uncle's,
Nor responded by a word.

"Said I, 'If that marvellous ballad
Did not seem my heart to touch;
It was not from want of feeling,
But because it felt too much.'

"And even as the rod of Moses
Called forth water from the rock;
So did now thy sweet reproaches
All my secret heart unlock.

"And my soul lay bare before thee;
And I told thee all; how strove,
As in fierce and dreary conflict,
My stern duty and my love.

"All I told thee—of my parents,
Of my angel-mother's fate;
Of the vow by which she bound me;
Of my present low estate.

"All I told thee, while the woodlarks
Filled with song the evening breeze,
And bright gushes of the moonlight
Fell upon us through the trees.

"And thou murmured'st, oh! my Ellen,
In a voice so sweet and low;
'Would that I had known thy mother,
Would that I might soothe thy woe!'

"Ellen, my sweet, life's companion!
From my being's inmost core
Then I blessed thee; but I bless thee,
Bless thee, even now, still more!

"For, as in the days chivalric
Ladies armed their knights for strife,
So didst thou, with thy true counsel,
Arm me for the fight of life.

"Saidst thou, 'No, thou must not waver;
Ever upright must thou stand:
Even in duty's hardest peril,
All thy weapons in thy hand.

"Doing still thy utmost, utmost;
Never resting till thou'rt free!
But, if e'er thy soul is weary,
Or discouraged—think of me!

"And again thy sweet voice murmured,
In a low and thrilling tone;
I have loved thee, truly loved thee,
Though that love was all unknown !

"And the sorrows and the trials
Which thy youth in bondage hold,
Make thee to my heart yet dearer
Than if thou hadst mines of gold !

"Go forth—pay thy debt to duty;
And when thou art nobly free,
He shall know, my good old uncle,
Of the love 'twixt thee and me !"

"Ellen, thou wast my good angel !
Once again in life I strove—
But the hardest task was easy,
In the light and strength of love.

"And, when months had passed on swiftly,
Canst thou not that hour recall—
'Twas a Christmas Sabbath evening—
When we told thy uncle all ?

"Good old uncle ! I can see him,
With those calm and loving eyes,
Smiling on us as he listened,
Silent, yet with no surprise.

"And when once again the lilacs
Blossom'd, in the merry May,
And the woodlarks sang together,
Came our happy marriage day.

"My sweet Ellen, then I blessed thee
As my young and wealthy wife,
But I knew not half the blessings
With which thou wouldst dower my life !"

Here he ceased, good Thomas Harlowe ;
And as soon as ceased his voice—
That sweet chorusing of woodlarks
Made the silent night rejoice.

OUR PHANTOM SHIP.

NEGRO-LAND.

In our Phantom Ship we shall occasionally take a cruise, in order to see what is going on in various parts of the globe. To-day, we intend looking in for a little while upon the land of the Negro, chiefly with the view of seeing how he is first converted into an article of merchandise for the supply of the American markets, North and South. Meanwhile, we think it but fair to the voyagers and travellers who have preceded us, to give some account of their exertions, discoveries, and disasters, made and encountered to check the Slave Trade.

For a long while after the establishment of the Slave Trade, nothing was known of the countries whence Negroes came. In 1482 it was that the Portuguese admiral brought ten Africans to Europe, for the purpose of converting them to Christianity, and found them excellent as slaves. In the next year some native boats were captured, and their crews brought home in slavery. The notion seized upon the public mind, and an association was got up at once for systematized traffic in Africans. In 1444, two

hundred slaves were captured, and brought home.

The discovery of the New World set our wise and good ancestors a-digging after gold. That is to say, it made them urge the native Indians to dig on their behalf. We, degenerate men of the year 1851, have weaker nerves than were in vogue in the good old times, three or four hundred years ago ; and we are silly enough to shudder at the barbarous blood-guiltiness of our rapacious forefathers. The Indians were found to be a difficult material, and were, moreover, being tortured rather fast into that great new world which each of us is destined some day to discover. So, in the year 1511, Ferdinand the Catholic gave his most Christian sanction to the importation of Africans as slaves into Hispaniola, that is to say, Hayti, which produced, in after day, Toussaint l'Ouverture.

The Portuguese had all the profit of the slave trade until the English put in their claim to a part of it. The first batch of negroes sold from English vessels was a cargo of three hundred, obtained by Sir J. Hawkins, from the coast of Guinea, and sold in Hispaniola.

Well ; flesh and blood being a profitable commodity, the trade in it very naturally grew. It became an important part of the world's commerce. So it occurred that curiosity became at length awakened on the subject of those unexplored regions which produced these black machines. In 1784, there was formed in England "The African Association," for the solace of geographers. Under the auspices of this association, two gentlemen, Mr. Ledyard and Mr. Lucas, went out as volunteers. Ledyard was to cross from Senaar, westward ; Lucas, starting from Tripoli, was to find his way through Fezzan to the Gambia and Guinea. Ledyard died at Cairo, Lucas was unable to reach Fezzan. The Association next sent Major Houghton, who was to reach the Niger by the Gambia. In the kingdom of Bambook, this traveller, too rich in merchandise, was plundered by his guides, and left to perish.

Mungo Park was the next volunteer. Ascending the Gambia, and reaching Sego, the capital of Bambarra, he there, on the 21st of July, 1796, was the first European who saw the Niger. It was there called—for its name varies in each country through which it flows—the Joliba.

Other travellers followed, but without success. A student of Göttingen probably penetrated far, but perished in the enterprise.

Mungo Park then went out again, in 1805, under the auspices of Government, with three officers, and forty-two men. Ascending the Gambia, he arrived at a point up the Niger, having seen all his companions die except Lieutenant Martyn and three men. These made a rude boat out of three rotten canoes, calling it H. M. schooner "Joliba." In this they embarked, to complete their enterprise, by tracing the stream down until it reached

the sea. They never reached the sea. The fate of Park was like the fate of Franklin—a long mystery. After five years, a man, Isaaco, who had been Park's guide through one part of his travels, and had brought the last news from him to the Gambia, was sent to obtain tidings, if he could. Isaaco found the native who had served as pilot to the Joliba, and learned from him that the Europeans had been checked at Bussah, by the rapids, and had been shot at while among the rocks, by order of the king, with bows and arrows. This account was confirmed by the admission of the king, to Clapperton and Lander. His Majesty deplored the accident, declaring that he had mistaken the party for Felatahs—an extremely lame excuse, as the incursions of the Felatahs are not made in boats. Quite a new version of the death of Park, however, is derived from a recent traveller, Mr. Duncan, who, on his road to the Kong mountains, under a friendly escort from the King of Dahomey, broke from his friends, to dart aside into a chase after a good Mussulman, and worthy merchant, who was said to have been present at the death of Park. This person, Terasso-wea, a man of note in his own country, was present as a young mallam (priest) at the tumult, and beheld the death of Park, which he describes in so circumstantial a manner, as to leave no doubt that he relates a real scene. It may have been the calamity of other white men. "Park," says Terasso-wea, "was killed at Yauri, higher up than Bussah, which he never reached. His pilot, a native of Yauri, was set ashore there, with his wages paid; but he complained before the king that he had been defrauded. Park was stopped and questioned, but refused to answer. The King of Yauri was a tyrant; and recently the populace was in Park's favour. There was a mob about the boat. Park and his party endeavoured to escape. The boat was held. A hand that held it was cut off. There followed an affray; and so Park perished."

The Niger was now partly traced. In 1811, Captain Tuckey was sent up the Congo River, with a hope it might prove to be the Niger, and another expedition followed on the trace of Park, to descend the Niger, and perhaps meet Capt. Tuckey. Both expeditions failed of their design, and many lives were lost.

Other attempts at exploration followed, failures all.

Clapperton, Oudney, and Denham, in 1822, crossed the Sahara from Tripoli, discovering the Kingdom of Bornou and Lake Chad. Clapperton, through Soudan, came to Socatoo, a capital of the Felatah country, and there heard that he was near the Niger.

In 1826, Clapperton, with Captain Pearce and two other gentlemen, left Badagry for Socatoo. All died upon the way, excepting Clapperton and his servant, Richard Lander. These arrived at Bussah, where they confirmed the account of the death of Park, crossed the

Niger, and reached Socatoo. There Clapperton died, possibly poisoned. Lander returned alone, bringing his master's papers.

Major Laing, at the same time, reached Timbuctoo, across the Desert, the first European who had done so. He was murdered by the Arabs in returning, and his papers have not been recovered. M. Caillié, a Frenchman, also reached Timbuctoo, and we possess his narrative.

Richard Lander next offered to trace the River Niger down from Bussah. Furnished with means by Government, he started, with his brother John, from Badagry, reached Bussah, and embarked there with four negroes in an open canoe, protected by umbrellas from the sun. They passed the spot at which the Chadda pours into the Niger a broad stream; at Kiri market they were made prisoners by Ibu traders, and taken before King Obi, from whom they were ransomed by King Boy, of Brasstown, near the outlet of the Niger. This fortunate captivity procured for them a safe conveyance down the last part of the river, and prevented them from floating out in their canoe, helpless, into the broad Atlantic, through the selection of an unfrequented outlet. Thus, as Park was the first who saw the Niger, so Lander was the first who traced it to the sea.

Tidings of ivory brought home by the two Landers induced merchants of Liverpool to fit out a trading expedition. One brig, to wait at the mouth of the river, and two steamers to ascend and return with cargo (the Quorra and Alburkah), went out, in 1832, under the superintendence of Messrs. M'Gregor Laird and Richard Lander. Arriving late, they ascended the river in the season when its flood was falling, and when they reached the confluence of the Chadda, one vessel grounded, and remained fast till the next year's rising of the water. Of forty-seven officers and men, all perished but eight. Mr. Laird, half dead and wholly disappointed, went home in the brig. Lander persevered: Lieutenant, now Captain Allen, who had been sent by the Admiralty with this expedition, for the purpose of making surveys, mapped the Niger up to Rabba, and explored eighty miles upon the Chadda also. Lander fitted out the Alburkah at Fernando Po, to make a fresh ascent, and sent it up the Niger, under Mr. Oldfield, the surviving surgeon, presently following himself, in a canoe, with an additional supply of goods. These he exposed on a sand bank in the Delta. He was attacked by the natives, fled down the river, and reached Fernando Po with a wound from a musket-ball in the upper portion of his thigh, of which, in a few days, he died. Mr. Oldfield abandoned the river, and the two steamers rot upon the beach at Fernando Po.

Mr. Becroft, an African trading captain, afterwards ascended the river to the distance of fifty miles beyond Rabba.

In 1841, Government sent out the Niger

Expedition, which stands next upon the mournful list—but we must stop now to account for this by a brief sketch of the growth of popular opinion.

Even in the middle of the last century, the iniquity of the principle had aroused Christians here and there, of every sect, from the Quaker to the Catholic, to preach or speak against the trade in men. As for the soil of England, Chief Justice Holt decided that a negro coming into England becomes free.

The abolition of the Slave Trade had been agitated, and it was in the same year, 1788, from which we date the commencement of African discovery by the formation of the African Society, that the first bill was passed putting a check upon the slave traffic. Sir William Dolben's Bill, passed on the 10th of July, in that year, enforced attention to the health and comfort of the slaves on shipboard.

In 1792, the King of Denmark took the lead, by formally prohibiting all Danes from the purchase, sale, or transport of any slaves whatever.

Exportation of slaves was prohibited by the United States in 1794.

Importation of slaves into British Colonies was prohibited in 1806, after a long ferment of debate. In 1807, an Act was passed, declaring the British trade in slaves, with Africa, to be unlawful traffic, and imposing a penalty of one hundred pounds for every slave sold or removed from Africa by any British subject.

Importation of slaves was prohibited by the United States in the same year.

Between 1816 and 1833, decrees tending to abolish slavery were passed in Mexico, and in republics of Central and South America—Guatemala, Columbia, Peru, Chili, &c.

In 1833 the great Act passed, emancipating all the negro slaves in British Colonies and decreeing payment of twenty millions in compensation to the slave-owners. The emancipated slaves remained under a five years' apprenticeship, and became entirely their own masters on the 1st of August, 1838. In 1843 many millions of slaves received liberty in British India. In 1845 Sweden emancipated all the slaves she had. France still more recently, in 1848, and Denmark, have added three hundred thousand to the sum of liberated slaves. But we are to go back to the Act of 1833.

England, since that date, has considered herself pledged to active and unwearied labour for the abolition of all trade in human beings among civilised communities. We do not sneer at her philanthropy, nor call her championship Quixotic. It is a fit work for a great country to set about—that is a truth raised above discussion. But reason may be shown for doubting whether we are quite right in some portion of our tactics. Since 1833 England has sought to enter into treaties, and has succeeded in obtaining treaties with the whole of Europe, with a great part of

America, and also with native chiefs of Africa, by which all pledge themselves to aid in the extinction of the Slave Trade. She has done no harm, at any rate, by that; at least, the moral force of a vast vote of censure is brought to bear against the wickedness.

So now we come back to the Niger Expedition of the year 1841, a treaty-making enterprise. This consisted of two large steamers, the "Wilberforce" and "Albert," and a small one, the "Soudan," with the "Amelia" tender. The steamers were cumbered with a bulky and useless ventilating apparatus, (Dr. D. B. Reid *fecit*.) and with a variety of edifying agricultural machines and implements for a proposed Model Farm of the African Civilisation Society. Mr. Carr went out, from the society, as superintendent of this farm. After many delays the expedition, on the 15th of August, entered the Nun branch of the Niger. The river was ascended to the confluence of the Chudda, whence the "Soudan" and the "Wilberforce," under Captain W. Allen, with nearly all sick, returned, on the 19th of September, to the coast. The "Albert," with Captain Trotter and Commander Bird Allen, pushed on as far as Egga, before turning back. A dismal spectacle, a very plague-ship, it was met and towed by Captain Beecroft in the "Ethiopia," and as it reached the bar of the Nun encountered the "Soudan" on the point of entering in search of its disabled companion. The "Amelia" had been left opposite the Model Farm, from which the superintendent, Mr. Carr, had come down to the sea in search of health. Mr. Carr rashly returned, with goods, in native canoes, and was never again heard of—doubtless murdered in the Delta. Lieutenant Webb re-ascended the Niger, to remove the Model Farm, if necessary, and found it in a state of miserable disorganisation, in consequence of gross misconduct of the settlers. It was removed, and so the expedition ended. Several treaties had been made with native chiefs, and fifty-three lives lost.

Captain Beecroft has since ascended again as far as Rabba.

In addition to these explorations of the Niger, adventurous trips have been made across the country; among others, into the dominions of the King of Dahomey, more than once. Profiting, therefore, by the active labours of our countrymen, we can sit by the fireside and travel in their track. Brave and high-minded men, zealous to substitute a civilising commerce for a shameful traffic, sleep in a hundred graves upon the field whereon they battled for humanity. Youth, genius and zeal, age and experience, the practised traveller, the gifted young physician on the threshold of a life all promise,—Park, Clapperton, Lander, Bird Allen, and others, alas! more than we may name,—lie buried there among the palms. Surely they have not died in vain.

It is but a sail of six weeks to the Bight of Benin, to that part of the coast of Africa

which is the hotbed of the slave-market. The Niger, a great river, navigable for hundreds of miles, with branching and tributary navigable streams, forms an easy highway into Africa. That Europe should use this highway as a means of carrying the spirit of healthy commerce, and all its attendant blessings, into an injured sister continent, became, after the Niger was discovered, the first natural and obvious idea. Trial was made at once by the Liverpool merchants, with a horrible result. Alluding to the first muster of his men on board the Quorra, Mr. Laird says, "the crew were all picked men, from twenty-five to thirty-five years of age; and little did I think, as I beheld their athletic and powerful frames, that in a few months the only survivors of us would be myself and three others." The expedition of 1841 alarmed all minds with the same fearful warning. Who will go out to travel on that stream of death?

Fortunately safe, in our Phantom Ship, we now step over instantly to Sierra Leone, and call at Freetown for some Kroomen. There are two tribes there, Kroomen and Fishmen, not very fond of one another. The Kroomen cut wood and serve as relief to the white crews on European vessels. They are a fine native race, well formed and muscular, with more than the average of African intelligence. They have great faith in Europeans, according to their own expression, "White man go to de debil, Krooboy follow." When the expedition of 1841 paused to leave the Niger, and the Kroo woodcutters could not keep pace, in their toil, with the impatience of the sufferers, knee-deep in water they cheerfully worked over-hours, and kindly bore the natural expressions of impatience. Afterwards, at Fernando Po, instead of dispersing themselves idly ashore, their first thought was to go and kneel down by the beds of the sick officers, and speak with a gentleness of sympathy that, as the listeners remarked, was in peculiar contrast with their large athletic forms. "Krooboy love white man too much"—and white man honours Krooboy. Lauder seems to be the only traveller who did not thoroughly appreciate this worthy race.

The Kroomen, being properly acclimatised, are taken by most vessels on coast service, to save the whites, and are required for Niger navigation which, to them, is by no means deadly. If ever the Niger be made—as it must and will eventually—a great highway for European commerce, we must be indebted to the Kroomen for it. So we take Kroomen on our Phantom Ship and steer directly for Cape Nun.

Surely the clouds are off to a committee meeting, they send all eastward and take up their stations in a semicircle. Take notice and prepare. There is a foam track flying to us on the water. Cannons, whirlwinds, thunder and spindrift, that's a tornado. Wait a bit says a sailor, "it's only old Nature

sneezing." It's over now with a heavy rain and the air wonderfully freshened.

Here is Cape Nun; a bar of sand to be crossed only at high water, stretches across the Nun branch of the Niger. Our countrymen of 1841 called it "the Gate of the Cemetery." The Niger spreads out over the last one hundred and sixty miles of its course into many branches, which discharge the waters of that river by twenty-two mouths—the Benue, Nun, Bonny, and others—into the sea. These branches inter-communicate, and all the country over which they flow is called the Delta. The Nun branch is the only one explored, and a creek so narrow that a vessel is sometimes unable to turn round in it, is, in one part, the only passage known to be safe. It is called Louis Creek.

The dwellers beside the river are in this part of its course a miserable race; sickly in appearance, vexed with skin diseases, and especially with craw-craw, a Brobdignagian kind of itch, afflicting all the body. Near enough to the coast to be demoralised by intercourse with Europeans, the natives of the Delta seem to be inhospitable as their swamps. As we pass through the mangroves there rises into the cool morning air a thick oppressive vapour, it looks like the smoke of wood fires; it is oppressive even to the smell. That is the Niger poison. Pass on and exult in health; escaping from the mangroves and the meanders of the Delta, float over the magnificent spectacle of a great river in the tropics; think yourself sound; but you have swallowed poison—most probably, too, in a fatal dose. It gives you sixteen days for respite; but on the sixteenth day the poison works. You think that you have got into a sickly portion of the river, that is not the case; but in passing through the Delta, you accepted a heavy bill of mortality, and it has now come due. In plain words, there is an interval of sixteen days between the reception of the poison, and its fatal outbreak. In the case of the Liverpool expedition, after the sixteen days were complete, the sweep of fever and death were terrible. Men fell one after the other as though suddenly brought up under an unseen battery. In 1841, there was the same reprieve—the same fortnight of false confidence followed by a check little less severe. In the main river itself there is nothing peculiarly deadly.

Before leaving the Delta we will pay a visit to King Boy of Brass-town. Among the potentates of the river King Boy has most to do with Europeans. Living near the sea, he trades with the interior for palm oil, but chiefly for slaves, has his own barracoons, and retails his wares at about three hundred per cent. probably on what he paid for them. Of him the Europeans buy. King Boy rules, or ruled—he may now be dead—at Brass-town, down a branch or creek of his own, though by-the-by there is another chief, King Jacket, on the other side. King Boy is

or was a most unmitigated rascal. We follow him in company with Mr. Oldfield, to his capital, on board a boat heavily laden. His Majesty with a cunning, coarse face, and red eyes, is attired in a Scotchman's dress, a present from England, the deficiency in which he has supplied with a huge pair of Turkish trowsers, fastened outside, the skirt of his kilt being tucked into them. He shouts to his subjects as he enters Brass-town, through a long speaking trumpet, his own praise. His mother, an old wretched looking negress, sits on the bank. They give her six glasses of rum, which make her to caper. We land. Here's a capital! Mud, dirt, rats, and huts—the river floods it. His Majesty takes us to the abode of a favorite wife, who has prepared dinner—goat's-flesh boiled with the hair on. Here is the sleeping apartment of his palace, ankle-deep in mud, with a raised part moderately sloppy, on which we may spread a mat—there is no other furniture. We are awakened by alarming uproar; there must be men breaking through the roof. We shout aloud for help, and all is quiet. We are still: our hearts beat—there they are at work again. Rats jovial in the roof. The thatch is full of them; the floor is riddled with rat-holes. We will not stay long with King Boy of Brass-town.

The number of kings in Western Africa is very large; the power of each accords with his physical strength and his possessions. On each side of the Cameroons is a king, and the two kings differ in one being painted red, the other white. One of these is a fine old man who has, after a fashion common with Coast Africans, fitted up for his honour and glory, a house of two stories, with chairs, tables, and European odds and ends; that is the manifesto of his wealth; without it he was a boy—having it, he is a *man*, a "big man" enough to be a king. He has procured of some ship's carpenter a painted signboard, with his name KING AQUA, painted on it in large Roman letters. This he has fixed over his house-door; unluckily, however, upside down; and the *tout ensemble* can contemplate with dignified humility from the door of the small hut down by the river-side, in which he lives. His palace is a fiction of the best bright poker class. There is also among these monarchs a due consideration of the necessity of preserving what we in Europe call the balance of power. A red coat given to "that rascal over the way," excites indignation in a slighted prince. Lieutenant Allen meeting a chief who thus believed himself insulted, was regarded wrathfully. "Plenty bad bob for you"—(bob in the Cameroons, means a palaver or scolding)—"plenty too much bad bob;" this was bold menace.

Leaving the coast and King Boy, our Phantom Ship has passed the Delta, and after one hundred and sixty miles of passage from Cape Nun, is at length really in the Niger. Very soon we shall reach Eboc.

What glorious magnificence of wood and water! The splendid African oak, the cotton tree, with its huge stem, the fibres of which are totally unfit for the Manchester market, and the light feathery plumes of the palm trees nodding over them against the deep blue sky! Here and there a gay hippopotamus is flirting with her friend, or dropping with a loud splash from the banks into the current. Higher up you may see these good-humoured beasts in parties of a dozen. Alligators, too! The natives cut up alligators, and consider them good meat. They have a quaint way of catching them. One negro darts a spear into his tail, pinning him to the ground, and holds him in that manner, twisting and leaping up and down the pivot he has made to keep it steady, and to hold the alligator safe. While his companion is thus wriggling and grimacing in a dance over the victim's tail, another with a long knife capers about his head, and darts in to inflict a wound as often as he can do so without risk. So at length the alligator being slain, is dragged up high and dry, cut into portions, and sold—as we might say—in pennyworths.

The huts in this lower part of the river are all square, higher up they are round, and then from that point throughout the interior—so far as we know—the huts of the natives are in all cases round. Fishing-nets suspended over the stream are part of the furniture of every village.

Now we are at Eboc, the first native town of any note since we have left the Delta. Here lives King Obi. King Obi is a tautological expression. Obi means king in that part of the world, and is the title of the chief. Just in the same way the next large town as we ascend the river Iddah—is governed by an Attah (Father) who was called King Attah by the early travellers.

King Obi does a great deal of business in palm oil and slaves, King Boy kisses the ground before him, as a shrewd country traveller will bow before a customer with whom he does a thriving business. Obi sells to Boy, and others like him; these traffic with the merchants on the coast. King Obi was one of those who signed a treaty for suppression of the slave-trade, on the faith of other commerce being substituted for it. We may state here our conviction, once for all, that as far up as Rabbah, or the country inhabited by the Felatahs, the native chiefs are not only ready, but anxious for commerce with the Europeans. Supposing the grand obstacle of the Delta vanquished, and granting that the first traders must inevitably lose money from loss of time, through unpreparedness, and inexperience, on the part of the natives—if we may boldly imagine these difficulties overcome, there is nothing whatever in the disposition or habits of the people to impede a friendly intercourse profitable to us and to themselves. Slavery is not in their eyes iniquitous; it is so to few

rude nations, it was not so even to the cultivated Greeks, and even in Europe the growth of mind has only lately brought us to an understanding—and still it is but a faint impression—of the dignity and value of a human being. It is a great truth, even now, but faintly dawning on the most enlightened nations of the earth. Our gutters show that England is a long way from the proper comprehension of it. We must not, therefore, quarrel with the Africans for treading in the path that our forefathers trod. The spirit of trade is among them. There is less evidence of trading spirit in the multitude of boats floating with cargoes on the Rhine, than on the Niger. That was remarked by an intellectual man who had sailed up both rivers. There are more slaves than oil-barrels, because there is more demand for slaves, and it has been throughout the policy of slave-traders to extinguish and suppress all other traffic.

A striking example of this fact occurs in the case of the Shea butter-tree. Shea butter is obtained from a plant, not unlike the laurel, which grows luxuriantly in many parts of the interior. It occurs in so great abundance, that large quantities can be obtained, and were obtained by the natives, when the slave-traders on the coast became alarmed lest the chief should discover that this butter might be made an article of commerce, and nothing must distract their attention from the slave-hunting business. They, therefore, laboured with success, and obtained an edict from the King of Dahomey, for the destruction of Shea butter-trees in his dominions. War is waged against them—they are burned down as fast as they spring up, and still they spring up again year after year—an eternal, active protest against man, who wilfully destroys a gift of his Creator, lest the light of its blessing should be shed upon the dark path he has resolutely chosen.

We cannot afford time to stop at Eboe. In passing we may note one or two superstitions. The Eboe woman who gives birth to twins is regarded as an especial object of Fetiche wrath, and becomes for the rest of her life an outcast. To hold up two fingers, or to call her Abo-wadakri (mother of twins) is the greatest affront that can be offered to an Eboe woman. Another prejudice, equally curious, is that which causes them to sacrifice all children who cut their first tooth in the upper jaw. This they believe to be premonitory of a savage disposition. Our Phantom Ship floats on to Iddah, the next capital, between which place and the sea, Eboe is not much more than half way.

We examine the town and its well thronged markets, see abundant evidence of a spirit of trade, and incipient civilisation. Country cloth is more expensive than the cloth of Manchester, on account of the rude and slow process of native manufacture; but cloth is woven, and moreover, very beautifully dyed. The dyes, however, are not fined. Hides are

tanned into leather for various uses—there are steel implements, bits for the horses, and well tempered weapons. They smelt ore in a furnace, dice-box shaped, and aided by bellows of peculiar construction, not unlike the method of an air pump, only that of course they are to pump air in, instead of out. The iron afterwards heated on charcoal is worked into material of exceedingly good quality, and rude inscriptions on the weapons are sometimes attempted. The money of the country is preferred as a medium of exchange to any species of barter, the money of course being here, as in all Negroland, cowries. Two thousand cowries are about worth a shilling. They are kept on strings in rows of more or less than a hundred, the number on a string being proportioned in each district to the value of the cowry, so that the value of a string is in all parts pretty much the same. The cowry itself increases gradually in its worth as we pass inland. As small change to represent fractional payments of amounts less than a cowry, earth-nuts are used. Leaving the market and the market-keeper—a deformed man in most places—who preserves order therein with a huge whip, we pay a visit to the Attah.

That, however, is an affair by no means simple. The potentate of Africa has forms and ceremonies, no less than the potentate of Europe. We will skip the preliminary forms, and get into his waiting-room, or hut, or court. Here we learn what it is to dance attendance on the great. The officers, in 1841, after long patience, received a message from his highness, that "he wished God to bless them, but it rained to-day, and, as rain never falls on the King, he could not receive them." Word was sent back that Englishmen could not be trifled with. Accordingly, with noise and drumming, and the twenty-washer-woman-power of chatter which characterises negro populations, presently his Majesty revealed himself on the withdrawal of a curtain. Too magnificent to speak, he has an officer, his "Mouth," to say aloud what the Attah whispers in his ear, and while the Attah whispers, all the people make a noise, to prevent any but the "mouth" from hearing him. The "mouth" told our countrymen that the Attah had come after the message, believing that they were able to stop the rain, but he was surprised to find it rained as much as ever. However, he drank water with them, the African ceremonial of friendship, and ate goora nut with them, the African civility—their substitute for our old formal cake and wine. He grumbled at the presents, through his "mouth," and magnified his own greatness, of which they were unworthy. When he coughed, ate, or drank, or when he laughed, his face was veiled with the fans carried by attendants: nobody must see the Attah yielding to the wants and impulses of ordinary men. On the whole, this Attah behaved very well, and is a well-beloved chief, unlike his

predecessor. An officer returned for some forgotten papers, after the audience was over, and found his Majesty, naked of all splendour, surrounded by his ministers of state, capering and chattering over his presents with child-like simplicity. The former Attah was a hateful tyrant, and the despotism of their chiefs, restrained only by the fear of poison from the headmen, is sometimes, whether in Africa or Russia, power terribly misused. A child picked up a snip of velvet, about two inches long, from a boat, when the Liverpool expedition was off Iddah. The little fellow made a bag of it, and put some seeds in for a charm, which he hung in the usual way about his loins. Presently, he was brought before the predecessor of the present Attah, reviled for wearing "king's cloth," and at a sign, his head was rolling on the floor.

Africans, according to their rank, abound in wives and domestic slaves. A king over much territory will have five hundred wives. The women are only considered lovely in proportion to their fat; some of them might be first cousins to their neighbour hippopotamus. The slaves are not worse treated than the wives. Domestic slavery in Africa itself is not a very bitter servitude. The African who has not been a slave is almost always a good-humoured master.

We quit Iddah, and continue our course up the stream. The country now assumes a new aspect, being mountainous. The Kong mountains touch the Niger here, and now we come to the next notable point upon the stream, the confluence of the broad water of the Chadda. The Chadda has been explored only for about a hundred miles; it is supposed to flow through Lake Chad, in the interior, the lake being, perhaps, an expanse of the river. Nearly opposite the confluence is the spot where the model farm was landed, and the gay tent which had figured in the Eglintoun tournament was put up for the accommodation of the colony.

We will take the opportunity of running up the Shary to Fundah, where Mr. Laird lay for a fortnight, almost dead. The King of Fundah was in his day a provoking rascal. After an audience with his Majesty, a portly personage, Mr. Laird was invaded in his hut by an old woman, the king's mother, and a cunning, wiry-looking little man. These worried for presents. The woman was soon satisfied, not so the man, who was at length kicked out in a summary manner. This little man turned out to be his Majesty himself, who wore "bombast" on state occasions. Horse-races afterwards took place at Fundah. African horses are all small; and as the riders on this occasion were stuffed into the appearance of so many Falstaffs, the effect was of course very ridiculous. The Africans admire rotundity, perhaps, because their climate favours it. Travellers note their own

tendency to become fat in the Niger: Lander became, in the phrase of his last companions, "as broad as he was long." The quantity of palm-oil mixed with food may assist in bringing about this result.

Talking of fat reminds us again of the negro women. They are as busy as the men, and shrewder traders. But there is no exception to the note of testimony in their favour. When Mr. Laird was at Fundah, ill-used by the king, reduced by disease to an irritable skeleton, covered with craw-craw, it could have been nothing but the pure impulse of a woman's heart that made the females risk beatings to bring him food and consolation. The stout black ladies with their anklets, their armlets, their henna-stained nails, and their wash to counteract the odour of black skin, are true women. Near the coast it is usual to drown one wife as a sacrifice upon the husband's death; but up the river this custom probably is not observed. There is a substitute, in the custom of giving "sassy water" (poison), with many ceremonies, to any wife suspected of having been a scold and a torment to the deceased. If she be innocent—that is to say if she be rich enough to bribe the priests—the dose of poison is not fatal to her. There is then a ju-ju or religious ceremony, in which, with a wild dance, and sundry odd proceedings, she comes pure out of the trial.

Our Phantom Ship continues its course up the stream. Here is a village burning; trembling natives huddled on a sand-bank in the middle of the stream, shrieks from the village, and the galloping of horsemen. Those horsemen are Felatahs, a fierce race, who are a scourge to the mild natives in their neighbourhood. They make a business of slave-catching. When they approach a village, as they come on horseback, and do not use canoes, all who can paddle off to any bank or island, or across the stream, are safe from capture. Those who remain are victims, and the village is destroyed. These Felatahs were extending their ravages lower and lower down the stream, until they menaced the poor Attah of Iddah himself, at the date of our last accounts. But, at the same time, the natives higher up were organising a conspiracy to make reprisal. Mr. Hecroft, on a recent visit up the Niger, found Rabbah, the Felatah capital, laid waste; so we may suppose the plot to have, so far, succeeded. But Rabbah is subject to Soccatoo, and from Soccatoo vengeance probably would come, and the Felatahs be more fierce than ever.

We will go up to Rabbah, the Felatah city, the highest point to which the Niger has been mapped. It is by far the largest town we have yet seen upon the river, covering much space, with extensive suburbs. Men may be seen galloping along the quay on fine Arabian horses. A dead horse, or a dead man may be found rotting on the highway, where we land. The Felatahs, who are all Musulmen,

* Our ancestors at one period wore clothes stuffed largely with wool, &c., which was called bombast.

have a striking appearance in their mysterious turbans, from which folds pass over the face, so that the keen eyes only are visible, as with the Tuaricks. They are first-rate riders; and, galloping about on their Arabians, saluting each other with animated gestures, carrying bows and poisoned arrows, they show themselves to be much more than a match for the simple-minded, impulsive negroes. There are here, also, busy markets, and more stinks than Coleridge ever counted in Cologne; all the offal of the beast-market lies in the town rotting under a tropical sun. The turkey buzzards there enjoy a paradise, and get between your legs.

It is well known, they say at Rabbah, that the whites eat black men. This fiction was invented by the slavers, and has travelled up the stream. The poor negroes have unbounded belief in the white man's power. It is easy for him, therefore, to excite in Africans a display of cowardice. The negroes are found often to tell lies, and are caught stealing—the same is true, we fear, of white communities. While delayed opposite one village, Mr. Oldfield, lying in his cabin, saw a woolly head pop through the cabin-window, and a long arm reached towards a dressing-case. He caught the culprit by the ears, and called down others to assist in holding him, while two men stepped into the canoe outside, and found him placed conveniently for a whipping. The next day the king of the village thanked the Europeans for the correction bestowed upon his son, (for the crown prince was the delinquent), a sad scapegrace. When the "Albarkah" ran aground she was unloaded and her wares exposed upon the bank, but slightly guarded, yet nothing was lost. There are rascals in all nations. The impulsive nature of the Africans makes many of them ask for everything they feel a wish to have; but, if it be not given them, they do not sulk. They think, no doubt, with the Sandwich Islander, who was asked whether refusals did not disappoint him, "Oh, no," he said, "I thought if I asked for a thing, you possibly might give it me, but it was quite certain you wouldn't if I didn't speak." We must quit the Niger now, remarking only that it is not yet proved whether the Niger can be entered safely or no when its stream is at the flood—safely, we mean, by fairly acclimatised Europeans. The Kroomen run but small risk in the Delta.

Time does not remain to us for the visit we intended paying to Dahomey. We may just allude to the lagoons within the coast by which slave cargoes are conveyed in canoes from point to point. Striking inland we may enter the dominions of the King of Dahomey, one of the most powerful of native chiefs, and reach his capital, Abomey. He is a man of more than average ability, with a sincere respect for the English. He is a great slave-hunter, carrying on his operations by means of a large army of women. These women

make their attack with a swift run, and are trained to climb barefooted and unhurt, over the thick fences of enormous thorns which are the usual fortifications of a town in Africa. Those who resist are killed and scalped; but those who yield without resistance, are tied with a cord, which each Amazon carries for the purpose, and marked with chalk upon the back, that the captor may afterwards identify her property. After the siege, each woman is praised and rewarded according to her deeds. The king's wives form the principal and bravest band.

To justify each slave-hunt, quarrels are invented, but revolting as this most unquestionably is, we must allow fair credit to the present king. He follows the customs of his forefathers with so much enlightenment that he has abolished many barbarous laws, and introduced many just and equitable practices. He means well, he respects the English, and is to all appearance willing to abolish slave-hunting and slave-trading in his dominions. But, as our Chancellors of the Exchequer say of our window-tax, without it what is to become of the finance! The King of Dahomey will throw up his part in the slaver's game, if we will show him how to thrive by other commerce.

Merchant ships are the true African blockade. Experience is proving on the coast of Africa, what has been proved every year since the Creation, that physical force is but a weak antagonist to moral wrong. We doubt whether moral force is brought to bear on a large scale, by the direct action of missionaries on the uncivilised mind. One Simon Jonas, left with Obi to improve his soul, was made court tailor, Obi beginning with the body first. History proves that commerce is the great means ordained by Providence for the improvement and advancement of the human race. For this the Africans are ripe. They do not see the moral wrong of slavery—no uncivilised nation ever yet did. But they are quite ready to believe white men, who say that it is wrong, and show them what is better; they are eager for instruction from the white man's wisdom. Unfortunately we have as yet been able to do little but exhort the natives on this text. The difficulties in the way of action certainly are great. It is our firm conviction that they can and will be overcome.

THE LAW.

As a happy illustration of the certainty, cheapness, and expedition of the English law, in upholding those who are in the right, we have received the following strange narrative from an esteemed correspondent, who is himself a lawyer:—

"The most litigious fellow I ever knew, was a Welshman, named Bonea. He had got possession, by some means, of a bit of waste ground behind a public-house in Hoxwash.

Street. Adjoining this land was a yard, belonging to the parish of St. Jeremiah, which the Parish Trustees were fencing in with a wall. Bones alleged that one corner of their wall was advanced about ten inches on his ground, and as they declined to remove it back, he kicked down the brickwork before the mortar was dry. The Trustees having satisfied themselves that they were not only within their own boundary, but that they had left Bones some feet of the parish land to boot, built up the wall again. Bones kicked it down again.

"The Trustees put it up a third time, under the protection of a policeman. The inexorable Bones, in spite of the awful presence of this functionary, not only kicked down the wall again, but kicked the bricklayers into the bargain. This was too much, and Bones was marched off to Guildhall for assaulting the bricklayers. The magistrate rather pool-pooched the complaint, but bound over Bones to keep the peace. The *causa belli*, the wall, was re-edified a fourth time; but when the Trustees revisited the place next morning, it was again in ruins! While they were in consultation upon this last insult, they were politely waited on by an attorney's clerk, who served them all with 'writs' in an action of trespass, at the suit of Bones, for encroaching on his land.

"Thus war was declared about a piece of dirty land literally not so big as a door-step, and the whole fee-simple of which would not sell for a shilling. The Trustees, however, thought they ought not to give up the rights of the parish to the obstinacy of a perverse fellow, like Bones, and resolved to indict Bones for assaulting the workmen. Accordingly, the action and the indictment went on together.

"The action was tried first, and as the evidence clearly showed the Trustees had built within their own boundary, they got the verdict. Bones moved for a new trial; that failed. The Trustees now thought they would let the matter rest, as it had cost the parish about one hundred and fifty pounds, and they supposed Bones had had enough of it. But they had mistaken their man. He brought a writ of error in the action, which carried the cause into the Exchequer Court, and tied it up nearly two years, and in the mean time he forced them *volens nolens* to try the indictment. When the trial came on, the Judge said, that as the whole question had been decided in the action, there was no occasion for any further proceedings, and therefore the Defendant had better be acquitted, and so make an end of it.

"Accordingly, Bones was acquitted; and the very next thing Bones did, was to sue the Trustees in a new action, for maliciously instituting the indictment against him without reasonable cause! The new action went on to trial; and it being proved that one of the Trustees had been overheard to say that they

would punish him, this was taken as evidence of malice, and Bones got a verdict for forty shillings damages besides all the costs. Elated with this victory, Bones pushed on his old action in the Exchequer Chamber to a hearing, but the Court affirmed the judgment against him, without hearing the Trustees' counsel.

"The Trustees were now sick of the very name of Bones, which had become a sort of bugbear, so that if a Trustee met a friend in the street, he would be greeted with an inquiry after the health of his friend Mr. Bones. They would have gladly let the whole matter drop into oblivion, but Jupiter and Bones had determined otherwise; for the indomitable Briton brought a Writ of Error in the House of Lords, on the judgment of the Exchequer Chamber. The unhappy Trustees had caught a Tartar, and follow him into the Lords they must. Accordingly, after another year or two's delay, the case came on in the Lords. Their Lordships pronounced it the most trumpery Writ of Error they had ever seen, and again affirmed the judgment, with costs, against Bones. The Trustees now taxed their costs, and found that they had spent not less than five hundred pounds in defending their claim to a bit of ground that was not of the value of an old shoe. But, then, Bones was condemned to pay the costs. True; so they issued execution against Bones; caught him, after some trouble, and locked him up in gaol. The next week, Bones petitioned the Insolvent Court, got of prison; and, on examination of schedule, his effects appeared to be £0 0s. 0d! Bones had, in fact, been fighting the Trustees on credit for the last three years; for his own attorney was put down as a creditor to a large amount, which was the only satisfaction the Trustees obtained from perusing his schedule.

They were now obliged to have recourse to the Parish funds to pay their own law expenses, and were consoling themselves with the reflection that these did not come out of *their own pockets*,—when they received the usual notification that a bill in Chancery had been filed against them, at Mr. Bones's suit, to overhaul their accounts with the parish, and prevent the misapplication of the Parish money to the payment of their law costs! This was the climax. And being myself a disciple of Coke, I have heard nothing further of it; being unwilling, as well perhaps as unqualified, to follow the case into the labyrinthic vaults of the Court of Chancery. The catastrophe, if this were a tale, could hardly be mended—so the true story may end here."

NUMBER 44 of "HOUSEHOLD WORDS," for the 25th of January, 1861, Price 3d., will contain the First Portion of

A CHILD'S HISTORY OF ENGLAND,

Which will be continued, at regular intervals, until the History is completed.

SATURDAY, JANUARY 25, 1851.

[PRICE 2d.]

A CHILD'S HISTORY OF ENGLAND.

CHAPTER I.

If you look at a Map of the World, you will see, in the left-hand upper corner of the Eastern Hemisphere, two Islands lying in the sea. They are England and Scotland, and Ireland. England and Scotland, form the greater part of these Islands. Ireland is the next in size. The little neighbouring islands, which are so small upon the Map as to be mere dots, are chiefly little bits of Scotland—broken off, I dare say, in the course of a great length of time, by the power of the restless water.

In the old days, a long, long while ago, before Our Saviour was born on earth and when he lay asleep in a manger, these Islands were in the same place, and the stormy sea roared round them, just as it roars now. But, the sea was not alive, then, with great ships and brave sailors, sailing to and from all parts of the world. It was very lonely. The Islands lay solitary, in the great expanse of water. The foaming waves dashed against their cliffs, and the bleak winds blew over their forests; but, the winds and waves brought no adventurers to land upon the Islands; and the savage Islanders knew nothing of the rest of the world, and the rest of the world knew nothing of them.

It is supposed that the Phœnicians, who were an ancient people, famous for carrying on trade, came in ships to these Islands, and found that they produced tin and lead; both very useful things, as you know, and both produced to this very hour upon the sea-coast. The most celebrated tin mines in Cornwall are, still, close to the sea. One of them, which I have seen, is so close to it that it is hollowed out underneath the ocean; and the miners say that, in stormy weather, when they are at work down in that deep place, they can hear the noise of the waves, thundering above their heads. So, the Phœnicians, coasting about the Islands, would come, without much difficulty, to where the tin and lead were.

The Phœnicians traded with the Islanders for these metals, and gave the Islanders some other useful things in exchange. The Islanders were, at first, poor savages, going almost

naked, or only dressed in the rough skins of beasts, and staining their bodies, as other savages do, with coloured earths and the juices of plants. But, the Phœnicians, sailing over to the opposite coasts of France and Belgium, and saying to the people there, "We have been to those white cliffs across the water, which you can see in fine weather; and from that country we bring this tin and lead," tempted some of the French and Belgians to come over also. These people settled themselves on the south coast of England, which is now called Kent; and, although they were a rough people too, they taught the savage Britons some useful arts, and improved that part of the Islands. It is probable that other people came over from Spain to Ireland, and settled there.

Thus, by little and little, strangers became mixed with the Islanders, and the savage Britons grew into a wild bold people—almost savage, still, especially in the interior of the country, away from the sea, where the foreign settlers seldom went; but hardy, brave, and strong.

The whole country was covered with forests, and swamps. The greater part of it was very misty and cold. There were no roads, no bridges, no streets, no houses that you would think deserving of the name. A town was nothing but a collection of straw-covered huts, hidden in a thick wood, with a ditch all round, and a low wall, made of mud, or the trunks of trees placed one upon another. The people planted little or no corn, but lived upon the flesh of their flocks and cattle. They made no coins, but used metal rings for money. They were clever in basket-work, as savage people often are; and they could make a coarse kind of cloth, and some very bad earthenware. But, in building fortresses they were much more clever.

They made boats of basket-work, covered with the skins of animals, but seldom, if ever, ventured far from the shore. They made swords, of copper mixed with tin; but, these swords were of an awkward shape, and so soft that a heavy blow would bend one. They made light shields, short pointed daggers, and spears—which they jerked back, after they had thrown them at an enemy, by a long strip of leather fastened to the stem. The butt-end was a rattle, to frighten an enemy.

horse. The ancient Britons, being divided into as many as thirty or forty tribes, each commanded by its own little King, were constantly fighting with one another, as savage people usually do; and they always fought with these weapons.

They were very fond of horses. The standard of Kent was the picture of a white horse. They could break them in and manage them wonderfully well. Indeed, the horses (of which they had an abundance, though they were rather small) were so well taught in those days that they can scarcely be said to have improved since—though the men are so much wiser. They understood, and obeyed, every word of command; and would stand still by themselves, in all the din and noise of battle, while their masters went to fight on foot. The Britons could not have succeeded in their most remarkable art, without the aid of these sensible and trusty animals. The art I mean, is the construction and management of war-chariots or cars, for which they have ever been celebrated in history. Each of the best sort of these chariots, not quite breast high in front, and open at the back, contained one man to drive, and two or three others to fight: all standing up. The horses who drew them were so well trained, that they would tear, at full gallop, over the most stony ways, and even through the woods, dashing down their masters' enemies beneath their hoofs, and cutting them to pieces with the blades of swords, or scythes, which were fastened to the wheels, and stretched out beyond the car on each side, for that cruel purpose. In a moment, while at full speed, the horses would stop, at the driver's command. The men within would leap out, deal blows about them with their swords like hail, leap on the horses, on the pole, spring back into the chariots anyhow; and, as soon as they were safe, the horses tore away again.

The Britons had a strange and terrible religion, called the Religion of the Druids. It seems to have been brought over, in very early times indeed, from the opposite country of France, anciently called Gaul, and to have mixed up the worship of the Serpent, and of the Sun and Moon, with the worship of some of the Heathen gods and Goddesses. Most of its ceremonies were kept secret by the priests, the Druids, who pretended to be enchanters, and who carried magicians' wands, and wore, each of them, about his neck, what he told the ignorant people was a Serpent's egg in a gold case. But, it is certain that the Druidical ceremonies included the sacrifice of human victims, the torture of some suspected criminals, and, on particular occasions, even the burning alive, in immense wicker cages, of a number of men and animals together. The Druid Priests had some kind of veneration for the Oak, and for the mistletoe—the same plant that we hang up in houses at Christmas Time now—when its white berries grew upon the Oak. They met together in dark woods

which they called Sacred Groves; and there they instructed in their mysterious arts, young men who came to them as pupils, and who sometimes stayed with them as long as twenty years.

These Druids built great Temples and altars, open to the sky, of which some are yet remaining. Stonehenge, on Salisbury Plain in Wiltshire, is the most extraordinary of these. Three curious stones called Kits Coty House, on Bluebell Hill near Maidstone in Kent, form another. We know, from examination of the great blocks of which such buildings are made, that they could not have been raised without the aid of some ingenious machines, which are common now, but which the ancient Britons certainly did not use in making their own uncomfortable houses. I should not wonder if the Druids, and their pupils who stayed twenty years, knowing more than the rest of the Britons, kept the people out of sight while they made these buildings, and then pretended that they made them by magic. Perhaps, they had a hand in the fortresses too; at all events, as they were very powerful, and very much believed in, and as they made and executed the laws, and paid no taxes, I don't wonder that they liked their trade. And, as they persuaded the people that the more Druids there were, the better off the people would be, I don't wonder that there were a good many of them. But, it is pleasant to think that there are no Druids now, who go on in that way, and pretend to carry Enchanters' Wands and Serpents' Eggs—and of course there is nothing of the kind, any where.

Such was the improved condition of the ancient Britons, fifty-five years before the birth of Our Saviour, when the Romans, under their great General, Julius Cæsar, were masters of all the rest of the known world. Julius Cæsar had then just conquered Gaul; and hearing, in Gaul, a good deal about the opposite island with the white cliffs, and about the bravery of the Britons who inhabited it, some of whom had been fetched over to help the Gauls in the war against him, he resolved, as he was so near, to come and conquer Britain next.

So, Julius Cæsar came sailing over to this island of ours, with eighty vessels and twelve thousand men. And he came from the French coast between Calais and Boulogne, "because thence was the shortest passage into Britain;" just for the same reason as our steamboats now take the same track, every day. He expected to conquer Britain easily; but, it was not such easy work as he supposed—for the bold Britons fought most bravely; and, what with not having his horse-soldiers with him (for they had been driven back by a storm), and what with having some of his vessels dashed to pieces by a high tide after they were drawn ashore, he ran great risks of being totally defeated. However, for once that the bold Britons beat him,

he beat them twice; though not so decisively, but that he was very glad to accept their proposals of peace, and go away.

But, in the spring of the next year, he came back; this time with eight hundred vessels and thirty thousand men. The British tribes chose as their general-in-chief, a Briton, whom the Romans in their Latin language called *CASSIVELLAUNUS*, but whose British name is supposed to have been *Casswallon*. A brave general he was, and well he and his soldiers fought the Roman army! So well, that whenever in that war the Roman soldiers saw a great cloud of dust, and heard the rattle of the rapid British chariots, they trembled in their hearts. Besides a number of smaller battles, there was a battle fought near Canterbury, in Kent; there was a battle fought near Chertsey in Surrey; there was a battle fought near a marshy little town in a wood, the capital of that part of Britain which belonged to *CASSIVELLAUNUS*, and which was probably near what is now Saint Albans in Hertfordshire. However, brave *CASSIVELLAUNUS* had the worst of it, on the whole, though he and his men always fought like lions. As the other British chiefs were jealous of him, and were constantly quarrelling with him, and with one another, he gave up and proposed peace. Julius Cæsar was very glad to grant peace easily, and to go away again with all his remaining ships and men. He had expected to find pearls in Britain, and he may have found a few, for anything I know! but, at all events, he found delicious oysters, and I am sure he found tough Britons, of whom, I dare say he made the same complaint as Napoleon Buonaparte the great French General did, eighteen hundred years afterwards, when he said they were such unreasonable fellows that they never knew when they were beaten. They never *did* know, I believe, and never will.

Nearly a hundred years passed on, and, all that time, there was peace in Britain. The Britons improved their towns and mode of life, became more civilised, travelled, and learnt a great deal from the Gauls and Romans. At last, the Roman Emperor, Claudius, sent *AULUS PLAUTIUS*, a skilful general, with a mighty force, to subdue the island, and shortly afterwards arrived himself. They did little; and *OSTORIUS SCAPULA*, another general, came. Some of the British Chiefs of Tribes submitted. Others, resolved to fight to the death. Of these brave men, the bravest was *CARACTACUS*, or *CARADOC*, who gave battle to the Romans, with his army, among the mountains of North Wales. "This day," said he to his soldiers, "decides the fate of Britain! Your liberty, or your eternal slavery, dates from this hour. Remember your brave ancestors, who drove the great Cæsar himself across the sea!" On hearing these words, his men, with a great shout, rushed upon the Romans. But, the

strong Roman swords and armour were too much for the weaker British weapons in close conflict. The Britons lost the day. The wife and daughter of the brave *CARACTACUS* were taken prisoners; his brothers delivered themselves up; he himself was betrayed into the hands of the Romans by his false and base stepmother; and they carried him, and all his family, in triumph to Rome.

But, a great man will be great in misfortune, great in prison, great in chains. His noble air, and dignified endurance of distress, so touched the Roman people, who thronged the streets to see him, that he and his family were restored to freedom. No one knows whether his great heart broke, and he died in Rome, or whether he ever returned to his own dear country. English oaks have grown up from acorns, and withered away, when they were hundreds of years old; and other oaks have sprung up in their places, and died too, very aged; since the rest of the history of the brave *CARACTACUS* was forgotten.

Still, the Britons *would not* yield. They rose again and again, and died by thousands, sword in hand. They rose, on every possible occasion. *SUETONIUS*, another Roman general, came, and stormed the Island of Anglesey (then called *MONA*), which was supposed to be sacred, and burnt the Druids in their own wicker cages, by their own fires. But, even while he was in Britain, with his victorious troops, the Britons rose. Because *BOADICEA*, a British queen, the widow of the King of the Norfolk and Suffolk people, resisted the plundering of her property by the Romans who were settled in England, she was scourged, by order of *CATUS* a Roman officer; and her two daughters were shamefully insulted in her presence, and her husband's relations were made slaves. To avenge this injury, the Britons rose, with all their might and rage. They drove *CATUS* into Gaul; they laid the Roman possessions waste; they forced the Romans out of London, then a poor little town, but already a trading place; they hanged, burnt, crucified, and slew by the sword, seventy thousand Romans in a few days. *SUETONIUS* strengthened his army, and advanced to give them battle. They strengthened their army, and desperately attacked his, on the field where it was strongly posted. Before the first charge of the Britons was made, *BOADICEA*, in a war-chariot, with her fair hair streaming in the wind, and her injured daughters lying at her feet, drove among the troops, and cried to them for vengeance on their oppressors, the licentious Romans. The Britons fought to the last; but, they were vanquished with great slaughter, and the unhappy queen took poison.

Still, the spirit of the Britons was not broken. When *SUETONIUS* left the country, they fell upon his troops, and retook the Island of Anglesey. The Emperor *AGRICOLA* came, fifteen or twenty years afterwards, and

retook it once more, and devoted seven years to subduing the country, especially that part of it which is now called SCOTLAND; but, its people, the Caledonians, resisted him at every inch of ground. They fought the bloodiest battles with him; they killed their very wives and children, to prevent his making prisoners of them; they fell, fighting, in such great numbers that certain hills in Scotland are yet supposed to be vast heaps of stones piled up above their graves. The Emperor HADRIAN came, thirty years afterwards, and still they resisted him. The Emperor SEVERUS came, nearly a hundred years afterwards, and they worried his great army like dogs, and rejoiced to see them die, by thousands, in the bogs and swamps. CARACALLA, the son and successor of SEVERUS, did the most to conquer them, for a time; but not by force of arms. He knew how little that would do. He yielded up a quantity of land to the Caledonians, and gave the Britons the same privileges as the Romans possessed. There was peace, after this, for seventy years.

Then, new enemies arose—THE SAXONS, a fierce, seafaring people from the countries to the North of the Rhine, the great river of Germany, on the banks of which the best grapes grow to make the German wine. They began to come, in pirate ships, to the sea coasts of Gaul and Britain, and to plunder them. They were repulsed by CARAUSIUS, a native either of Belgium or of Britain, who was appointed by the Romans to the command, and under whom the Britons first began to fight upon the sea. But, after his time, they renewed their ravages. A few years more, and the Scots (which was then the name for the people of Ireland) and the Picts, a northern people, began to make frequent plundering incursions into the South of Britain. All these attacks were repeated, at intervals, during two hundred years, and through a long succession of Roman Emperors and chiefs; during all which length of time, the Britons rose against the Romans, over and over again. At last, in the days of the Roman Emperor, HONORIUS, when the Roman power all over the world was fast declining, and when Rome wanted all her soldiers at home, the Romans abandoned all hope of conquering Britain, and went away. And still, at last, as at first, the Britons rose against them, in their old brave manner; for, a very little while before, they had turned away the Roman magistrates, and declared themselves an independent people.

Five hundred years had passed, since Julius Caesar's first invasion of the Island, when the Romans departed from it for ever. In the course of that time, although they had been the cause of terrible fighting and bloodshed, they had done much to improve the condition of the Britons. They had made great military roads; they had built forts; they had taught them how to dress and arm themselves much better than they had ever known how to do before; they had refined the whole British

way of living. AGRICOLA had built a great wall of earth, more than seventy miles long, extending from Newcastle to beyond Carlisle, for the purpose of keeping out the Picts and Scots; HADRIAN had strengthened it; SEVERUS, finding it much in want of repair, had built it afresh of stone. Above all, it was in the Roman time, and by means of Roman ships, that the Christian Religion was first brought into Britain, and its people first taught the great lesson that, to be good in the sight of God, they must love their neighbours as themselves, and do unto others as they would be done by. The Druids declared it was very wicked to believe any such thing, and cursed all the people who did believe it, very heartily. But, when the people found that they were none the better for the blessings of the Druids, and none the worse for the curses of the Druids, but, that the sun shone and the rain fell without consulting the Druids at all, they just began to think that the Druids were mere men, and that it signified very little whether they cursed or blessed. After which, the pupils of the Druids fell off greatly in numbers, and the Druids took to other trades.

Thus, I have come to the end of the Roman time in England. It is but little that is known of those five hundred years; but, some remains of them are still found. Often, when laborers are digging up the ground, to make foundations for houses, or churches, they light on rusty money that once belonged to the Romans. Fragments of plates from which they ate, of goblets from which they drank, and of pavement on which they trod, are discovered among the earth that is broken by the plough, or the dust that is crumbled by the gardener's spade. Wells that the Romans sunk, still yield water; roads that the Romans made, form part of our highways. In some old battle-fields, British spear-heads and Roman armour have been found, mingled together in decay, as they fell in the thick pressure of the fight. Traces of Roman camps overgrown with grass, and of mounds that are the burial-places of heaps of Britons, are to be seen in almost all parts of the country. Across the bleak moors of Northumberland, the wall of SEVERUS, over-run with moss and weeds, still stretches, a strong ruin; and the shepherds and their dogs lie sleeping on it in the summer weather. On Salisbury Plain, Stonehenge yet stands, a monument of the earlier time when the Roman name was unknown in Britain, and when the Druids, with their best magic wands, could not have written it, in the sands of the wild sea-shore.

ASPIRE!

ASPIRE! whatever fate befall,
Be it praise or blame—
Aspire! even when deprived of all—
It is thy nature's aim.
The seed beneath the frozen earth,
When winter checks the fresh green birth,

Still yearningly aspires,
With ripening desires,
• And, in its season, it will shoot
Up into the perfect fruit;
But had it not lain low,
It ne'er had learn'd to grow.

Aspire ! for in thyself alone
That power belongs of right ;
Within thyself that seed is sown,
Which strives to reach the light ;
All pride of rank, all pomp of place,
All pinnacles that point in space,
But show thee, to the spheres,
No greater than thy peers ;
But if thy spirit doth aspire,
Thou risest ever higher—higher—
Towards that consummate end,
When Heavenward we tend.

PHYSIOLOGY OF INTEMPERANCE.

"ONE glass more," exclaimed mine host of the Garter. "A bumper at parting! No true knight ever went away without 'the stirrup cup.'"

"Good," cried a merry-faced guest; "but the Age of Chivalry is gone, and that of water-drinkers and teetotalers has succeeded. Temperance societies have been imported from America, and grog nearly thrown overboard by the British Navy."

"Very properly so," observed a Clergyman who sat at the table. "The accidents which occur from drunkenness on board ship may be so disastrous on the high seas, and the punishment necessary to suppress this vice is so revolting, that the most experienced naval officers have recommended the allowance of grog, served both to officers and men in our Navy, to be reduced one-half. In America, as well as in our own Merchant Service, vessels sail out of harbour on the Temperance principle; not a particle of spirits is allowed on board; and the men, throughout the voyage, are reported to continue healthy and able-bodied. Tea is an excellent substitute; many of our old seamen prefer it to grog."

"That may be," exclaimed the merry-faced guest. "Horses have been brought to eat oysters; and on the Coromandel coast, Bishop Heber says, they get fat when fed on fish. Sheep have been trained up, during a voyage, to eat animal food, and refused, when put ashore, to crop the dewy greensward. When honest Jack renounces his grog, and, after reefing topsails in a gale of wind, goes below deck to swill down a domestic dish of tea, after the fashion of Dr. Samuel Johnson, at Mrs. Thrale's, I greatly fear the character of our British seamen will degenerate. In the glorious days of Lord Nelson, the observation almost passed into a proverb, that the man who loved his grog always made the best sailor. Besides, in rough and stormy weather, when men have perhaps been splicing the mainbrace, and exposed to midnight cold and damp, the stimulus of grog is surely

necessary to support, if not restore, the vital energy!"

"Not in the least," rejoined the Clergyman. "Severe labour, even at sea, is better sustained without alcoholic liquors; and the depressing effects of exposure to cold and wet weather best counteracted by a hot mess of cocoa or coffee served with biscuit or the usual allowance of meat. In fact, I have lately read, with considerable satisfaction, a prize essay by an accomplished physician, in which he proves that alcohol acts as a poison on the nervous system, and that we can dispense entirely with the use of stimulants."

"Not exactly so," observed a Physician, who was of the party. "Life itself exists only by stimulation; the air we breathe, the food we eat, the desires and emotions which excite the mind to activity, are all so many forms of physical and mental stimuli. If the atmosphere were deprived of its oxygen, the blood would cease to acquire those stimulating properties which excite the action of the heart, and sustain the circulation; and if the daily food of man were deprived of certain necessary stimulating adjuncts, the digestive organs would no longer recruit the strength, and the wear and tear of the body. Nay, strange as it may appear, that common article in domestic cookery, salt, is a natural and universal stimulant to the digestive organs of all warm-blooded animals. This is strikingly exemplified by the fact, that animals, in their wild state, will traverse, instinctively, immense tracts of country in pursuit of it; for example, to the salt-pans of Africa and America; and it is a curious circumstance, that one of the ill effects produced by withholding this stimulant from the human body is the generation of worms. The ancient laws of Holland condemned men, as a severe punishment, to be fed on bread unmixed with salt; and the effect was horrible; for these wretched criminals are reported to have been devoured by worms, engendered in their own stomach. Now, I look upon alcohol to be, under certain circumstances, as healthful and proper a stimulant to the digestive organs as salt, when taken in moderation, whether in the form of malt liquor, wine, or spirits and water. When taken to excess, it may act upon the nervous system as a poison; but the most harmless solids or fluids may, by being taken to excess, be rendered poisonous. Indeed, it has been truly observed, that 'Medicines differ from poisons, only in their doses.' Alcoholic stimulants, artificially and excessively imbibed, are, doubtless, deleterious."

"The subject," observed the Host, filling his glass, and passing the bottle, "is a curious one. The port before us, at all events, is not poison; and I confess, that so ignorant am I of these matters, that I would like to know something about this alcohol which is so much spoken of."

"The explanation is not difficult," answered

the Doctor. "Alcohol is simply derived by fermentation, or distillation, from substances or fluids containing sugar; in other words, the matter of sugar, when subjected to a certain temperature, undergoes a change, and the elements of which the sugar was previously composed enter into a new combination, which constitutes the fluid named Alcohol, or Spirits of Wine. Raymond Lully, the alchemist (thirteenth century), is said to have given it the name of Alcohol; but the art of obtaining it was, in that age of darkness and superstition, kept a profound mystery. When it became more known, physicians prescribed it only as a medicine, and imagined that it had the important property of prolonging life, upon which account they designated it 'Aqua Vitæ,' or the 'Water of Life,' and the French, to this day, call their Cognac 'Eau de Vie.'"

"It is a remarkable circumstance," observed the Clergyman, filling his glass, "that there is hardly any nation, however rude and destitute of invention, that has not succeeded in discovering some composition of an intoxicating nature; and it would appear, that nearly all the herbs, and roots, and fruits on the face of the earth have been, in some way or other, sacrificed on the shrine of Bacchus. All the different grains destined for the support of man; corn of every description; esculent roots, potatoes, carrots, turnips; grass itself, as in Kamtschatka; apples, pears, cherries, and even the delicious juice of the peach, have been pressed into this service; nay, so inexhaustible appear to be the resources of art, that a vinous spirit has been obtained, by distillation, from milk itself."

"Milk!" cried the merry-faced guest, "Can alcohol be obtained from mother's milk?"

"Very probably," continued the Clergyman, "The Tartars and Calmucks obtain a vinous spirit from the distillation of mares' and cows' milk; and, as far as I can recollect, the process consists in allowing the milk first to remain in untanned skins, sewed together, until it sours and thickens. This they agitate until a thick cream appears on the surface, which they give to their guests, and then, from the skimmed milk that remains, they draw off the spirit."

"Exactly so," observed the Doctor, "but it is worthy of notice, that a Russian chemist discovered that if this milk were deprived of its butter and cheese, the whey, although it contains the whole of the sugar of milk, will not undergo vinous fermentation."

"These facts," observed the Host, "are interesting, but they are more curious than useful. The alcohol, I presume, from whatever source it be derived, is chemically the same thing; how, then, does it happen that some wines, containing precisely the same quantity of alcohol, intoxicate more speedily than others?"

"The reason," explained the Doctor, "is

simply this. We must regard all wines, even the very wine we are drinking, not as a simple mixture, but as a compound holding the matter of sugar, mucilaginous, and extractive principles contained in the grape juice, in intimate combination with the alcohol. Accordingly, the more quickly the real spirit is set free from this combination, the more rapidly are intoxicating effects produced; and this is the reason why wines containing the same quantity of alcohol have different intoxicating powers. Thus, champagne intoxicates very quickly. Now this wine contains comparatively only a small quantity of alcohol; but this escapes from the froth, or bubbles of carbonic acid gas, as it reaches the surface, carrying along with it all the aroma which is so agreeable to the taste. The liquor in the glass then becomes vapid. This has been clearly proved. The froth of champagne has been collected under a glass bell, and condensed by surrounding the vessel with ice; the alcohol has then been found condensed within the glass. The object, therefore, of icing champagne—or rather, the effect produced by this operation—is to repress its tendency to effervesce, whereby a smaller quantity of alcohol is taken with each glass. Wines containing the same quantity of alcohol accordingly differ in their effects; nay, it is not to the alcohol only they contain that certain noxious effects are to be attributed, for, as Dr. Paris clearly shows, when they contain an excess of certain acids, a suppressed fermentation takes place in the stomach itself, which will cause flatulency and a great variety of unpleasant symptoms. In fact, a fluid load remains in the stomach, to undergo a slow and painful form of digestion."

"But, in whatever shape you introduce it," remarked the Host, "whether disguised as wine, or in the form of brandy, whiskey, or gin-and-water, it matters not—I wish to have a clear idea of the immediate effects of alcohol upon the living system."

"Well!" said the Doctor, "it can very easily be described. When you swallow a glass—let us say of brandy-and-water—the stimulating liquid, upon entering into the stomach, excites the blood vessels and nerves of its internal lining coat, which causes an increased flow of blood and nervous energy to this part. The consequence is, that the internal membrane of the stomach becomes highly reddened and injected, just as if inflammation had already been produced by the presence of the stimulant. Thus far you probably follow me;—but this is not all—the vessels thus excited have an absorbing power; they suck up (as it were) and carry directly into the stream of the circulation a portion (at all events) of the alcohol which thus irritates them. The result is, that alcohol is thus mixed with the blood and brought into immediate contact with the minute structure of all the different organs of the body."

"But how," asked the merry-faced guest, "can this be known? Who ever saw into the stomach of a living man?"

"Strange as it may appear to you, that has been done, and all the circumstances connected with the digestion of solids and fluids in the stomach have been very accurately observed. It happened, in the year 1822, that a young Canadian, named Alexis St. Martin, was accidentally wounded by the discharge of a musket, which carried away a portion of his ribs, perforating and exposing the interior of the stomach. After the poor fellow had undergone much suffering, all the injured parts became sound, excepting the perforation into the stomach, which remained some two and a half inches in circumference; and upon this unfortunate individual his physician, Dr. Beaumont, when he was sufficiently well, made a series of very careful observations, which have determined a great variety of important points connected with the physiology of digestion. Fluids introduced into the stomach rapidly disappeared, being taken up by these vessels and carried into the system. We cannot, therefore, be surprised to hear that so subtle and penetrating a fluid as alcohol should very speedily find its way into all the tissues of the body. Its presence may be smelt in the breath of persons addicted to spirituous liquors, as well as in their secretions generally."

"But to what do you attribute the noxious effects of alcohol, allowing it to be thus carried by direct absorption into the circulation?" asked the Host.

"To the excess of carbon," answered the Doctor, "which is thus introduced into the system; and explains why the liver, in hard drinkers, is generally found diseased."

"How so?" inquired the Host. "I have heard of the 'Gin Liver.'"

"It is well known that a long residence in India," interposed the Clergyman, "will give rise to enlargement and induration of this organ."

"And for the same reason," answered the Doctor, "the liver acts as a substitute for the lungs—just as the skin acts vicariously for the kidneys."

"Not a word of this do I understand," said the merry-faced guest.

"Well then," continued the Doctor, "I will endeavour to explain it. By a wonderful provision of Nature, which appears to come under the law of compensation, when one organ, by reason of decay, is unable to perform its functions, another undertakes its functions, and, to a certain extent, supplies its place. You all know that blind people acquire a preternatural delicacy in the sense of touch, which did not escape the philosophical observation of Wordsworth, who speaks of

"A watchful heart,
Still couchant—an inevitable ear;
And an eye practised like a blind Man's touch."

Now, it is the office of the vessels of the skin to throw off by perspiration the watery parts of the blood; the kidneys do the same; and under a great variety of circumstances which must be familiar to all, these organs frequently act vicariously for one another. The office of the liver, and the lungs also, is in like manner, to throw off carbon from the system, and when during residence in a Tropical climate the lungs are unable, from the state of the atmosphere, to perform their functions, the liver acting vicariously for this organ is stimulated to undue activity, and becomes consequently diseased. Applying these remarks to the Spirit Drinker, it is obvious that the excess of carbon introduced into the system by alcohol is thrown upon the liver, and by stimulating it to undue activity produces a state of inflammation."

"This I understand," observed the Clergyman, "but how does it act upon the brain? Does the alcohol itself actually become absorbed, and enter into the substance of the brain?"

"The effect of an excess of carbon, in the blood-vessels of the brain, is to produce sleep and stupor; hence the drunkard breathes thick, and snores spasmodically, and after this state, ends in confirmed apoplexy and death—just as dogs become insensible when held over the Grotto del Cane, in Italy, where they inhale this deleterious gas. But in addition to this it has been clearly proved, that alcohol does enter into the substance of the brain, for it has been detected by the smell, upon examining the brain of persons who have died drunk; besides which, alcohol, after having been introduced by way of experiment, into the body of a living dog, has afterwards been procured absolutely as alcohol by distillation from the substance of the brain. It is so subtle a fluid that Liebig says, it permeates every tissue of the body."

"But how do you explain the circumstance that death sometimes happens suddenly after drinking spirits," asked the Host, "before there can be time for absorption to take place?"

"I remember, not many years ago," interposed the merry-faced guest, "a water-man in attendance at the cab-stand at the top of the Haymarket, for a bribe of five shillings, tossed off a bottle of gin, upon which he dropped down insensible, and soon died."

"This may clearly be accounted for," observed the Doctor. "The stomach as I premised, is plentifully supplied with nerves, and is connected with one of the great nervous centres in the body, so that a sudden impression produced upon these nerves, by the introduction of a quantity of such stimulus, gives a shock to the whole nervous system, which completely overpowers it. From the centre to the circumference it acts like a stroke of lightning, and the death is often instantaneous. A draught of iced water taken

when the system has been over-heated by exertion, by dancing or otherwise, has been known to be immediately fatal. The physiological action—or rather the ‘shock’ upon the nervous system, is in both cases the same—violent mental emotion, will in like manner, suspend the action of the heart and produce instant death. These are the terrors of alcohol, when drunk to excess; but the health of the habitual tippler is sure to be undermined; his hands become tremulous, he is unsteady in his gait, his complexion becomes sallow; and all his mental faculties gradually impaired.”

“To what, may I ask,” inquired the merry-faced guest, “do you attribute the circumstance of the trembling hand recovering its steadiness, after taking a glass of spirits in the morning after a debauch; ‘hair of the dog,’ as it is called, ‘that bit overnight!’”

“Action and reaction is the great Law of the Animal Economy,” replied the Doctor; “over stimulation will always produce a corresponding degree of depression; when, therefore, the nervous system has been over excited by alcoholic liquors, the usual amount of nervous energy which is necessary to give tone to the muscular system is wanting, and then a stimulus gives a fillip to the nervous centres, which restores the nervous powers to the extremities. When this state of things, however, has been permitted to go on, and the brain has been frequently brought under alcoholic influence, its structure becomes affected, and a slow and very insidious inflammation takes place, which terminates in a softening of its substance. This mischief may proceed for a considerable period without being suspected, but on a sudden ‘*delirium tremens*’ may supervene, which will terminate, perhaps, in paralysis—perhaps death!”

“To what, Doctor,” inquired the Clergyman, “do you attribute the mental pleasures of intoxication? Can this be explained upon physiological principles?”

“Easily, I think,” answered the Doctor. “All inebriating agents have a two-fold action—as I have already pointed out—first, on the circulation; and secondly, on the nervous system. There can be no doubt that the mind becomes endowed with increased energy when the circulation through the brain is moderately quickened. This has been proved by observation. The case has been reported of a person who having lost by disease a part of the skull and its investments, a corresponding portion of brain was open to inspection. In a state of dreamless sleep, the brain lay motionless within the skull; but when dreams occurred, as reported by the patient, then the quantity of blood was observed to flow with increased rapidity, causing the brain to move and protrude out of the skull. When perfectly awake and engaged in active thought, then the blood again was sent with increased force to the brain, and the protrusion was still greater. Under all circumstances, increased circulation through the brain, gives rise to mental excitement, and sometimes to an unusual lucidity of ideas. It is observed in the early stages of fever and even in the dying—and this accounts for the clearing up of the mind which sometimes occurs in the last moments of life—what is called familiarly ‘the lightning before death.’”

“That,” observed the Clergyman, “is a very curious circumstance, which I firmly believe; and you account for this, if I understand your meaning, by explaining that the blood which no longer circulates in the extremities which may have become cold, flows with increased impetus through the brain.”

“Exactly so,” replied the Doctor, “and upon this very principle the rapidity of ideas, and the pleasurable mental excitement attending that temporary state of intellectual exaltation, depends on the increased rapidity of the flow of blood through the brain; but when this becomes carried to too great an extent, and the rapidity of the current disturbs the healthy condition of the brain, then the manifestations of the mind necessarily become impaired, the ideas are no longer under the control of the reasoning faculty, and the bodily organs, usually under the dominion of the will, no longer obey its mandates. This I believe to be the true theory of mental intoxication.”

“But there are many circumstances,” observed the Host, “which may accelerate or retard this excitement.”

“Certainly,” continued the Doctor; “persons who join the social board already elated with some good news, or cause of unusual happiness; persons who talk much, and excite themselves in argument, are apt to become affected more speedily than those who hold themselves in the midst of the convivial scene sedate and taciturn. The mind, in fact, may exercise a considerable power of resistance against inebriation; for which reason, persons in the society of their superiors, under circumstances which render it necessary they should maintain the appearance of being always well conducted, drink with impunity more than they otherwise could, if they did not impose upon themselves this consciousness of self-government. We also observe the influence of the mind, in controlling, and, indeed, putting an end to a fit of intoxication, by making, doubtless, an impression on the heart and causation, when a sense of danger, or a piece of good or bad news, suddenly communicated, sobers a person on a sudden.”

“I have heard,” observed the merry-faced guest, “that moving about—changing from one seat into another—will check the effects of liquor; and I have known persons who have left a social party perfectly sober, become suddenly tipsy in the open air. How is this to be explained?”

"Precisely on the same principle," answered the Doctor, "upon leaving an overheated room, on your returning homewards, you expose yourself to an atmosphere many degrees below that you have just left. The cold checks the circulation on the surface of the body; the blood is driven inwards; it accumulates, consequently, in the internal organs; and sometimes its pressure is such on the brain, as to produce on a sudden the very last stage of intoxication. The limbs refuse to support their burthen, and the person falls down in a state of profound insensibility."

"I have recently," said the Host, "read in the Police Reports several cases of this description; and imagined that some narcotic drug must have been mixed with the liquor drank by such persons. Adulteration of some sort must go on to a frightful extent in gin-palaces."

"Not by any means," answered the Doctor, "to the extent you suppose. It is said that the spirit-dealer makes his whiskey or gin head by adding a little turpentine to it. Well! what then? Turpentine is a very healthy diuretic. It is given to infants to kill worms in very large doses. Then, again, vitriol is spoken of; but so strong is sulphuric acid, that it would clearly render these spirits quite unpalatable. I do not affirm that the art of adulteration may not occasionally be had recourse to, even with criminal intentions, for such cases have been brought under the notice of the authorities; but I do not believe the practice is so general as some persons suppose. I apprehend dilution is a more general means of fraud."

"It has often occurred to me," said the Clergyman, "that our municipal regulations might, on this subject, be much improved. Our Excise officers enter the cellars of the wholesale and retail spirit-dealer, only to gauge the strength of the spirit, and to ascertain how much it may be overproof, which alone regulates the Government duty; but for the sake of the public health I would go further than this. If a butcher be found selling unhealthy meat; a fishmonger, bad fish; or a baker cheat in the weight of bread, they severally have their goods confiscated, and are fined; and so far the public is protected. But the authorities seem not to care what description of poison is sold across the counter of gin-palaces—an evil which may easily be remedied. I would put the licensed victualler on the same level with the butcher and fishmonger; and if he were found selling adulterated spirits, and the charge were proved against him by the same having been fairly analysed, he, too, should be liable to be fined, or even lose his licence. The public health is, upon this point, at present utterly unprotected."

"Some such measure," observed the Host, "might be advantageously adopted; but I confess that I do not advocate the prohibition-

principle; instead of preaching a Crusade against the use of any particular article, whether of necessity or comfort, let us educate the people, and improve their social condition by inculcating sound moral principles; they will soon learn that habits of industry and temperance can alone ensure them and their children happiness and prosperity; and in so doing, you will teach a sound, practical, permanent lesson."

"But," interrupted the Clergyman, "if we continue the conversation longer, we shall ourselves become transgressors; the 'stirrup-cup is drained: much remains doubtless to be said respecting the evils, physical and moral, which arise from intemperance; but let us now adjourn."

"With all my heart!" exclaimed the Host, "and now, 'to all and each, a fair good night!'"

LIFE IN A SALADERO.

WHENCE come the thirty-five thousand tons of ox-hides annually imported into this country?—whence a large proportion of the seventy thousand tons of tallow?—whence the twenty thousand tons of dry bones—for sugar-refining, ornamental turnery, and fancy articles?—whence the millions of horns?—whence do the great slave populations of Brazil, Bahia, Pernambuco, and Cuba obtain the dry and salted beef which is their staple food?

The answer to these questions is a description of a South American "Saladero."

Thousands of miles of the finest pasturage in the world are spread over the Pampas or Plains of Southern America; and upon them browse, nearly in a wild state, innumerable oxen and cows, which are dexterously caught by means of the lasso; are brought within the precincts of an "Estancia," (described in former numbers of this work), and thence transferred to the "Saladero" to be killed, skinned, dissected, salted, and distributed to every commercial quarter of the globe.

A "Saladero," signifies, literally, a salting-place, from the Spanish word *sal*, salt. The chief establishments of this nature are situated on both banks of the River Plate, near the two capitals, Buenos Ayres and Monte Video. Trade and manufacture are, however, banished from the neighbourhood of the latter town, by the prolonged siege, which, emulating that of Troy, has been carried on since 1843; and commercial, and every other sort of peaceful activity, has been removed to the Southernmost province of Brazil, Rio Grande da Sul. But the Saladeros of Buenos Ayres, not having been disturbed by warfare, are the only ones in regular and constant operation. They number about twenty-four. Most of them are situated on both sides of a small river, called Riachuelo de Barracas, at a distance of about three miles from the city of Buenos Ayres. Around them a little town has sprung up, and is gaining fresh inhabi-

every day, from the increasing business of the Saladero.

The particular establishment which I inspected was that belonging to the Spanish house of Santamaría, Llamé and Cambaceres; which is situated on a piece of ground that may have a length of four hundred yards and a breadth of nearly two hundred and fifty yards. Its form is quadrangular, having the river on one of the longer sides. On the other three sides it is enclosed by a ditch, or *arroyo*, through which the blood of the slaughtered cattle is discharged into the river. In the middle of the square stands a white flat-roofed house, with a small garden and separate yard. This serves as the residence of the *major-domo*, or manager of the whole establishment, and for counting-houses.

Entering through a gateway from the road on the South, the visitor finds himself in a large yard, surrounded on three sides by buildings. On the left is the *corral*. This is a wide but oblong inclosure, with a separate portal from the road, for the cattle to enter at. Within is a smaller *corral* or *creté*, entirely round, and paved with wood. These inclosures are formed by closely-wedged fences of the trunks of poplar trees. From the month of November to April the great *corral* is always full of bellowing fat cattle, which is brought, with great trouble and often great loss, by people called *acarreadores*, or *reeros*, from the Estancias in the interior. They drive the cattle, either on their own account, or on account of the house of Santamaría and Co., at the rate of from nine to fifteen miles a day.

Let us suppose a herd to have arrived; and, in order to get a clear idea of the life and activity going on in these Saladeros, follow the victims to their doom. Imagine them collected in the great *corral* preparing to be driven into the small one. The entrance to this is approached by a narrow lane, consisting of two rows of enormous stakes—whole trunks of trees in fact—driven into the earth. The gate between the great *corral* and the main road, is closed. The *reeros* are pushing and goading, and hallooing with might and main, till the beasts are wedged together as tightly as people at the pit-door of a theatre on the night of a popular play; but, unlike the pit entrance, the door of the great or smaller inclosure is of the partition kind; and when the performances inside are to commence, it is lifted up. The bovine victims rush in; but the moment they enter, they encounter sights and smells portentous of their coming fate, which impel them to make a sudden retreat. Alas! the instant the last tail has passed under the opening, down falls the door to oppose all egress; and the unhappy oxen find themselves as completely imprisoned as rats in a trap.

It is three o'clock in the morning of a South American summer, and a bell has already summoned the workmen to their

various avocations. Several jolly figures appear, joking with each other, and smoking their paper cigars. Though so merry, they are sanguinary-looking fellows; their calico shirts, their *consensillas* or wide trowsers, the *chiripé* or apron, the sash which confines all these round the waist, and the handkerchief which is folded tightly round their heads, are blood-stained. Into the sash is stuck, on one side, a couple of long knives, kept in formidable order by a steel suspended from the other; such being the characteristic dress and appliances of the *desolladores* or skinners. They all make towards a large floor paved with wood, and sheltered under a roof which is supported by huge wooden pillars. This is the *plaza* or butcher-ho se. At one corner of this *plaza* is a communication with the *creté*, a sort of doorway, across which is fastened midway into each post, a great bar. Upon this bar is fitted a small wheel, over the circumference of which is rove a strong and long rope of hide, with a lasso, or running noose, at one end in the *creté*, and a couple of horses attached to the other end, in the *galpon*. Under the bar is a low carriage, into which the beast falls, when dead, to be drawn away. Sharpening their knives and arranging their implements, the executioners are soon ready for action.

Meanwhile the *Capataz de los Corrales* (Captain of the Corrals) with a half-dozen boys, are busy riding round the larger enclosure on horseback, making the most hideous noises their lungs are capable of, and galloping about in all directions, till they have frightened from eighty to a hundred of the beasts into the lesser enclosure. When that is done, the cattle are shut in, and fall under the knife of the slaughterman by a very ingenious process. Near to the bar and wheel an *enlassador*, or lasso-thrower stands upon a raised platform—a short gallery, in fact—and with unerring aim throws the noose of his lasso over the horns of the nearest animal, and catches it. He then gives the word "*dele!*" (go on), to the horses harnessed to the other end of the lasso; they move rapidly on, the lasso travels round the wheel till the ox's head is pressed so tightly against it, that he is powerless, and forced into a position most convenient to be slaughtered. The *enlassador* then draws from his belt a short dagger, and stabs the animal in the back of the neck—its most vulnerable part—just between the skull and the spine. Death is instantaneous; after a convulsive shudder the beast drops down as if struck with lightning. This is a comparatively humane mode of slaughter, which might with advantage be adopted in this country.

In a minute the car upon four wheels which receives the animal is drawn (on the bar being lifted) into the interior of the *galpon*, on a tram. The carcass is delivered over to the skinners, and the car returns to the fatal bar and wheel for another victim. This goes on all day, with the exception of a half-hour's rest,

till three or four in the afternoon; and so dexterously and rapidly is this sort of butchery kept up, that during the twelve hours from four to five hundred animals are daily disposed of.

The *desollador* now proceeds to dissection. He cuts the head off in a trice. The skin is disengaged from the trunk by a series of rapid and even cuts, and then stripped. Beef is the next consideration; but only the fore part of the beast is prepared for the salting process. The skinner takes out the two shoulder pieces, the two back pieces, and two breast pieces; so that only six joints are thought worthy of preservation. The carcass is drawn away, and makes room for another animal just slaughtered, to be dealt with in like manner.

The meat having been washed, dried, and removed from the bones, is taken to another place, which is the "*Saladero*" proper, or salting-house. It has been cut into pieces, which are now arranged in a square pile, each layer being covered with salt. This *pila* containing the results, in beef, of the day's slaughter is afterwards removed to be dried again, and is then ready for exportation. When there is a great demand for beef the drying is done by a forced process, in three or four days; but it is best done when the piles are allowed to remain for several weeks, before dried.

While the meat is being salted and piled, the bones, fat, and intestines are hurried to another part of the yard, where two tall chimneys indicate to us where the *fabrica*, or melting-house is situated—just opposite to the *galpon*, and forming one side of the square we have just crossed. We pass under its roof—for, like none of the other sheds, it has walls—and observe two fire-places, each surmounted by an enormous boiler. From these boilers ascend four copper tubes, through each of which is driven with the force of an engine, a powerful jet of steam into the bottom of a *tina* or vat, from fourteen to eighteen feet high, and made of thick pine staves, bound together with hoops. As each steam pipe leads to a separate vat, (of which there are eight), either capable of containing from a hundred to a hundred and fifty carcasses and heads. It takes several hours "to load" each vat; but when that operation is completed, the steam is turned on and the whole is steamed incessantly from forty-eight to seventy-two hours. The cleaned and whitened bones are, at the end of that time, taken out and the tallow drawn off, purified in flat vessels and packed in barrels for shipment. The remaining mass is so completely reduced to dry fibre, that it makes excellent fuel, and is used to heat and stew succeeding "loads." This is a great advantage in a district very scantily supplied with wood, and in which there is no coal whatever. The peculiar fuel, thus supplied, is appropriately called *carne cocida*, "boiled beef." In a *Saladero* nothing is ever lost, and the utility of *carne cocida* is not con-

sidered to be "wasting," in which circumstances, means are supplied up in immense piles; at a market in Buenos Ayres and left to burn till it is. These ashes are used in stones, as well as wood, are used of the river, and successive strata have so raised the banks of the they protect the *Saladeros* from in-

The most important and profitable the ox is its hide. There are two which hides are prepared for export: they are either salted or dried. While meat is carried from the *playa* to the *saladero*, house, and the carcass to the *fabrica*, the skin is delivered over to a set of workmen called *descarnadores* or trimmers. They lay each hide on the flat of their left hands, scrape off all the beef and fat which may be adhering to the inner coating with a knife in the right hand, trim the edges, and then stretch out the hides by means of stakes driven into the ground, if the skins are to be dried. If they are to be salted, a pile is made of them with layers of salt. Dried hides require much more time and skill, than when they are only salted. In the latter case, they are packed in casks for exportation; in the former, when shipped, they are tied up in bundles.

It is thus that the principal parts of the beast are disposed of; but he yields certain minor articles of merchandise which, in the aggregate, materially increase the trade of a *Saladero*. The heads are detained on their way to the *fabrica* by boys whose business it is to take the tongues out. When this is done, the tongues are salted, a process which requires great skill, that the salt may penetrate the thick part as well as the tip. In order that the roots may receive the salt more readily, they are hammered on a stone.

But before the head is tossed into the vat, it has to be denuded of its horns, which are to be brought off with the frontal bone which holds them. A few days' exposure to the air, especially in wet weather, so loosens the horns that they are removed with very little effort. Millions of them are exported every year. The refuse, left behind by the *descarnadores*, is employed in glue-making. Even the tails of oxen are made into merchandise. When sufficiently dry, they are packed up in *bales*, but whether their ultimate destiny be soup or not, we have not been able to learn. Certain it is, that from the hoods is extracted, in a special department of the *Saladero*, an oil which pays remarkably well.

The work-people are paid wages which would astonish the European operative. Boys gain from four to five shillings a day. While the more skilful workmen can make as much as from six to seven pounds sterling per week.

The control and business arrangements of these great establishments are confided to a

no resides on the
spatas, or overseer,
 These are almost
 od family. Indeed, the
 all situations: foreigners,
 and Irish, increase daily.
 men have been much im-
 ners and intelligence by the
 all work in harmony in the
 ough the general character of the
 lation is turbulent in the extreme.
 the fine territories in that part of
 id are periodically plunged in fierce
 ainous war, which retards civilisation,
 nders commerce uncertain and hazardous.
 is to be hoped, however, that with increasing
 intercourse with Europe, the people of South
 America will be convinced of the benefits of
 commerce, which ever brings in its train those
 industrious habits and moral advantages,
 which war has hitherto banished from the
 best districts.

THE CHURCH POOR-BOX.

I AM a Poor-Box !—here I stick,
 Nailed to a wall of whitewashed brick,
 Teeming with "fancies coming thick,"
 That sometimes mingle
 With solid pence from those who kneel ;
 While, now and then, oh joy ! I feel
 A sixpence tingle !

The robin on me oft doth hop ;
 I am the woodlouse' working shop ;
 And friendly spiders sometimes drop
 A line to me ;
 While e'en the sun will often stop
 To shine on me.

I am of sterling, close, hard grain
 As any box on land or main ;
 But age, my friends, who can sustain,
 In solitude ?
 Neglect might make a Saint complain,
 Whatever his wood.

Heaven hath, no doubt, a large design :
 Some hearts are harder grain'd than mine ;
 Some men too fat, and some too fine,
 And some can't spare it ;—
 I do not mean to warp and pine,
 But humbly bear it.

This is a cold and draughty place,
 And folks pass by with quickened pace,
 Praying, perchance, a dinner-grace ;
 But ever then,
 I feel the comfort of His face,
 Who pities men.

I saw, last week, in portly style,
 A usurer coming down the aisle ;
 His chin a screw, his nose a file,
 With gimlet eye :
 He turned his head, to cough and smile—
 And sidled by.

I saw the same rich man, this morn,
 With sickly cheek and gait forlorn—
 As feeble, almost, as when born ;
 He dropt some pelf,
 To the Poor—the weak and worn—
 Meaning "himself."

I saw, last year, a courtly dame,
 With splendid bust, and jewels' fame,
 And all the airs of feathered game—
 A high-bred star-thing :
 All saw the gold—but close she came,
 And dropt—a farthing.

Two days ago, she passed this way,
 Heart-broken—prematurely grey—
 Her beauty like its mother—clay :
 She gave me gold ;
 "I am like thee"—I heard her say—
 "Hollow and cold."

The farmer gives when crops are good,
 Because the markets warm his blood :
 The traveller, 'scaped from field and flood,
 Endows the Poor ;
 The dying miser sends his mud,
 To make Heaven sure.

A lover with his hoped-for bride
 (Her parents being close beside)
 Drew forth his purse with sleek-faced pride,
 Rattling my wood :
 All day I felt a pain in the side,
 He was "so good."

The Captain fresh from sacking towns,
 My humble claim to pity owns ;
 The Justice on his shilling frowns ;
 But, worst of all,
 Arch-hypocrites display their crowns
 Beside my wall.

There came a little child, one day,
 Just old enough to know its way,
 And, clambering up, it seemed to say
 "Poor lonely Box !"
 Gave me a kiss—and went away
 With drooping locks.

I have to play a thankless part ;
 With all men's charities I smart,
 But those who give with a child's heart,
 From pure fount spring :—
 The rest I take, as on the mart ;
 Wise head—still tongue.

A BIOGRAPHY OF A BAD SHILLING.

I BELIEVE I may state with confidence that my parents were respectable, notwithstanding that one belonged to the law—being the zinc door-plate of a solicitor. The other, was a pewter flagon residing at a very excellent hotel, and moving in distinguished society ; for it assisted almost daily at convivial parties in the Temple. It fell a victim at last to a person belonging to the lower orders, who seized it, one fine morning, while hanging upon some railings to dry, and conveyed it to a Jew, who—I blush to record the insult offered to a respected member of my family—melted it down. My first mentioned parent—the zinc plate—was not enabled to move much in society, owing to its very close connexion with the street door. It occupied, however, a very conspicuous position in a leading thoroughfare, and was the means of diffusing more useful instruction, perhaps, than many a quarto, for it informed the running as well as the reading public, that

Messrs. Snapples and Son resided within, and that their office hours were from ten till four. In order to become my progenitor it fell a victim to dishonest practices. A "fast" man unscrewed it one night, and bore it off in triumph to his chambers. Here it was included by "the boy" among his numerous "perquisites," and, by an easy transition, soon found its way to the Hebrew gentleman above mentioned.

The first meeting between my parents took place in the melting-pot of this ingenious person, and the result of their subsequent union was mutually advantageous. The one gained by the alliance that strength and solidity which is not possessed by even the purest pewter; while to the solid qualities of the other were added a whiteness and brilliancy that unadulterated zinc could never display.

From the Jew, my parents were transferred—mysteriously and by night—to an obscure individual in an obscure quarter of the metropolis, when, in secrecy and silence, I was cast, to use an appropriate metaphor, upon the world.

How shall I describe my first impression of existence? how portray my agony when I became aware *what I was*—when I understood my mission upon earth? The reader, who has possibly never felt himself to be what Mr. Carlyle calls a "sham," or a "solemnly constituted impostor," can have no notion of my sufferings.

These, however, were endured only in my early and unsophisticated youth. Since then, habitual intercourse with the best society has relieved me from the embarrassing appendage of a conscience. My long career upon town—in the course of which I have been bitten, and rung, and subjected to the most humiliating tests—has blunted my sensibilities, while it has taken off the sharpness of my edges; and, like the counterfeiters of humanity, whose lead may be seen emulating silver at every turn, my only desire is—not to be worthy of passing, but simply—to pass.

My impression of the world, on first becoming conscious of existence, was, that it was about fifteen feet in length, very dirty, and had a damp unwholesome smell; my notions of mankind were, that it shaved only once a fortnight; that it had coarse, misshapen features; a hideous leer; that it abjured soap, as a habit; and lived habitually in its shirt-sleeves. Such, indeed, was the aspect of the apartment in which I first saw the light, and such the appearance of the professional gentleman, who ushered me into existence.

I may add that the room was fortified, as if to sustain a siege. Not only was the door itself lined with iron, but it was strengthened by ponderous wooden beams, placed upright, and across, and in every possible direction. This formidable exhibition of precautions against danger was quite alarming.

I had not been long brought into this

"narrow world" best from the outside of the master paused, as if at the point of sweeping my companions (who had been mysteriously ushered into this place of safety. Reassured, second tapping, of more marked he commenced the elaborate pro- fastening the door. This having been plished, and the entrance left to the ship only of a massive chain, a my watchword was exchanged with some outside, who was presently admitted.

"Hollo! there's two on you!" said the master, as a hard elderly animal entered, followed somewhat timidly by a younger one of mild and modest aspect.

"A green un as I have took under my arm," said Mr. Blinks (which I presently understood to be the name of the elder one), "and werry deserving he promises to be. He's just come out of the stone-pitcher, without having done nothing to entitle him to have gone in. This was it: a fellow out at Highbury Barn collared him, for lifting snow from some railings, where it was a hanging to dry. Young Innocence had never dreamt of anything of the kind—bein' a walking on his way to the work-us—but beaks being proverbially otherways than fly, he got six weeks on it. In the 'Ouse o' Correction, however, he met some knowing blades, who put him up to the time of day, and he'll soon be as wide-awake as any on 'em. This morning he brought me a pocket-book, and in it eight-ty pound in fimsies. As he is a young hand, I encouraged him by giving him three pun' ten for the lot—it's runnin' a risk, but I done it. As it is, I shall have to send 'em all over to 'Ambug. Howsomever, he's got to take one pund in home made; bein' out of it myself, I have brought him to you."

"You're here at the nick o' time," said my master, "I've just finished a new batch—"

And he pointed to the glittering heap in which I felt myself—with the diffidence of youth—to be unpleasantly conspicuous.

"I've been explaining to young Youthful that it's the reg'lar thing, when he sells his swag to gents in my way of business, to take part of it in this here coin." Here he took me up from the heap, and as he did so I felt as if I were growing black between his fingers, and having my prospects in life very much damaged.

"And is all this bad money?" said the youth, curiously, gazing, as I thought, at me alone, and not taking the slightest notice of the rest of my companions.

"Hush, hush, young Youthful," said Mr. Blinks, "no offence to the home coinage. In all human affairs, everythink is as good as it looks."

"I could not tell them from the good—"

every day, from the pavement, I should call the Saladero.

The particular estab-lish-up with vanity, and spotted was that bely companions at these house of Santamaría. In I was fast losing the which is situated with. In justice to myself, may have a length bound to say that I have, in a breadth of my subsequent experience, seen yards. Its lords and masters of the creation the river on such more absurdly under the in-other three flattery.

Now, then, we must put you up to the means sloughing out the real Turtle from the mock." In my master. "It's difficult to tell by the flattery. Silver, if it's at all cracked—as lots of

money is—don't ring no better than pewter: besides, people can't try every blessed bit o' tin they get in that way; some folks is offended if they do, and some ain't got no counter. As for the colour, I defy anybody to tell the difference. And as for the figgers on the side, wot's your dodge? Why, wen a piece o' money's give to you, look to the hedges, and feel 'em too with your finger. When they ain't quite perfect, ten to one but they're bad 'uns. You see, the way it's done is this—I suppose I may put the young 'un up to a thing or two more!" added Mr. Blinks, pausing.

My master, who had during the above conversation lighted a short pipe, and devoted himself with considerable assiduity to a pewter pot—which he looked at with a technical eye, as if mentally casting it into crown pieces,—now nodded assent. He was not of an imaginative or philosophic turn, like Mr. Blinks. He saw none of the sentiment of his business, but pursued it on a system of matter of fact, because he profited by it. This difference between the producer and the middle-man may be continually observed elsewhere.

"You see," continued Mr. Blinks, "that these here 'bohs'—by which he meant shillings—"is composed of a mixter of two metals—pewter and zinc. In coorse these is first prigged raw, and sold to gents in my line of bi'ness, who either manufactures them themselves, or sells 'em to gents as does. Now, if the manufacturer is only in a small way of bi'ness, and is of a mean natur, he usually casts his money in plaster of Paris moulds. But for nobly gents like our friend here (my master here nodded approvingly over his pipe), this sort of thing won't pay—too much trouble and not enough profit. All the top-sawyers in the manufactur is scientific men. By means of what they calls a galvanic battery a cast is made of that partiklar coin selected for imitation. From this here cast, which you see, that these dis is made, and from that there dis impressions is struck off on plates of the metal prepared for the purpose. Now, unfortunately we ain't got the whole of the masheonery of the Government institution yet at our disposal, though it's our intention for to bribe the Master of the Mint (in imitation coin) some of these days

to put 'em up to it all—so you see we're doing for instance (taking 'em up again as he spoke), upon different plates of metal, joining of 'em together afterwards. Then comes the melting round the hedges. This we do with a file; and it is the himperfection of that ere as is continually a praying upon our minds. Anyone who's up to the bi'sness can tell whether the article's genuine or not, by a looking at the hedge; for it can't be expected that a file will cut as reglar as a masheen. This is reely the great drawback upon our purfession."

Here Mr. Blinks, overcome by the complicated character of his subject, subsided into a fit of abstraction, during which he took a copious pull at my master's porter.

Whether suggested by the onslaught upon his beer, or by a general sense of impending business, my master now began to show symptoms of impatience. Knocking the ashes out of his pipe, he asked "how many bob his friend wanted?"

The arrangement was soon concluded. Mr. Blinks filled a bag which he carried with the manufacture of my master, and paid over twenty of the shillings to his *protege*. Of this twenty, I was one. As I passed into the youth's hand I could feel it tremble, as I own none would have done had I been possessed of that appendage.

My new master then quitted the house in company with Mr. Blinks, whom he left at the corner of the street—an obscure thoroughfare in Westminster. His rapid steps speedily brought him to the southern bank of the "fair and silvery Thames," as a poet who once possessed me, (only for half-an-hour), described that uncleanly river, in some verses which I met in the pocket of his pantaloons. Diving into a narrow street, obviously, from the steepness of its descent, built upon arches, he knocked at a house of all the unpromising rest the least promising in aspect. A wretched hag opened the door, past whom the youth glided, in an absent and agitated manner; and, having ascended several flights of a narrow and precipitous staircase, opened the door of an apartment on the top story.

The room was low, and ill ventilated. A fire burnt in the grate, and a small candle flickered on the table. Beside the grate, sat an old man sleeping on a chair; beside the table, and bending over the flickering light, sat a young girl engaged in sewing. My master was welcomed, for he had been absent, it seemed, for two months. During that time he had, he said, earned some money; and he had come to share it with his father and sister.

I led a quiet life with my companions, in my master's pocket, for more than a week. At the end of that time, the stock of good money was nearly exhausted, although it had on more than one occasion been judiciously mixed with a neighbour or two of mine.

Want, however, did not leave us half-attent. Under pretence of going away again to get "work," my master—leaving several of my friends to take their chance, in administering to the necessities of his father and sister—went away. I remained to be "smashed" (passed) by my master.

"Where are you going so fast, that you don't recognise old friends?" were the words addressed to the youth by a passer-by, as he was crossing, at a violent pace, the nearest bridge, in the direction of the Middlesex bank.

The speaker was a young gentleman, aged about twenty, not ill-looking, but with features exhibiting that peculiar expression of cunning, which is popularly described as "knowing." He was arrayed in what the police reports in the newspapers call, "the height of fashion,"—that is to say, he had travestied the style of the most daring dandies of last year. He wore no gloves; but the bloated ruddiness of his hands was relieved by a profusion of rings, which—even without the cigar in his mouth—were quite sufficient to establish his claims to gentility.

Edward, my master, returned the civilities of the stranger, and, turning back with him, they agreed to "go somewhere."

"Have a weed," said Mr. Bethnal, producing a well filled cigar-case. There was no resisting. Edward took one.

"Where shall we go?" he said.

"I tell you what we'll do," said Mr. Bethnal, who looked as if experiencing a novel sensation—he evidently had an idea. "I tell you what—we'll go and blow a cloud with Joe, the pigeon-fancier. He lives only a short distance off, not far from the abbey; I want to see him on business, so we shall kill two birds. He's one of us, you know."

I now learned that Mr. Bethnal was a new acquaintance, picked up under circumstances (as a member of parliament, to whom I once belonged, used to say in the House) to which it is unnecessary further to allude.

"I was glad to hear of your luck, by-the-by," said the gentleman in question, not noticing his companion's wish to avoid the subject. "I heard of it from Old Blinks. Smashing's the thing, if one's a presentable oove. You'd do deuced well in it. You've only to get nubby togs and you'll do."

Mr. Joe, it appeared, in addition to his ornithological occupations, kept a small shop for the sale of coals and potatoes; he was also, in a very small way, a timber merchant; for several bundles of firewood were piled in pyramids in his shed.

Mr. Bethnal's business with him was soon despatched; although not until after the latter had been assured by his friend, that Edward was "of the right sort," with the qualification that he was "rather green at present;" and he was taken into Mr. Joe's

confidence, and also into Mr. Joe's upstairs sanctum.

In answer to a request from Mr. Bethnal in a jargon, to me then unintelligible, Mr. Joe produced from some mysterious depository at the top of the house, a heavy canvas bag, which he emptied on the table, discovering a heap of shillings and half-crowns, which, by a sympathetic instinct, I immediately detected to be of my own species.

"What do you think of these?" said Mr. Bethnal to his young friend.

Edward expressed some astonishment that Mr. Joe should be in the line.

"Why, bless your eyes," said that gentleman; "you don't suppose I gets my livelihood out of the shed down stairs, nor the pigeons neither. You see, these things are only dodges. If I lived here like a gentleman—that is to say, without a occupation—the p'lese would soon be down upon me. They'd be obliged to take notice on me. As it is, I comes the respectable tradesman, who's above suspicion—and the pigeons helps on the business wonderful."

"How is that?"

"Why, I keeps my materials—the pewter and all that—on the roof, in order to be out o' the way, in case of a surprise. If I was often sedd upon the roof, a-looking arter such-like matters, inquisitive eyes would be on the look out. The pigeons is a capital blind. I'm belived to be devoted to my pigeons, out o' which I takes care it should be thought I makes a little fortun—and that makes a man respected. As for the pigeon and coal and tatur businesses, them's dodges. Gives a opportunity of bringing in queer-looking sacktuls o' things, which otherwise would compel the 'spots'—as we calls the p'lese—to come down on us."

"Compel them!—but surely they come down whenever they've a suspicion!"

"You needn't a' told me he was green," said Mr. Joe to his elder acquaintance, as he glanced at the youth with an air of pity. "In the first place, we takes care to keep the workshop almost impregnable; so that, if they attempts a surprise, we has lots o' time to get the things out o' the way. In the next, if it comes to the scratch—which is a matter of almost life and death to us—we stands no nonsense."

Mr. Joe pointed to an iron crowbar, which stood in the chimney-corner.

"I ses nothing to criminate friends, you know," he added significantly to Mr. Bethnal "but you remember wot Sergeant Higley got?"

Mr. Bethnal nodded assent, and Mr. Joe volunteered for the benefit and instruction of Edward an account of the demise, and funeral of the late Mr. Sergeant Higley. That official having been promoted, was ambitious of being designated, in the newspapers, "active and intelligent," and gave information against a gang of coiners; "Wot was

the consequence?" continued the narrator, "Somehow or another, that p'leseman was never more heered on. One fine night he went on his beat; he didn't show at the next muster; and it was s'posed he'd bolted. Every enquiry was made, and the 'mysterious disappearance of a p'leseman,' got into the noospapers. Howsomnever, *he* never got anywheres."

"And what became of him?"

Mr. Joe then proceeded to take a long puff at his pipe, and winking at his initiated friend, proceeded to narrate how that the injured gang dealt in eggs.

"What has that to do with it?"

"Why you see eggs is not always eggs." Mr. Pouter then went on to state that one night a long deal chest left the premises of the coiners, marked outside, 'eggs' for exportation. They were duly shipped, a member of the firm being on board. The passage was rough, the box was on deck, and somehow or other somebody tumbled it overboard."

"But what has this to do with the missing policeman?"

"The chest was six feet long and —."

Here Mr. Bethnal became uneasy.

"Vell," said the host, "the firm's broke up, and is past peaching upon, only it shows you my green 'un what we *can* do."

I was shaken in my master's pocket by the violence of the dread which Mr. Joe's story had occasioned him.

Mr. Bethnal, with the philosophy which was habitual to him, puffed away at his pipe.

"The fact o' the matter is," said Mr. Joe, who was growing garrulous on an obviously pet subject, "that we ain't afeerd o' the p'lese in this neighbourhood, not a hap'orth; *we* know how to manage them." He then related an anecdote of another policeman, who had been formerly in his own line of business. This gentleman being, as he observed, "fly" to all the secret signs of the craft, obtained an interview with a friend of his for the purpose of purchasing a hundred shillings. A packet was produced and exchanged for their proper price in currency, but on the policeman taking his prize to the station house to lay the information, he discovered that he had been outwitted. The rouleau contained a hundred good farthings, for each of which he had paid two pence halfpenny.

"Then, what is the bad money generally worth?" asked Edward, interrupting the speaker. "As a general rule," was the answer, "our sort is worth about one-fifth part o' the wallie it represents. So, a sovereign—(though we ain't got much to do' with gold here—that's made for the most part in Brummagem)—a 'Brum' Sovereign—may be bought for about four-and-six; a bad crown piece for a good bob; a half-crown for about fipence; a bob for twopence halfpenny, and so on. As for the sixpenny's and

fourpenny's, we don't make many on 'em, their wallie bein' too insignificant." Mr. Joe then proceeded with some further remarks for the benefit of his protégé;—

"You see you need have no fear o' passing this here money if you're a respectable looking cove. If a gentleman is discovered at anythink o' the kind, its always laid to a mistake; the shopman knocks under, and the gentleman gives a good piece o' money with a grin. And that's how it is that so much o' our mannyfactur gets smashed all over the country."

The visitors having been somewhat bored, apparently, during the latter portion of their host's remarks, soon after took their departure. The rum-and-water which Mr. Joe's liberality had supplied, effectually removed Edward's scruples; and on his way back, he expressed himself in high terms in favour of "smashing," considered as a profession.

"O' course," was the reply of his experienced companion. "It ain't once in a thousand times that a fellow's nailed. You shall make your first trial to-night. You've the needful in your pocket, hav'n't you? Come, here's a shop—I want a cigar."

Edward appeared to hesitate; but Mr. Joe's rum-and-water asserted itself, and into the shop they both marched.

Mr. Bethnal, with an air of most imposing nonchalance took up a cigar from one of the covered cases on the counter, put it in his mouth, and helped himself to a light. Edward, not so composedly, followed his example.

"How much?"

"Sixpence."

The next instant the youth had drawn *me* from his pocket, received sixpence in change, and walked out of the shop, leaving me under the guardianship of a new master.

I did not remain long with the tobacconist: he passed me next day to a gentleman, who was as innocent as himself as to my real character. It happened that I slipped into the corner of this gentleman's pocket, and remained there for several weeks—he, apparently, unaware of my existence. At length he discovered me, and one day I found myself, in company with a good half-crown, exchanged for a pair of gloves at a respectable looking shop. After the purchaser had left, the assistant looked at me suspiciously, and was going to call back my late owner, but it was too late. Taking me then to his master, he asked if I was not bad. "It don't look very good," was the answer. "Give it to me, and take care to be more careful for the future."

I was slipped into the waistcoat pocket of the proprietor, who immediately seemed to forget all about the occurrence.

That same night, immediately on the shop being closed, the shopkeeper walked out, having changed his elegant costume for garments of a coarser and less conspicuous description, and hailing a cab, requested to be

driven to the same street in Westminster in which I first saw the light. To my astonishment, he entered the shop of my first master:—how well I remembered the place, and the coarse countenance of its proprietor! Ascending to the top of the house, we entered the room, to which the reader has been already introduced,—the scene of so much secret toil.

A long conversation, in a very low tone, now took place between the pair, from which I gleaned some interesting particulars. I discovered that the respectable gentleman, who now possessed me, was the coiner's partner,—his being the "issue" department, which his trade transactions, and unimpeachable character, enabled him to undertake very effectively.

"Let your next batch be made as perfectly as possible," I heard him say to his partner. "The last seems to have gone very well: I have heard of only a few detections, and one of those was at my own shop to-day. One of my fellows made the discovery, but not until after the purchaser had left the shop."

"That, you see, will 'appen now and then," was the answer; "but think o' the number on 'em as is about, and how sharp some people is getting—thanks to them newspapers, as is always a interfering with wot don't concern 'em. There's now so much of our metal about, that it's almost impossible to get change for a suff'r in nowhere without getting some on it. Everybody's a-taking of it every day; and as for them that's detected, they're made only by the common chaps as ain't got our maskeenery,"—and he glanced proudly at his well-mounted galvanic battery. "All I wish is, that we could find some dodge for milling the edges better—it takes as much time now as all the rest of the work put together. Howsomever, I've sold no end on 'em in Whitechapel and other places, since I saw you. And as for this here neighbourhood, there's scarcely a shop where they don't deal in the article more or less."

"Well," said Mr. Niggles (which, I learned from his emblazoned door-posts, was the name of my respectable master), "be as careful about these as you can. I am afraid it's through some of our money that that young girl has been found out."

"Wot, the young 'ooman as has been remanded so often at the p'lese court?"

"The same. I shall know all about it to-morrow. She is to be tried at the Old Bailey, and I am on the jury as it happens."

Mr. Niggles then departed to his suburban villa, and passed the remainder of the evening as became so respectable a man.

The next morning he was early at business; and, in his capacity of citizen, did not neglect his duties in the court, where he arrived exactly two minutes before any of the other jurymen.

When the prisoner was placed in the dock, I saw at once that she was the sister of my first possessor. She had attempted to pass

two bad shillings at a grocer's shop. She had denied all knowledge that the money was bad, but was notwithstanding arrested, examined, and was committed for trial. Here, at the Old Bailey, the case was soon despatched. The evidence was given in breathless haste: the judge summed up in about six words, and the jury found the girl guilty. Her sentence was, however, a very short imprisonment.

It was my fortune to pass subsequently into the possession of many persons, from whom I learnt some particulars of the after-life of this family. The father survived his daughter's conviction only a few days. The son was detained in custody; and as soon as his identity became established, charges were brought against him, which led to his being transported. As for his sister—I was once, for a few hours, in a family where there was a governess of her name. I had no opportunity of knowing more; but—as her own nature would probably save her from the influences to which she must have been subjected in jail—it is but just to suppose, that some person might have been found to brave the opinion of society, and to yield to one so gentle, what the law calls "the benefit of a doubt."

The changes which I underwent in the course of a few months were many and various—now rattling carelessly in a cash-box; now loose in the pocket of some careless young fellow, who passed me at a theatre; then, perhaps, tied up carefully in the corner of a handkerchief, having become the sole stock-in-hand of some timid young girl. Once I was given by a father as a "tip" or present, to his little boy; when, I need scarcely add, that I found myself ignominiously spent in hardbake ten minutes afterwards. On another occasion, I was (in company with a sixpence) handed to a poor woman, in payment for the making of a dozen shirts. In this case I was so fortunate as to sustain an entire family, who were on the verge of starvation. Soon afterwards, I formed one of seven, the sole stock of a poor artist, who contrived to live upon my six companions for many days. He had reserved me until the last—I believe because I was the brightest and best-looking of the whole; and when he was at last reduced to change me, for some coarse description of food, to his and my horror I was discovered!

The poor fellow was driven from the shop; but the tradesman, I am bound to say, did not treat me with the indignity that I expected. On the contrary, he thought my appearance so deceitful, that he did not scruple to pass me next day, as part of change for a sovereign.

Soon after this, somebody dropped me on the pavement, where, however, I remained but a short time. I was picked up by a child, who ran instinctively into a shop for the purpose of making an investment in figs. But, coins of my class had been plentiful in that neighbourhood, and the grocer was a saga-

clear man. The result was; that the child went flimsy away, and that I—my edges curl as I record the humiliating fact—was nailed to the counter as an example to others. Here my career ended and my biography closes.

CHIPS.

DEATH IN THE SUGAR PLUM.

At this present writing, there lie on our desk a half-a-dozen sweetmeats. They are about the size of pigeon's eggs; captivating to the eye, being of a bright red colour; tempting to the taste, being almonds encased in a sugary compound; and easy to be procured, being about a penny per dozen. They are sold in all manner of shops; and, as if they could not be sufficiently disseminated among the juvenile population at large, are very generally hawked about in poor neighbourhoods, at a great reduction in price.

They are rank poison! and we give a melancholy history connected with them, transmitted to us by a mourning father, whose name and address are appended to his letter:—

"My daughter" he says, "aged nineteen, purchased on the 19th of October, and ate an ounce of a fancy sweetmeat called Burnt Almonds—(I find that she had eaten some of them previously in the course of the same week)—and during the following night she was taken with violent pains and sickness, and exhibited all the symptoms of having taken poison. She suffered intense agony until the 4th of November, when in consequence of the inflamed and weakened state of the intestines, collapse or strangulation of them took place, and after dreadful sufferings she died on the Sunday following, having about seven hours previously underwent a painful surgical operation.

"I am influenced by no personal motive. My daughter has lost her life, when a long duration of it and its enjoyments appeared before her; and it is in order that parents may escape the mental sufferings that I have experienced, and that their children may escape the agonies that my daughter endured, that I court publicity to these painful facts. These poisonous sweetmeats are sold in every street; and they not only contain poison in the colouring matter, but sulphate of barytes, a species of plaster of Paris procured from Derbyshire, enters largely into their composition in the place of sugar. I send you a sample of the burnt almonds, the same sample with Dr. Letheby's letter, and a more detailed account of my daughter's case I forwarded to the Home Office, innocently supposing that protection of life from poison might be of sufficient importance to engage the attention of Government; they were returned with a formal acknowledgment of the receipt of my letter; it therefore rests, as Dr. Letheby intimates, with the public "to put a check on the practice."

Dr. Letheby, one of our most eminent toxicologists, in his answer to the above application, communicates his analysis in the following terms:—

"In reply to your letter of yesterday, I have to state, that, on Wednesday, the 6th instant, I received, from Mr. Byles, a parcel of red-coloured sweetmeats, which are, I believe, sold under the name of 'Burnt Almonds.' I have made an analysis of the material, and I find that it contains portions of lead; but I cannot venture to say, without learning more of the history and progress of the malady, that this metallic impregnation was the cause of the disease from which your daughter suffered. This, however, I may state, that lead is a very insidious poison, and that it cannot be taken, even in very small quantities, for any length of time, without producing serious effects on the animal economy; it ought not, therefore, to be introduced, under any circumstances, as a constituent of our food. Should the disease in question have been occasioned by the colouring matter made use of in the preparation of the sweetmeat, it is a disaster which cannot, I think, create much surprise, when we consider how recklessly the manufacturers of cheap confectionery are permitted to practise their art."

We have Dr. Letheby's authority for adding, that, within the last three years, as many as seventy cases of poisoning have been traced, in this country, to the deleterious pigments in fancy sweetmeats; and, unless the public themselves make some effort to put a check on the practice, more serious results will yet follow.

Although it is understood that carelessness exists in the general manufacture of confectionery, yet it is not in all sweetmeats that the existence of poison should be suspected. The playful beauty at a ball supper, who pulls a "cracker" with her simpering swain, need not be more afraid of the ruby confit which the explosion discharges into her lap, than of the equally harmless motto that surrounds it. The colouring matter used for the best confectionery is comparatively harmless. In this, as in most similar cases, it is the poor alone who suffer. Our warning is raised more especially against cheap sweetmeats; and against these—as against poison in any form—the less educated and affluent ought to be protected; but in this country, when a deadly evil affects chiefly or wholly the poor, it is allowed to have full sway—the check, if it ever be put on, is slowly and often ineffectually applied. Hence, the poison-sold-everywhere system which we noticed in our number thirty-three, is permitted to go on killing its hundreds per annum, without one member of Parliament of sufficient influence rising "in his place" to legislate a preventive measure. Even when several guests are poisoned at a mayor's feast, there is not influence or earnestness enough amongst the whole corporation, to endeavour

after immunity from sickness or death for the rest of the liggers who have a taste for 'sweetmeats.' If, however, destructive "Burnt Almonds" were sold at Eton or at Harrow, and a scion of an influential house were to be taken ill in consequence of indulgence in these poisoned sugar-plums; a bill would speedily be carried that would shield both rich and poor.

The difficulty, if any should arise, of passing an act to prevent the dissemination of poison, either neat or confected, is very much lessened by the existence of such laws on the Continent. In France, for example, no one can sell poisonous drugs without a special licence, and even then only under strict and wise regulations. There, too, where confectionery is much more used than on this side of the Channel, the medical officials exercise a vigilant inspection over its manufacture.

THE TRUE REMEDY FOR COLLIERY EXPLOSIONS.

SIR,—With great interest and curiosity I perused a letter which appeared in number forty of "Household Words," purporting to supply a remedy for those lamentable colliery explosions that are unhappily so frequent.

Briefly, I beg to inform you that Artesian wells are only a partial and very uncertain method for carrying off a *portion* of the gas accumulated in the "goafs" of a mine.

In a properly managed colliery, this important object is thus effected:—The "goafs" are securely cut off from communication with other parts of the workings by *stoppings*, and the gas continually accumulating in these spaces is carried away to the "dumb-drift," which is an air-passage rising gradually, and forming a junction with the upcast shaft, about five yards above the fire of the furnace. At a glance it will be perceived that this is far more efficacious than any number of bore-holes—the draught of the furnace is powerful enough to draw off the impure air in the "goafs," while the greater space afforded by a drift, instead of a bore-hole, is another important advantage.

But it is not that we are without the means of ventilating our mines, or that we are in want of clever practical men; both are within our reach, and explosions most frequently arise from those means not being made available. You, Sir, have told us, in a few judicious remarks at the close of a "Coal Miner's Evidence," in No. 27 of "Household Words," the best and most effectual remedy for colliery explosions.

Government Inspection—not the appointment of four gentlemen for the United Kingdom—but a searching and daily scrutiny into the system of working pursued in all fiery collieries, is the only remedy within our reach. The present arrangement adopted by Government is miserably inefficient. No four men can inspect all the collieries in the kingdom.

Not till some chemical agent is discovered

capable of absorbing or neutralising carburetted hydrogen, will mines be *perfectly safe*. It may, or may not be, in the power of our chemists to achieve this, but it does not seem impossible; and if our Faradays and Brandes can effect it, they will do more good to their fellow creatures, by such a discovery, than any that has yet been made.

S. R.

THE MODERN SOLDIER'S PROGRESS.

PART II.—FOREIGN SERVICE.

THE pleasures of a barrack-yard, which Maurice began now to enjoy, were not destined to be of long continuance—at least without further probation; for one fine day in June, a letter arrived from the Horse Guards, ordering the commanding officer to hold the regiment in readiness for immediate embarkation for foreign service. The news soon spread, and a stir was visible throughout the barracks, every man eagerly asking what was "The Route?" To enhance his national importance, which stood little in need of anything out of the common, the serjeant-major made a mystery of this particular, until he had assembled the "none-commissioned" (so he called them) to whom he communicated the fact—with as much circumstance as if he had received it personally under the Duke's own autograph—that the regiment was ordered to Halifax in Nova Scotia.

In spite of the regimental school, which did not, however, at that time, attract one-twentieth part of the voluntary scholars who now flock to it, there were very few who knew exactly where Halifax, or indeed, where North America itself was situated. The prevailing idea was in favour of "Chiny," that being the region to which all *terre incognite* are generally consigned by the uninitiated; but some, whose geographical notions were even less precise, associating Halifax with a proverbial expression current in the army, were inclined to think that it claimed kindred with even a warmer climate than that of "the flowery land." They found out their mistake before they had been many months on the other side of the Atlantic.

But the regiment was not left altogether to burst in ignorance, or discover, by dint of experience where Nova Scotia really was; for it happened that there was one old soldier in it—and he richly deserved the appellation—who had formerly been quartered there. This was a man of the name of Patrick Mac Manus, who had commenced his military career in the "Music" of the regiment, when he was barely ten years old, and just able to jingle the triangles, whose melody he was called upon to elicit. From the band he was transferred to the drums; and after two or three years' experience in drubbing sheepskin, was elevated to the fife. To what further musical eminence he might have attained, it is difficult to say; perhaps he

might have expended himself on the key-bugle, or have become absorbed in the big drum; but at the proper age for rendering efficient military service, the instrument to which he took a fancy, was the musket—and he was drafted into the battalion.

There might have been something more than mere fancy in his last choice, for Patrick was tender-hearted; and, though he would have fought any lad in the regiment of his own weight and age—or heavier and older, for that matter—as soon as eat his breakfast, he never could bring himself to handle “the cat;” and when MacManus was a boy, a week seldom passed without his having more than one “five-and-twenty” to administer as his share of punishment inflicted before breakfast—when the meal that followed the punishment parade was rarely swallowed.* On these occasions the drum-major’s cane left tokens on Patrick’s shoulders of the unwillingness with which he performed this description of “duty;” and that functionary, who was a sharp, red-faced little man, with a bandy elbow, gladly resigned his “chicken-hearted” pupil—as he called him, by a misnomer which Patrick very soon rectified. Mac Manus quickly became a smart soldier, and, being generally liked in the regiment, had as reasonable a prospect of promotion as could be desired; but, whether he were born—as some are—without ambition, or whether ill-luck, as frequently happens, predominated over his destiny, is a matter of doubt. Perhaps the real cause of his continuing in the ranks arose from the good-nature and “devil-may-care-ism” that got him into so many scrapes; which, though they did not affect his moral character, by no means elevated him in the eyes of the authorities as a model of military discipline.

But if he did not acquire distinction by rank, Mac Manus speedily gained that sound distinction which renders a man invaluable on a march or bivouac, round a camp-fire or on a recruiting party; he could tell a good story, sing a good song, had an inexhaustible fund of good spirits, and made the best of everything that was bad. “It’s the rough coat that turns the wet,” he used to say, “so never take sorrow to heart, boys.” But if Mac Manus kept sorrow aloof he did not exclude sympathy, and it is difficult in the long run to prevent the two from uniting, only he

* A vast amelioration with respect to corporal punishment has taken place within the last twenty-five years. At that time the articles of war permitted, and the inclination of the commanding officer very often enforced a punishment of three hundred lashes, when such was the sentence of a Regimental or Garrison Court Martial; moreover, if the crime were desertion, or a more than ordinarily flagrant breach of military discipline, and a General Court Martial sat on the delinquent, the amount of punishment might range from five hundred to eight hundred lashes (or even more), though the latter number was the most we ever had the misfortune to witness the infliction of, on one individual. Now, the amount of corporal punishment is never permitted to exceed fifty lashes, and this only in aggravated cases; the general number being twenty-five, and those rarely inflicted, so that, practically, corporal punishment may be said to be almost abolished.

took the disease in a mild form, his warmth of heart preventing him from catching cold upon it. The best elements of popularity were thus in his natural disposition, and then the length of his service gave him authority, so that if any question were on foot in the regiment affecting the rights or interests of the soldier, or if any doubtful point were to be decided, an appeal was always made to Mac Manus, and whatever he said was sure to give satisfaction.

Accordingly, when the route, of which we have spoken, was made known, a bevy of fellows, foremost amongst whom was Maurice Savage, hurried off to the Canteen where Mac Manus was taking a quiet pipe and pot with his friend Corporal Rattler, and “discoorsin” on the now universal topic.

“It’s about Halifax, then, that you want to know, boys!” said the veteran. “Make a circle and keep silence, and I’ll tell you as much as will serve you all round for night-caps. I was but a gossoon when first I put my foot upon the iron-bound shores of Novy Skoshy, but I saw enough while I was there, and staid long enough to remember all about the place. It was in the Duke of Kent’s time,—her Majesty’s royal father—he was called Prince Edwarl then, and a pretty time we had of it. Oeh, boys, the drill was murdering entirely! The officers called it ‘discipline,’—it’s harrassin’ the men in quarters, not discipline in the field that I mane, for ye can’t have too much discipline in front of the enemy—that is, in rayson. You think it hard, boys, to be handed over to the care of Corporal Rattler (here’s your health Corporal), when you hear the ‘rouse and turn out,’ at six o’clock on a fine summer’s morning; but I should like to know what you’d have said, when the bugle blew in the middle of the night, and it was who should be first up to plaster his head with powder and pomatum, shave off his whiskers close under the cheek-bone, leaving just enough to swear by, tie his comrade’s pigtail at a mathematical angle, pipe-clay his belts, heel-ball his pouch, and do fifty other things that he ought to have got ready the evening before, to be in time for the daylight parade in the climate of Novy Skoshy, with the glass down at zero,—that’s ‘nothing,’ boys—or may be, five or six degrees below it.”

“Less than nothing!” interrupted the schoolmaster sergeant, who was *ex-officio* the regimental Bonnycastle, and had a vile habit of taking nothing for granted till it was proved; “less than nothing! How do you make that out, Pat?”

“As pat as you please, Sergeant, for a learned ignoramus as you are! A glass that held less than nothing would be a bad one to drink out of; wouldn’t it, Corporal Rattler?—(the gallant militarist nodded, and drained his own, by way of trying the experiment)—but I’m spaking of a weather-glass, an instrument like my pipe filled with quicksilver,

only it 's straight up and down, like your cane, with 'nothing' scored across the belly of it, and plenty of tail to bring up the rear. But we wanted no thermometer to tell us it was cold in Novy Skoshy, where the water froze over the fire; and if a man handled his piece awkwardly, he maybe left the skin of his fingers sticking to the barrel."

The majority of Mac Manus's auditors gave a furtive glance at their horny hands as he made this announcement.

"It 's clumsy work tossing Brown Bess about in gloves," continued Mac Manus; "but you must do it there if you want to keep out of hospital—ay, and wash your face in snow if you're frostbitten; or, perhaps, you may lave your ears behind you, and wake with a blue nose like the native Haligonians! How any of us preserved a feature of our faces is more than I can tell you; for when we got outside the barrack-yard, and were marched off in the dark to Rockingham, where his Royal Highness lived, a place between five and six miles off, the Barber got a-hould of us, and—"

"Was it the barber of the ridgement?" interrupted Maurice, whose beard had not yet begun to sprout.

"Ay, and garrison too, my lad—the universal barber—he had a roving commission, as the sailors say; but I'll tell you, boys—'The Barber' is the name the Haligonians give to the north-wester, that cuts in them parts sharper than any razor. You've about six months' winter, dead-on-end, in that climate, and he blows pretty nigh all the time. Well, we had this to face on our march, two hours of it, pitch dark, with creepers on our feet and heavy packs on our backs, and what for? To be overhauled by his Royal Highness and staff, almost afore they could see whether we was the soldiers they came out to inspect, or so many ridgements of half-friz Novy Skoshian bears! Faith, the bears had the best of it, for they had no tails to tie or pomatum to use—though they're said to furnish it in plenty—and only comes out when they're hunger-driven, but stays at home, for the most part, sleepin' and suckin' their paws. The devil a much sleep did we get, with three nights in bed for garrison duty, and two out of it every week for parade at Rockingham, at half-past six on a winter's mornin' in heavy marching order! And then the sentries, whether it war on the dockyard wharf, or in the fort, high or low, the could got at you and nipped you like a vice. Oh, there was one post on the brow of the hill,—many's the time I never expected to be alive when the relief came round, and more than one poor fellow took his last sleep in that sentry box, not from neglect of duty, but in respect of the drowsiness which bate 'em entirely. Once give way to it, boys, and it's all up with you!"

"And is it so cold as this all the year round?" asked one of his hearers.

"It is not," replied Mac Manus with emphasis. "Thry a three hours drill on the common in summer, and see what you'll make of it. Talk of the glass then; it's at boiling hate, and the birds in the air fall down ready roasted. Or go into the woods, and a pumpkin's a fool to the size of your head, after being stung to death with the black flies and muskeeties, when you come out again. But these is all the accidents of climate, boys. There's plenty to make up for them inconveniences. Speruts is dirt chape (hear, hear, from Corporal Rattler), 'specially Prince Edward's Island Whiskey; mate of all kinds is raysonable, and so is greens, and the like, and 'tatics; fish is to be had for a song, and they throw the lobsters at you, if you just looked at 'em. A lad, when he's off duty, may go out of an afternoon and ate as many ras'bries off the rocks as would keep a pastry-cook in jam for a twelvemonth. Then there's the fogs and the snow when you can't go out to drill (Barrack room drill can always be had, suggested Corporal Rattler), and the sleigh-driving, and the snow-balling, and the sliding down hill—for it's all down hill at Halifax—and the officers' plays, and all kinds of diversions of which you partake, more or less. Oh, take my word for it, there's worse places in the world than Novy Skoshy, and some of us'll live to find that out."

In this *exposé* of Mac Manus there was enough, and more than enough, to set his audience thinking, and many were the speculations to which it gave birth; but, on the whole, the men were well enough pleased with their destination. It seldom happens otherwise, for no class is so fond of change and movement as the soldier, and that, at least, was secured by the order to march. How the march or transit was to be conducted, was another affair, and that it is our business now to describe.

Four transports were immediately taken up by government, and, as fast as they were got ready, were sent round to Liverpool, to receive the number of troops allotted to each. It will be enough for our purpose to select that which bore Maurice and his fortunes.

An embarkation, however, is never a very satisfactory performance, even in private life; but when the "small family party" consists of a couple of hundred soldiers, a good many of them not very sober, with their wives, their children, their pet dogs, their bird-cages, their arm-chests, their handboxes, bundles, and other *impedimenta*, the pleasures of travel are not very greatly enhanced. It is pleasant enough, marching out of barracks to the tune of "The Girl I left behind me," but before your troops are fairly settled down in your transport, a variety of "disagreeables" have to be encountered.

The worst of these occur on board the transport; but it is no trifling task to get everybody fairly into the boats; and a drover's

at Smithfield has but a slight duty to perform in getting his flock into their pen, compared with that of officers and non-commissioned officers in routing the stragglers out of the public-houses into which they will drop to take "the parting-glass" with each other, though their destination be identical, and the dreaded separation no greater than the distance between their respective hammocks. The ladies too—pity that we should say so—give no little trouble. The stern rules of the service admit of only six married women per company; and the selection, in this case, is guided by the good conduct of the claimants, of whom there are always more than the regulations admit of taking. Add to this, the fact, that it generally happens that promises which, no doubt, would gladly be forgotten—not to say broken—are rigidly enforced during the last week before the regiment embarks, by damsels who will not be included in the category alluded to in the pleasant tune with which the men march out of quarters. The consequence of this is, that three or four women, per company, are often added to its strength—we must not say its weakness—at the very last moment, for whom there is not the shadow of a chance that they will be permitted to go out with their husbands. Nevertheless, they marry; they climb into the baggage-wagon, "just to say good-bye,"—they weep and embrace, and wave their handkerchiefs at the water-side; they scream "farewell," in accents of the wildest despair; they swoon on the beach, are carried off by compassionate individuals, and are seen no more, till some four or five days afterwards, when the transport is fairly "in blue water," when they emerge from their hiding-places, between decks, satisfied—though they are not to be provisioned, and are threatened with all sorts of pains and penalties—that it is impossible now to send them back; in spite of the declaration of the commanding officer on board, that he will hail the first vessel he meets returning to England, and trans-ship them in the middle of the Atlantic!

How these extra women manage to effect their entrance into the transport, is a mystery as great as that which puzzled George the Third in the celebrated case of the apple-dumplings; but ban and bar them as you will, seize on them when they are half-way up the side, put double sentries at each gangway, resort to every ingenious expedient that can be thought of, and, *malgré tous*, not a "man-jack" of these Ariadnes will be left behind. Perhaps the inappropriate word we have just used may furnish some clue to the enigma in the alteration of costume; but this is a mere conjecture on our part, having no experience to recount of having detected the Billy Taylor transmigration.

The distribution of the troops into their several berths; the stowing of the baggage into impossible corners—perhaps already filled by some of the prohibited women; the safe

bestowal of "the inebriated;" the successful mustering of "the sick, lame, and lazy;" are strokes of art which ought alone to ensure the promotion of those who are called upon to perform them. If the people of the transport lent any kind of assistance, it would be something; but from the agent in his cabin, to the loblolly boy in the caboose, the sole occupation of each consists in damning "the sogers," and sulkily refusing to answer the simplest questions; so that they don't mend the matter, and the only thing left, is to trust to time and that providential interference, which is always working for our good, unseen, though we by no means recommend those in difficulties to trust to it alone.

As long as the transport is in harbour, difficulties abound; boats are always coming alongside with hecatombs of fresh meat and piles of vegetables, for the officers and sergeants' messes; smugglers insinuate gin in bladders; an unlucky woman is discovered, and sent ashore, who comes back again somehow, like a bad penny—probably in the return boat; in short, until the Blue Peter is hoisted, the vessel is one scene of unutterable confusion. In the early days of Patrick Mac Manus, this scene was prolonged till the wind blew fair, but the steam-tugs now are the "trickay spirits" that supersede the wind till the transports are outside.

It was by the aid of two of these nautical Effects that the "Eliza Biggleswade" transport, with "No. 27" painted on each side of her bows, which conveyed the last division of the — Regiment, was tugged into the Channel, where Maurice Savage, and about a hundred and fifty of his comrades—to say nothing of women and children—commenced that series of involuntary evolutions which are almost invariably performed by those who have never been at sea before.

In the course of a few days, however, matters righted themselves a little. Soldiers are not allowed to be sick any longer than is absolutely necessary; and it is surprising how effective the word of command is which sends a fellow on deck to look out for his grog at the tub, or his ration at the caboose, when he knows that if he remains below he shall receive neither. "Sea legs" are not very readily found in ordinary cases; but a soldier discovers his as soon as most people, having his ranks to keep, and certain manœuvres to go through on a limited scale, in spite of the rolling or pitching of the vessel, and at the expiration of a week or so, there remained scarcely half-a-dozen on board the "Eliza Biggleswade" who had not been laughed or drilled out of their "sea-sickness." The voyage was accomplished without any remarkable casualties; there was cod-fishing by day, on the Banks of Newfoundland, to amuse the men and give them a welcome supply, and a careful watch and ward by night on the same banks to escape being run down in the heavy Newfoundland fogs.

Sable Island, dreary and inhospitable though it be, was hailed and passed with pleasure. Sambre' light was a welcome signal; the pilot, who came on board in the grey of the morning, was a messenger of glad tidings; and the beautiful harbour of Halifax a joyful sight after seven weeks' confinement in the "Eliza Biggleswade."

To land with far more regularity than they had embarked—shake hands with their comrades, who had preceded them—to march up the hill to barracks, with the air of men who had already seen some service, and were prepared to see more—and to know that they were in a new hemisphere, with no aspect materially altered of things they had been accustomed to behold—were matters on which the young soldiers congratulated themselves with no small degree of internal satisfaction; and no one amongst them more readily than Maurice Savage, heretofore the unwilling pupil of Corporal Rattler, but now by no means the least active or efficient of the light company in the Regiment.

His further and final progress will be told next week.

"JUDGE NOT!"

MANY years since, two pupils of the University at Warsaw were passing through the street in which stands the column of King Sigismund, round whose pedestal may generally be seen seated a number of women selling fruit, cakes, and a variety of eatables, to the passers-by. The young men paused to look at a figure whose oddity attracted their attention. This was a man apparently between fifty and sixty years of age: his coat, once black, was worn threadbare; his broad hat overshadowed a thin wrinkled face; his form was greatly enervated, yet he walked with a firm and rapid step. He stopped at one of the stalls beneath the column, purchased a halfpenny worth of bread, ate part of it, put the remainder into his pocket, and pursued his way towards the palace of General Zajonczek, lieutenant of the kingdom, who, in the absence of the Czar, Alexander, exercised royal authority in Poland.

"Do you know that man?" asked one student of the other.

"I do not; but, judging by his lugubrious costume, and no less mournful countenance, I should guess him to be an undertaker."

"Wrong, my friend; he is Stanislas Staszic."

"Staszic!" exclaimed the student, looking after the man, who was then entering the palace. "How can a mean, wretched-looking man, who stops in the middle of the street to buy a morsel of bread, be rich and powerful?"

"Yet, so it is," replied his companion. "Under this unpromising exterior is hidden one of our most influential ministers, and one of the most illustrious *seigneurs* of Europe."

The man whose appearance contrasted so

strongly with his social position, who was as powerful as he seemed insignificant, as rich as he appeared poor, owed all his fortune to himself—to his labours, and to his genius.

Of low extraction—he left Poland, while young, in order to acquire learning. He passed some years in the Universities of Leipsic and Gottingen, continued his studies in the College of France, under Brisson and D'Aubanton; gained the friendship of Buffon; visited the Alps and the Apennines; and, finally, returned to his native land, stored with rich and varied learning.

He was speedily invited by a nobleman to take charge of the education of his son. Afterwards, the Government wished to profit by his talents; and Staszic, from grade to grade, was raised to the highest posts and the greatest dignities. His economical habits made him rich. Five hundred serfs cultivated his lands, and he possessed large sums of money placed at interest. When did any man ever rise very far above the rank in which he was born, without presenting a mark for envy and detraction to aim their arrows against? Mediocrity always avenges itself by calumny; and so Staszic found it, for the good folks of Warsaw were quite ready to attribute all his actions to sinister motives.

A group of idlers had paused close to where the students were standing. All looked at the minister, and every one had something to say against him.

"Who would ever think," cried a noble, whose grey moustaches and old-fashioned costume recalled the era of King Sigismund, "that he could be a minister of state? Formerly, when a Palatin traversed the Capital, a troop of horsemen both preceded and followed him. Soldiers dispersed the crowds that pressed to look at him! But what respect can be felt for an old miser, who has not the heart to afford himself a coach, and who eats a piece of bread in the streets, just as a beggar would do?"

"His heart," said a priest, "is as hard as the iron chest in which he keeps his gold; a poor man might die of hunger at his door, before he would give him alms."

"He has worn the same coat for the last ten years," remarked another.

"He sits on the ground for fear of wearing out his chairs," chimed in a saucy-looking lad, and every one joined in a mocking laugh.

A young pupil of one of the public schools had listened in indignant silence to these speeches, which cut him to the heart; and at length, unable to restrain himself, he turned towards the priest, and said:—

"A man distinguished for his generosity ought to be spoken of with more respect. What does it signify to us how he dresses, or what he eats, if he makes a noble use of his fortune?"

"And pray what use does he make of it?"

"The Academy of Sciences wanted a place for a library, and had not funds to hire one.

Who bestowed on them a magnificent palace ? Was it not Staszic ! ”

“ Oh ! yes, because he is as greedy of praise as of gold.”

“ Poland esteems, as her chief glory, the man who discovered the laws of the sidereal movement. Who was it that raised to him a monument worthy of his renown—calling the chisel of Canova to honour the memory of Copernicus ! ”

“ It was Staszic,” replied the priest, “ and so all Europe honours for it the generous senator. But, my young friend, it is not the light of the noon-day sun that ought to illumine Christian charity. If you want really to know a man, watch the daily course of his private life. This ostentatious miser, in the books which he publishes, groans over the lot of the peasantry, and in his vast domains he employs five hundred miserable serfs. Go some morning to his house—there you will find a poor woman beseeching with tears a cold proud man who repulses her. That man is Staszic—that woman his sister. Ought not the haughty giver of palaces, the builder of pompous statues, rather to employ himself in protecting his oppressed serfs, and relieving his destitute relative ? ”

The young man began to reply, but no one would listen to him. Sad and dejected at hearing one who had been to him a true and generous friend, so spoken of, he went to his humble lodging.

Next morning he repaired at an early hour to the dwelling of his benefactor. There he met a woman weeping, and lamenting the inhumanity of her brother.

This confirmation of what the priest had said, inspired the young man with a fixed determination. It was Staszic who had placed him at college, and supplied him with the means of continuing there. Now, he would reject his gifts—he would not accept benefits from a man who could look unmoved at his own sister's tears.

The learned minister, seeing his favourite pupil enter, did not desist from his occupation, but, continuing to write, said to him :

“ Well, Adolphe, what can I do for you to-day ? If you want books, take them out of my library ; or instruments—order them, and send me the bill. Speak to me freely, and tell me if you want anything.”

“ On the contrary, Sir, I come to thank you for your past kindness, and to say that I must in future decline receiving your gifts.”

“ You are, then, become rich ! ”

“ I am as poor as ever.”

“ And your college ! ”

“ I must leave it.”

“ Impossible ! ” cried Staszic, standing up, and fixing his penetrating eyes on his visitor. “ You are the most promising of all our pupils—it must not be ! ”

In vain the young student tried to conceal the motive of his conduct ; Staszic insisted on knowing it.

“ You wish,” said Adolphe, “ to heap favours on me, at the expense of your suffering family.”

The powerful minister could not conceal his emotion. His eyes filled with tears, and he pressed the young man's hand warmly, as he said :

“ Dear boy, always take heed to this counsel—‘ JUDGE NOTHING BEFORE THE TIME.’ Ere the end of life arrives, the purest virtue may be soiled by vice, and the bitterest calumny proved to be unfounded. My conduct is, in truth, an enigma, which I cannot now solve—it is the secret of my life.”

Seeing the young man still hesitate, he added :

“ Keep an account of the money I give you, consider it as a loan ; and when some day, through labour and study, you find yourself rich, pay the debt by educating a poor, deserving student. As to me, wait for my death, before you judge my life.”

During fifty years Stanislas Staszic allowed malice to blacken his actions. He knew the time would come when all Poland would do him justice.

On the 20th of January, 1826, thirty thousand mourning Poles flocked around his bier, and sought to touch the pall, as though it were some holy, precious relic.

The Russian army could not comprehend the reason of the homage thus paid by the people of Warsaw to this illustrious man. His last testament fully explained the reason of his apparent avarice. His vast estates were divided into five hundred portions, each to become the property of a free peasant—his former serf. A school, on an admirable plan and very extended scale, was to be established for the instruction of the peasants' children in different trades. A reserved fund was provided for the succour of the sick and aged. A small yearly tax, to be paid by the liberated serfs, was destined for purchasing, by degrees, the freedom of their neighbours, condemned, as they had been, to hard and thankless toil.

After having thus provided for his peasants, Staszic bequeathed six hundred thousand florins for founding a model hospital ; and he left a considerable sum towards educating poor and studious youths. As for his sister, she inherited only the same allowance which he had given her, yearly, during his life ; for she was a person of careless, extravagant, habits, who dissipated foolishly all the money she received.

A strange fate was that of Stanislas Staszic. A martyr to calumny during his life, after death his memory was blessed and revered by the multitudes whom he had made happy.

HOUSEHOLD WORDS.

A WEEKLY JOURNAL.

CONDUCTED BY CHARLES DICKENS.

N^o. 45.]

SATURDAY, FEBRUARY 1, 1851.

[PRICE 2d.]

PLATE GLASS.

Two other gentlemen occupied the railway carriage, which, on a gusty day in December, was conveying us towards Gravesend, *via* Blackwall. One wore spectacles, by the aid of which he was perusing a small pocket edition of his favourite author. No sound escaped his lips; yet, his under-jaw and his disengaged hand moved with the solemn regularity of an orator emitting periods of tremendous euphony. Presently, his delight exploded in a loud shutting up of the book and an enthusiastic appeal to us in favour of the writings of Dr. Samuel Johnson. "What, for example, can be finer, gentlemen, than his account of the origin of glass-making; in which, being a drysalter, I take a particular interest. Let me read the passage to you!"

"But the noise of the train——"

"Sir, I can drown that."

The tone in which the Johnsonian "Sir" was let off, left no doubt of it. Though a small man, the reader was what his favourite writer would have denominated a Stentor, and what the modern school would call a Stunner. When he re-opened the book and began to read, the words smote the ear, as if they had been shot out of the mouth of a cannon. To give additional effect to the rounded periods of his author, he waved his arm in the air at each turn of a sentence, as if it had been a circular saw. "Who," he recited, "when he saw the first sand or ashes, by a casual intense-ness of heat, melted into a metalline form, rugged with excrescences, and clouded with impurities, would have imagined, that in this shapeless lump lay concealed so many conveniences of life, as would in time constitute a great part of the happiness of the world? Yet by some such fortuitous liquefaction was mankind taught to procure a body at once in a high degree solid and transparent, which might admit the light of the sun, and exclude the violence of the wind: which might extend the sight of the philosopher to new ranges of existence, and charm him at one time with the unbounded extent of the material creation, and at another with the endless subordination of animal life; and, what is yet of more importance, might supply the decays of nature, and succour old age with subsidiary sight. Thus was the first artificer

in glass employed, though without his own knowledge or expectation. He was facilitating and prolonging the enjoyment of light, enlarging the avenues of science, and conferring the highest and most lasting pleasures; he was enabling the student to contemplate nature, and the beauty to behold herself. This passion for——"

"Blackwall, gents! Blackwall, ladies! Boat for Gravesend!" We should, unquestionably, have been favoured with the rest of the ninth number of the "Rambler" (in which the foregoing passage occurs) but for these announcements.

"There is one thing, however," said the little man with the loud voice, as we walked from the platform to the pier, "which I cannot understand. What does the illustrious essayist mean by the 'fortuitous liquefaction' of the sand and ashes. Was glass found out by accident?"

Luckily, a ray of school-day classics enlightened a corner of our memory, and we mentioned the well-known story, in Pliny, that some Phœnician merchants, carrying saltpetre to the mouth of the river Belus, went ashore; and, placing some lumps of the cargo under their kettles to cook food, the heat of the fire fused the nitre, which ran among the sand of the shore. The cooks finding this union to produce a translucent substance, discovered the art of making glass.

"That," said our other companion, holding his hat to prevent the wind from blowing it aboard the Gravesend steamer (which was not to start for ten minutes), "has been the stock tale of all writers on the subject, from Pliny down to Ure; but, Sir Gardiner Wilkinson has put it out of the power of future authors to repeat it. That indefatigable haunter of Egyptian tombs discovered minute representations of glass-blowing, painted on tombs of the time of Orsirtasin the First, some sixteen hundred years before the date of Pliny's story. Indeed, a glass bead, bearing the name of a king who lived fifteen hundred years before Christ, was found in another tomb by Captain Henvey, the specific gravity of which is precisely that of English crown-glass."

"You seem to know all about it!" exclaimed the loud-voiced man.

"Being a director of a plate-glass company

I have made it my business to learn all that books could teach me on the subject."

"I should like to see glass made!" said the vociferous admirer of Dr. Johnson, "especially plate glass."

To this, the other replied, with ready politeness, "If your wish be very strong, and you have an hour to spare, I shall be happy to show you the works, to which I am going,—those of the Thames Plate Glass Company. They are close by."

"The fact is," was the reply, "Mrs. Bossle (I'm sorry to say Mrs. Bossle is an invalid) expects me down to Gravesend to tea; but an hour won't matter much."

"And you, sir!" said the civil gentleman, addressing me.

My desire was equally strong, and the next hour equally my own; for, as the friend, whom a negligent public had driven to emigration, was not to sail until the next morning, it did not much matter whether I took my last farewell of him at Gravesend early or late that evening.

Tracking our guide through dock gates, over narrow drawbridges, along quays; now, dodging the rigging of ships; now, tripping over cables, made "taut" to rings; now, falling foul of warping-posts (for it was getting dusk); one minute, leaping over deserted timber; the next, doubling stray casks; the next, winding among the strangest ruins of dismantled steam-boats, for which a regular Hospital seemed established in that desolate region of mud and water; then, emerging into dirty lanes, and turning the corners of roofless houses; we finished an exciting game of Follow my Leader, at a pair of tall gates. One of these, admitted us into the precincts of the southernmost of the six manufacturing plate glass existing in this country.

The first ingredient in the making of glass, to which we were introduced, was contained in a goodly row of barrels in full tap, marked with the esteemed brand of "Truman, Hambury, Burton, & Co." It is 'the well-known fermented extract of malt and hops, which is, it seems nearly as necessary to the production of good plate glass, as flint and soda. To liquefy the latter materials by means of fire, is, in truth, dry work; and our *cicerone* explained, that seven pints per day, per man, of Messrs. Truman, Hambury, Burton, and Company's entire, has been found, after years of thirsty experience, to be absolutely necessary to moisten human clay, hourly baked at the mouths of blazing furnaces. These furnaces emit a heat more intense than the most perspiring imagination can conceive, or the staunchest thermometer indicate. An attempt to ascertain the degree of heat was once made: a pyrometer (a thermometer of the superlative degree, or "fire-measurer,") was applied to the throat of a furnace—for every furnace has its mouth, its throat, and its flaming tongues; but, the wretched instrument, after five minutes' scorching, made an

expiring effort to mark *thirteen hundred degrees above boiling point*, cracked, was shivered into bits, and was finally swallowed up by the insatiable element whose proceedings it had presumptuously attempted to register.

Having, by this time, crossed a yard, we stood on the edge of a foul creak of the Thames, so horribly slimy that a crocodile, or an alligator, or any scaly monster of the Saurian period, seemed much more likely to be encountered in such a neighbourhood than the beautiful substance that makes our modern rooms so glittering and bright; our streets so dazzling, and our windows at once so radiant and so strong.

"In order to understand our process thoroughly," said the obliging director of the seven acres of factory and the four hundred operatives we had come to see, "we must begin with the beginning. This," picking up from a heap a handful of the finest of fine sand—the glittering pounce, in fact, with which our forefathers spangled their writing,—is the basis of all glass. It is the whitest, most highly pulverised flint sand that can be procured. This comes from Lynn, on the coast of Norfolk. Its mixture with the other materials is a secret, even to us. We give the man who possesses it a handsome salary for exercising his mystery."

"A secret!" cried Mr. Bossle. "Every body I thought, knew—at least everybody in the dyslathery line understands—what glass is made of. Why, I can repeat the recipe given by Dr. Ure, from memory:—'To every hundred parts of materials, there are of pure sand forty-three parts; soda twenty-five and a half (by the bye, we have some capital carbonate coming forward *ex* Mary Anne, that we could let you have at a low figure); quick-lime, four; nitre, one and a half; broken glass, twenty-six. The Doctor calculates, if I remember rightly, that of the whole, thirty parts of this compound run to waste in fusing, so that seventy per cent. becomes, on an average, glass.'"

"That is all very true," was the answer; "but our glass is, we flatter ourselves, of a much better colour, and stands annealing better, than that made from the ordinary admixture: from which, however, ours differs but little—only, I think, in the relative quantities, in that lies the secret."

Mr. Bossle expressed great anxiety to behold an individual who was possessed of a secret worth several hundreds a-year, paid weekly. Romance invariably associates itself with mystery; and we are not quite sure from the awful way in which Mr. Bossle dropped his voice to a soft whisper, that he did not expect, on entering the chamber of pre-vitrified chemicals, to find an individual clothed like the hermit in "*Rasselas*," or mingling his "elements" with the wand of *Hermes Triemegistus*. He looked as if he could hardly believe his spectacles, when he

saw a plain, respectable-looking, indifferent-tempered man, not a whit more awe-inspiring—or more dusty—than a miller on a market-day.

We do not insinuate that Mr. Bossle endeavoured to “pluck out the heart of the mystery,” though nothing seemed to escape the focus of his spectacles. But, although here lay, in separate heaps, the sand and soda and saltpetre and lime and *cullet*, or broken glass; while there, in a huge trough, those ingredients were mixed up (like “broken” in a confectioner’s shop) ready to be pushed through a trap to fill the crucible or stomach of the furnace; yet, despite Mr. Bossle’s sly investigations, and sonorous enquiries, he left the hall of “elements” as wise as he had entered.

Passing through a variety of places in which the trituration, purification, and cleaning of the materials were going on, we mounted to an upper story that reminded us of the yard in which the cunning Captain of the Forty Thieves, when he was disguised as an Oil Merchant, stored his pretended merchandise. It was filled with rows and rows of great clay jars, something like barrels with their heads knocked out. Each had, instead of a hoop, an indented band round the middle, for the insertion of the iron gear by which they were, in due time, to be lifted into and out of the raging furnaces. There were two sizes; one about four feet deep, and three feet six inches in diameter, technically called “pots,” and destined to receive the materials for their first sweltering. The smaller vessels (*cuvettes*) were of the same shape, but only two feet six inches deep, and two feet in diameter. These were the crucibles in which the vitreous compound was to be fired a second time, ready for casting. These vessels are built—for that is really the process; and it requires a twelvemonth to build one, so gradually must it settle and harden, and so slowly must it be pieced together, or the furnace would immediately destroy it—of Stourbridge clay, which is the purest and least silicious yet discovered. (The clay mentioned in our recent article, “The Devonshire Dorado,”* may be worth a trial, for the manufacture of these crucibles.)

“We have now,” said Mr. Bossle, wiping his spectacles, and gathering himself up for a loud Johnsonian period, “seen the raw materials ready to be submitted to the action of the fire, and we have also beheld the vessels in which the vitrification is to take place. Let us therefore witness the actual liquefaction.”

In obedience to this grandiloquent wish, we were shown into the hall of furnaces.

It was a sight indeed. A lofty and enormous hall, with windows in the high walls open to the rainy night. Down the centre, a fearful row of rearing furnaces, white-hot: to

look at which, even through the chinks in the iron screens before them, and masked, seemed to scorch and splinter the very breath within one. At right angles with this hall, another, an immense building in itself, with unearthly-looking instruments hanging on the walls, and strewn about, as if for some diabolical cookery. In dark corners, where the furnaces ready glimmered on them, from time to time, knots of swarthy muscular men, with nets drawn over their faces, or hanging from their hats; confusedly grouped, wildly dressed, scarcely heard to mutter amidst the roaring of the fires, and mysteriously coming and going, like picturesque shadows, cast by the terrific glare. Such figures there must have been, once upon a time, in some such scene, ministering to the worship of fire, and feeding the altars of the cruel god with victims. Figures not dissimilar, alas! there have been, torturing and burning, even in Our Saviour’s name. But, happily those bitter days are gone. The senseless world is tortured for the good of man, and made to take new forms in his service. Upon the rack, we stretch the ores and metals of the earth, and not the image of the Creator of all. These fires and figures are the agents of civilisation, and not of deadly persecution and black murder. Burn fires and welcome! making a light in England that shall not be quenched by all the monkish dreamers in the world!

We were aroused by a sensation like the sudden application of a hot mask to the countenance. As we instinctively placed a hand over our face to ascertain how much of the skin was peeling off, our cool informant announced that the furnace over against us had been opened to perform the *tréjetage*, or lading of the liquid *pot à feu* from the large pots into the smaller ones. “I must premise,” he said, “that one-third of the raw materials, as put together by our secret friend, are first thrown in; and when that is melted, one-third more; on that being fused, the last third is added. The mouth of the furnace is then closed, and an enormous heat kept up by the *tiseur* or stoker (all our terms are taken from the French), during sixteen hours. That time having now elapsed, in the case of the flaming pot before you, the furnace is opened. The man with the long ladle thrusts it, you perceive, into the pot, takes out a ladleful, and, by the assistance of two companions, throws the vitrified dough upon an iron anvil. The other two men turn it over and over, spread it upon the inverted flat-iron, and twitch out, with pliers, any speck of impurity; it is tossed again into the ladle, and thrown into a *cuvette* in another furnace. When the *cuvettes* are full, that furnace is stopped up to maintain a roaring heat for another eight hours; and, in the language of the men, ‘the ceremony is performed.’”

At this moment, the noise burst forth from the middle of the enormous shed, of several beats of a gong: so loud, that they even

* See Page 263.

drowned the thundering inquiries with which Mr. Bossle was teasing one of the "teasers." In an instant the men hastened to a focus, like giants in a Christmas pantomime about to perform some wonderful conjuration; and not a whisper was heard.

"Aha! exclaimed the director, "they are going to cast. This way, gentlemen!"

The kitchen in which the Ogre threatened to cook Jack and his seven brothers could not have been half so formidable an apartment as the enormous cuisine into which we were led. One end was occupied with a row of awful ovens; in the midst, stood a stupendous iron table; and upon it lay a rolling-pin, so big, that it could only be likened to half-a-dozen garden-rollers joined together at their ends. Above, was an iron crane or gallows to lift the enormous messes of red-hot gruel, thick and slab, which were now to be brought from the furnaces.

"Stand clear!" A huge basin, white with heat, approaches, on a sort of iron hurley; at one end of which sits, triumphant, a salamander, in human form, to balance the Plutonian mass, as it approaches on its wheeled car—playing with it—a game of see-saw. It stops at the foot of the iron gallows. Mr. Bossle approaches to see what it is, and discovers it to be a cuvette filled with molten glass, glowing from the fiery furnace. What is that man doing with a glazed mask before his face? "Why, if you will believe me," exclaims Mr. Bossle, in the tones of a speaking-trumpet, (we are at a prudent distance,) "he is ladling off the scum, as composedly as if it were turtle-soup!" Mr. Bossle grows bold, and ventures a little nearer. Rash man! His nose is assuredly scorched; he darts back, and takes off his spectacles, to ascertain how much of the frames are melted. The dreadful pot is lifted by the crane. It is poised immediately over the table; a workman tilts it; and out pours a cataract of molten opal which spreads itself, deliberately, like infernal sweet-stuff, over the iron table; which is spilled and slopped about, in a crowd of men, and touches nobody. "And has touched nobody since last year, when one poor fellow got the large shoes he wore, filled with white-hot glass." Then the great rolling-pin begins to "roll it out."

"But, those two men, narrowly inspecting every inch of the red hot sheet as the roller approaches it—is their skin salamandrine?—are their eyes fire-proof?"

"They are looking," we are told, "for any accidental impurity that may be still intruding in the vitrification, and, if they can tear it out with their long pincers before the roller has passed over it, they are rewarded. From the shape these specks assume in being torn away, they are called 'tears.'"

When the roller has passed over the table, it leaves a sheet of red-hot glass, measuring some twelve feet by seven.

This translucent confection is pushed upon

a flat wooden platform on wheels—sparkling, as it touches the wood, like innumerable diamonds—and is then run rapidly to an oven, there to be baked or annealed. The bed or "sole" of this *caryatide* is heated to a temperature exactly equal to that of the glass; which is now so much cooled that you can stand within a yard or so of it without fear of scorching off your eyelashes. The pot out of the furnace is cooled too, out in the rain, and lies there, burst into a hundred pieces. It has been a good one: for it has withstood the fire, seventy days.

So rapidly are all these casting operations performed, that, from the moment when Mr. Bossle thought his spectacles were melting off his nose, to the moment when the sheet of glass is shut up in the oven, about five minutes have elapsed. The operations are repeated, until the oven is full of glass plates.

When eight plates are put into the *caryatide* it is closed up hermetically; for the tiniest current of cold air would crack the glass. The fire is allowed to go out of its own accord, and the cooling takes place so gradually, that it is not completed until eight days are over. When drawn forth, the glass is that "rough plate" which we see let into the doors of railway stations, and forming half-transparent floors in manufactories. To make it completely transparent for windows and looking-glasses, elaborate processes of grinding and polishing are requisite. They are three in number:—roughing down, smoothing and polishing.

"I perceive," said Mr. Bossle, when he got to the roughing down room, where steam machinery was violently agitating numerous plates of glass, one upon the other, "that the diamond cut diamond principle is adopted."

"Exactly: the under plate is fastened to a table by plaster of Paris, and the upper one—quite rough—is violently rubbed by machinery upon it, with water, sand, and other grinding powders between. The top plate is then fastened to a table, to rough down another first plate; for the under one is always the smoother."

Then comes the "smoothing." Emery, of graduated degrees of fineness, is used for that purpose. "Until within the last month or so, smoothing could only be done by human labour. The human hand alone was capable of the requisite tenacity, to rub the slippery surfaces over each other; nay, so fine a sense of touch was requisite, that even a man's hand had scarcely sensitiveness enough for the work; hence females were, and still are, employed."

As our pains-taking informant spoke, he pushed open a door, and we beheld a sight that made Mr. Bossle wipe his spectacles, and ourselves imagine for a moment that a scene from an Oriental Story-Book was magically revealed to us; so elegant and graceful were the attitudes into which a bevy of some fifty females—many of them of fine forms and handsome features—were unceasingly throw-

ing themselves. Now, with arms extended, they pushed the plates to one verge of the low tables, stretching their bodies as far as possible; then, drawing back, they stood erect, pulling the plate after them; then, in order to reach the opposite edge of the plane, they stretched themselves out again to an almost horizontal posture. The easy beauty of their movements, the glitter of the glass, the brilliancy of the gaslights, the bright colours of most of the dresses, formed a *coup d'œil* which Mr. Bossle enjoyed a great deal more than Mrs. Bossle, had she been there, might have quite approved.

The fairy scene is soon, however, to disappear. Mr. Blake, the ingenious manager of the works, has invented an artificial female hand, by means of which, in combination with peculiar machinery, glass smoothing can be done by steam. The last process is "polishing." This art is practised in a spacious room glowing with red. Every corner of the busy interior is as rubicund as a Dutch dairy. The floor is red, the walls are red, the ceiling is red, the pillars are red, the machinery is very red. Red glass is attached, by red plaster of Paris, to red moveable tables; red rubbers of red felt, heavily weighted with red leads, are driven rapidly over the red surface. Little red boys, redder than the reddest of Red Indiana, are continually sprinkling on the reddened glass, the rouge (moistened crocus, per oxyde of iron), which converts the scene of their operations into the most gigantic of known rubrics.

When polished, the glass is taken away to be "examined." A body of vigilant scrutineers place each sheet between their own eyes and a strong light: wherever a scratch or flaw appears, they make a mark with a piece of wax. If removable, these flaws are polished off by hand. The glass is then ready for the operation, which enables "the beauty to behold herself." The spreading of the quicksilver at the back is, however, a separate process, accomplished elsewhere, and performed by a perfectly distinct body of workmen. It is a very simple art.

The manufacture of plate-glass adds another to the thousand and one instances of the advantages of unrestricted and unfettered trade. The great demand occasioned by the immediate fall in price consequent upon the New Tariff, produced this effect on the Thames Plate Glass Works—They now manufacture as much plate-glass per week as was turned out in the days of the Excise, in the same time, by all the works in the country put together. The Excise incubi clogged the operations of the workmen, and prevented every sort of improvement in the manufacture. They put their gauges into the "metal" (or mixed materials) before it was put into the pot. They overhauled the paste when it was taken out of the fire, and they applied their foot-rules to the sheets after the glass was annealed. The duty was collected during the various stages of

manufacture half-a-dozen times, and amounted to three hundred per cent. No improvement was according to law, and the Excise put his veto upon every attempt of the sort. In the old time, the mysterious mixer could not have exercised his secret vocation for the benefit of his employers, and the demand for glass was so small that Mr. Blake's admirable polishing machine would never have been invented. Nor could plate glass ever have been used for transparent flooring, or for door pannels, or for a hundred other purposes, to which it is now advantageously and ornamentally applied.

Thanking the courteous gentleman who had shown us over the works, we left Mr. Bossle in close consultation with the Manager. As, in crossing the yard, we heard the word "soda!" frequently thundered forth, we concluded that the Johnsonian dry-salter was endeavouring to complete some transaction in that commodity, which he had previously opened with the director. But, it is not in our power to report decisively on this head, for our attention was directed to two concluding objects.

First, to a row of workmen—the same we had lately seen among the fires and liquid glass—gloom-humouredly sitting, with perfect composure, on a log of timber, out in the cold and wet, looking at the muddy creek, and drinking their beer, as if there were no such thing as temperature known. Secondly, and lastly, to the narrow passages or caves underneath the furnaces, into which the glowing cinders drop through gratings. These looked, when we descended into them, like a long Egyptian street on a dark night, with a fiery rain falling. In warm divergent chambers and crevices, the boys employed in the works love to hide and sleep, on cold nights. So slept DE FOX's hero, COLONEL JACK, among the ashes of the glass-house where he worked. And that, and the river together, made us think of ROBINSON CRUSOE the whole way home, and wonder what all the English boys who have been since his time, and who are yet to be, would have done without him and his desert Island.

A GUILD CLERK'S TALE.

THE office of clerk of the Carvers' Company has been filled by members of my family for one hundred years past. My great-grandfather was elected in the year 1749. After him, came his younger brother; and, when he died, my grandfather was chosen by nine votes out of twelve; after that, all opposition vanished. Our dynasty was established. When my grandfather died, my father went through the ceremony of calling upon the members of the Court of Assistants, and soliciting their votes; and, afterwards, the formality of a show of hands being passed, he was declared, as every one knew he would be who was aware of the existence of the

Company, the successor of his father. The transition from him to myself was so easy as to be hardly felt. When I threw aside my yellow breeches, and came out of the "Blue Coat School," with some knowledge of Greek, and very small skill in penmanship, I was at once transplanted to a stool at my father's desk; which stood railed off, in a corner of the great hall, under the stained-glass window. The master and twelve senior liverymen, who formed what is called the Court of Assistants, saw me there when they met together; and one patted me on the head, and prophesied great things of me, while I sat, very red in the face, wondering who had been talking to him about me. Another, who had himself worn the girdle and blue-petticoats, some half a century previously, examined my classical knowledge; and, finding himself somewhat at fault, remarked that he was not fresh from school, like me. At length, my father and I attended their meetings alternately; and, as he became old and infirm, the duties devolved entirely upon me. When he died, therefore, there was no change. The twelve liverymen held up twelve of their four-and-twenty hands, and my election was recorded on the minutes.

Carvers' Hall was a place not very easy to find out, for any but the warden and twelve liverymen: but, as few people else ever had occasion to find it out, that was not of much consequence. The portion of the city in which it stood had escaped the Fire of London, which took a turn at a short distance, owing, perhaps, to a change in the wind, and left the Hall and some adjacent courts untouched. In order to arrive there, it was necessary, first, to pass through a narrow passage running up from Thames Street; then, along a paved yard, by the railing of a church; and, lastly, down an impassable court, at the bottom of which stood the antique gateway of Carvers' Hall. Over the doorway was a curious carving of the Resurrection, in oak, which must have cost some ancient member of the Worshipful Guild considerable time and trouble. There were represented graves opening, and bald-headed old men forcing up the lids of their family-vaults—some looking happy, and some with their features distorted by despair. Out of others, whole families, mother, father, and several children, had just issued, and were standing hand-in-hand. Some, again, were struggling, half-buried in the ground; while others, already extricated, were assisting their kinsmen in their efforts to disinter themselves. The scene was made a section, in order to give the spectator a view of an immense host of cherubim above, sitting upon a massy pile of cloud; through which—the middle point of the picture—the summoning angel was throwing himself down, with a trumpet in his hand; which, according to the relative scale of the work, must have been several leagues, at least, in length. Having passed

under this gateway, you entered a small square yard, paved with black and white stones, placed diamond-wise; and facing you was the Hall itself, up three stone steps, and with a wooden portico.

This solitary building, silent and retired, though in the heart of a crowded city, has been my home for nearly sixty years. I have become assimilated to the place by long usage. I am myself silent, retired, and tenacious of old habits; though I do not think this is my natural disposition. But why do I talk of natural disposition? Are we not all moulded and made what we are by time and outward influences? However, when I was at school I was a cheerful boy, though the monastic life of Christ's Hospital is not calculated to improve the spirits. It was only on entering my father's office that I began to be subdued to the formal being which I have since become. The portraits of my predecessors hang in the Hall; they are exactly alike, both in features and in dress, except that the first two wore hair-powder. It was my father's pride that he clung to the style of dress which was prevalent when he was a young man, which he considered to be, in every way, superior to all modern inventions. I was only released from the absurd dress of the blue coat boy to be put into garments equally provocative of remarks from impertinent boys. The family costume is, *in primis*, a pair of knee-breeches with buckles; then a blue coat with metal buttons; and a large white cravat, spread out over the whole chest, and ornamented in the middle with a cornelian brooch. The same brooch appears in every one of the portraits. I have worn this dress all my life, with the exception of a short period, when I changed it to return to it shortly again.

If happiness consists in having many friends, I ought to have been a happy man. Old carvers, neighbours, pensioners of the Company, every one down to the house-keeper, and Tom Lawton, my only clerk, spoke kindly of me. There was no lip service. I knew they liked me in their hearts. The world, too, had gone smoothly with me. I knew nothing of the struggles for bread, the hardships and wrongs which other men endure. They appeared to me even fabulous when I read them. The means of getting my living were put into my hands. The Company seemed almost grateful to my father for bringing me up to the office. My income was two hundred pounds per annum, as well as the house to live in, and coals and candles, which was more than I needed for my support, though I always found means of disposing of the surplus, and never saved anything. I was not, however, a happy man. I had always the feeling of a spirit subdued to a life to which it was not suited. I do not say that in another sphere I should have led a boisterous life. My mind was, perhaps, more prone to reflection than to action, although I felt that if I had been more in the world, if

I had known more of life and change, I should have been a happier man. But from my earliest days the vanity of life, and the virtue of keeping aloof from temptation, were instilled into me. "A rolling stone gathers no moss," was the first proverb which I heard from my father's mouth. These principles, implanted early, took deep root, though, perhaps, in an unfavourable soil. Living also under the same roof with my father, I felt alarmed at every whispering of my own inclinations which was opposed to his wishes, and strove to subdue them, as if I were struggling with the evil portion of my nature. Thus, in course of time, I became what I am; not a misanthrope, thank God, but a timid and somewhat melancholy man. We had no mirth-making in our household, except at Christmas-time, when we feasted in good earnest. My father loved at that time to display a rough hospitality. We had generally two or three nights of merry-making, at which were both young and old people—all carvers or the children of carvers—and after his death I continued the custom. Often, as I sat with my happy friends about me, some sweet young woman would give me a sly hit upon my obdurate determination to die an old bachelor; little thinking that her heedless words could give me pain, though they cut me deeply, and set me looking at the fire with a thoughtful face. I might have married, perhaps, if I had found a partner: my income was not large, but many men run the risk of a family with less means to support one than I had; but, somehow, I found myself at forty-five years of age unmarried, slim, and prima—the very type of an old bachelor. It was not from indifference, for I was by nature sensitive and affectionate. For women I had a kind of reverence. I pictured them to myself all that is noble and good; yet, in their presence, I only looked upon them timidly, speaking little, but thinking of them, perhaps, long afterwards when they were gone.

One result of my reputation for gravity was a number of executorships which had been imposed upon me by deceased friends. Any one would have thought that there was a conspiracy abroad to overwhelm me with proofs of confidence. My stock of mourning rings is considerable. The expression, "Nineteen guineas for his trouble," had to me an old familiar sound with it. At length, I was obliged to hint to any old carver who waxed sickly, that my duties in that way were already as much as I could fulfil. There was, however, an old grocer of my acquaintance, named Cawthorne, who would make me executor of his will, in spite of my remonstrances, relieving my scruples by assuring me that he had named another friend for my colleague, who, it was understood, was to undertake, if we survived him, the greater part of the duties, including the guardianship of his daughter Lucy. We did survive him; and the other executor entered upon his

office, seldom troubling me except when absolutely necessary. Thus he went on for some years. The daughter had become a fine young woman of nineteen, with blue eyes and fair hair, rippled like the sunlight upon waters touched by a light wind. I saw her often in the house when he was taken ill, and thought her very beautiful. I fancied, sometimes, how she would look robed in pure white, and holding in her hand an olive branch, as I had seen some angels carved in stone. I have met her ascending the stairs with a candle in her hand, the light striking upward, like a glory on her face, and she seemed to me not to mount from step to step, but slowly to ascend without a movement of the feet. My feeling with regard to her almost amounted to a superstitious awe; for I seldom spoke many words to her, and I think, at first, she thought me harsh and cold. At length her guardian died, and although I had known from the first that in that event his duty would devolve upon me, the fact seemed to take me by surprise. I could hardly believe that henceforth, for some time, she would look to me as her sole protector. However, in a short time, the affairs of my deceased colleague were set in order, and she came to reside with me in the old hall.

She soon forgot her first antipathy, and we became good friends together. I took her over the old place, and showed her the library and the paintings, and everything there that was quaint and curious. We had a garden at the back of the Hall, in which she sat at work on fine days. It was not large, but it was, nevertheless, a garden, and in the midst of London. It was planted with shrubs, and contained two or three large trees, as well as a rustic seat upon a grass-plot; though the grass was not very thriving, on account of the trees shutting out the sun and air. However, sitting here, the back of the Hall had a picturesque look, half covered with the great leaves of a fig-tree nailed against the wall, and with its worn stone steps guarded on each side by an aloe in a green tub. This was her favourite place. She worked or read there in the morning, and in the afternoon she taught two little nieces of the housekeeper to read and write. Sometimes, in the evening, I got an old book from the library, and read to her, and made her laugh at its quaintness. I remember one translation of a Spanish novel in folio, printed in the seventeenth century, which amused her very much. The translation occupied one half of the book, and the prefaces the other. There was the Translator's "Apology for his labour;" "A declaration for the better understanding of the book;" an address "To the learned Reader;" another "To the discreet and courteous Reader;" and another "To the vulgar Reader," with some others; and, finally, the Spanish novel itself was ushered in by a number of verses in English and Latin, laudatory of the book and the translator, by celebrated men of the period.

On Sunday we sat at church, in the same pew, and often I forgot my own devotions in listening to the earnest tones with which she said the prayers. I thought that she, of all that congregation, was best fitted to speak those words of christian love. I was vexed to hear an old overseer of the parish, whom I knew to be a bad and worldly man, in the next pew, repeating the same words in a drawing tone; and I could almost have requested him to say them to himself.

Thus, ours was not a very cheerful way of life for a young maiden; but she seemed always happy and contented. For myself, although I was sorry for the death of my co-executor, I blessed the day when she came into the house; and I grieved that I had objected to become her guardian from the first, that she might have grown up from childhood with me, and learnt to look up to me as a father. Living with her daily, and noting all her thoughts and actions sometimes even when she did not suspect that I observed her, I saw her purer than the purest of my own ideals. My feeling was almost an idolatry. If I had, at forty-five years of age, still any thoughts of marrying, I renounced them for her sake, and resolved to devote all my care to her, until such time as she should find a husband worthy of her.

By an ancient bequest to the Company, we distributed, on the day before Christmas Day, to twenty-four poor people, a loaf of bread, a small log of wood, or bavin, as we called it, and the sum of two shillings and ten pence to each person. The recipients were all old decrepid men and women. There was an ancient regulation, still unrepealed, that they should all attend on the following court-day, at noon precisely, to "return thanks for the same;" though that performance of mechanical gratitude had been allowed to fall into disuse by a more philosophical generation. The first Christmas after Lucy came there, she begged me to let her distribute these gifts, and I consented. I stood at my little desk at the end of the hall, with my face resting upon my hand, watching her, and listening to her talking to the old people. Next to the pleasure of hearing her speak to little children, I delighted to hear her talk with very aged folks. There was something in the contrast of the two extremes of life—the young and beautiful maiden, and the bent and wrinkled old people—that pleased me. She heard all their oft-repeated complaints, their dreary accounts of their aches and rheumatics, and consoled them as well as she could; and, with some of the very old, she took their brown and sinewy hands in hers, and led them down the steps. I did not know what ailed me that day. I stood dreaming and musing, till I seemed to have lost that instinctive dexterity with which we perform the simple operations of our daily life. Some accounts lay before me which I was anxious to cast, but several times I essayed, and seemed in-

capable of doing so. As the simple words of our daily language, which issue from our lips simultaneously with the thought, become vague and indistinct if we muse upon their origin, and repeat them several times to ourselves; so by dwelling long upon the idea of the work before me, it seemed to have become confused, and difficult to realise. I handed them over to my clerk, Tom Lawton, who sat opposite to me.

Poor Tom Lawton! I thought I saw him looking anxiously at me, several times, when I raised my eyes. No being upon earth ever loved me more than he. It is true, I had done him some acts of kindness, but I had often done as much for others, who had forgotten it since; whereas his gratitude became a real affection for me, which never failed to show itself each day that he was with me. He was a fine young man, and a great favourite with the housekeeper, who said "she liked him because he was so good to his mother, just as she thought her poor son would have been if he had lived." Tom was fond of reading, and sometimes wrote verses, of which he made copies for his friends in a neat hand. He was a shrewd fellow, in some things, but in others he was as simple as a child. His temper was the sweetest in the world—the children knew that. No diving into his coat-pocket ever ruffled him; no amount of pulling his hair could ever induce him to cry out.

Tom was to spend his Christmas Eve with us, and to make "toast and ale," as was our custom; so, when the gifts were all distributed, he left me, and ran home to dress himself smartly for the occasion. I stood at my desk, still musing, till the evening closed upon the short and wintry afternoon. Lucy came and called me, saying the tea was on the table.

"We thought you were fallen asleep," said she. "Mr. Lawton is come."

We sat round a large fire in the old wainscoted sitting-room, while Lucy made the tea—and would have made the toast, too; but Tom said he would sooner burn his eyes out than suffer her to do so. The housekeeper came up; and afterwards came an old carver and his daughter. We sat till after midnight. The old carver told some anecdotes of people whom my father knew; and Tom told a ghost story, which kept them all in breathless terror, till it turned out, at last, to be a dream. But I was restless, and spoke little. Once, indeed, I answered the old carver rather sharply. He had patted Lucy on the head, and said he supposed she would be soon getting married, and leaving us old people. I could not endure the thought of her leaving us; though I knew that she would do so, probably, one day. She had never looked to me more interesting than she did that evening. A little child, worn out with playing, had fallen asleep, with its head upon her lap; and, as she was speaking to us, her hand was entangled in its hair. I gazed at her, and

caught up every word she spoke; and when she stopped, my restlessness returned. I strove in vain to take part in her mirth. I wanted to be alone.

When I sat that night in my little bedroom, I was thinking still of Lucy. I heard her voice still sounding in my ear; and, when I shut my eyes, I pictured her still before me, with her dear kind face, and her little golden locket hung upon her neck. I fell asleep, and dreamed of her. I woke, and waited for the daylight, thinking of her still. So we passed all the Christmas holidays. Sometimes it was a happy feeling which possessed me; and sometimes I almost wished that I had never seen her. I was always restless and anxious; I knew not for what. I became a different man to that which I had been before I knew her.

When, at last, I concealed from myself no longer that I loved her fondly, deeply—deeper, I believe, than ever man has loved—I became alarmed. I knew what people would say, if it came to be known. She had some property, and I had nothing; but what was worse, I was forty-five years of age, and she was only twenty. I was, moreover, her guardian; and she had been consigned to my care by her dying father, in confidence, that if she came under my protection, I would act towards her as he himself would have acted, if he had lived, not dreaming that I should encourage other thoughts than those of a protector and a friend. I knew that I should have been jealous, angry, with anyone who evinced a liking for her; and yet I asked myself whether it was right that I should discourage any man who might make her happy; who, perhaps, would love her nearly as much as I did, and be more suited for her, by reason of his youth and habits; not like mine, seditate and monkish. Even if I eventually gained her affections, would not the world say that I had exerted the undue influence of my authority over her; or that I had kept her shut up from society; so that, in her ignorance of life, she mistook a feeling of respect for a stronger sentiment? And, again, if all these things were set aside, was it not wrong that I should take a young and beautiful girl and shut her up in that old place for ever—checking the natural gaiety of youth, and bringing her by slow degrees to my old ways? I saw the selfishness of all my thoughts, and resolved to strive to banish them for ever.

But they would not leave me. Each day I saw something in her that increased my passion. I watched her as she went from room to room. I walked stealthily about the place, in the hope of seeing her somewhere, unobserved, and hearing her speak, and stealing away again before she saw me. I walked on tiptoe once, and saw her through the open door, thoughtful—looking at the candle—with her work untouched beside her. I fancied to myself what thoughts possessed

her: perhaps the memory of a friend, no longer of this world, had touched her suddenly, and made her mute and still; or, perhaps, the thought of some one dearer. The idea ran through me like a subtle poison, and I shuddered. I thought she started. I believe it was a fancy; but I stole away again hurriedly, on tiptoe, and never looked behind me till I reached my corner in the Hall.

Every one remarked a change in me. Lucy looked at me anxiously sometimes, and asked me if I was not ill. Tom Lawton grieved to see me so dejected, till he became himself as grave as an old man. I sat opposite to Lucy sometimes, with a book in my hand. I had ceased to read aloud; and she seeing that I took no pleasure in it, did not press me to do so. I looked at the pages, without a thought of their contents, simply to avoid her looks. I thought, at last, that she grew vexed with my neglect. One night I suddenly threw down my book, and looking at her boldly and intently, to observe the expression of her features, I said—

"I have been thinking, Lucy, that you grow weary of my dull ways. You do not love me now, as you did some months ago."

"Oh, yes!" she replied, "indeed I do. I do not know what makes you talk like this, unless I have offended you in something. But I see it now," she said. "I must have said something that has given you pain; though it was never in my thought to do so. And this is why you treat me coldly, day by day, and never let me know what I have done."

She came over to me, and took my hand in hers; and, with tears in her eyes, begged me to tell her what it was.

"I know," she said, "I have no friend more kind and good than you. My father died before I knew how great a friend I had in him; but had he lived, I never could have loved him more than I love you."

"Well, well, Lucy," said I, "I did not mean to hurt you. I know not why I reproached you. I am not well; and when I feel thus, I know not what I say."

"Kiss me, then," said she, "and tell me you are not angry with me; and do not think, now, that I am tired of living here with you. I will do everything to make you happy. I will not ask you to read. I will put away my work, and read to you in future. I have seen you silent, looking unhappy, and have said nothing—thinking that was best, as I did not know what it was that made you so; and you have thought, perhaps, that I was vexed with you, and wished to show it by a sullen air. But now I will strive to make you cheerful. I will read and sing to you, and we will play at draughts, sometimes, as we used to do. Indeed, I like this old place, and all that live in it, and never was so happy in my life as I have been since I came here."

I placed my hand upon her head, and kissed her on the forehead, saying nothing.

"You are trembling," she exclaimed; "this is not merely illness. You have some sorrow on your mind that haunts you. Tell me what it is that ails you; perhaps I may be able to console you. I have not so much experience as you; but sometimes a young mind can advise the oldest and the most experienced. Perhaps, too, you magnify your trouble by brooding over it; you think upon it till your mind is clouded, and you cannot see the remedy, which I, looking at it for the first time, might see directly. Besides," she said, seeing me hesitate, "if you do not tell me, I shall always be unhappy—imagining a hundred evils, each, perhaps, more serious than the truth."

"No, Lucy," said I, "I am unwell; I have felt thus for some time, and to-night I feel worse. I must go to bed; I shall be better after a night's rest."

I lighted a candle, and, bidding her good night, left her and stole up to bed—afraid to stay longer, lest I should be tempted to reveal my secret. Oh, how could I endure the thought of her kind words, more painful to me than the coldest scorn! She had said she loved me as a father. In the midst of all her kindness, she had spoken of my age and my experience. Did I, then, look so old as that? Yes, I knew that it was not my years which made me old; it was my staid manners, my grave and thoughtful face, which made me look an old man, even in my prime. Bitterly I complained of my father, who had shut me out from the knowledge of all that makes life beautiful; who had biassed me to a belief that such a life as his was best, by hiding from me all comparison; till now, when I perceived my error, it was too late to repair it. I surveyed my antiquated garments with disgust; my huge cravat; the very hair of my head, by long training, become old-fashioned beyond all reclaiming. My whole appearance was that of a man who had slept for half a century, except that I was without a speck or soil. I believe they would have admitted me to a masquerade in such a dress, without a single alteration, and think that I had hired it for the occasion. But a new hope sprang up within me. I would change my way of life—I would try to be more cheerful; I would wear more modern clothes, and endeavour, at least, not to make myself look older than I was.

I had known nothing like the peace of mind which these thoughts brought me, for many days. I wondered that what was so obvious had not occurred to me before. I had gone about dreaming in my absent way, brooding unprofitably over my troubles, instead of devising something practical and useful. But I would act differently—I would not despair. Five-and-forty years was, after all, no great age. I recalled to my mind many instances of men marrying long after that time with women younger than themselves, and living afterwards very happily. I re-

membered one of our Wardens who married at sixty, a young and very beautiful woman, and every one saw how happy they were, and how she loved her husband for years, till a rascal, by slow and artful steps, won over her affections, and she ran away with him. But Lucy would not do that; I knew too well the goodness of her nature to have any fear of such a result. Then I thought how kind I would be to her—studying every way that could amuse and please a youthful mind; till she, seeing how all my life was devoted to her, would come to love me in the end. I planned out minutely our way of life. I would invite more friends to visit us, and we would go out and visit others. We would play at our old game of draughts together in the winter evenings, and sometimes I would take her to the theatre. In the summer we would go into the country—lingering all day long in quiet shady places, and returning about dusk. Sweet thoughts, that held my mind until I slept, and lingered, breeding pleasant dreams!

The next day I visited my tailor, who took my orders with evident astonishment. My clothes were brought home in a few days, and I threw off my knee-breeches, as I thought, for ever. I felt a little uneasy in my new attire—my legs had been so long used to feel cool and unrestrained, that the trousers were irksome. However, I supposed I should soon become accustomed to them; and they really made me look some years younger. What would my father have said if he had visited the earth that day and seen me? My hair, however, was less manageable—in vain I parted it on the right side, and brushed it sideways, instead of backward, as I had hitherto done. For five-and-forty years it had been brushed in one direction, and it seemed as if nothing but five-and-forty years' daily brushing in the other, could ever reverse it. I descended my room, trying to look unconscious of anything unusual in my appearance. It was court-day; the Warden and Assistants stared at me, and would have laughed, no doubt, if most of them had not left off laughing for many years. Some of them, however, coughed; and one addressed to me some simple questions, evidently intended to test my sanity. I felt a little vexed; for I thought it was no concern of theirs, if I chose to adopt some alterations in my dress. However, I said nothing, but went quietly through my duties. Tom Lawton was there. It should have been a joyful day for him; for they increased his salary at that court. But he looked at me compassionately, and evidently thought, like the rest, that I was going mad. I was, however, amply consoled—for Lucy was pleased to see the change in my dress and manners. I laughed and chatted with her, and she read to me, and sang, as she had promised. Thus I went on for some time; when something of my old restlessness came back. I saw how little she suspected that I loved her more than as a friend; and fearing still to let her know the

truth, I felt that I might go on thus for years to little purpose. So, by degrees, I returned to my former sadness, and became again reserved and thoughtful.

One night, I descended from my little room into the garden, and walked about with my hat in my hand, for I felt feverish and excited. Night after night, my sleep had been broken and disturbed by dreams, that glided from my memory when I woke, but left a feeling of despondency that followed me throughout the day. Sometimes, I thought, myself, that my reason was deserting me. We were very busy at that time, and Tom Lawton and I were to have worked together all the evening, but I had left him; utterly unable to fix my attention upon what I set before me. I paced to and fro several times, when passing by the window where I had left him at work, I heard him speaking with some one. A word, which I fancied having caught, made me curious, and I mounted upon a stone ledge and listened; for the sliding pane of glass which served to ventilate the Hall had been pushed back, and I could hear distinctly when I applied my ear to the aperture. The light being inside, I could not be seen, although I could see his desk. The lamp was shaded, and the window was of stained glass, so that I did not see very clearly. But I had a quick vision for such a scene as that before me.

That form standing beside Tom Lawton, with its hand in his, was Lucy's! The blood rushed to my head. A thousand little lights were dancing before my eyes. I felt myself falling, but I made an effort, and clutched the window-sill, and listened. It was Lucy's voice that I heard first.

"Hush!" she said, "I heard a noise; there is some one coming. Good night! Good night!"

"No, no," said Tom, "it is the wind beating the dead leaves against the window."

They seemed to listen for a moment, and then he spoke again,—

"Oh, Miss Lucy, do not run away before we have talked together a little. I see you now so seldom, and when I do there are others present, and I cannot speak to you of what is always uppermost in my thoughts. I think of you all day, and at night I long for the next morning, to be in the same house with you, in the hope of seeing you before I go; though I am continually disappointed. I think I am unfortunate in all but one thing, though that consoles me for the rest—I think you love me a little, Lucy."

"Yes, Tom, I do; a great deal. I have told you so many times, and I am not ashamed to repeat it. I would not hide it from any one, if you did not tell me to do so. But why do you tease yourself with fancies, and think yourself unfortunate? I do not know why we should not tell him all about it. He is the kindest being in the world, and I know he would not thwart me in anything that

could procure my happiness; and then, again, you are a favourite of his, and I am sure he would be delighted to think that we loved each other."

"No, no, Lucy; you must not say a word about it. What would he think of me, with nothing in the world but my small salary, encouraging such thoughts towards you, who are rich; and going on like this—laying snares, as he would say, for months, to gain your affections, and never saying a word about it; bringing, too, disgrace upon him, as your guardian, that he had suffered a poor clerk in his office to find opportunities of speaking to you alone, and at last persuading you to promise to become his wife one day?"

"All this you have told me many a time; but indeed this need not be an obstacle. I wish that I had not sixpence in the world. My money is become a misfortune to us, instead of a blessing, as it should be. I wish I might give it away, or renounce it altogether. I am sure we should be as well without it, one day; and if we had to wait a long time, we should still be able to see one another openly, and not have to watch for secret opportunities, as if we were doing wrong. You do not know, Tom, how unhappy the thought of all this makes me. I never had a secret before, that I feared to tell before the whole world; and now I sit, night after night, with him from whom I should conceal nothing, and feel that I am deceiving him. Every time he looks at me, I fancy that he knows all about it, and thinks me an artful girl, and waits to see how long I shall play my part before him. Many times I have been tempted to tell him all, in spite of your injunction, and beg him not to be angry with me because I had not dared to tell him before. I would have taken all blame upon myself, and said that I had loved you secretly before you had ever spoken to me about it—anything I would have said, rather than feel myself deceitful, as I do!"

"Lucy!" exclaimed Tom, in a broken voice, "you must not—you must not, indeed, ever give way to such an impulse. I know not what might come of it, if he knew. It would ruin us—perhaps, be the cause of our being separated for ever—make him hate us both, and never pardon me, at least, while he lives. Oh, Lucy! I have not told you all. Something yet more serious remains behind."

"Tell me—what is this, Tom?—you alarm me!"

"Come here then, and bring your ear closer. No; I will not tell you. Do not ask me again. It is, perhaps, only a fancy, which has come into my head because I am anxious about you, and imagine all kinds of misfortunes that might arise to make us wretched. But, oh! if I am right, we are, indeed, unfortunate. No misfortune that could befall us could be equal to this."

Lucy's eyes were filled with tears. "I do not like to go back into the parlour," she said, "lest he should be there, and ask me

why I have been crying. He was in his room, up stairs, I think, just now, and he may have come down, and I am sure I could not stand before him as I am. You have, indeed, made me miserable. Oh! Tom, Tom, do tell me what this is?"

"I cannot tell you," he replied, "it would not be right to breathe a word about it till I have surer ground for my suspicion. Let me dry your eyes, and now go back into the parlour, or your absence will be observed."

Twice he bade her "good night" before she left him, and each time I saw him put his arms about her, and kiss her; then he called after her—

"Lucy!"

She turned back, and ran up to him.

"I hardly know why I called you back. Only, I may not see you again for some time, and it may be many, many days, before I can speak to you alone."

"Well?"

I trembled for what he was about to say, and in my anxiety to catch his words, I put my ear closer, and, in so doing, struck the door of the ventilator.

"Hark! I thought I heard something moving. Go, go!" said Tom. "Good night! Good night!" And she glided across the hall, and was gone in a moment.

In the eagerness with which I had listened to their conversation, I had not had time to feel the terrible blow which I had received. It was only when the voices ceased, that I felt how all my hopes had been shattered in a moment. I relaxed my hold; and, alighting on the ground, walked again to and fro—but more hurriedly than before. I had never dreamed of this: Tom Lawton!

I sat down upon the garden-seat, and wept and sobbed like a child—the first time for many years. I could not help feeling angry with them both. "Oh!" thought I, "Tom Lawton, you were right in thinking that I should never pardon you for this. You have taken away the one hope of my life. I shall hate you while I live. Lucy, also, I blame; but my anger is chiefly with you. In order to shield you, she would have told me, poor child, that she only was to blame; but I know better. You have laid snares for her, and inveigled her; your heart told you that you had, when you put the words into my mouth."

I walked about and sat down again several times. I groaned aloud, for my heart was swelled almost to bursting. So I continued for some time fiercely denouncing my rival to myself; but that night, upon my bed, when I was worn out with my passion, a better feeling came upon me. I grew more calm and resigned to my misfortune. I saw how useless—nay, how wrong, would be all persecution; and I felt that it was natural that the young should love the young before the old. So, with a sorrowful and humbled spirit, I resolved to encourage them and bring about their union. God knows how

much the resolution cost me; but it brought with it a certain peace of mind—a consciousness of doing rightly—which sustained me in my purpose. I would not delay a day, lest my resolution should waver. In the morning I walked into the parlour, and bidding Tom Lawton follow me, stood there before him and Lucy. Tom looked pale, as if he dreaded my anger.

"I expect," said I, "a direct answer to what I am going to ask you. Have you not given your faith to one another?"

Tom turned paler still; but Lucy answered before he could say a word, and confessing all, said she took the blame upon herself; but Tom interrupted her, exclaiming that he only was to blame.

"There is no blame attached to either," said I, "except for a little concealment, for which I pardon you."

Thus far I had done the duty which I had set before me; but I did not feel it to be completed till they were married.

About three months after I gave my permission, and the day was fixed. I saw them the happiest creatures upon earth. They never knew my secret. That Tom had suspected it, and that it was to that he referred when he was speaking to Lucy in the Hall, I had never doubted; though the readiness with which I had befriended them had deceived him. He had taken a small house, and everything was ready. But, on the day before their wedding, my heart failed me. I knew then that I had never ceased to love her, and I could not endure the thought of her marriage. I felt that I must go away until the day was past; so I gave out that I had suddenly received a summons to go into the country, and that it was my wish that the marriage should not be delayed on that account. That night I went away, not caring whither.

I know what were my thoughts in those two days that I was absent. When I returned, the Hall was silent—Lucy was gone; and I was again alone in the old place.

I remain there.

MERCY.

GOD looked, and smiled, upon the wakening earth—

In form, power, motion, wondrous and complete—

Which, in the flush and beauty of new birth,

Breasted the seas of ether at His feet;

Earth with companion-worlds, that throbbed and shone

With warmth and light transmitted from His throne,

On noiseless axes ever spinning round,

And moving evermore along the vast profound.

He called to Him three ministers, who wait

Unceasing on His wise and sovereign will,

Servants, and yet partakers of His state,

And watchers of all human good and ill;

An Angel-shaped Triumvirate they seemed,

Whose lofty-throned foreheads ever beamed,

August in presence as they are in name,

And clothed in flowing robes of many-coloured flame.

Justice was one, in aspect calm and cold;
 With a severe, yet not oppressive mien;
 Another, Truth, with brow sublimely bold,
 And onward looks, all radiant and serene;
 The last was Mercy, whose consoling eyes
 Caught the reflection of celestial skies,
 With a benignant and beseeching face,
 And wedded hands upraised with supplicating grace.

"Let us make man, for lo! you lovely sphere,
 Which in its amplitude of orbit rolls,
 Shall be—ye bright Intelligences, hear!—
 Place of probation for immortal souls;
 There shall he dwell, there shall he rule and reign,
 Yet not exempt from sinfulness and pain,
 But destined, 'mid his struggles and his storms,
 To people boundless heaven with countless angel-forms."

"Oh, make him not!" cried Justice; "I foresee
 That he will trample on Thy sacred laws—
 Doubt, question, violate, Thy great decree,
 Feel his own being, yet deny its Cause."
 "Oh, make him not!" cried Truth, "for he will toil
 'Gainst Thee and me, and ruthlessly despoil
 Thy sanctuaries; grow corrupt and vain,
 Worship himself, and scorn Thy everlasting fane."

"Create this unseen being, gracious Lord!"
 Said gentle Mercy, with imploring look—
 "And I will guide him by thy precious Word,
 The precepts of Thy yet unwritten Book;
 My voice shall move him with mysterious power,
 My wings shall shield him in the perilous hour;
 I'll check, subdue, inspire, as best I can,
 The soul which Thou wilt breathe into the form
 of Man."

"Even so be it!" And Man straightway was born,
 Richly endued, and full of joy and trust;
 Serene, pure, happy, was his early morn,
 Till the dread Tompter bowed him to the dust;
 Then, shame and sorrow, and recurrent sin,
 Snook his best nature, soiled the shrine within;
 But Mercy pleaded, and God sent him light
 To cheer his darkling soul, and lead his steps aright.

Then, take the Angel to thine home and heart,
 And with her walk along the paths of life;
 List to her teachings; learn the exalted art
 Which conquers hatred, prejudice, and strife.
 Not Truth, not Justice, must we put away;
 But lean towards Mercy whensoever we may;
 Forgive our brother, be ourselves forgiven,
 And thus, by gentle deeds, draw down the smile
 of Heaven.

FATHER THAMES.

It was a dusky evening in the latter end of autumn, with a mizzling rain, when I passed up the Strand, and turned into the gloomy archway-entrance of old smoke-dried Somerset House. I was in a meditative mood. Having nothing to do, which is a circumstance that constitutes (though I do not by any means recommend it as a general rule), one of the best Aids to Reflection, I began very slowly—over-coat buttoned close up—arms folded—eyes bent upon the moist flag-stones—with heavy, pausing paces, to perambulate the quadrangle. How long I continued doing this, or what was the main subject of my

thoughts, it is not necessary to relate; suffice it to say that, almost unconsciously, I stopped beside the parapet wall beneath the great stone figure of Father Thames, who is pointing down into the dark depths of the semi-circular vault, pit, or basement, beneath. With closed hands, and elbows lodged against the edge of the parapet, I leaned my head upon my hands, quietly crushing in the front of my hat, until I had attained the thinking attitude I meditated. This being accomplished, and no policeman chancing to pass near, who might have thought himself justified in taking charge of me as a gentleman in an "abnormal" state of mind, my meditation progressed at a great rate.

The duration of this is immaterial to my story; all I know is, that I was aroused by a sound—soft and trickling at first, and then bubbling and pouring, and falling with a quick succession of splashes. A warm vapour at the same time began to steal underneath my hat, and bedew my cheek-bones. I raised my head. The great smoke-black recumbent figure of Father Thames was evidently looking at me with a grim, gaunt smile, while out of the mouth of his huge, bent-down urn, a thick hot stream of no definite colour was now rapidly pouring forth, and falling with a loud noise to the bottom of the deep and dark semi-circular area below.

To this his great fore-finger pointed with more than usual significance. The clock of St. Mary-le-Strand now tolled six, and while the echo in the court below was still vibrating, a great voice, very like the distant sound of a captain on deck calling out through his speaking trumpet to somebody on shore—exclaimed "Good evening, Mr. Beverage! will you take a cup of tea with Old Thames!"

I sank backward a pace at this address. I am a great tea-drinker, it is true, but I could not feel otherwise than overcome, at the moment, by the tremendous cordiality of this invitation. I looked upward at the shadowy countenance of the giant. The grotesque features had relaxed into a good-humoured though still a very grim smile; and, while his inverted urn still continued to vomit forth the stream, a strong odour of various kinds, in which that of tea might be detected—or, at any rate, imagined—rose in clouds of vapour from the deep semicircular abyss to which his forefinger so significantly pointed. If, indeed, I did not take a draught, I certainly found it impossible to avoid inhaling a considerable portion of the infusion. It was by no means to my liking.

Again, the great, distant-sounding speaking-trumpet voice echoed over the quadrangle—"Mr. Beverage, will you take a jolly good cup of tea?"

The stupendous familiarity of this renewed invitation did not place me, by any means, so much at my ease as was intended; if, however, summoned sufficient boldness to reply—"Oh, Father of Rivers! I am, indeed, a very

considerable tea-drinker, and I thank you for the high and unlooked-for favour of this your invitation; but, pardon me, most venerable of River-deities, if I add, that, having already inhaled a good 'taste of your quality,' a certain little scruple interferes with my availing myself of further favours."

"Speak it aloud to the Metropolis!" said Father Thames.

"Do not think me ungrateful," said I, "nor by any means insensible of the honour you do me; but the truth is, that, although I drink more tea than most men, probably than any other gentleman in London, I am rather scrupulous as to the water I make it with."

"Indeed!" exclaimed the River-god; "then come with me, and I will show you the magnificent broad stream from which my urn is constantly filled."

A great torch flashed before my eyes!—then another!—then three or four!—then a dozen were dancing round me, and waving me onward, and along with them—now this way, now that, now up, now descending slippery steps—till I found myself seated in a huge dark barge, with Father Thames, and floating slowly down the stream by torch-light.

"How black and solid stands the forest of shipping on each side!—how large and black lie their shadows on the water!—how the lights glance from the windows on the shore!—how fast the current runs! Commerce—commerce—but, what is that floating by?—pah! it's a dead dog, or something—'a sort of not-of-the-newest poor-john!' How very thick the water is hereabouts, Father Thames; and, pray, may I inquire what that black, sluggish stream may be which I see pouring into you from a wile, bricked archway, yonder?"

"Oh, that's one of my sewers," replied the Father of Rivers, without turning his head, "my Blackfriars sewer-outlet; and a fine, generous, open fellow, he is."

"So he seems," said I; "have you any more of them?"

"Oh, yes: one generally near every bridge, with here and there another, and another, just as the quantity of sewage in a neighbourhood has determined. They all come to me. I have, in fact, a hundred and forty-one sewers between Battersea and London Bridge. All come to me, sir."

"That's very kind of them. But what are those smaller mouths that send forth strange party-coloured currents to mingle with your waters?"

"That one belongs to a soap-boiler—a particular friend of mine; the next to it, is from a slaughter-house, kept by a very estimable friend indeed, who wouldn't allow a particle of the refuse and drainage of his yards to run anywhere else, on any account. From Brentford down to Blackwall, every one presents his compliments to me. Those

other agreeable little outlets you are looking at, or will shortly see, on both sides of my banks, are from gas-factories, brew-houses, shot-factories, coal-wharfs, cow-houses, tan-pits, gut-spinners, fish-markets, and other cheerful and odoriferous tributaries; while the inky flood yonder which your eyes are now fixed upon, is from a very populous grave-yard, which produces so large a quantity of liquid every four-and-twenty hours, that it has to be drained off by regular arrangement, and made to flow into my convenient, all-embracing bosom. Some people affect to turn up their noses at this; but the City Corporations are more wise than nice, and *they* know better."

I was silent for some time, as well I might be, after such a dose of "information for the people;" and during this pause in the conversation, I had unconsciously dangled one arm over the side of the barge, till presently my hand, by a swell of the current, was immersed above the wrist. I drew it up, and found it covered—coated, I may say—with a thick, dingy, slimy liquid of an offensive odour. Gazing on the water around, as we proceeded, I saw that we were surrounded by whole acres of it. I looked at the imperturbable countenance of Father Thames.

"What in the world is all this?" said I.

"The mess we are passing through?" responded the giant coolly;—"oh, it's only a little scum derived from barges, and lineworks, and colliers, and the shipping around us, and bone-grinders, and tar-works, and dredging-machines, and steamers, and back-gardens, and floating remains of creatures from knackers' yards, and rotting vegetables, and what not."

"And what *not*, indeed, Father Thames!" cried I, starting up, quite unable to endure it any longer; "is *this* the water you make your tea with?"

"And do all my cooking with," continued Old Thames, taking no sort of notice of my dismay and excitement; "and all my washing. I have done so, you must know very well, for years and years—my water being in just the same state as you now see it. Don't all our ships, bound to foreign ports, fill their tanks with it? and don't they find it keep good a wonderful length of time? It has, to be sure, to putrify once, during which time sailors who are thirsty on a hot day in the tropics, have to go into a dark corner to drink it, straining it through their teeth as it goes down; but after all the queer stuff has sunk to the bottom of the tanks, and settled for good, everybody says there's no water like it. So now—about barge—we'll return home to Somerset House to tea!"

"Father Thames," said I, firmly, though with every respect; "Father Thames, if I drink a single cup of your tea, then—to quote the words of the immortal Falstaff, who knew a trick worth two of it—'fillip me with a three-man beetle.'"

"Why, how now, Mr. Beverage!—what is the meaning of this?"

"You really must excuse me—I *can't* drink your tea."

"Why not?"

"I may be thought too scrupulous by my City friends, as to the water, but in truth I can't—in short, I won't."

"Oh, Sir Beverage, of Rockwell! this fine gentleman must be your fanciful descendant! Scrupulous about the water you drink!" exclaimed Old Thames; "of course, then, you are not a Londoner—they don't mind *what* they drink. A genuine Londoner can stand anything, and for any number of years."

"I am fully persuaded of it," answered I; "but there must be changes in all things. Even Londoners—and let me assure you that I am one—even Londoners will some day or other come to a determination to have a purer stream to their kettles and urns, than is at present furnished by your Rivership's noble current. We live in a time of changes, and even *you* cannot much longer escape them."

"Changes!" exclaimed the Father of Rivers—"there you touch me to the very mud; for what changes have I not undergone, of which this generation, and the one before it, have not only no memory, but no idea. I, however, know it too well."

"Ah, do you so?—pray unbosom yourself, Great River!"

"Changes, Mr. Beverage!—there you reach the bottom of my proud old heart, and make me confess how much of my indifference, however I may be hardened by long habit, is assumed. I, in some measure, pretend not to care for those abominations, because I cannot help them. The City loves them; the seven District Commissioners of Sewers, long cherished them; the West-end turns up its nose at mention of them, and walks away; aldermen scream out against innovation and purification—*what* hope have I? I don't pretend that I was ever a pellucid stream—a crystal current such as pastoral poets delight to describe—no great river, with much shipping or other water-traffic upon it, ever can be clear; but it may be a vast deal clearer than my present condition—ay, purer beyond all comparison as beyond all doubt."

"Pardon me, venerable River, said I, "if I ask how this could be; for did not the sewers empty themselves into you formerly as they do now?"

"Yes," said Old Thames, "they certainly did; but then their stream was not what it now is. Formerly, the sewers were rain-courses—mere land and surface drains; they were for water only, and if anybody threw a dead cat into me, an old pair of boots, a bullock's offal, or any other refuse, he was punishable by the law."

"Where then did the house-drains have their outlets?" I anxiously inquired.

"House-drains—our ancestors' house-drains!—ha! ha! ha!" laughed Father Thames—

"why, they had none. The very idea had never occurred to them."

"An extensive system of cesspools, then," said I, "like our own, till very recently?"

"Not even so decent as this. Every house took care of itself, after its own sweet will, and the passengers in the streets, especially at night, had also to take care of themselves, and run sometimes, for their lives, when they heard a window opened above them."

"Very much in the same way as in some parts of Scotland at the present time," said I.

"I know nothing of the Scotch water-works," said Old Thames:—"I have always had enough to do with my own affairs. What with one tributary and another, each bringing fresh trouble into my waters, I am sometimes almost sick of my life—especially in the dog-days—when—a painful subject that of dogs, for they suggest cats and kittens, and other varieties, with or without brickbats round their necks. One hot summer's day, half a horse, that used to draw the Lord Mayor's coach, came float—but I shall spoil your tea; let's change the current of our discourse."

I now proposed that we should converse a little on the different Water Companies of the Metropolis. At mention of these, Father Thames sunk back against a bulk-head and laughed aloud. "Where do you think the Water Companies derive their supplies from?" said he.

"From beautiful, unpolluted, clear rivers, rising in the rural districts," answered I, with frank innocence.

"Shall I give you the source and derivation of each of them?"

"I shall feel exceedingly obliged to you," answered I, in some little trepidation, for I began to fear that my tea-drinking was likely to be troubled by his information.

"Then, behold in me that source," said Father Thames. "I, Sir, I am that beautiful, unpolluted, clear river, from which the greatest part of them derive their supplies. Some of these are peculiarly favoured by circumstances. The Southwark Company, and the Vauxhall Company take their stock in trade from me near Vauxhall,—a neighbourhood which constantly presents me with so abundant a supply of the most objectionable contributions, that it is no wonder the water of these two companies should furnish the mass of microscopic monsters which have recently occupied the attention of Mr. Arthur Hill Hassall. The Lambeth Company fills its pipes from me at Lambeth, famous for the grand outlet of a capacious sewer, hard by. In this way do the Water Companies wisely cater for the London public. You see, they know your taste."

"Taste!—I beg, Father Thames, you will make me an exception to any such taste. My heart resents—I may say, rises at it."

"Well, well—I don't very much wonder. You are not so well seasoned to it as some

people. As for me, I am well-nigh grown callous, being hopeless of amendment amidst the insincere and prevaricating process of all Government legislation on the matter. To what end are all the elaborately prepared reports of the Board of Health ;—to what end do the Commissioners of Sewers lay their heavy heads together, lay down pipes, and listen while their secretary lays down the law ;—to what end do surveyors and clerks carry each other pick-a-back through the main sewers once a week, to gauge, and weigh, and sniff, and snuff about, at their lives' peril,—if, after all, my Lord Do-nothing sits in the highest chair, wiping his spectacles and clearing his throat, and reducing everybody to his own condition of inactivity ?”

“But surely, in your remarks on the Water Companies, you except the New River ?”

“The New River Company derives its supply from springs, called its ‘Head,’ which may be simply described as a small pool, filled from a narrow ditch full of weeds and half-animated plants, and swarms of animalcules in great variety of ugly shapes, which often rise from the surface and display themselves in clouds along the margin. Indifferent as these springs must therefore be, as to purity, the supply is not limited to them, but assisted from the River Lea. It has also an accession to its volume from a well and two reservoirs at Cheshunt (cleared out and cleansed once in twelve years), and it used to derive a final supply in aid from my waters along Upper Thames Street (convenient to Billingsgate), where they still keep up their ‘works,’ in case of need, and people do say, &c. The long canal, ingeniously denominated New River, is also a famous place at numerous spots for bathing. There’s nothing unwholesome in bath-water, is there ?”

“May I request, Father Thames, that you will put me ashore ?”

“To tea—well, you need not make so shocking a grimace, Mr. Beverage. You can get no better tea-water in London. But I’ll add a word or two. The East London Company takes its supply from the Lea, which is joined by several small rivers ; and in its course runs through three-and-twenty small towns and villages, most of which use the water for various purposes of washing and bathing ; and some of them drain their sewers into it. Moreover, the Lea is a barge-river ; and as bargemen and their families are proverbial for the elegance and refinement of their habits, nobody but your over-nice people could object to drink after them. The Lea reaches my stream near Blackwall, and half of its water is in fact derived from me. Stop ! I have not done. The Hampstead — What’s the matter !”

“Oh, Father Thames !” cried I, “it’s a wonder and a mercy we are not all poisoned. We Londoners have, for the most part, a very pale look—and here’s the cause, I do believe.”

As I said this, a strange expression lighted up the face of the River-god ; and rousing himself from his indolent resumbency in the barge, he suddenly exclaimed, “Vengeance ! yes, vengeance, Mr. Beverage ! It is true that I have become hardened to all these outrages, and almost callous ; but, Sir, I have some feeling left ; and though I would not myself condescend to be vindictive on the populations whom I have so long reared in commercial prosperity, yet you cannot expect me to shed tears over the punishment which they bring upon themselves. For every dead dog and cat that is flung into my bosom, there’s a typhus patient—perhaps a dozen ; for every slaughter-house, fish-market, or graveyard near my banks, there’s a dozen scarlet fever patients—perhaps a hundred ;—for every main sewer draining into me, there is a legion of cholera patients, in due season. I have been deeply injured, but I am amply avenged.”

The barge was again nearly abreast of Somerset House, and the time was at hand for me to go ashore. The grand tone of melancholy which Old Thames had now fallen into, with the absence of any personal anger at all his years of ill-usage, gave me an additional interest in him. Though I certainly could not take tea with him, I yet did not like to lose his company.

“We are now about to part, Mr. Beverage,” said the River-god, shouldering his urn—“I return to my broad pedestal in the gloomy quadrangle—you to your equally solitary tea.”

“Nevertheless, oh Father of Rivers,” said I, “there is no immediate hurry. Besides—I am thinking.”

“Of what, Mr. Beverage ? Why do you stand and muse thus ? On what imaginary cup of perfect tea, or toast-and-water, do you speculate ?”

“On one made with exquisite spring-water, of which I have recently been reading.”*

“That is easily found—enough for you and I, and a friend or two ; but, for my people, my throngs of London people, my commercial offspring—where shall we find enough pure water from rock or well, or land-spring, to supply all their necessities ?”

“That very thing is asserted by scientific men who have recently been to make tea there. Boiled some beef also—and made a bowl of punch. But tea’s the best test.”

“And a good draught of the water itself the best of all—and the only safe guide ?”

“Shall we go there ?”

“Be it so ;” said the River-god, “I have nothing else to do, but pour up, and pour down currents, and my time will be as well spent in this visit, as in lying along my stone pedestal, pointing down into the deep basement.”

So, again, the torches flashed around us, for the night was far advanced, and up

* See Sir William Napier’s Report on the Bagshot Springs.

the stream we went, the tide having just turned.

Father Thames remained silent for some time. He had fallen into a profound meditation, which I could not venture to interrupt. At length he broke forth into the following strain:—

"To pour up, and pour down currents for ever—nothing else remained for me, did I say? Nothing!—oh yes, there is the Memory of the Past, with all its mighty images. Where are all my city walls, and gates, and embattled towers, of olden time? Fallen—vanished. Excepting a few of the oldest fragments of the Tower of London, scarcely a stone remains of the edifices that adorned me four or five hundred years ago. Where are the numerous barges, of royal state and high nobility, that constantly moved up and down my breast,—now in the centre of my stream, (then comparatively pure, and never offensive,) now gliding beneath the huge overhanging gables of houses on my banks? Where is burly old Harry, in his barge—where resolute Queen Bess in hers—coming down the stream with flags flying, and trumpets, shawms, harps, and divers instruments of minstrelsy? I ask not for these, or such like sovereigns to live again, but where are their representatives? Where are all my fleets of snow-white swans? Choked—sunk. How often did I see William Shakespeare and his *troupe* coming along in his boat to play at the palace! And now all this is over. I ask not again to see a condemned king or queen, or noble, all in black array, sit pale in a creeping barge to the Tower dungeon, or to the axe on Tower Hill; but where are the festive river-throngs to replace those gloomy scenes with those of better times? Where are my palaces, each with its landing-place, and steps—its barges and boats, worthy of all the romance of Venice? Transformed to wharfs for boxes, bales, and coal-barges. Where is the Strand—with its flourishing trees, its sloping gardens, its turrets, and pinnacles? All its ancient beauty is jammed into brick-work and shop-windows. Where are the forty thousand watermen who belonged to me? Transmogrified into cabmen and omnibus-drivers. Where are all their songs? Forgotten—lost—all excepting those of my dear son John Taylor, the water-poet, who for so many years rowed a wherry on my stream, and wrote a volume of poems to my honour. The decrease of his calling by the gradual innovation of coaches, is well recorded by my son, where, in 1662, he sayeth—

'When Queen Elizabeth came to the crown,
A coach in England then was scarcely known.'

But if, in his day, the melancholy transformation of boats into land carriages had commenced, how must I observe the desertion now! Still, let me say, I am not ungrateful to fate—I do not repine that instead of meeting a queen, or a noble, or a dramatist and

* See Knight's *London*, Vol. I., "The Silent Highway."

his players, a gentleman's barge to church, or a fleet of apricot-boats to market, I now encounter a succession of steamers, several men-of-war, great merchant ships, or a fleet of colliers. No—I feel that I am not only the Father of Rivers—I am the Father of English Commerce. This supports me—this consoles me; and the glories of the present (though I cannot forgive—I cannot patiently bear the pollution of my waters) rewards me for all my labours, and enables me to look back upon the past without too deep a sorrow."

By this time we had arrived at the entrance of the river Wey. The torch-bearers were now dismissed; they returned rapidly down the stream, flashing out, one by one,—and with a gentle swerve, the great black barge passed through the mouth and went rippling onward, while the banks and borders seemed gradually to close in as we proceeded.

It was a fine clear night. The stars were out in myriads. Following the windings of the river—now between ranks of dwarf willows—now between green grassy banks and slopes—here coming close among colonies of osiers—there brushing against squadrons of bulrushes, or between lengthy marginal fringes of rustling sedge, the barge of Old Thames pursued its course. It was the same barge as at first, and yet it seemed a smaller one; for, somehow, it had imperceptibly contracted, narrowing and shortening itself to accommodate its form and size to the changeable width and windings of the river. At length it came to a stop. Its dark broad bows were buried in a low green bank.

"We can go afloat no further here," said Father Thames. "But come; I know the place you have mentioned, and have been curious to visit it for some time. If all be true that I have heard, it will be the saving of me, as it will of the lives of millions who drink me. So, jump out of the barge and follow me."

I did so; and in the morning twilight, with stars still shining, and the moon still visible, though pale and very high, Father Thames led the way along green marshy patches, and over wet grassy fields, and moist fallow land, and through long oozy plots of rushes, till finally we arrived at a sandy district, interspersed with large heaths and stony tracks, and then more sands,—and finally a region of fresh water springs, all glancing, and bubbling, and rippling along, like pure crystal, or liquid silver, or rivulets of clear light, according to the light and shade that fell upon them!

The Father of Rivers stopped—looked down at the bright spouting springs, following their several courses with his eye—now in one direction, now in another; then clasping his hands, and raising his face to the blush of morning now tinging the east, he exclaimed aloud, "Heaven and Earth be praised!—there's some hope for Old Thames, and for all London at last! Look here!—and look yonder!—and yonder! and yet again there!

and there! and yonder! and beyond! There are fifty millions of gallons a-day!"

He paused a moment; then added, "My dear Mr. Beverage do you see this?"

"I do! I do! venerable River-god!" I exclaimed. "Fifty millions of gallons of pure spring water a-day! There's tea, and salubrious drinks, and wholesome cooking for all London at last! No more emulsion of dead dogs and what-not—no more Water Company monopolies—no more qualms of nose and eye, and others to follow within—but water, such as Nature intended man to drink, not only savage man, but civilised man, too, if he will but have the sense to value the blessing."

"I breathe fresh life," ejaculated the River-god, devoutly; "I rejoice in my civilisation, and in the science that will govern it, when Thames, being free of his pollutions, shall be himself again!"

CHIPS.

A WOMAN'S EXPERIENCE IN CALIFORNIA.

THE voice of one of the fair sex has not yet been heard from the land of gold; but, we are now able to print extracts from a letter written by a young woman resident there, to her sister. She is married, and first went out, it would appear, with her brother, to New Zealand, in the service of a family whose fortunes she, her husband, and her brother, followed to Stockton, in California. The epistle is dated in August, 1849. "Dear Rachael," it begins, "You see we have arrived at the very place that Christopher read to you and me about, in one of the London papers. At the time he read it, you know, I said I did not believe in it; but I only wish we had come here twelve months sooner; we should have saved a fortune. This is indeed a money-making place, if a person will work. You will be surprised to know how much money we can earn. I do my own work, and the washing and cooking for Mr. T. and Mr. S., and draw from eight to ten pounds per week, which is a great deal for a woman to do; but if I had any one to help me, I could do treble the work I now do. I have refused a great deal of good work; and to get a woman or girl here to help me—I may as well look for a needle in a bottle of hay. Now, my dear sister, all I want is your consent to come here to us. Brother and Mr. T. have long since advised me to send for you; and we would open a shop—go to San Francisco to buy our goods, haberdashery, &c.—and you would soon see the money we should make! I would open a shop now, only I have so much work, I could not manage it myself. I don't suppose you are married; but if this is the case, and you come here, you would soon make a fortune, there is so few females here. I am treated with the greatest respect by the gentlemen; as they say it is such a treat to talk to a lady, and particularly to an English

lady. They touch their hats, and shake hands with me, and treat me as though I was quite the lady. 'Madam' is a vast word when they speak to me. I never was treated with more civility in my life.

"We have done as well or better than any who came out in our ship. We intend staying in this country, if we are spared, for some time, as we are doing well; and should we make much money, we intend going to New Zealand, as we like that, much, for cheap living, though we may change our minds. We have never yet wished ourselves back in England; though, at the same time, we should very much like to see you all, and often wish you here. We are only thirty miles from the gold diggings; I have had several pieces of gold in my hand, and expect to have some more soon."

The brother, in another letter, gives a glowing account of the labour market; and corroborates,—by way of per contra,—all that has been hitherto stated as to the high prices of food and rent:

"I am working at the carpentry, and get twelve pounds per week, and L. (the sister) gets more than I do some days; but our intention is to go into some kind of business shortly. Provisions are dear here, but not so dear in proportion as in England, considering the price we are paid for labour; but all sorts of labour is so well paid, that a man will hardly open his mouth under a dollar. Some chickens was sold here on Saturday last, at three pounds per couple; eggs, new-laid, two shillings each; milk, two shillings per quart; butter, four shillings per pound; cabbages, four shillings each; cucumbers, one shilling each; but potatoes are a penny per pound—though they have been a shilling; onions, five shillings per pound; good beef, tennepence; flour, fourpence; tea, four shillings; sugar, one shilling; coffee, three shillings; veal, one shilling; mutton, two shillings; hams, one shilling and sixpence; dried apples, two shillings; and other dried fruits about the same. House-rent, extravagantly dear; a small, one-roomed house, two pounds per week; and in some parts of the town, the ground-rent is twelve to twenty pounds per week."

The kind of lodgings made shift with, to avoid such high rents, is thus described:

"We have a large tent, which Mr. T. had made in New Zealand. It is put up in a large field, free of expense; it is twenty-four feet long, and sixteen feet wide, and is very comfortable. As we have no rain here for six or seven months, living in a tent is not inconvenient; but we intend to have a nice house before winter sets in."

In urging his sister to join them, he continues:

"We do not know whether you are married or not, but if you are, we hope you are both well and happy. If you were here, you could save as much money in one month as you

could in twelve months in England. With downright hard drudgery and rigid economy, a man and wife may save from twelve to twenty pounds per week here, if they have any luck at all; but you must not think you get it without working for it. You have to work, and work hard, but you get good pay. I have seen scores of people that have been here twelve and eighteen months, that have not saved a dollar—they gamble it all away as they get it. People go to the gambling houses every day till they get into such a loose habit. They are opened all day on Sunday, and some are never closed, neither night nor day. Some men will come from the mines, and put a pound of gold on the table at a time, and in less than an hour lose a fortune."

THE MODERN SOLDIER'S PROGRESS.

PART III.

At the period when Maurice arrived in Halifax, the Lieutenant-Governor of the province was in England, on leave, and during his absence the command of the garrison devolved on the senior officer for the time being, with additional pay and allowances, and the title of "Commandant." In this office the Lieutenant-Colonel of Maurice's regiment found himself invested at the moment of his arrival; not, however, to his surprise, for he was aware of the Lieutenant-Governor's absence, and had embarked in the first transport, in order to profit by his seniority as soon as possible.

Colonel Stormy was a man who, in the course of a tolerably long military career, had seen some service, here and there, though none of the most brilliant kind; a circumstance partly owing to the nature of the expeditions in which he had served, and partly to the natural wrong-headedness that distinguished him. It was not his fault, to be sure, that Flanders should first have called for the display of his abilities; but if he had not been so obstinately bent on mistaking a celery bed for the trenches before Courtray, he would not have received that shot through his left leg which gave him an agreeable limp for the rest of his days. It was through no mistake of his that Whitelock's army surrendered at Buenos Ayres; but if he had followed that prudent General's example, he certainly might have escaped the *lasso* which would either have strangled or made him prisoner, in a skirmish there, if a friendly sword had not severed the obnoxious cord. It was not he who was responsible for the failure at Walcheren; but he might, perhaps, have avoided the fever, if he had followed the advice of the regimental surgeon, and not have gone to bed in his wet boots, after reconnoitring all day in a fog, without orders to that effect. Unfortunate expeditions, in short, were the scenes of all his exploits, and it was his peculiar fate to illustrate them to

his own disadvantage. We are wrong, however, in saying "all"—for, at the battle of Moose Island, in the Bay of Fundy (which was not recorded on the regimental colours, and is, indeed, remembered by few, having been somehow eclipsed by Waterloo) where Colonel Stormy was *not* present—at the battle of Moose Island, he carried a village of wigwams, at the head of his grenadiers, in very gallant style; and had the capture of that island made him master—as he supposed—of the key to the whole American continent, he might possibly have received the Order of the Bath, which he always considered his due, and grumbled at the Horse Guards for withholding it. But, if he did not obtain that merited distinction, he held Moose Island with his regiment, against all comers, for full six months after peace had been agreed on, and during that time acquired the taste for absolute government which he never afterwards lost an opportunity of developing.

This taste was aided by the pecuniary recommendations of "a command," and, as a soldier and a Scotchman, he had a keen appetite for all the loaves and fishes that came in his way. His talents for civil government were on a par with his military qualifications, and hot water was, consequently, the element in which he chiefly resided. Colonel Stormy did not deserve the entire application of Dryden's celebrated lines, but he laid claim to one which he made peculiarly his own; and nobody who had the fortune to serve under him, was slow to discover that the Commandant was not only "stiff in opinion," but most assuredly also "ever in the wrong." To complete this outline of the man, whose position enabled him to sway the destinies of so many of his fellows, it must be added that he was excessively passionate, but—as a set-off to the less amiable traits of his character—he was quick to forgive, of a jovial temperament, and sufficiently good-natured when not particularly thwarted. As all persons in authority in the army have their *sobriquet*, we may as well mention that the colonel was familiarly known as "Mad Jock."

A regiment, under the command of an officer such as we have described Colonel Stormy to have been, was not likely to maintain a very high reputation for discipline, in spite of the exertions of two steady-going majors and an adjutant, whose strictness bordered very closely on severity; and as long as Colonel Stormy had no other object to engage his attention, the regiment was knocked about like a shuttlecock—at one moment all work and at another all play. But the commandantship of a garrison, composed of three complete regiments, besides Artillery and Engineers, and a numerous local staff, gave Mad Jock a wide field for interference, and left his own corps comparatively undisturbed, while it afforded its more responsible officers an opportunity of getting the regiment in order.

Amongst those profited by the new state of things was Maurice Savage. The pride which he had originally felt in wearing a red coat, had not been discouraged; and he had learnt from Mac Manus that to be "smart" was the first step towards the promotion which the old soldier had, all along, so unambitiously neglected. Maurice, therefore, took pains with his personal appearance, and it was not long before he attracted the adjutant's attention at guard mounting, and, instead of being told off for the usual tour of duty, was very frequently ordered to fall out as an orderly for the day, in which situation a private soldier enacts at humble distance the part of aide-de-camp—without any increase of pay, but with a little more personal liberty than if he had his eight hours' sentry to perform. As an "orderly," his attendance on the adjutant, who sometimes selected Maurice specially to convey his orders, led him to observe the advantages which accrued to those men who were most regular in their attendance at school.

This was even then an optional course, and in the earlier days of Mac Manus and a few of the old soldiers of the regiment, had no existence; but when Maurice joined the service, the acquirement of education was every day becoming more widely extended, and at the present time, happily, we have it to say, the most effectual step towards advancement in the army lies through the school-room doors.

The Limited Enlistment Bill is a vast improvement, moreover, on the old system, which was generally for life; for now, a young man may enter the service at eighteen, and be dismissed at twenty-eight a perfectly educated man. This phrase is no hyperbole, for education in the army is not confined at present, as it was of yore, to the mere rudiments, sufficient to render the possessor of them capable of writing out the orders or of paying a company—but embraces a well grounded knowledge of history and geography (leaving the locality of "Novy Skoshy" no longer a matter of doubt), and a competent acquirement, not only of arithmetic and mathematics, but of geometry, algebra, mensuration, and fortification; so that, on returning to "civil life," the soldier is not compelled to fall back on the little mechanical knowledge which, peradventure, he owned before he exchanged the cobbler's awl, or the tailor's needle, for the musket and bayonet, but may earn an honourable existence by teaching those sciences which he has acquired in his military capacity.* The difficulty which the

schoolmasters of regiments now have, is, not the task of employment in teaching, but positive overwork, the consequence of the avidity with which the men who have joined the battalion attend the classes. The barrack library—successful rival of the barrack canteen—towards the support of which the soldier now cheerfully pays his penny per month, convincingly proves that the desire for education has taken root in the British service, and we trust the time is not far distant when the reproach will be removed from our army of being, in point of intellectual cultivation, so far behind the armies of France and Prussia.

We have said, that when the spirit of emulation awoke in the breast of Maurice Savage, the education of the men was in no wise compulsory; they were not then required, even as recruits, to attend school for two hours a-day, and afterwards continue at their own will and pleasure to be students; but, still, it frequently happened that a man preferred the request to be allowed to pick up the crumbs of knowledge that fell from the schoolmaster's table,—and Maurice Savage was one of these. It followed, in proportion to his assiduity, not that he became estranged from his comrades, but that he rose superior to the greater part of those by whom he was surrounded. His newly awakened desire for study brought with it another notable advantage; it kept him from those haunts of idleness and vice where nothing is learnt but that which tends to degradation and leads to crime.

It is the misfortune of most of our colonies that spirits are excessively cheap, and that even the little pocket-money which comes to the soldier may, if he is so disposed, at any moment, purchase liquor enough to make him "the worse for it." When once he gets a taste for the rum and whiskey, which are so abundant in the North American garrison towns, his demoralisation becomes as complete as that of the Red Indian, who is now seldom seen in quarters except as an object for men to make sport withal as he exhibits his drunken antics. The vice of drinking, growing by that it feeds on, cannot continue to be indulged in by the soldier, out of the pittance which, if saved, might, in the course of time, accumulate, in the Regimental Savings' Bank, to a respectable sum; his own respectability being insured the while. To obtain the unhallowed gratification, he runs in debt at the low grog-shops; and to pay his debt—for the villainous storekeeper threatens to complain, though he knows he cannot claim the amount, the credit of the troops having been "cried

* That genius will make its way in spite of every obstacle, is too true a theme for us to insist upon in this place, but during the two hundred years' existence of a standing army in England, how few have been the instances of private soldiers elevated to distinction by the force of education. Coleridge is not an example, for he owed his advancement to the accidental discovery of his being an educated man before he enlisted in the dragoons; but the late Mr. William Sturgeon, of Manchester, was one of those rare exceptions. He was apprenticed to a shoemaker, and dialling that con-

ployment, at the age of nineteen entered the Westmoreland Militia, and two years later enlisted in the Royal Artillery. "While in this corps," says a recent biographical notice of him, "he devoted his leisure to scientific studies, and appears to have made himself familiar with all the great facts of electricity and magnetism, which were then opening on the world. His subsequent career has created, for him, a name in the annals of scientific discovery."

down,"—the drunkard sells his necessaries. He is confined, and put under stoppages for this; but his downward career is too often only arrested for a time, and when the opportunity offers of getting out of barracks, he again frequents the grog-shop, spends more than he can call his own, and, anticipating severer punishment, makes up his mind to commit the worst crime in the catalogue of military offences, by deserting.

Halifax is, in many respects, an excellent military station; but the fatal facility of procuring cheap spirits is only too patent there. We know not whether the nest of abomination is yet to be found, which, when Maurice first went out to the colony, was still in existence, and from the frequency of the disturbances which took place there, went by the name of "Knock-me-down Street;" but if not "put down," it is a crying infamy that calls for immediate extirpation. The inhabitants of the hovels that formed this appropriately-named spot, were a small colony of black people of both sexes, originally brought from one of the remote West India islands, by the admiral on the station, and permitted to settle in Halifax, as a compensation for some loss or damage experienced by them, in the course of the war. Their notions of colonisation were of a peculiar kind, and consisted in drinking, and making others drunk, in fiddling, dancing, singing, shouting, and fighting. The squeaking tones of the kit, the shrill laughter, and shriller screams of the women, and the occasional report of fire-arms, showed that the place was not only disorderly, but dangerous, and that whoever had a reputation worth procuring, or a life he was not quite tired of, would do well to shun the disgusting dens of Knock-me-down Street. This "Suburra" was, unluckily, situated exactly between the barracks, where different regiments were quartered, and those who passed from one to the other, were obliged to pass through it. Its external hideousness was insufficient to repel visitors from the orgies which were held within, though by daylight no soldier ever dared to enter; but the case was different after dark, and many a man lived to rue the time when his foot first crossed the threshold of one of these haunts of licentiousness and crime.

Amidst the various blunders, practical and theoretical, which occupied the time of Mad Jock, was an occasional resolve to "look up" his own regiment, the discipline of which he would have acted wisely in leaving altogether to the senior major. We do not mean to say that the cares of his new station ought to have withdrawn Colonel Stormy from the paramount duty of superintending his own corps; on the contrary, he might have exercised a constant regimental superintendence, and at the same time have neglected none of the staff occupations of the garrison. But it was his misfortune to do everything by fits and starts; at one moment he would

delegate the entire control of the regiment to the officer next in seniority; and at another he would, without any previous warning, resume the command, enter into the minutest details, order and counter-order, revise and find fault with everything to which he had previously given his sanction. Because he was not there to look after everything, he would say the regiment was going to the devil: everyone neglected his duty; the officers thought of nothing but balls and plays, and shooting parties, and gallivanting after the ladies—he knew what they were about when they little dreamt he was watching them; the non-commissioned officers were a pack of ignorant beasts—"lazy dromedaries,"—(this was his favourite phrase), and deserved "to be broke," every one of them; as to the men, they were, one and all, a set of drunken blackguards; nothing but flogging would do them good; and straightway he would order a parade in heavy marching order, where, without giving time for the regiment to appear properly under arms, he would stalk up and down the ranks, prancing, and taking snuff, and brandishing his cane, and swearing at everything and everybody that came in his way. The usual result of one of these sudden "inspections" (as he called them) was the ordering of half-a-dozen courts-martial on as many unlucky fellows for unsoldierlike conduct in not appearing properly dressed at parade; or for some other offence equally slight—or, it might be, altogether fanciful. He would then call for the defaulters' book, fasten on the words "drunk on duty," hurry to the front some three or four scapegraces of the regiment whom, in spite of the standing orders to the contrary, he had ordered to be "logged," and read the entire regiment a lecture on drunkenness, so worded, as to include everyone present, and lead a bystander to suppose, that from the senior officer to the smallest drummer-boy on parade, they were all a parcel of Helots; and that it was his mission to expose and punish everyone alike; his constant peroration being—

"But I'll take the rum out of you, Gentlemen! Demmee, I'll take the rum out of you!"

And the plan he adopted to effect this laudable object, was forthwith to call for his horse, and, riding in front, order the regiment out to the Common, where he would put it through a series of manœuvres, executed in "double time," till the men and officers were ready to drop with fatigue; nor cease from his exertions till he had clubbed the battalion and rendered himself inaudible between rage and hoarseness. He would then call the officers to the front, desire the Adjutant to extricate the men from the confusion into which he had thrown them, and march them home; counter-order the court-martial; and, after a few pinches of snuff, taken with a sort of grim unction, resume his ordinary

manner, satisfied that he had given the regiment a lesson which would not be forgotten in a hurry.

Nor were these lessons thrown away; but their result was to render the officers dissatisfied, and the men discontented: the former felt that all their efforts were held as nought, and the latter that no amount of good conduct made them safe, when Mad Jock gave way to one of his indiscriminate fits of passion; for on such occasions the best man was as likely to suffer as the worst. In short, these ill-considered visitations on the part of Mad Jock had a precisely contrary effect to that which he intended; they caused him to be held up to ridicule by the men; neutralised the authority of the officers in general; and drove more than one man to desertion.

It was in the midst of troubled waters like these that Maurice Savage had to steer his way, to avoid punishment, and acquire approbation; that he succeeded in doing so, was owing to more causes than one. The counsel of Mac Manus, whose motto was, "Do your duty first, Maurice, and complain afterwards," proved of no slight service; not less so was the spectacle of Corporal Rattlor, whom nothing could keep from coming drunk to parade, for which he was reduced to the ranks—flogged—sent to hospital—and finally sent home with *phthisis pulmonalis*, an incurable invalid; nor was the example thrown away of two or three men, little older than himself, but who had been better prepared before they joined for the education they now received, and were already making their way upward; but, without doubt, the most serviceable thing for Maurice, as well as for the whole regiment, was the displacement of Colonel Stormy from his command, by the sudden return of the Lieutenant-Governor of the province, who had been hastily ordered out by the Horse Guards, when the consequence of certain indiscretions on the part of Mad Jock became only too apparent at headquarters. A private letter from a friend in office, to the last named gallant but blundering individual, advising retirement, and showing where good terms might be had, induced Colonel Stormy to apply for leave of absence as soon as the General arrived; and, after taking farewell of "his boys," with tears in his eyes and something that sounded very like "dromedaries" on his lips, he recrossed the Atlantic; was gazetted a few months afterwards, as having sold out, pocketed a heavy sum by the transaction, and was never heard of afterwards.

The regiment, left in the mean time to the care of the steady-going Major, began once more to hold up its head, and by the time the new Lieutenant-Colonel joined, was in a fit state to profit by the measures which the latter had been instructed by the Commander-in-Chief to adopt, in anticipation of general improvements which "the Duke" then meditated.

This officer was discriminating, just and liberal; he knew how to make allowances for the temptations to which a soldier is exposed; he was able to forbear when, more from thoughtlessness than wilful misconduct, a man got into trouble; he saw clearly what was fairly to be expected from the troops under his command, and refrained from exacting impossibilities; and he was endowed with that accuracy of judgment which made all his rewards worthily bestowed. Thus qualified, he was quick to discover that Maurice Savage was not the least undeserving of the care with which he regarded all, and the recommendation of the young man to the probationary rank of lance-corporal was favourably received. The advice which he gave on the occasion, was not thrown away, and five years had not passed by from the time when Maurice Savage "took the shilling" from Serjeant Pike, before he became that worthy's superior in rank; indeed the last reports from the regiment, now stationed in Upper Canada, make mention of the early retirement of the Serjeant-Major who is about to claim his discharge and settle in that country, and the letter which conveys this intelligence adds, that when this event takes place it is almost certain he will be succeeded by Colour-Serjeant Savage.

At his age, with the testimonials of good conduct which he has already received, and the prospect which now opens before him, there is nothing improbable in the expectation, that in a few years he may be recommended for a commission. He has always invested his spare money in the Regimental Savings' Bank, where it is as safe and as lucrative to him as if in the Bank of England. His increased pay enables him constantly to add to the amount; and, should the expectation be realised, which has become a legitimate goal for the soldier's hopes, Maurice Savage will scarcely stand in need of the hundred pounds which is now presented to every non-commissioned officer, to enable him to bear the expenses and assist him in supporting the rank to which he has wisely been permitted to attain.

A word on parting about Patrick Mac Manus. The new system was introduced too late for him to profit by it to any extent. He was "too old," he said, "to learn from books and them kind of things, but he didn't see that they did the boys any kind of harm." He thought, perhaps, that "he might have cut more of a figure, if, instead of powthering the outside of his head when he first entered the service, he had been made to put something into it. He was thankful, too," he added, "for the warrant that gave him an extra sevenpence a-day pension for good service, after knocking about for more than thirty years; and anyhow he'd be happy to drink long life to them as made it their study now to care for the soldier's wants, and give him a man's chance of gettin' on in the world."

as if he had a body worth preserving and a soul worth saving."

These sentiments he constantly repeated, after he had obtained his discharge, when he used to pitch his quarters as near the barracks as he could get a place to put himself into; where, on a fine summer's evening, when the men were off duty, he would gather a knot round him, as he sat on a log smoking his pipe, and tell them long stories about "His Royal Highness Prince Edward," and the long list of martinets, which ended "let us hope, boys, in Mad Jock!"

PEACE AND WAR.

Said War, "I pray thee my playthings see:—

See warriors glittering in the sun;
They're all automations, moved by me,
The proudest, the lowliest—every one.
At my beck or nod they rush to death;
Rush—ay, with frantic cries of joy—
To the cannon's mouth. But, then, above
I strew bits of laurel, by way of decoy."

Said Peace, "I pray thee my playthings see:—

See harvests ripening under the sun;
List to the shuttle's whirr. With me
The yeoman's happy battle is won.
Cheered by me, they toil till death,
While maids and matrons their linen weave;
The earth is not damp'd with their parting breath,
And I smooth their pillow as they take leave."

Said War, "I pray thee my triumphs see:—

See now how nobly my chosen fall:
List to the cannon's roar, and their gloe,
When the enemy's blood bespatters them all.
The warrior's head is upturn'd to the stars;
The warrior's plume lies soil'd in the dust;
But a halo of glory fits round his scars.
And with the blood of the enemies shall his
sword rust."

Said Peace, "I pray thee my triumphs see:—

See roses creep up the cottager's wall:
The children crowd round the father's knee;
The mill-wheel turns, to grind food for all.
I gather his friends round the poor man's bed,
When Death, 'the lean fellow,' seizes his prey;
I call blessings down on the orphan's head,
And point to the flowers of the bright May-day."

Said War, "My triumphs are won with blood,
The bravest and best with which veins e'er
throb'd."

Said Peace, "I triumph in yielding food
To the famished widows whom war hath robb'd."

Said War, "I am worshipp'd in every land;
My trophies bedeck every sacred dome."

Said Peace, "Mine are raised by the small white
hand
Of Truth—and I'm honoured in every home."

HOW TO BE IDOLISED.

THE hyperbole of being "idolised" was never, perhaps, made a literal truth in so striking a manner as is shown in the following story; for which we are indebted to a French author.

In 1818, the good ship "Dido" left the

Mauritius, on her voyage to Sumatra. She had a cargo of French manufactures on board, which her captain was to barter for coffee and spice with the nabobs of the Sunda Isles. After a few days' sail, the vessel was becalmed; and both passengers and crew were put on short allowance of provisions and water.

Preserved meats, fruits, chocolate, fine flour, and live-stock, were all exhausted, with the exception of one solitary patriarchal cock, who, perched on the main-yard, was mourning his devastated harem, like Mourad Bey after the battle of the Pyramids.

The ship's cook, Neptune, a Madagascar negro, received orders, one morning, to prepare this bird for dinner; and, once more, the hungry denizens of the state-cabin snuffed up the delicious odour of roast fowl. The captain took a nap, in order to cheat his appetite until dinner-time; and the chief mate hovered like a guardian-angel round the caboose, watching lest any audacious spoiler should lay violent hands on the precious dainty.

Suddenly, a cry of terror and despair issued from the cook's cabin, and Neptune himself rushed out, the picture of affright, with both his hands twisted, convulsively, in the scoty wool that covered his head. What was the matter? Alas! in an ill-starred hour the cook had slumbered at his post, and the fowl was burnt to a cinder.

A fit of rage, exasperated by hunger and a tropical sun, is a fearful thing. The mate, uttering a dreadful imprecation, seized a large knife, and rushed at Neptune. At that moment, one of the passengers, named Louis Bergaz, interposed to ward off the blow. The negro was saved, but his preserver received the point of the steel in his wrist, and his blood flowed freely. With much difficulty the other passengers succeeded in preventing him, in his turn, from attacking the mate; but, at length, peace was restored, the aggressor having apologised for his violence. As to poor Neptune, he fell on his knees, and kissed and embraced the feet of his protector.

In a day or two the breeze sprang up, and the "Dido" speedily reached Sumatra. Four years afterwards, it happened, one day, that Louis Bergaz was dining at the public table of an English boarding-house at Batavia. Amongst the guests were two learned men who had been sent out by the British Government to inspect the countries lying near the equator. During dinner, the name of Bergaz happening to be pronounced distinctly by one of his acquaintances at the opposite side of the table, the oldest of the savans looked up from his plate, and asked, quickly,

"Who owes the name of Bergaz?"

"I do."

"Curious enough," said the savant, "you bear the same name as a god of Madagascar."

"Have they a god called Bergaz?" asked Louis, smiling.

"Yes. And if you like, after dinner,

I will show you an article on the subject, which I published in an English scientific journal."

Louis thanked him; and afterwards read as follows:

"The population of Madagascar consists of a mixture of Africans, Arabs, and the aboriginal inhabitants. These latter occupy the kingdom of the Anas, and are governed by a queen. The Malagasys differ widely from the Ethiopian race, both in their physical and moral characteristics. They are hospitable and humane, but extremely warlike, because a successful foray furnishes them with slaves. It is a mistake to believe that the Malagasys worship the devil, and that they have at Teintigua, a tree consecrated to the Evil One. They have but one temple, dedicated to the god Bergaz (*beer*, source, or well, in the Chaldean, and *gas*, light, in the Malagasy tongue). To this divinity they are ardently devoted, and at stated periods offer him the sacrifice of a cock, as the ancient Greeks did to Æsculapius. So true it is that the languages and superstitions of all lands and ages are linked together by mysterious bonds, which neither time nor distance can destroy."

Louis Bergaz thought the latter philosophical reflection very striking.

"You can scarcely imagine," said his companion, "how important these remote analogies, traced out by us with so much labour and fatigue, are to the advancement of science!"

Bergaz bowed, and was silent.

The cares of a busy commercial life soon caused him to forget both the philosopher and his own idol namesake.

After the lapse of about two years, Bergaz set out to purchase ebony at Cape St. Maria, in Madagascar; but a violent tempest forced the vessel to stop at Simpal on the Avas Coast. While the crew were busy refitting the ship, Bergaz started off to explore the interior of the country. There are no carnivorous wild beasts in Madagascar; but, there is abundance of game to tempt the sportsman: and Lewis, with his gun on his shoulder, followed the chase of partridges, quails, and pheasants, for several miles, until he reached the border of a thick bamboo jungle.

There, he saw a number of the natives prostrate before the entrance of a large hut. They were singing, with one accord, a monotonous sort of hymn, whose burden was the word "Bergaz!" so distinctly pronounced, that Louis immediately recollected the account given him by the philosopher in Batavia.

Impelled by very natural curiosity, he stepped forward, and peeped into the temple. No attempt had been made to ornament its four walls, built of bamboo, cemented with clay; but, in the centre of the floor stood, on a pedestal, the statue of the god Bergaz, and Louis was greatly struck with his appearance.

The idol, although far from being a finished work of art, was yet far superior in form and workmanship to the ordinary divinities of

savage nations. The figure represented a man, dressed in European costume, with a wide straw hat on his head, and a striped muslin cravat round his neck. He was standing in the attitude of one who is intercepting a blow, and his right hand was stained with blood. There was even an attempt, Louis Bergaz thought, to imitate his own features; and the god had thick black whiskers meeting under his chin, precisely such as Louis had worn in 1818. The dress, too, resembled his own; and the cravat, marked in the corner L. B., was one which he had given Neptune the cook. In a few minutes, a procession of natives entered the temple; they kindled a fire in a sort of chafing-dish; and, placing on it a dead cock, burnt the sacrifice before their god, amid loud acclamation. Bergaz, unluckily, was not able to preserve his gravity during this pious ceremonial. He burst into a fit of laughter, and was instantly seized by the offended worshippers. With shouts of rage they were about to sacrifice him to their outraged deity, when a noise of cymbals announced the approach of the Chief of the tribe. The high priest met him at the door, and announced the sacrilegious conduct of the stranger. The incensed chieftain seized a Malayan *creese*, and ran to take vengeance on the offender. Bergaz turned and looked at him; each uttered a cry of surprise; the next moment, the chief was embracing the feet of Louis.

"Neptune, old fellow! what is all this?" asked Bergaz pointing to the figure, "Bergaz is my god!" cried the negro, striking his breast. Then, to the unbounded astonishment of all present, the European and the chief walked off lovingly together towards the palace of the latter.

On their way thither, Neptune related his history to his friend. The powerful Radama, sovereign of Madagascar, had concluded a treaty of peace with his enemy Róné. The wife of the latter, being a woman of genius, was named queen of the Anas, by an edict of Radama; and this lady was the sister of Neptune, ex-cook of the Dido.

No sooner was she seated on the throne than she released her brother from his menial situation, and gave him absolute authority over the small province of Simpal.

Neptune's first act was an endeavour to manifest his gratitude, after the strange fashion of his people, to his protector Bergaz; and we may fancy how cordial was the reception, how warm and affectionate the welcome, bestowed on the living benefactor, whose wooden semblance he and his people worshipped as a god. The grateful negro loaded him with presents, and sent his most skilful workmen to assist in repairing the ship. Probably, to this day, the god Bergaz may still be worshipped in Simpal; and the Æsculapian cock may still excite the wonder, and fill the note-books of travelling philosophers.

"Familiar in their Mouths as **HOUSEHOLD WORDS**."—SHAKESPEARE.

HOUSEHOLD WORDS.

A WEEKLY JOURNAL

CONDUCTED BY CHARLES DICKENS.

NO. 46.]

SATURDAY, FEBRUARY 8, 1851.

[Price 2d]

TWENTY-FOUR HOURS IN A LONDON HOSPITAL.

It is slippery walking up Ludgate Hill, early on a mid-winter morning, with an atmosphere well mixed with Thames fog and sea-coal smoke, after a week of rainy days. Look up for the dome of St Paul's, and so much of it as you can see looks unusually magnificent, half-hidden in its bath of London yellow clouds. You can scarcely see the large clock-face, with the hands full six feet long, and everything looks so dim and dark, that when you hear it strike six, you fancy it must have made a mistake, and gone too fast in the night, in its desire to get through the cold season as quickly as possible. Still, six at night it cannot be, for the shops are all shut, and there are no well-dressed people about, hurrying on their way for business or pleasure. A policeman sauntering, three bricklayers' labourers hurrying, and one fishmonger's boy in a cart, driving the horse within an inch of a general smash, have this part of the thoroughfare all to themselves. Turn to the left up the Old Bailey, and the scene changes. Newgate is there, hard, nubbly, and black as usual, and St. Sepulchre's, with its tall tower and bells that toll men to execution below,—both stern, calm. But round about them both there is a very whirlpool of life. Noise of all kinds—bellows, beatings, the rattle of wheels, the barking of dogs, the sound of blows, many and fast, the clatter of hoofs, the tramp of hurrying feet, with ever and ever rising above all a running chorus of execrations, rude oaths launched by brutalised men against infuriated over-driven brute-beasts. Pass on from the Old Bailey towards Smithfield, and the crowd thickens and thickens, and, at each step you take, up splashes the thick yellowish-black slush that, literally, floats on all sides. Thousands of oxen are packed in rows, as close as so many soldiers in a line, shoulder to shoulder, whilst acres of sheep are panting away the little span of life now left in them, as butchers and salesmen are making terms, and drovers are yelling to dogs, and dogs plunging amongst herds yet unpenned. Every animal you see has heaving sides, and open mouth, and panting breath; and, had they human voices, their thousand drouthy throats, and lolled out

parching tongues, would join in one long, loud wail, drowning all cries in one for Water! Water!

Take care of your toes, or they will be trodden down by drovers' hobnailed shoes; take care of your eyes, or they may be probed by the iron goads at the end of drovers' sticks; take care of your head, or it may be broken by blows meant for an unlucky ox; take care of your pockets, for all the thieves are not inside the building you have just passed, and where canvas money-bags are seen, there nimble fingers often congregate. The human throng is as thick almost as the quadruped one; and for blows or losses, there is at Smithfield, on market morning, little time either for sympathy or redress.

Look out upon the army of sheep, oxen, calves, and pigs there drawn up, all full of life, and remember, then, that all this is not three days' meat for London; that within a week all these living things will have been killed, cooked, eaten, and digested—their skins in the tan-yards, their horns in the turner's workshop, and their hoofs in the glue-pot. Gone; used up; to help feed London for just a few days, and you will have one element for making up a notion of how vast an affair this same London is.—

But Smithfield is not a safe place for abstraction.

A rush, and a shriek, and a heavy fall, and a new shower of oaths—and straightway part of the crowd proceeds to pick up a wretched woman who is trying to cross the way to her work, just as an ox which had been driven and goaded all night, makes a grand tilt at his tormentors. The drovers had driven him to mad fury, and the poor charwoman comes in for the punishment.

"Take her to the hospital," grumbles a fat salesman, whose proceedings are interrupted by the thickening of the crowd round about. Her bonnet has fallen off, and, as they lift her up, her grizzled hair escapes from her cap and hangs down, dabbled in the slush. Her thin, poverty-stricken clothing offers little resistance to the horn of the ox, and the blood shows that the blow took effect on her side.

"Take her to the hospital," repeats the fat salesman; and straightway, as by one consent, and with very few words, a police-

man and three beggars bear her off to the doors that stand ever open, close by, for the victims of accident or heavy sickness.

Saint Bartholomew's Hospital now stands just where it stood centuries ago, in days when Smithfield was the scene of holiday makings and executions; of tilts and tournaments before kings and princes at one time, and of death agonies of political criminals and religious martyrs at another. The present building has no remnant of the old one in its construction; indeed, the hospital has grown to five times its original extent. Patients now-a-days are admitted at a gate under the colonnade, where proper persons wait night and day to receive sufferers by accidents and other urgent cases; and to this gate the victim of a Smithfield ox is brought.

The handle of the bell hangs near, and one pull brings a porter to the gate. The words "An Accident," are enough to open the portal without further parley, and the old woman in a few more minutes has been examined by the house surgeon of the night, and—her injuries being severe—is placed in a kind of sedan, and carried off to a bed in the female ward, allotted to such cases. Following her, brings us into the square of the hospital, and whilst she is being tenderly borne across it, and up the noble wide oak stairs that lead to the wards, let us stay to notice the peculiarities of the place.

The buildings of the Hospital, abutting on Smithfield, give no idea of the real character, or exact extent of the place. They are, indeed, a kind of outworks to the main structure, placed where they are, partly to give increased accommodation, but chiefly to occupy a space formerly covered by tradesmen's tall houses, which some years ago, shut out the air and light from the main body of the Hospital. These were pulled down to let in the air from the open space of Smithfield—for it must be remembered that the market has its quiet hours, and that plenty of indifferent air is better than a scarcity of air altogether. To look at the main building, then, to which these more recent structures have been added, we stand within a quadrangle. In the centre of the enclosed space there is an ugly circular pump, which looks like a slice of a worn-out steam boiler with a lamp on the top, whilst on each side rises a large and handsome stone building, many stories in height, with long rows of windows, and each side having a central door and hall of entrance, from which oak staircases ascend. Each floor is divided into two wards, usually one medical and one surgical, and each ward has its little body of resident officers under the command of a matronly woman, called the "Sister." All the wards are christened; some after benefactors of the Hospital, some after the names of the virtues, some after the characters of Bible history. Indeed, it may be said, there are wards with Christian names, and wards

with mercenary names—the one given from pious motives, the others from pecuniary ones. The names are all written on the sides of the doors, just as lawyers put up their cognomens on the sides of dingy portals in the Temple or Lincoln's-Inn. There, on one side we see written "Darker," "Sitwell," "Harley," and "Kenton" wards, named after persons who have done service to the place; whilst on another—the Christian side—we have "Lazarus," "Job," "Luke," "Hope," "Faith," and "Charity." The resident officer of each of these is named after her ward—the captain, as it were, is christened after the ship—and we hear nothing of Mrs. Jones or Mrs. Smith, but only "Sister Darker," and "Sister Sitwell," "Sister Hope," "Sister Job," "Sister Luke," "Sister Faith" and "Sister Charity." Many of these women are models in their way; full of patience, experience, kindness, and firmness, having withal the modes of good management requisite for preserving order, cleanliness, quiet, and an air of comfort in places where disease in its worst forms, and with its most unpleasant accompaniments, is ever present. Each sister has a little box—perhaps more like a little ship's cabin than anything else—fixed up in one corner of the ward. This is her sanctum, having its tiny fire-grate; its bed and table, and chairs. To this Sister Hope can retire to speak with the doctor, or to take her quiet cup of tea, and from this she issues to rule over her little kingdom of sick patients, and hard working nurses, and to keep all under her sway in as much comfort as their condition will permit. Each ward has its bath and other conveniences; and each its speaking-pipes, through which orders are given and received from the hall; each has also three nurses, in addition to the sister, with the power of calling for additional aid when requisite, from the well-filled ranks of servants attached to the place. This female staff has ordinarily twenty-six patients under its care; and day and night there is always one nurse at least on duty, to attend to the needs of the sick. The nurses, indeed, have their watches like seamen in a ship, the night nurse going on duty at eleven o'clock, and being on watch till six in the morning, when the hospital life of the day is commenced by the medicines being given to those patients who are to receive physic more than once in twenty-four hours. Soon after the clock strikes six, there is a great shaking of bottles, and a great array of wry faces amongst the five hundred sick people who tenant Bartholomew; and within the next half-hour how many pounds' weight of pill, and how many quarts of "house physic" are swallowed, we may know more about by-and-bye, when we come to look into the Apothecary's proceedings.

Having described thus far the special staff of one ward, we have only to multiply by twenty, and the whole hospital may be, thus far, understood. One ward may be appro-

printed to medical cases, in charge of physicians; and another to accidents, and other visible injuries and diseases entrusted to surgeons: but each has the knot of resident attendants we have described. The patients in this building may at one time number only five hundred; and at another, may amount to nearly six hundred: but, be the number what it may, they are arranged in companies, controlled and attended as we have seen.

How this large sick family, with the needful servants, are fed, and physicked, and tended, let us spend a day in the place to see.

Our poor old acquaintance, the woman gored by the ox, now lies in bed; and the house-surgeon having satisfied himself of the nature of her injuries, and applied the requisite means for her relief, re-crosses the square to his domicile. Let us go with him to the quadrangle, and look and inquire about us.

London, by half-past six, is but very partially astir; and though the din of Smithfield is, we know, close by, the hospital has an air of stillness and repose. As we walk round, we see outside the square, on one hand, the low line of buildings forming the medical school, the room for prescribing for out-patients, the apothecaries' laboratory and shop, the lecture theatre, the dissecting-rooms, the library, the museum, the dead-house (which through the year has an average of one tenant for its still walls each day), and the receptacle for coffins. On another side we find, still outside the noble central quadrangle, the collegiate part of the establishment, including the house in which a portion of the students live, their dining-hall, and the residence of the ever-present, ever-working warden and assistant-surgeon, Mr. Paget; and in the near neighbourhood, the surgery, some surgical wards for special cases, and the operating theatre. On a third flank, we find within the hospital boundary nothing less than the church of St. Bartholomew the Less; and the reason of a parish church being shut up, as it were, within the confines of a special establishment, is explained by the fact, that the hospital itself covers the whole parish, with the exception of some three or four houses! So that the place has its own parochial jurisdiction, its own parish church, its own parish meetings, its own parish vestries, and its own parish rates. It stands, indeed, a little principality, as it were, of its own,—with the laws of charity for its institutions; doctors and surgeons, and almoners, for its ministers and chief officers; stewards, and matrons, and ward-sisters, for its officers; nurses, and surgery men, and cooks, and cellar-men for its subordinates; and the sick and poor of the modern Babylon for its subjects.

To feed the large family residing in the huge hospital is a serious affair. It being now seven in the morning, and the physicians being over, the nurses pay their first visit of the day to the buttery, to fetch the allotted quantities of food served out in the morning. The patients are, of course, on different scales

of diet, according to their bodily condition. Here is one day's list of how five hundred and thirteen sick folks were rasked on the diet list:—One hundred and sixty-two on "full diet," a hospital term which means the following ample allowance for each day—one pint of milk porridge, fourteen ounces of bread, meat weighing half a pound when cooked, half a pound of potatoes, beer, two pints for men and one pint for women, and one ounce of butter. Next comes "half-diet," which would be thought blissful abundance by many folks outside the walls, for it means the pint of milk porridge, twelve ounces of bread, a quarter of a pound of cooked meat, half a pound of cooked potatoes, a pint of beer, and three quarters of an ounce of butter. In "Broth-diet," broth and gruel are substituted for the meat and beer, the other items being nearly the same, with the addition that the potatoes are mashed, and made more acceptable to sick stomachs. "Milk-diet" almost explains itself, it being chiefly milk, with the addition of rice, sago, arrow-root, and bread.

The zero of this feeding scale, "Low Diet," means those thin comforts—gruel, or barley-water. Patients needing them have extra allowances, when ordered by the medical officers, such as mutton-chops, beef-tea, eggs, pudding, jelly, porter, ale, wine, brandy, and—hear it, Oh, Father Mathew—gin! No wonder that the poor who have once tasted the comforts of Bartholomew's in days of sickness and tribulation should wish for them again. The following scale is for one day in December 1850:—On full diet, 162 patients, 66 of them with extra allowances; 148 on half diet; 157 on milk; the remainder being fed on broth, beef-tea, rice-milk, arrow-root, and sago.

The meat used on the same day in the hospital for patients and nurses, weighed three hundred and four pounds, besides half-a-hundred weight of beef for beef-tea, making together three hundred and sixty pounds. With this noble dish of mutton and beef, four hundred and forty pounds' weight of bread was eaten, accompanied by about one hundred and fifty pounds' weight of potatoes, thirty pounds of butter, fifty eggs, washed down by fifty gallons of milk, and the butler only knows how many gallons of beer. Not a bad day's eating for a sick house! A month's butcher's bill comes to one hundred and fifty pounds; and a year's consumption makes a very strong array of figures. Here they are—

24,000 pounds of beef;
35,200 pounds of mutton;
16,760 gallons of milk;
12,000 eggs.

This is a glimpse of the sunshiny side of the hospital fare. We shall presently find some startling facts connected with the apothecaries' department, one of which, however, we may

give here as an addendum to the above items of yearly consumption. It is this:

1359 gallons of black draught!

It would surely take a whole statistical society to discover how many wry faces are drawn over the swallowing of such an ocean of salts and senna.

Whilst we have been going over this summary of hospital dietetics, all the beds have been made, the hospital breakfast has been got through, and another half hour of our visit has slipped by. The sound of the clock striking eight, quickens the steps of certain tardy students, who are now seen hurrying away to prayers in the church, whence they emerge in about twenty minutes to meet at breakfast, in the collegiate dining hall, such of their companions as eschew the early service. The morning meal having been discussed, the future doctors trudge off at nine o'clock to the Lecture Hall, to begin their scholastic day with anatomy and physiology. Whilst all this goes on, the Apothecary, or the "House Doctor," as he is familiarly called, is going through the physician's wards, and the "dressers" are busy with strappings, bandages, ointments, and rollers, amongst the surgical patients; attending to wounds, and making all "ship-shape" against the arrival of the superior medical staff, by and by. The "Clinical clerks" are also busy at bed-sides, taking down notes of symptoms, of the action of remedies, and the progress of special cases—all remarkable instances of disease, having their chroniclers, who watch each stage of the patient's progress from the day of admission to the hour of cure, or death—adding to each, when the result is fatal, the after-death appearances. By ten o'clock the students are seen leaving the anatomical theatre for the neighbouring one, where chemistry reigns supreme amongst a host of bottles, retorts, crucibles, test-glasses, and the thousand and one philosophical nicknacks, making up the chemist's tools. Whilst a great deal of difficult talk is going on here about oxygen, that giant amongst elemental things, and his companions, hydrogen, and nitrogen, and carbon, the nurses are off to the store for arrow-root, and sage, and other good things, in one place, and another part of the establishment is rapidly filling with the large class of patients who are relieved with advice and medicine, but not received into beds in the hospital. On Thursdays this class of applicants is most numerous, because on that day a certain number of the most serious cases are selected from their ranks, to fill any beds that may have become vacant. This being known, poor people are often seen amongst the throng who have come ten, twenty, thirty, and sometimes fifty miles in the hope of obtaining the help of the institution.

The patients enter by the colonnade seen from Smithfield. Passing the outer portal, there are two doors: one for women, and one

for men; and these lead to two separate rooms. By eleven o'clock the forms with which these apartments are filled, are lined with people of all ages, from the baby a month old, sickening with measles or whooping cough, to the old crone of seventy, groaning with old age, which she declares to be "roomatiz, which the doctors can cure." Such a collection of sickly, unhappy faces, and such a variety of dirty, dilapidated clothes, with here and there a dash of faded finery, must only be looked for in the waiting-room of a large hospital. Here and there you may see a handsome face, and here and there an interesting one; but the majority of these poor waiters for help belong to the class upon whom falls the general weight of the work, and of rough usage, and of the risks of injury of a great city; and their physiognomy, though full of character, has but small claim to good looks. The crowd of patients becomes thicker and thicker as eleven o'clock draws near. Rows of mothers are seen seated with rows of children with measles, children with whooping coughs, children teething, and, above all in number and discomfort, mothers and children with cough and colds in all stages of that popular English disorder. Scarcely anybody talks to a neighbour, but all sit waiting for the man who is to tell their doom—the doctor. In one part of the room enormous earthen pitchers decorate a corner filled up as an appendage to the surgery, where salves, and plasters, and "house physic," and cough mixtures, are dispensed with great readiness, when wanted. At eleven o'clock the apothecary enters the scene, with a handful of tickets differently marked. Beginning at the end of the first form, he commences his first examination of the out patients—a task that looks enough to occupy the whole day. "What is it?" is the rapid inquiry; and while these words come with a jerk, as it were, from his tongue, his rapid practised eye is scanning the face of the patient, and his finger is feeling a pulse. The few first words of the patient tell him all he needs; and in another second he has, if it be a trifling case, selected one of the tickets, with the injunction, "Get that medicine. Take a dose twice a-day. Come here again the day after to-morrow." In half a moment more—"What is it?" startles the next on the form. Another tongue is out; another face has been scanned; and the ticket and direction given; and "What is it?" assails patient No. 3; and so the work goes on more rapidly than this description has been written.

When a case of injury is amongst a throng, the patient is sent off to the surgery, close by, from whence groans and screams every now and then sound out to startle and horrify those whose turn is yet to come. More than a thousand people are seen and prescribed for every week in this place; this sick multitude affording the main bulk of the applicants, from whose ranks the greater part of the in-

patients, that is, the people taken into the house, are recruited. Diseases have their seasons here, in Smithfield, just as fruits and flowers have theirs in Covent Garden, and are expected with almost the same punctuality; the two great staple facts being that winter enormously increases the coughs and chest affections, whilst summer brings diarrhoea, and other affections of the bowels.

During rapid examination of patients in the reception-room, those who require something more than an off-hand physic ticket, or a trifling operation, are kept back to be prescribed for by the surgeon or apothecary; the worst cases of all receiving letters, and being sent to another apartment, called the admission-room, in which they undergo another and more deliberate examination, after which the worst of all are admitted to the wards, to be there kept till they are well. One ingenious plan, amongst many adopted in this hospital, may be here named. The letters are printed in different coloured inks. Some are yellow, some black, some red, some green, brown, and blue. These six colours indicate, at a glance, to the officials the name of the medical officer under whose charge the patient is; and simple as such a matter may at first seem to be, its practical value is really very great. Thus, suppose red, blue, and black, are physician's colours, and yellow, green, and brown, surgeon's colours, the general character of the disease of the patients is known at once. But more than this, red means a particular physician, say Dr. Roupell, then blue may mean Dr. Burrows, whilst yellow means, not only surgeon's case, but Mr. Lawrence's case, and green Mr. Stanley's or Mr. Lloyd's. With a dozen or a hundred sick people such distinctions may be unnecessary, but where, as in Bartholomew's Hospital in 1849, seventy-seven thousand seven hundred and ten patients ask relief in one year, all and every means for obtaining rapid modes of classification become most important.

But the clock says it wants but a quarter to twelve, and the receiving, or casualty rooms, being cleared of the crowd that thronged it an hour ago, let us pass to the Admission-Room—the second stage of the patient's progress into hospital. Here the more serious aspects of disease begin to present themselves. The large, and rather noble looking old room has forms like the other, but they have backs to them, against which the sick and weary may lean. The gaping look that was manifest amongst the "casuals" is not seen here. The very sick have little time for curiosity. Pale-faced women are seated on the one side; men, with heads bandaged and arms in slings, on the other. Moans come out from what seem to be mere masses of clothes, great coats, wrapping handkerchiefs and shawls; crumpled-up forms lie on the seats, still and silent, oblivious of all, save the constant pain that brings them here; up in the corner yonder is a young girl with

a cheek blooming like peach blossom, and eye bright as that of the fabled Houri; but the long thin fingers, with their filbert shaped nails—and, hark! the cough—tell plainly enough that she is blooming only for the grave. Near her see that girl's shawl rise on her breast—you may count the pulses of her heart. Go near her, and listen, and you may hear them. She too, cheerful as she seems, in her youth and her sin, is sure to pass away suddenly and soon, and without the time for thought and preparation vouchsafed to her consumptive neighbour, for she has disease of the heart—the most frightful, perhaps, of all the diseases of our modern civilisation, because so sure to slay with little warning. But the almoners and the doctors are coming, and, as they approach, we have just time for a glance at the arrangements made for them. The room is large, with heavy paneled sides, looking old and solid. The walls are well dotted about with scripture texts, speaking of religion and charity. On the shelf is an old carved wooden figure of a cripple, in the costume of two or three centuries ago; and in one corner of the room another and larger wooden model of a cripple, painted in imitation of life. This, in former days, when each house had its sign, was hung out in front of the hospital in Smithfield, to tell the unlettered crowd the nature of the building, and probably to excite, in favour of its inmates, the charitable feelings of passers by. One corner of the room has a portion converted into a small distinct apartment, or large closet, into which patients are, when needful, taken for private examination; whilst opposite this, and on the other side of a noble sized fireplace (with fire enough in it, in winter time, to roast a sheep), is a portion partitioned off and enclosing desks for the almoner and medical officers employed in admitting patients. It is soon evident that the absolute presence of serious disease is sufficient to secure a bed, at all times, for those who greatly need it, though an ancient form of petition is still kept up—and it is but a form. This the sufferer is supposed to fill up and present. It runs as follows:—

"To the Worshipful the President, Treasurer, and Governors of St. Bartholomew's Hospital.—The humble Petition of —, residing at —, in the parish of —, and belonging to the parish of —, sheweth, that your petitioner is afflicted with —, and is likely to perish without the charitable assistance of this house; therefore humbly prays to be admitted into the said Hospital for cure, and, as in duty bound, will ever pray."

A note in the corner says, "Here state the name and address of any relation or friend of the petitioner;"—but this signature is not insisted upon.

At twelve o'clock the ceremony of washing faces and physic swallowing goes forward in all directions, and precisely at that hour on these

important Thursday mornings, the almoner, and physician, and surgeon, enter the admission-room from the hall, attended by the headle, and usually by matron and steward. About eighty to a hundred patients are usually present, the majority being males. The number of vacant beds being reported, the medical officers begin the task of inspection. One after another the names of the patients most in need are written on the petitions. This done, the names of the applicants, to whom beds have been allotted, are read aloud, the list of women being called over first; the men next. The number thus selected for treatment "in the house" varies very much, but being settled for the day, the words "No more beds vacant" are shouted out, and those still waiting receive letters as out-patients. The sisters of the ward next enter the room to muster the cases allotted to each. The names of the patients for Hope are called out by Sister Hope, when off she marches, with them in the rear, to Hope Ward. Sister Charity then goes through her list, which done, off she walks with her flock of sick behind her, and so on until all are drafted towards their respective places in the building. Those unable to walk are carefully taken by *chaise à porteur*. Before being taken to their respective beds they are put into warm baths, and those who need it have suitable garments lent them; though almost all, as a rule, comply with the usual requirements of a hospital, and bring with them the clothing requisite for a sick bed.

As the patients thus file off, a balance of rejected candidates are seen being lifted into cabs, or being led by their friends through the hospital gates. About six thousand in-patients are admitted every year, but even Bartholomew's, large as it is, cannot hold all who ask admission to its wards.

By about half-past twelve all this selection, separation, and allocation of the sick has been finished; and as many of them reach the wards, the first sound they hear is a voice up the speaking tubes that tells it is dinner-time. One porter makes this known in a very few minutes through all the rooms in an entire wing, for, in the hall, ranged side by side, are mouth-pieces communicating with each ward. Up comes the voice, and off file the nurses with their cards and tickets showing how many dinners they are to draw, and of what kind.

The food for five hundred people having been served out, taken to bed-sides, and ward-tables, and arranged, another half-hour has gone, and by this time the neighbourhood of the Apothecary's shop is besieged by hosts of out-patients waiting to see the assistant-physicians, and assistant-surgeons, and, when they have been prescribed for, waiting for the physic they are to take.

The Apothecary's shop and that physic factory—the laboratory—which adjoins it are amongst the most curious portions of the

entire establishment. Passing through the throng of patients—who (women in one room and men in the other) are ready, each in turn, to pass through the turnstile which prevents crowding, by allowing only one or two at a time to reach the counter where the medicines are served out—we cross the dispensing-room, and descending a step or two, find ourselves in the laboratory. The floor is stone and the roof high. On one side fumes a steam-engine; next it are large coppers fixed in brickwork, and having most capacious coverings, looking like huge copper nightcaps large enough to cover the heads of a whole family of giants. Each of these is moved up from the simmering, steaming mass within by means of pulleys, and other machinery. Mr. Wood, who, like Mr. Paget, is one of the omnipresent people of Bartholomew's, reigns chief magician over this region of stills, funnels, crucibles, evaporating pans, and potent things. He raises one lid just an inch, when out gushes a fragrant aromatic steam of boiling sarsaparilla; he lifts another, and we note the soporific fumes of syrup of poppies. A little further on we see an assistant mixing up gallons of treacle for syrups and confections, and another opening casks full of the pulp of hips, and mixing it with large masses of sugar; an early process in the preparation of a popular tincture for coughs. How many millions of wild roses must have blossomed in quiet country hedgerows before even one of five casks could be filled with the pulp of hips; how many bright autumn days must have been spent in gathering the ripe fruit of those wild flowers from the rural English banks where they grew! They come chiefly from Hertfordshire, and are plucked by children, who take out the seeds and store up the pulp, which comes here by the hundred-weight.

But the things in this alchemist-looking place are not all so pleasant to think of, or so harmless to smell as the rose fruits and the sarsaparilla. The men in the corner there, are preparing and extracting the poisonous juices of henbane and foxglove, and monkshood. The fumes come off, and, hardened as they are to the work, they will all suffer more or less from their task, before they have done. They are always, more or less, sick after it, and were they always so employed, it would doubtless cost them their lives. Happily a little poison goes a long way; and to-morrow, or next day, they will be engaged in the more harmless duty of mixing the thirteen gallons of black dose, which the house requires regularly twice a week, and sometimes thrice! All round the place run pipes containing hot distilled waters, and others conveying steam, by means of which a boiling heat can be got under the evaporating pans, or in the coppers. The evaporating dish in the corner is made of solid tin, and though holding about a gallon only, the metal for it cost fifteen pounds. Next this dish stands a

hydrostatic press, by which a weight of one hundred tons can be brought down upon any drugs to squeeze out the last drops of their useful juices, for economy goes hand in hand with abundance in this part of the establishment, as the well and elaborately kept books show. Next the laboratory is a kind of store-room, full enough of physic to frighten a dyspeptic man into health—and that's saying a great deal. The drugs come here in their raw state, and are made up in the laboratory, on one side, to be dispensed in the apothecary's shop on the other. In this place, in a year they use enormous quantities of drugs, and some of the single bottles and drawers, hold an amount of value, surprising to recount. One bottle holds, in solution, as much iodide of potass—a thing largely used—as cost at wholesale price, fifteen pounds. In the drawers you may see sixty or seventy pounds worth of bark—about a year's consumption, besides which, above one hundred and fifty pounds a year is spent upon quinine! As all this is got from the smaller branches of a particular kind of South American oak, what forests must be needed to keep up the supply for this one hospital alone!

Between two and three hundred pounds are spent, every year, for strong sound port wine, for the sick poor. It is bought in pipes and drawn off as needed. Nearly two thousand pounds weight of castor oil; two hundred gallons of spirits of wine, at seventeen shillings a gallon; twelve tons of linseed meal; a thousand pounds weight of senna; twenty-seven hundred-weight of salts; are items in the annual account for drugs. The grand total spent upon physic, in a twelve month, being two thousand six hundred pounds. Five thousand yards of calico are wanted for rollers, for bandaging; to say nothing of the stouter and stiffer fabric used for plaisters. More than half a hundred-weight of sarsaparilla is used every week, a sign how much the constitution of the patients requires improvement. In a year twenty-nine thousand seven hundred leeches were bought for the use of the establishment—an invasion of foreigners without parallel, until we have the influx of the Great Exhibition—for the leeches brought to bite and die in this London Hospital are gathered in France and Poland, in Africa and Spain. A ton and a half of treacle is annually used to make some kinds of syrup; the five casks of hips, which, mixed with a cask of sugar, makes linctus for coughs, has been already mentioned, but one little fact, in addition, respecting it should not pass unnoticed. This preparation for coughs is red in colour, and looks fruity, and tastes somewhat sweet, having still, however, an acid dash. As winter comes the coughs increase, and the demand upon the stock of linctus becomes heavier and heavier. This is expected and provided for; but one season it had been larger even than usual. The same children and the same women came again

and again, most perseveringly; when, in consequence of some inquiries, it was found that one of the most urgent claimants for the favourite physic lived by selling little sweets and pies to children, in a back street, near Smithfield, and that she used the favourite linctus to make fruit tarts of!

But we have been a long time with Mr Wood, the apothecary, and must return to the wards. By half-past one the ward dinners are all over, and all the inmates are expecting the visit of the chief surgeons and physicians of the day. The approach of these is known by the tramp of many feet up the stairs—for the medical officer is medical teacher also, and comes surrounded by the bevy of students who are "walking the hospitals." Tall and short, fat and lean, young and middle-aged, in black, green, brown, and gray, but all displaying a certain grave, inquiring seriousness, on comes the crowd.

You may always know the medical repute of a man by the number of his pupils; and somehow, the surgeons always have most. There is something certain and exact; something free from doubt and humbug about anatomy and surgery, which commends itself to young and ingenuous inquirers; and hence, partly, perhaps, the greater throng round the chief surgeon, as he makes his way through the wards of a hospital, than round any of his merely medical brethren.

Whilst this company of surgeons that are and surgeons that hope to be, are going from bed to bed, examining and questioning and prescribing for patient in surgical ward after surgical ward, the physicians are performing a similar duty in the medical wards; for the uninitiated should know that a great merit of a large hospital, lies in the opportunities it has for classifying the sick. The timid patient with disease of the heart, or the delicate woman suffering with still more critical maladies, in a good-sized establishment can be separated from the contact, and be away from the groans of any sufferer by accident or from operations.

The rapidity with which the old medical practitioners detect the peculiarities of a case, is marvellous. The size, strength, complexion, general aspect, tone of voice, brightness or dullness of eye displayed by the sick, tell as much, or more, than any verbal story of aches and pains. The glance, a few questions, a pen and ink scratch of some half-dozen pharmaceutical hieroglyphics upon a card handed from the bed-head by the attendant nurse, and on go the crowd to the next bed, and the next, until all have been seen. The last stairs are descended; and as the surgeons and physicians get into certain yellow chariots, and bright blue broughams, which have been waiting all the while in the hospital square, the students trudge off round the angle of the building to the half-past two anatomical lecture.

Again, there is a gathering up of physic

bottles, and a collection of prescription cards, and a voice is heard up the speaking-tube, shouting the word "shop." On fog-mistresses and sisters, in haste, to the apothecary's shop, and then there comes such a filling of vials, and a pouring out of pints and quarts of odd smelling fluids, and a counting out of pills, as can be seen in few places else. Drawers full of pills, hundreds of printed labels, and gallons of physic are served out, and, at last, one by one, the nurses all march off, with each her unsavoury but serviceable burthen. By the time they are back in the wards, on the three open days in the week, "Visitors are admitted," and then arises many a scene. Husbands come to see bed-ridden wives, and children to see bed-ridden mothers, and, often more sad still, wives and little ones to see dying husbands and fathers. Many a tragedy of humble life have these old hospital walls seen in their time; many a death-bed of remorse, and many a smothered shriek of agony, as the living have parted from their dead. Could we but hear the revelations of a hospital pillow, what a story it must be: of aching heads, and breaking hearts, and souls just passing from their clayey tenement, yet yearning for scenes and people far away beyond reach, and beyond hope,—of sons prodigal and truant, dying here unknown, whilst parents grieved for them in distant homes they shall never see again,—of daughters sin-stained and lost, weeping out their last breath, not that life is going, but that a mother's forgiveness may not be implored, and a mother's voice once more be heard to pray,—of fathers brought in to die, fallen from scaffoldings, or crushed by machinery, whilst wives are waiting their return from work, and children wonder why father is so late.

As the friends of the sick are leaving the hospital, soon after four o'clock, the students are thinking about leaving their books and scalpels; and forsaking the gossip in the library to see about dinner. Those attached to the place congregate, at five o'clock, in the College dining-hall, where Mr. Paget rules the roast very satisfactorily. By six, there is a stroll round the square, if the evening is fine, for the students, and the less pleasant occupation of face-making, and pill and potion-swallowing for the patients. By seven, the surgical lecture commences, and by the same hour the afternoon cup of tea has been enjoyed in the wards, and all who were able to be out of bed, have returned to it. The outer gates are closed; the work of the day begins to slacken; the men of many labours and great usefulness, the assistant surgeon, and warden, and the "house-doctor," begin to think of sitting down to rest; but before this can be done the wards must be gone through, to see that all is right. Sister Rahere (for a ward and a sister are still called after the name of the kindly founder of the hospital)—Sister Rahere—wishes Mr. Paget would just

look at the accident in her ward." Mr. Paget paces off of course. "The accident" is our poor old acquaintance of the morning. She is evidently worse. In each ward there are a few useful things, such as calomel, ipecacuanha, wine, and brandy; but something else is needed, so Mr. Wood is sent for, and the doctor's shop, only locked an hour ago, is re-opened, and what is needful for the sick sufferer is obtained, and administered.

The wards are quiet enough now. The noble old fire-places throw out a cheerful light that warms the room. Most of the patients are sleeping, but some lie restless with pain, and some turn a curious eye towards the one bed by the side of which the surgeon stands watching, with a nurse beside him who evidently thinks at this moment how hard it is that accidents to some people will interfere with other people's rest. But there she stands also—and, hark! how much stiller the place has grown, for there's the great clock of St. Paul's striking ten. But still the poor victim of the furious ox gets worse, and, after careful thought, and still more careful examination, the assistant-surgeon—who, since eight this morning, has been at work, talking, writing, advising, walking up-stairs and down-stairs, and across the courts and back again, and seeing patients all day, (saving just eleven minutes and a quarter for luncheon, and half an hour at dinner.)—makes up his mind that the only hope is in an operation. And as "capital" operations must be done by chief surgeons, away in a cab he sends a porter to fetch a chief surgeon from a family party which it so happens is being given this very night. But family parties, and birth-nights, and wedding-days are all alike to doctors when life is in danger. The messenger being gone and a few more orders given, off trudges Mr. Paget across the court to the Operating Theatre. It is still quieter here, in this out-of-the-way corner of the building. The chair there has supported hundreds in their moments of greatest human trial; and the tier above tier of seats for students, have been the places where thousands have learnt their chief lessons in practical surgery. The moon now shines through the broad skylight at the top, and down upon the benches, and the pullies, and the instrument-cases, as placidly and as calmly quiet as if there were no pain or mortal agonies in the world. By its light the assistant-surgeon finds what he wants, and as he re-crosses the square, St. Paul's tolls eleven; and, at the same moment, a Hansom's Patent Safety (no time or need to get out one's own horses at this hour of night) whirls into the square with the chief surgeon. Up the stairs the two doctors go together, and in five minutes the suffering woman has inhaled chloroform, the delicate operation has been completed, and the sufferer, relieved from present pain, sighs out her thanks as the surgeon goes off again.

to his family party, and the assistant surgeon goes off at last to his midnight bed.

A night nurse has been set to watch by the bedside they have left, and as she does so, she counts the hours—these long still watches of the night—wearily enough. St. Paul's Clock speaks audibly from hour to hour. *One; two;* still all quiet; *three,* and there is a hum from Smithfield; *four,* and the hum has grown into a noise of distant rumbling wheels mingled with the sounds of an increasing throng; *five* is less heard, for other noises of roused and awakening London begin to absorb the sounds of the clock in themselves; *six!*—the hour we entered yesterday. We have completed the circle of one day of the life that is led in Bartholomew's, from year's end to year's end, amongst the throng of sick, and the labours of those who wait on them in their affliction. Walk out again into Smithfield. The cattle are all gone. It is a different market to the one we saw last, for the smell of new hay comes gratefully towards us, suggesting memories of quiet pleasant spots in the country, trebly pleasant to think of after spending Twenty Four Hours in a Hospital.

A CONFIDENT PREDICTION.

IN one of the defiles of the range of mountains that divides Valencia from New Castile, stands the ruin of an ancient monastery. Many years had elapsed since this monastery had been in prosperous splendour; but its crumbling walls had not been finally deserted until the ravages of war, during the French Invasion, having reached even this barren and secluded spot, the few remaining monks were partly driven away by terror, and partly by force, from their spoliated cloisters and demolished cells. At the period when this tale commences, the edifice was not only quite deserted, but was in a state of mouldering dilapidation and ruin. The grass was growing between the stone pavement of the church; the roof was blown off in many parts; the altar was dismantled, and bare of ornament; and alone, amidst the general solitude and decay of the building, a large figure of Christ, in black marble, yet stood, surveying, as it were, the ruins and desolation that surrounded it on all sides.

On a gloomy evening, in the spring of 1812, a regiment of French hussars rode cautiously up the defile in which this deserted monastery stood. They had had a long and weary march, and gladly hailed the sight of the ruins, as a convenient place for a more comfortable bivouac than the open air afforded. The troop drew up before the front of the church, surveyed its capabilities, and, after some anxious deliberation, decided that the encampment for the night had better be arranged outside the tottering walls, as the bivouac fires would be better sheltered there, than in the ruined church, through which gusts of wind rushed on all sides; as well as on

account of the possibility of a surprise, should the ruins be already occupied by some of the enemy placed in ambush for that purpose. The night also threatened to be stormy, and the broken and demolished roof of the church did not look as if it could stand a tempest.

The fires were lighted in the most unaltered spot; the troop supped, and wrapping themselves in thin travelling cloaks, and such blankets as they had, extended themselves on the ground round the various fires, to take their night's rest. Léon Felner, the captain of the troop, was the last to lie down by the fire prepared for him. He had visited the sentinels, and the horses, and surveyed the environs, and seen to the general comfort of his men, before he thought of his own repose. Satisfied with every precaution that had been taken, he, at length, wearied out, wrapped his cloak closely around him, and resting his head on his horse's saddle, prepared for sleep.

But sleep was not to be obtained. His busy thoughts rambled from scene to scene of his active life, and the recollections of his home, family, and friends, arose vividly to his memory. Two years had he been away from all he most loved. Latterly, even communication with them had been impossible. The image of Gabrielle, to whom he was betrothed, at length rose, in vivid distinctness, above his other thoughts. He could dwell with pleasure on this remembrance, for his loyalty to her had never swerved. The charms of the far-famed Spanish women had not shaken his fidelity; they might be more beautiful, but had not Gabrielle's candour and modest grace; and he longed for the conclusion of the war, that he might be once again by her side.

While thus pondering upon his country, home, and love, he began to doze; insensibly he was dropping asleep, when a rude blast of wind, accompanied by a driving sleet, and heavy peal of thunder, aroused him. The fire was nearly extinguished. Léon arose, and looked about for a shelter from the storm, which now no longer merely threatened. Opposite to him was the unclosed door of the ruined church. He pushed it wider open, and entered.

The church was damp and gloomy; flashes of lightning illuminated, at intervals, the few panes of painted glass that yet remained in the broken windows, and brought into view the stone tombs of ancient knights and abbots, as well as the dismantled altar. The black image of the Saviour stood out in bold relief during these transitory gleams, and added to the sensation of awe and desolation that the whole scene called up. In spite of his better reason, the young soldier shuddered at the loneliness of this gloomy place; and even felt a slight emotion of terror as the sound of the echo of his own footsteps, and clank of his spurs and sabre, sounded through the vast nave, disturbing the profound silence that otherwise reigned there. He did not advance

far into the church, but stopped against the first column he met; for the cracking of the walls, as the gusts of the tempest drove against them, added to the uneasiness that was beginning to creep over him, and caused him to doubt the prudence of the shelter he had sought. He began to retrace his steps, as well as the darkness would permit, when, loud amidst the howlings of the wind, and clatter of the fierce rain, the old bell of the church sounded. Léon involuntarily stopped to count the strokes, and he numbered twelve.

As the last stroke resounded, a dim light pervaded the church, and the creaking of the hinges of a door slowly opening made Léon turn in the direction of the sound. The door of the sacristy was opening, and a dark figure was seen emerging from it. Léon fixed a steady gaze upon it, and saw, as it approached, that it was a priest, dressed in a black chasuble with a white cross embroidered on the breast. In his hands he bore the sacramental cup and consecrated host. With very slow and solemn motion, he advanced in the direction of the altar. His tread was so light, that he passed across the pavement, and up the stone steps, without awakening any echo in the sonorous ruin. With solemn dignity he placed on the altar the holy cup, and turned his pale, emaciated face towards Léon, fixed a steady gaze upon him, and raising his finger, beckoned to him to approach.

Instinctively, the young soldier obeyed; he had not power to resist. The little reverence he had had for church performances when he quitted college for the army, had been quite obliterated by the painful scenes of the campaign in which he had been actively engaged. The mysterious influence, therefore, that drew him passively obedient to the steps of the altar confounded him. The nearer he approached the figure, standing at the altar, the more solemn and shadowy it appeared. At a given sign Léon knelt, and covered his eyes with his hand. A deep sepulchral voice, in slow and measured accents, recited the Service for the Dead. The recollections of childhood vividly arose, and, as the service proceeded, the young officer found himself giving the responses almost as accurately as the deacons and sub-deacons are wont to do. The sound of his own voice, filling up the intervals of the awful looking priest's, formed such a strange contrast, as to make Léon's blood curdle. What was he doing? Whose funeral rites was he thus celebrating? All power of reflection seemed annihilated, and, as the ceremony proceeded, the young man became in such a state of mental agony as to be a passive instrument in the hands of the mysterious influence which was commanding him. He almost doubted if he were alive.

When the ceremony was ended, the priest pronounced the farewell benediction, as if a numerous congregation filled the church; and then, for the first time addressing Léon, he said to him, "Young stranger, the pious

service you have just rendered has helped to redeem my soul from purgatory. For centuries, by this nocturnal penitence, have I been expiating a sin committed against the severe laws of our monastery. For centuries have I waited for the assistance of a living being to aid me in the holy sacrifice. For centuries the hour of midnight mass has tolled every night, but no human being has appeared. You alone have come to kneel before the altar of God, and have released me from some of the bonds which chained my soul in purgatory, and deterred its entering into the heavenly abode. Your piety shall have its reward. Ask any one question before I go, and I will answer you."

The unearthly tones of the speaker penetrated and roused the half paralysed Léon. Shuddering, and shrinking from the gaze of the lustreless eye that was fixed upon him, the young man involuntarily asked—"Whose funeral service is this?"—"Alas! my son," returned the mysterious priest in a sad and subdued voice, "three years hence, at the same hour, and the same day, your departing spirit will restore your body to the dust. Be ready at the hour. The funeral service is THINE OWN!"

As he uttered these words, the old man disappeared without any noise, without leaving any trace of his presence, or indication whether he had returned to the tomb, or mounted to heaven!—and the church was again in total darkness.

Oppressed by amazement and awe, Léon remained at the altar. The words of the old priest were indelibly impressed on his memory. The sensation that overwhelmed him was not fear of death. Over and over again, he had confronted the possibility of that catastrophe on the field of battle. The gallant deeds that had won his promotion, had not been performed without great personal risk of life. Yet alone in this old gloomy church, the doom he had heard pronounced, had chilled him to the heart. He could not contemplate the annihilation of all the golden promises and hopes of his youth with resignation.

By degrees the horror subsided into melancholy, and a furious blast of wind slamming the church-door, with violence, aroused him. He arose from his kneeling position, and fancying he might be under a delusion, stamped with his iron-heeled boot on the pavement, to convince himself he was awake.

The darkness was becoming less intense; a faint, almost imperceptible, grey light began to steal gradually through the building. The dawn was breaking through the clouds of night, the storm without was evidently less violent. Léon strode down the aisle with nervous haste. Alas! he could no longer doubt his presence in the church. He had then received a real warning!

With some difficulty he pulled open the church door, which the wind had violently closed, and inhaled the fresh breeze with

feverish impatience. His men answered to his agitated call as he emerged from the church-porch. Léon joined them. The troop were preparing to depart, and, as soon as all were ready, left the inhospitable ruins where, without exception, the whole party had passed a most uncomfortable night. The hopes of soon reaching dry quarters and warm breakfast hastened their movements. The gloomy silence of their leader they attributed to the same causes as were affecting themselves—wet, cold, and hungry men, are seldom disposed to be merry.

Animation, however, was ere long restored to the troop; for before they were able to reach the village where they expected to join the rest of the detachment, they fell in with the advanced guard of the opposing army, and a sharp skirmish ensued. Felner, with intrepidity and coolness, and at unsparing personal exposure, preserved his troop from destruction by effecting an adroit retreat.

The war continued with unaltered rigour. But little time was left for reflection to men engaged, day by day, in the perils of the retreats which the French had to effect, as the successes of the English troops roused the natives also to action. Léon saw his friends fall, but himself seemed to bear a charmed life. His immunity from the fate of his comrades scarcely surprised him. The monk's prediction had taken such firm hold on his mind, that it was hardened with the conviction that he was safe for the rest of the three years. But in the intervals of active combat, a brooding melancholy took possession of him. Life had lost its charms. He had almost hoped to die on the field; he would have preferred to end his existence amidst the horrors of the battle field, than to wait the slow coming of the death ordained.

On the return of peace, he delayed his journey homeward. The fatal visit to the monastic ruin had quenched his ardent desire to rejoin the nearest and dearest of his kindred. The many years of domestic happiness he had so long anticipated to pass with Gabrielle were never, he believed, to be realised. He would only be united to her to be, in a short space, torn from her by death.

At length, the urgent solicitations of his friends grew into reproaches, and he could no longer refuse to return; but he turned his face towards his home with a heavy, aching heart, resolutely determined to keep his fatal secret to himself. The sight of that happy home, the old, dear, and familiar faces, the cordial reception of his beloved Gabrielle, made him doubly melancholy. Nothing aroused him to happiness, not even promotion, so dear to the soldier's heart. His military skill and undaunted courage were not unrequited. Just before his marriage he had been made colonel, with the promise of having a responsible command confided to him when next called to the field.

Still his sufferings did not abate, but the

cause no one could extract from him. For some time Gabrielle doubted whether he did not repent his engagement to her. But he assured her that he loved her even more ardently than before; and to quiet her doubts, urged the preparations for his marriage, but in heavy-hearted tones more characteristic of the mourner than the bridegroom.

Two years had nearly passed since the fatal bivouac at the monastery. All things were arranged for the marriage. At the altar, when pronouncing the vow of life-long love and protection, Léon hesitated; for a conviction that the oath was a mockery—that it would be broken by death in a little more than a year—weighed heavily upon him.

Marriage caused no change in his habitual melancholy. People wondered; for Léon Felner ranked high in military honours, had ample fortune, and possessed a good and beautiful wife, whom he loved, and who was fondly attached to him. Wherefore this despondency and distaste of life? Tears were often observed to fill his eyes, as he gazed upon the young bride from whom he felt he was so soon to be parted. He became more and more gloomy, and sadness fell upon the cherished wife.

A son was born. Gabrielle had hoped this event would restore his cheerfulness. Vain hope! His despondency increased, for only a month now remained—to live. As yet no persuasion had wrung from him the fatal secret. With surprise and unutterable grief, Gabrielle saw him making preparations for an early death. He arranged all his affairs, settled his property, declared his wishes. Was he intending suicide? Night and day his wife, or his mother, watched by him.

Meanwhile, history was crowding its page with great events. Napoleon's escape from Elba, Fontainebleau, the hundred days, the concentration of the grand army to the Belgian frontier. It had already been intimated to Léon, that his services would be required, and he only awaited final orders from head-quarters—not to lead his old comrades as their colonel—but to take the head of a division.

The excitement such news was calculated to produce took no effect upon Felner. He knew that the last day of life approached, and he awaited it with the despondency of despair. It came; and after sunset, Léon summoned his wife and mother to his chamber. Here he revealed the fatal secret, and took an affecting farewell of them. It is impossible to describe their anguish. The first part of the night was spent in bemoaning the expected fulfilment of the warning; and then, exhausted by grief and watching, Léon, with his weeping wife, and with his desolate mother seated beside him, awaited the death that was to come with the dawn.

The first faint streak of day appeared, in the eastern horizon! Léon shuddered convulsively—a cold shiver seized his limbs; and

a confused murmur sounded in his ears. "He tried to rise; but the effort seemed to overcome him, and he sank motionless in the arms of his wife."

Did he still breathe? Madame Felner the elder, who still retained her self-possession, could not ascertain. Her daughter did everything to restore consciousness that despair suggested.

Amidst this dreadful uncertainty, the blast of a trumpet, the hoofs of horses, and clanging of arms, was heard in the courtyard. To this, Gabrielle was insensible; she clung to her inanimate husband with frantic grief. Madame Felner, however, ran to the window; a troop of hussars was drawn up in the form of a guard of honour. At the same instant an officer rushed into the room, and without heeding the ladies, shook the dying man by the hand with the rough energy of an old campaigner.

"Felner! Felner!" he shouted; "awake! You have not a moment to lose." A tremor passed over the prostrate man's frame. His wife shrieked for joy at this sign of animation.

The hussars in the court-yard now presented arms, and the "salute" was blown lustily by the trumpeters. This was followed by a loud shout "Long live the General!"

At these words the dying man rose slowly as if still in a trance. He stood for a moment transfixed. He pressed his hands to his head; his eyes slowly opened.

"General Felner!" began the officer.

"General?" repeated Léon, like a man in a dream. His wife and mother looked on in much amazement.

"Yes; here is your commission, and the Emperor's orders under his own hand."

Léon took the paper like a somnambulist; but at the sight of Napoleon's writing, consciousness appeared to return; and he began to give orders for his own immediate departure, with the habitual precision and promptitude of an officer on active service.

Meanwhile, the cause of Léon's malady was explained to Major Angarde. The major smiled.

"Why, that monk," he said, "is an old ally of mine! Four years ago I was in the hospital in the same monastery; and even then the same monk played the farce which so deluded the General. He carries it on to this day. He is stark mad. He is possessed by the idea that he is dead, and had, by an earthly penance, to redeem his soul from purgatory, by performing a certain number of services, in which he was continually asking us to help him, and as continually dooming whoever was wise enough to comply, to death, in three years."

Léon was not slow in reviving from his delusion. Further explanations completely dispelled it, and he hid his shame in the embraces of his wife, whose grief was now awakened from another cause; that of his departure to the field of battle.

Léon Felner passed through the battle of Waterloo scatheless, although he performed his part bravely and well, and lives to this day to smile at having made himself for three whole years the hero of a Modern Monkish Legend.

THE NINEVEH BULL.

To the honour of the Unapproachable, and of his Ministers, the Fires of Heaven and Earth, he it spoken:—

I am the Bull of Nineveh. I was born in the quarries beside the river, the great river, in the birth-place of my Creator, Man. My early existence I know but dimly; my memory is as the figures in morning's mist. Thus much I recollect. As a shapeless block was my substance borne to its place; there did the hands of cunning workmen fashion me; and as my shape was formed, so did I gain a knowledge of things around: the chisel carved my ear, and I heard; the tool opened mine eyes, and I saw; I stood on my pedestal and gazed around me. Beside me was a companion like myself; we two guarded the threshold. It was a hall of royal magnificence. From a floor of alabaster rose walls of like substance; their height was as mine own height, and above them were gaudy patterns, textures of silver, gold, and brilliant dyes: over all was a roof fretted with the odoriferous cedar, the lithe poplar, and the pillared palm.

But who can tell the glory of the sculptured wall? I beheld it with no ignorant gaze, for as was my body, so was there given me a mind; with my wings I could soar like the Eagle, my feet bore me as the Bull; I was decked in royal apparel, and above I had the lineaments, the head, and the mind of man. I gazed and wondered. Here raged the battle; there, in exulting pomp, moved the solemn triumph; there was the strong warrior, here the sad captive. I beheld the awful rites of worship, the forms of holy men, the symbols of mighty gods. There were figures as of kings before me; they bent the warrior's bow, or hurled the hunter's lance, or knelt in humble adoration before the mystic tree, or fell prostrate to the Almighty Seven, the rulers of the heavens, the fates of men below. They were a voiceless company around me, and yet they had an utterance, not by the passing sound of tongues, but with the enduring memorial of the glittering characters that shone forth among them. I felt myself the guardian of a nation's history, the emblem of its power, and the thought stamped itself on my features in a smile which has endured till now, proud as once and solemn, showing a consciousness not unpleasing of my might and glorious destiny.

And now the living forms of my companions throng around me; a thing exceeding glorious to behold proudly sits on the throne of the Great Hunter. About him are his subject

princes. They speak of new conquests, of spreading empire; and the heaped-up treasures of many a captive nation bear witness to their words. With wealth comes luxury; and ere an hour of the world's great week has passed, the sound of music strikes my ear, singing, and the voluptuous dance; no more the battle-car, the crash of armies, and the shout of victory; Ashur's monarchs, sunk in an inglorious ease, make me a spectator of such revels as were misery to see, and shame to chronicle.

Anon there is a rush of feet, a clash of arms, a troubled surging of unknown tongues amidst our halls, already ancient to ephemeral man; "Cyaxares! Cyaxares!" rings loud and triumphant. It tells a mournful tale. Ashur is fallen—the conqueror is conquered—the destroyer, destroyed!

Long did the foreigners hold us; and by degrees the beauty of ancient work faded: walls crumbled, roofs decayed, but I and my companions stood firm. At length, the building tottered and fell; elsewhere, fire had completed the work of the conqueror; we were left to silent ruin; a heap of earth covered all in, and no vestige of our magnificence remained, save a stray stone, or a crumbling elod.

From this time, I remember little but at intervals, as in the breaks of a heavy slumber; the spring rain sometimes uncovered part of our dwelling; I felt the greenness of the moist season, the drought and fervid glare of summer. Travellers came, at long periods; one I heard speak gloriously, in a foreign tongue, of tales gathered from many climes, of a fair land beneath the northern star; many a story of our ancient grandeur he told, and of the history he would write of all our wonders. He passed away, and again I slept until the same tongue echoed among our halls, now masses of shapeless ruin. Their rude speech named our home Iarissa; they spoke of Cyrus and of Xenophon, and again left us in our gloomy silent abode, watching in ruins over our forgotten nation.

Once more a mighty concourse passed, crying "Alexandros;" they looked at us with ignorant eye, and never dreamed that these shapeless mounds had seen armies more noble, kingdoms more vast, and men more brave than they.

Again I slept; as one dreaming the fitful visions of illness I felt the hours, days, and years roll on, countless and dreary; at times a dark figure flitted by, cursing me as the unbelievers' idol, or a cry of misery rose from the dwellers in the village hard by: all else was stern and desolate.

But my sleep was not to be ever. I had long heard the sounds of spade and mattock around me; I had little heeded them; at length the shrouding earth fell from before me, and for the first time after many an age, I gazed with waking eye on the scene around me. And what a change was there! I was in a deep pit, from the bottom of which rose

my head; around me were half-clad wild seeming men, viewing me with wonder and awe. Presently came one who seemed a lord among them; his dress was strange, unlike what I had seen before. Joy was in his face as he gazed on me, and I rejoiced in spirit, for I saw he knew me and my history; I was again awake and restored to the world. Meanwhile men dug and laboured near me, as I had seen them do in the days when I was young. Soon I rose in my ancient dignity, standing over the ruins. Often would the man of strange aspect, but of noble and enterprising countenance, contemplate me, as one whose mind is in the ages passed away; methought he spake to me as doth a child to one many of years; he asked me of the days of yore; I seemed to answer with mine own thoughts, and I said, "I am the guardian of the house of Ninus, protector of nations, reverence of kings; to me are known the secrets of our mystic worship, the sacrifices of our dread altar; Father am I of many generations; ruler of the world!" Thus boasted I in the weakness of my heart; for, in his silent steady gaze, I read my changed condition; I called to mind my long slumber, my inglorious waking, and I felt my fallen state. Thrice had the world's great wheel rolled on to its close; four more days were added since I fell asleep; and he said, "Behold the change around thee; where once thou sawest a mighty nation standing in its pride, where thou gloriedst in wealthy temples, in the riches of great cities, in the mastery of the world, now look upon the misery and ignorance of barbarian hordes, see around the ruins and shapeless heaps of earth. Where was thy noble palace, now passes the rude plough, now waves the yellow corn!

And my shame was clear in mine own eyes; I was sad, for my pride was fallen. Why need I tell more, the tale is grievous to me; I was borne down beside my own ancient river, amidst strange voices and shouts—"Layard!—Layard!" they seemed to cry. I saw my country desolate, my dwelling a prey to strangers, I was tossed many days on the heaving waters. Now I stand in a strange land, the wonder of earth's younger children. They say I am far from my violated home, in a city prouder, greater, more glorious than my native realm; but boast not, ye vain-glorious creatures of an hour. I have out-lived many mighty kingdoms, perchance I may be destined to survive one more.

WEALTHY AND WISE.

LEAVE he leeth, who, for greater gain
Of wisdom, letteth fall the golden clime.
By which he should unto those hoards attain,
Of treasure which the feet of men pursue.
Small toll of sorrow to the bar is due
Of him who, on the pathway to success,
Pauses, and passes not beyond the True,
Content an inward pleasure to possess.
In God, whose worship is Man's noblest worldliness

No human wealth is worthy to be won
That spins mean hours of flattery or gulls.
Repayment for the labour we have done—
Does this demand the sycophantish smile?
Measure and watch thy words, more than the pile
Of perishable gold they may beget.
Take care of thy soul's deeds, and wait awhile;
Although they may not suit the law courts yet,
When the last bill falls due, they are to meet the debt.

Arrested by the tearless bailiff, Time,
Looked in the debtor's prison of the grave,
Upbraided with a balance-sheet of crime,
The terrors of the Judgment who can brave?
Of talents lent and squandered, he who gave
No heed to his soul's work, yields no account,
Bankrupt hereafter. Bitter flows the wave
Of water that was bitter at the fount;
And he who crawls through life, through death
Will never mount.

Yet worthy produce of our upright toil,
Is wealth well earned with honourable pain:
Hands that are clean, from gold receive no soil—
There needs a mordant to complete a stain.
Men seek the rich: is he then rich in vain,
Whose goodness makes him worthy to be sought?
Wealth to the good to all the world is gain.
So count we not this life's rewards as nought,
But work for them like men, and use them as we
ought.

SLEEP.

OUR health and happiness depend very much on the way in which we regulate our lives. Strange, as it may appear, there is a discipline which should be observed in our sleeping, as well as in our waking hours. But after all, what is sleep? "It is so like death," said Sir Thomas Browne, "that I cannot trust myself to it without my prayers." Our medical philosophers puzzle themselves in vain to account for it; and move about in a circle of truisms, reminding us of the kitten described by Goethe, everlastingly playing with its own tail. There is no better description given of the approach of sleep than that which we find in one of Leigh Hunt's papers in the "Indicator."

"It is a delicious moment—certainly, that of being well nestled in bed, and feeling that you shall drop gently to sleep. The good is to come—not past; the limbs have been just tired enough to render the remaining in one posture delightful: the labour of the day is done; a gentle failure of the perceptions comes creeping over one; the spirit of consciousness disengages itself more and more, with slow and halting degrees, like a mother detaching her hand from that of her sleeping child; the mind seems to have a balmy lid closing over it like the eye,—'tis closing—'tis more closing—'tis closed. The mysterious spirit has gone to take its airy rounds." But what is the immediate cause of sleep? Let us explain.

There can be no doubt that a certain amount of nervous energy is necessary to support the activity of the body; and when

this is exhausted by the exertions of the day, the organs of animal life become fatigued, and unable any longer to perform their functions. Hence their prostration, arising from the want of their usual nervous stimulus, superinduces a state of sleep. The perception of external objects becomes confused; the eyes grow dim; the lids drop, in spite of every effort to uphold them; then the muscles of the back and neck relax their tension; the head falls forwards, or to one side or the other, and the body sinks, as far as circumstances will permit, into a horizontal position. But the sense of hearing remains for a period after that of sight; so that we may hear the conversation of persons around us, long after we are able to perceive their gestures, and discriminate the object of their remarks. In this half-waking, half-sleeping condition, which the French call "*demi-sommeil*," we may remain, as in a pleasing reverie, for some time, until sleep absorbs the last glimmering of consciousness. Now, if this state arise, as we believe it does, from a deficiency or exhaustion of nervous energy, the more perfectly developed we shall find the nervous system, the greater will be the amount of sleep required to recruit the animal strength. Let us take a glance through the different gradations of the Animal Kingdom.

If we begin with Insects we shall find that although many, like the common housefly, remain for months in a state of torpidity, yet they may continue wakeful and cheerful throughout the year—in fact, they scarcely sleep at all. We shall next observe that in fishes the nervous system is only imperfectly developed, therefore they require little sleep, and when asleep, they may be observed motionless in the water, with the exception of a gentle movement of the tail, in which state they may be easily netted, or even taken with the hand; but, if suddenly touched, they start in an instant, and swim away in evident alarm. The Serpent tribes, which rank somewhat higher in the scale of organisation, remain awake many days and nights, and then have long periods of repose. The Boa Constrictor, after gorging itself to repletion, will remain for many days or weeks motionless and insensible. But this should be regarded as a state of lethargy, consequent upon over distension, rather than one of natural repose.

As we proceed higher in gradation, we shall find that birds sleep much more than fish or reptiles; but the slightest noise or movement will awaken them, as was evinced by the cackling of the sacred geese which saved the Capitol of Rome from the soldiers of Brennus, when the watchdogs and sentries were sleeping at their posts. When we arrive at the different orders of quadrupeds, the brain and spinal marrow appear more fully developed; and the consequence is that in obedience to their instincts, those which are active by day, sleep by night; and those

which roam abroad in quest of prey during the night, sleep by day. It is a curious circumstance, however, that this order of their nature is reversed in those animals which are kept in captivity; thus it may be observed that the lions, tigers, hyenas, &c., in the Zoological Gardens, remain awake during the day, and sleep by night. They accommodate themselves, so far, to the uses of "civilisation." The Monkey tribes—particularly the ringtails and smaller species, are very restless; but the great baboon or Chimpanzee, the organisation of whose brain very closely resembles that of Man, will take his six or eight hours' sleep, if undisturbed. We therefore come to the conclusion that the more fully developed the nervous system is—the greater being the amount of nervous energy that is successively generated and exhausted, as it were, from its electrical battery—the greater will be the quantity of sleep required; hence it has been truly remarked, that "Man sleeps longer than any of the larger animals."

Let us now draw near to the bedside, and consider more attentively this mysterious state;—let us examine the phenomena of Sleep.

It will be observed that the breathing is slower than it is when we are awake; the inspirations are fuller and deeper, and there is a greater interval between them. They also take place with an increased sound; and, when very forcible, the most "unmusical" of instruments, viz., the nose, is "called upon" for a song—and snoring occurs; more especially if the tongue touch the palate, or the mouth remain partially open. In these cases the inspired and expired air encounters an obstruction; and when the soft palate at the back of the mouth is thrown thereby into a state of vibration, a louder and more discordant noise is produced. Many persons, however, particularly young people who are delicate, breathe very gently; their respiration, during sleep, is sometimes scarcely audible.

We have known a lady in extreme grief lie in a kind of trance, breathing so feebly for nearly a fortnight, that her respiration was scarcely perceptible to the ear. It is the same in infancy; and under the exhaustion produced by many diseases, there would appear to be no manifest boundary between sleep and death. Like the respiration, the circulation also diminishes in rapidity; the pulse becomes slower and fuller. The vessels of the skin relax; and it has been proved that a person sleeping healthfully and without any artificial means to promote it, will during an undisturbed sleep in a given space of time, perspire insensibly twice as much as a person awake. The temperature of the body, under such circumstances, falls somewhat below its waking standard; which, in the management or discipline of sleep, is a matter of considerable importance. On this account, during sleep, there is less resistance to the cooling power and morbid effects of cold than when

we are awake. "Therefore," says Dr. Elliotson, "persons cover their heads before going to sleep; and when habit has not overcome the necessity for this, cold is continually caught from its neglect. A draught of air is far more dangerous in the sleeping state, and the back of the body appears less vigorous than the front, as a draught at the back is much more dangerous than in front." The cause of this is obvious: the cold strikes directly on the spinal column—the back-bone having, unlike the chest, very little muscular protection. It is important, therefore, that during sleep the back should be well covered. Dr. Elliotson adds, that "agues are caught more readily if persons fall asleep;" which may be explained by this simple fact, that although the muscular system is relaxed and prostrate, and the organs of sense veiled, as it were, from communion with the external world, the processes of absorption, digestion, and nutrition go on with increased activity. The function of absorption is particularly active, which explains the danger of sleeping in marshy places, or where there is a succession of pallid exhalations. Already we have observed, that during sleep—when the nervous system is in repose, the temperature of the body is reduced—there is less animal heat generated; hence arises the danger of yielding to sleep when exposed to cold. "The power of intense cold in producing sleep," as Dr. Macnish observed, is very great in the human subject; and nothing in the winter season is more common than to find people lying dead in the fields and the highways from such a cause. When Dr. Solander was crossing the mountains which divide Sweden from Norway, in company with Sir Joseph Banks and several other gentlemen, he warned them, saying, "Whoever sits down will sleep; and whoever sleeps will wake no more." Shortly afterwards Dr. Solander was the first who felt an irresistible inclination to lie down, and one of his fellow travellers, Mr. Richmond, persisted in doing the same, declaring that "he desired nothing better than to lie down and die." Both lay down. Finding it impossible to proceed with them, Sir Joseph Banks and the rest lit fires with brushwood around them; having done which, Sir Joseph endeavoured to wake Dr. Solander, and happily succeeded; but though he had not slept five minutes, he had almost lost the use of his limbs, and the muscles were so shrunk, that the shoes fell from his feet. He consented to go forward with such assistance as could be given him; but no attempts to relieve Mr. Richmond were successful—he died on the spot. In severe winter weather, when the poor suffer much from cold, blankets are almost as indispensable to them as food. There is also one very interesting and important fact connected with this subject; it is that sleep promotes the cure of all diseases. What the physicians of old called "*the crisis*" occurs in this state, and it is not, therefore without reason that

the afflicted relatives watching round a sick bed await with painful anxiety the awaking of their patient. In a state of health, sleep not only contributes to the prolongation of life; but enhances the conscious pleasure even of our existence; indeed, it frequently happens, after a refreshing night's rest, that the mind experiences a high degree of unwonted buoyancy, particularly after pleasant dreams, although the details of them may not be remembered—a circumstance which Shakespeare has admirably described, where Romeo says, in a tone of exultation,

"If I may trust the flattering eye of sleep,
My dreams portend some joyful news at hand;
My bosom's lord sits lightly on his throne,
And all this day an unaccustom'd spirit
Lifts me above the ground with cheerful
thoughts."

In order, however, that we may enjoy these advantages it behoves us to consider in what manner sleep should be disciplined, for when we consider "how use doth breed a habit in a man," it is obvious that even this "wide blessing" may be strangely abused. We may, therefore, fairly ask what is the quantity of sleep which a reasonable man should be contented with?

This is somewhat a difficult question. Tall and bulky people require more sleep than short and thin people; men than women; and all animals sleep longer in winter than in summer. Age, constitution, climate, occupation, and a variety of incidental causes must be taken into consideration. During the first three months of life nutrition and sleep constitute the whole sum of existence; the infant awakes when hungry to take nourishment, when satisfied it falls asleep again. As the development of the nervous system, in particular, goes on at this period, with remarkable rapidity, the more it sleeps the better. In extreme old age much sleep is also required. The famous Dr. Thomas Parr, who died at the extraordinary age of one hundred and fifty-two years and nine months, latterly slept away the greater part of his existence. We knew an old lady, one hundred and five years of age, in Essex, who slept nearly twenty out of the twenty-four hours. Youth and young adults sleep, habitually, very soundly; and it is during this period of life that lazy and sluggish habits are easily engendered. The faculty of remaining asleep longer than is necessary cannot be indulged in without impairing the strength both of the body and mind. The continued depression of the nervous system and excessive transpiration occasion physical debility, while the intellectual faculties, from constantly slumbering in a state of inactivity, become gradually enfeebled. Valentin relates the case of a young man, who, in consequence of too much sleep, became lethargic, and died at the age of twenty-three years. Boerhaave gives an account of a physician, who, from excessive sleep, became

mentally imbecile, and perished miserably, in a hospital. The somnolency of the fat boy in *Pickwick* is, by no means, an exaggeration. Persons have existed who have almost dozed away their entire existence. One Elizabeth Owen, Dr. Macnish says, spent three-fourths of her life in sleep. Another woman, Elizabeth Perkins, would sleep for ten or eleven days at a time, and then spontaneously awake, and go about as usual. The "Sleeping Lady of Nismes" (as she was called) had attacks of somnolency which lasted sometimes for days—and even months. Her sleep was remarkable. During the brief interval of her wakefulness she hurriedly swallowed small quantities of broth, which was kept ready prepared for her. When the somnolency had continued for six months, it left her suddenly for six months, and then attacked her again, leaving another interval of six months. At length the affection gradually disappeared altogether, and she lived to the age of eighty-one, and eventually died of dropsy. Sleep, therefore—too prolonged sleep—may become a disease; nay more, persons, from habit, may bring themselves to sleep when they will and wake when they will. Quin, the celebrated comedian; Napoleon; the philosopher-Reid; and Captain Barclay, the great pedestrian, are said to have commanded this faculty.

On the other hand, some persons have lived in a state of constant wakefulness, and scarcely slept at all; we frequently, indeed, meet with individuals of an active, nervous temperament, who habitually require very little sleep. The celebrated General Elliot never slept more than four hours of the twenty-four; his food consisting wholly of bread, water, and vegetables. Frederick the Great of Prussia, and the eminent John Hunter, never slept more than five hours during the same period. Dr. Gooch gives an instance of a man who slept for only fifteen minutes out of the twenty-four hours. Sir Gilbert Blanc states, that General Pichegru informed him that, in the course of his active campaigns, he had, for a whole year, not slept more than one out of every twenty-four hours. There can be no doubt that mental activity, accompanied by anxiety, will keep up an excitement of the brain which will produce a state of constant wakefulness. Boerhaave says, that after his mind, on one occasion, had been greatly over-worked, he could not sleep for six weeks; and it is well known that sleeplessness is one of the most ordinary symptoms of insanity. In a state of health the amount of sleep required to restore the nervous energy averages, we conceive, from six to eight hours. Jeremy Taylor insisted that three hours sleep was sufficient; Baxter, four; and Wesley recommends the standard to be limited to six out of the twenty-four hours. We believe that six hours is, with many, sufficient; it is so with the Duke of Wellington, and few statesmen, engaged in active business, allow them-

elves a longer period of repose. Three or four hours, we have heard, is all that Lord Brougham, in his best days, required, and he always rose sufficiently refreshed; but literary men need more sleep perhaps than others. We are informed, by Lockhart, that Sir Walter Scott, both as a young man and in more advanced age, required "A good allowance of sleep;" and he, on principle, indulged in it, saying, "he was but half a man if he had not fallen seven hours of utter unconsciousness." We have already premised that tall and bulky people require more sleep than short people; and Sir Walter, besides being a large boned, was, it may be said, a tall man. It is a curious circumstance, we do not remember to have met with in his Biography, that, being desirous of joining an athletic club, which existed in Edinburgh, he was proposed as a candidate. This was called "The Six Feet Club," and it was a *sine quâ non* that every member should be of that stature. We believe the Earl of Errol became the patron of this club, the object of which was to promote athletic exercises and the sports and pastimes of the "Highland Games." When Sir Walter Scott presented himself to be measured there was some doubt about his being eligible; but, when he had taken off his shoes and placed himself under the measuring ordeal-post, it was found that he exactly reached the requisite height. His head just scraped the mark, and he was, therefore, admitted a member of the "Six Feet Club," with all the honours.

To return. Whatever may be the quantity of sleep required, early rising is essential to health, and promotes longevity. Almost all men who have distinguished themselves in Science, Literature, and the Arts have been as Mr. Maenish states, early risers. The industrious, the active minded, the enthusiast in pursuit of knowledge or gain, are up betimes at their respective occupations, while the sluggard wastes the most beautiful period of life in pernicious slumber. Homer, Virgil, and Horace, are all represented as early risers; the same was the case with Paley, Franklin, Priestley, Parkhurst, and Buffon; the last of whom ordered his servant to awaken him every morning, and compel him to get up by force if he evinced any reluctance, for which service he was rewarded with a crown each day, which recompense he forfeited if he did not oblige his master to get out of bed before the clock struck six. Bishops Jewel and Burnet rose every morning at four o'clock. Sir Thomas More did the same thing. Napoleon was an early riser, so were Frederick the Great and Charles the Twelfth: so is her present Majesty; and so are almost all the nobility in attendance upon the Court. That early rising tends to prolong life, appears to be clearly proved. One of our most eminent Judges, Lord Mansfield, was at the pains of collecting some curious evidence on this subject. When he presided in his judicial capacity over the

court, he questioned every very old person who appeared at the Bar, respecting his habits. "What age are you?" "What sort of life have you led—often drunk, eh?" "Please, God," answered a man upwards of ninety, "I have seldom gone to bed sober," and in fact it turned out that while some of these veterans pleaded guilty to habitual intemperance, and others on the contrary, attested their uniform sobriety, all agreed on one point—that of having been early risers. Nevertheless, the morning snooze, as we confess, its temptations. Our readers will remember Burns' pleasant little song.

"Up in the morning's, no for me,
Up in the morning early;
When a' the hills are cover'd wi' snaw,
I'm sure it's winter fairly."

Thomson, the author of "The Seasons," passed a great portion of his time in bed.

Dean Swift, we are told, lay in bed until eleven o'clock every morning, to think of wit for the day.

Sir Walter Scott observed, "I like to lie *sinuering* over things for an hour or so before I get up—and there's the time I am dressing to overhaul my half-sleeping, half-waking *projet de Chapitre*, and when I get the paper before me, it commonly runs off pretty easily." We have always considered the morning toilette should be gone through very methodically, and very deliberately; it is a ceremony that should not be too hastily performed; during the operation of shaving in particular, which ought always to be performed slowly, many strange fancies, and thoughtful suggestions may flit across the mind. It should, however, be added that Sir Walter Scott during the greater part of his life, rose by five o'clock, and that his literary work was chiefly accomplished before breakfast.

Early rising, if inculcated in youth, will in after life become a habit; hence many persons at whatever hour they retire to bed, will awaken at the same hour the next morning. The influence of habit on the discipline of sleep is very remarkable. Persons accustomed to sleep in the noisy thoroughfares of a town are disturbed by the quietude of the country, and complain that they cannot sleep for the silence. The story is related of a miller, who being very ill, his mill was stopped that he might not be disturbed by its noise; but this so far from inducing sleep prevented it altogether, and it was not until the mill was again set going, that he could compose himself to sleep at all. So also the manager of some vast Iron Works, who slept close to them amid the din of hammers, forges, and blast-furnaces, always awoke if there were any cessation of the noise during the night. If a person fall asleep listening to the ringing of a church bell, he may remain conscious, while sleeping, that it continues ringing, and will be aroused by its suddenly stopping. We also remember the anecdote of an old admi-

with wife who was awakened by not hearing the morning gun go off. It is certain that by habit a person may bring himself to awake at any given hour. Seamen and soldiers on duty do so constantly. When the British troops returned into cantonments, after bivouacking in the Peninsula, and sleeping constantly on the ground, they preferred sleeping on the floor in the barracks and hospitals, even to the palliasses, or matted beds provided for them. Hence, persons accustomed to sleep on a mattress cannot endure what others conceive to be the luxury of a feather bed. How differently our ancestors fared, in respect to these comforts will be found detailed in many an old chronicle. "Our fathers," says Holinshed, "and we ourselves have lain full often upon straw pallettes, covered only with a sheet, under coverlets made of dagswain, or hoperlots (I use their own terms) and a good round log under their heads, instead of a bolster. If it were so that the father or the good man of the house had a mattress, or a flock bed, and thereto a sack of chaff to rest his head upon, he thought himself to be as well lodged as the lord of the town. So well were they contented. Pillows, said they, were thought meet only for women. As for servants, if they had any sheet above them, it was thought well; for seldom they had any under their bodies to keep them from the prickling straws that ran oft through the canvas, and pared their hardened hydes." There can be little doubt that the tendency of over-civilisation, is to produce effeminacy; and many of our fashionable young aristocrats resemble, now-a-days, the delicate youth, who could not sleep because, forsooth, a rose-leaf was doubled under him.

There is one very curious fact connected with this subject, that merits particular attention—it is the periodicity of sleep. The laws of nature may be tampered with, but they cannot be subverted; we may step out of the paths she has prescribed, but we cannot go far beyond them with impunity. It needs scarcely any evidence to prove that the day was intended for exercise, and the night for repose; yet many persons, forgetting that this is the order of nature, endeavour to what is familiarly called "turn day into night." The votary of pleasure retires to his couch frequently after sunrise, and the university student, not unfrequently, remains poring over his books all night, abridging the amount of repose which is necessary to recruit the exhausted energies of his brain. The result of this bad custom is sooner or later severely felt; study becomes more and more difficult, and, at last, impossible. The over-worked brain can toil no longer; its intimate structure gives way, and the most distressing symptoms—extreme debility of body, and prostration of mind, ensue. Many of the most talented and promising young men in our universities, have thus fallen victims to their not having properly disciplined the

hours of their sleep. That night cannot, with impunity, be converted into day, has been proved by a variety of observations. Two colonels of horse in the French army had much disputed, which period of the twenty-four hours was fittest for marching, and for repose; and it being an interesting question in a military point of view, they obtained leave from the commanding officer to try the following experiment. One of them, although it was in the heat of summer, marched in the day and rested at night, and arrived at the end of a march of six hundred miles without the loss of either men or horses; but the other, who thought it would be less fatiguing to march in the cool of the evening and part of the night, than in the heat of the day, at the end of the same march had lost most of his horses, and some of his men. Another remarkable circumstance has been observed. It is more unhealthy to get up before the sun has risen, and burn candles until daylight, than it is to sit up by candle-light after sunset. "I have no doubt," says Sir John Sinclair, "of the superior healthiness, in the winter time, of rising by day-light, and using candle-light at the close of the day, instead of rising by candle-light and using it some hours before day-light approaches."

But, it may be said, "All this is very well," Mr. Philosopher, "but supposing that we cannot sleep, and that with all appliances and means to boot, we toss about our bed, beat our pillow, and adjust and re-adjust our bed clothes, counterpane, blankets, and sheets, in vain. What then is to be done?" Our answer is, emphatically, avoid having recourse to narcotics, for although they may produce a temporary repose, the sleep will not be refreshing, and the following morning the deleterious effects, whether of opium or henbane, will still linger in the system. We believe, speaking generally, that the more the mind can be brought to dwell on any single impression, the sooner the attention will be fatigued, and sleep induced. It is upon this principle that monotonous sounds produce sleep; but other sensations, monotonously excited and repeated, produce the same effect. A common blister, by fatiguing the attention, often brings on sleep; so also will frictions, particularly along the course of the spine. It is a common practice with Spanish women to put their children to sleep by rubbing the spine along the vertebrae of the back. It is quite certain, also, that the waving of the hands before the face and body during the operation of animal magnetism, produces a very profound sleep, followed by hysterical symptoms which are sometimes extremely perplexing. "We have seen boys at school," says Dr. Binns, "fall asleep by fixing their eyes steadily on a candle, or a hole in the shutter." A few years ago a Mr. Gardner, in London, professed to have discovered the art of teaching people to procure sound and refreshing sleep at will, and among the number of his converts

was Dr. Binna, just quoted, who gives the following description of this mysterious process. The sleepless sufferer having duly tossed about his bed, as restless and unanchored as a ship at sea, is directed to "turn on his right side, place his head comfortably on the pillow, so that it exactly occupies the angle, a line drawn from the head to the shoulder would form, and then slightly closing his lips, take rather a full inspiration, breathing as much as he possibly can through the nostrils. This, however, is not absolutely necessary, as some persons breathe always through their mouths during sleep, and rest as sound as those who do not. Having taken a full inspiration, the lungs are then to be left to their own action—that is, the respiration is not to be accelerated or retarded too much, but a very full inspiration must be taken. The attention must now be fixed upon the action in which the patient is engaged. He must depict to himself that he sees the breath passing from his nostrils in a continuous stream, and the very instant he brings his mind to conceive this, apart from all other ideas, consciousness and memory depart; imagination slumbers; fancy becomes dormant; thought ceases; and sleep supervenes. It will happen, sometimes, that the patient does not succeed on the first attempt, but he must not be discouraged. Let him persevere in taking full inspirations and expirations without attempting to count them, for if he does, the act of numeration will keep him awake; and even should he not succeed in inducing very sound sleep, he will, at least, fall into that state of pleasing delirium which is the precursor of repose, and which is scarcely inferior to it. Many trials have satisfied us of this." We do not pledge ourselves, be it observed, for the success of this experiment, which reminds us of an observation once made to us by a poor lunatic. "Ah!" said he, "everything is now done by steam; we live by steam,—breathe by steam,—and pray by steam, which is the reason that my aunt, who is a very devout woman, although she robbed me of my snuff-box, has a turn-up nose. The steam, always ascending, gave it an upward twist." Poor fellow! he was full of fancies; and we can easily conceive that if any person could (which is the difficulty,) exhaust his attention by watching his own breathing until it emitted visible steam, he would fall into a sound slumber long before the phenomenon became apparent. The best preparatives for sleep at night are healthy exercise and occupation—bodily and mental, during the day—but it should be remembered that over-fatigue produces a state of irritability and restlessness. Once, however, asleep, wrapt in deep unconscious slumber, how is it that we again awake?

This, we apprehend, may be accounted for in the following manner.—As we have already endeavoured to explain, sleep arises from exhaustion of the nervous energy; and when

during repose, it is regenerated in sufficient abundance, the nerves are stimulated to renewed action. Hence, in the early part of the night, our sleep is more profound than it is afterwards; it becomes lighter and lighter as this nervous power is gradually restored, until at length we are awakened by its stimulus. Ought then a person who is in a natural placid and profound sleep to be unnecessarily awakened? As a general rule, we think not. We conceive that sleep is a provision of Nature to restore the exhausted energies of the animal system—physical and mental—and as such it should be dealt with kindly, gently, and gratefully. The mind, too, as Sir Thomas Browne premised, should compose and prepare itself for slumber by proper discipline; "the virtuous thoughts of the day lay up good treasures for the night." But we are now touching upon the land of Dream, and must pause ere we venture to explore its mysteries. We shall return to it anon; and then, as we draw aside the curtain, it will be made manifest that "Our life is twofold—Sleep hath its own World."

CHIPS.

THE INVITED INVASION

WHEN, O provincial or foreign visitor! you look down at mid-day upon Ludgate Street from the outer gallery of the dome of St. Paul's, you behold four currents of hats with a variegation of bonnets here and there, (like flowers floating in an inky river) flanking two more streams of vehicles. These trails move in alternate rows eastward and westward without intermission and without end. Upon that gilded and giddy height, you get an idea of a dense population. It is there that you fully understand that two millions and a quarter of us are congregated upon this out-of-the-way corner of the earth, which is on terrestrial globes labelled "London." It is there that you smile at the stories of ancient Babylon and its fabulous census of Assyrians, and laugh the vaunted population of Pekin to scorn. It is there that, straining your eyes to the right and to the left, while circumambulating your airy perch, you feel some hesitation in descending; lest, there being no room even for your moderate corpus, you should be pushed aside like a straw in a torrent. Yet this traffic is not so great as that which passes under the ugly clock which protrudes from the elegant spire of Bow Church, like a mis-shapen tumour on the neck of a beauty. Into Cheapside are disgorged, not only the east-going thousands now passing under your eye; but an equal multitude from Holborn and Newgate Street. These concentrate and thicken at Bow Church—to be born within earshot of whose belfry constitutes a Cockney. Ethnologically therefore Bow Church is the centre of London.

You may, perhaps, suppose, O innocent provincial! that the moving manifestation of to-day is exceptional. Like the other countryman, who waited at the threshold of Goldsmith's publisher (whose house is just below you) for half a day, and then enquired "when the crowd would have done passing," you imagine that some extraordinary attraction has brought the people into the streets. But, be assured, you behold the ordinary average. Hear the secretary of the City of London police on the number of foot, omnibus, cab, carriage and coach passengers who daily traverse the City thoroughfares:—During every twenty-four hours throughout the year, he says, an average of one hundred and nineteen thousand, six hundred and two individuals pass Bow Church, and only a little more than half of them are foot passengers, the rest being riders. In the Month of May, he adds, the number of persons who enter the City daily, on foot and in carriages, is little less than four hundred thousand persons! two-thirds more than the entire population of Edinburgh; and four times greater than the number of lieges who own the sway of the Grand Duke of Mecklenburgh Strölitze!

With these facts before you and the moving masses below you, do you not tremble when told that from May next ensuing to September, the narrow necks of the swarming thoroughfares will be throttled with one-third more passengers!—not mere population, including the infantine, aged, and disabled; but sturdy, trudging, nutting sight-seeing pedestrians—regular beaters of pavements and throngers of shop fronts. You box the compass on your elevated balcony, and see little or no preparation for this invited invasion. The new Cannon Street opening will hardly draw off much traffic from Cheapside; for, although the street may be ready in time, its attractions will not have been put forth. There will be no shops—it has no public buildings—nothing but London-stone to divert our visitors from the highway to the Mansion House, the Bank, the Royal Exchange, Gog and Magog, and the New Post Office. Then, north-westward the new Farringdon Street opening, which is to lead, some day or other, to Clerkenwell, can scarcely be made worthy of foreign or provincial patronage in time; despite Sharp's Alley on the one side, and Field Lane on the other. It follows, therefore, that from whatever quarter visitors may arrive, in order to get at the great centres of City attraction they must pass Bow Church.

Come down, then, O, half-frozen stranger! from your gusty place of contemplation, and battle with me to the Old Jewry, that we may look in at the City Police Office, and examine its returns on the matter a little more closely. We will glance over a "Report of the Number of Vehicles which passed Bow

Church, Cheapside, between the hours of six p.m. on Thursday, the eighth day of August, and six p.m. on Friday, the ninth day of August, one thousand eight hundred and fifty; and the Number of Persons in and with the said vehicles. Also the Number of Foot Passengers who passed during the same time."

Here is the history of a City thoroughfare on an autumn day. 'Tis "post meridian half-past six." Most of the public and merchants' offices are cleared of their clerks. The principals are at home, dining at the West End, or are miles away at their villas; yet during the hour between six and seven, eight hundred and fifty-one vehicles, with three thousand three hundred and twenty-three persons riding in or guiding them, and four thousand and forty foot passengers (total seven thousand three hundred and sixty-three) have passed Bow Church. At eleven, when every retailer and every assistant has finished his day's work, the numbers have dropped off to three hundred and fifty-two vehicles and three thousand and seventeen persons. After bed-time the traffic subsides, though it never ceases. The hour between three and four in the morning, is that of the greatest repose; for then, only thirty-five wheeled carriages and one hundred and fifteen individuals pass the Church.

Circulation increases gradually from four o'clock until after breakfast time. During the hour which ends on the stroke of nine, the numbers are—vehicles, four hundred and eleven; persons, three thousand nine hundred and fifty. The business begins in earnest; the public and merchants' offices are to be filled by ten, hence, for that, the figures are nearly doubled, standing thus:—carriages, nine hundred and twenty-nine; individuals, eight thousand and seventy-five. The culminating point of traffic is reached at noon, the hour previous to which one thousand and eighty-two vehicles, and nine thousand eight hundred and fifty-five persons stream through Cheapside. Then a subsidence takes place until between three and five in the afternoon. During the last of those hours upwards of a thousand carriages and eight thousand eight hundred and eighty individuals are crowding once more towards their houses, their villas, or their lodgings.

What, then, will be the condition of Cheapside, about twelve o'clock, on the eighth day of August, one thousand eight hundred and fifty-one? The lowest estimate we have seen—(we do not pledge ourselves to put our trust in it)—computes that there will be an extra million of people in the Metropolis, during the most part of the time that the Great Exhibition remains open. These would augment the passengers through the City's centre to *fifteen thousand*; and, as the new comers will have to be fed with food carried from place to place on wheels, the passage of vehicles will be increased in number to upwards of fifteen hundred! What they will do when

they try to push through the Poultry, the Lord Mayor only knows!

Upon this, another consideration supervenes:—if there will be a deficiency of walking and riding room for the welcome invaders, how are they to be housed?

Although a great pressure of business is being forced upon house agents, by persons living in more affluent neighbourhoods, who hope to make harvests of profit from the influx of strangers; yet, such strangers as can afford good accommodation and high rents, will, we apprehend, form but a small minority. The bulk of visitors will be of the artisan and humbler classes; yet, for such persons, has any temporary accommodation been planned, upon a comprehensive scale? Londoners in their own rank are not so circumstanced as to be able to turn out of their houses to oblige, even to their own profit, the coming strangers. Tents are not particularly adapted for an English climate; still, as few of the class we advert to will be able to afford to remain long at the multitudinous Congress, slightly-constructed buildings would suffice. These ought to be set about without loss of time.

THE ACE OF SPADES.

HONEST John Sillett solves, by the most satisfactory of all tests—that of fact and personal experience—one of the most momentous problems of social economy. He demonstrates that spade husbandry is not only the most productive, but the most *profitable* system of agriculture. His theory is, that small farms will not only maintain large families in comfort and independence, but leave a much larger proportionate margin than the most approved system of “high farming under liberal covenants,” on a great food manufactory; that in this country, at the present, and even lower prices, the tiller of the soil may “earn a good living,” and that the establishment and extension of peasant proprietorships could not fail to promote the virtuous industry and happiness of the people, and, consequently, the greatness and good order of the State.

John Sillett's history is that of the pursuit of digging under difficulties. He ended in the calling which Adam began, but by no means in a Paradise.

“I served my apprenticeship,” quoth John, “to a grocer and draper, and at the expiration of my time I went to London. I lived in different situations as a linen-draper, and a short time at Birmingham, in the same trade. I afterwards returned into the country, and went into business as a general shopkeeper, in a village called the ‘Garden of Suffolk;’ but it proved a very unproductive garden to me, for after a six years’ struggle, I was placed on the wrong side of fortune.” He returned to London, carried on the business of haberdashery, &c., was compelled by bad health to

restore the country-bred lungs of his family to Suffolk once more, and there, in the old line, to keep still on the lee-shore of bad luck—Jack of all trades, hitherto master of none—although the profitless slave of each.

Like the highly-respectable father of Young Norval,

“His constant care was to increase his store,”

but he couldn't manage it; and so he longed, like Norval junior, to “follow to the field” not some warlike lord—but a plough.

“Having a natural taste for a rural life, and reading works on Husbandry,” he continues, “I was always anxious to catch hold of any books or articles in the newspapers on the subject. The first thing that particularly struck my attention was an article in a newspaper, headed, ‘How to keep a Cow and a Pig upon an Acre of Land.’ Delighted with this account, I purchased, on the demise of my mother, two acres of land sold under my father's will. I gave one hundred and eighteen pounds per acre (two hundred and thirty-six pounds), besides the expenses incurred upon the purchase. This same piece of land my father purchased, thirty years before, for one hundred and thirty pounds. Our present agricultural distress exhibits, therefore, itself in doubling the price of land. This land is freehold, tithe-free, and land-tax redeemed, and, consequently, entitles me to a vote for the county. I was afterwards offered four hundred and eighty pounds per acre for my purchase; but by and bye I proved that I could turn it to better account by keeping it, and tilling it.”

The “article in the newspaper” was soon “topped” by John's cabbage Mentor, William Cobbett, who in his “Cottage Economy,” showed him “how to keep a cow off a quarter of an acre of land.” His freehold has a northern exposure. It had no buildings on it. He had to become his own architect, bricklayer, and builder. He “could not afford brick buildings,” so he “erected them on a wooden frame, and covered them in with pan-tiles, and enclosed them with walls of clay;” which he “collected from his ditch, and hedge ditch.” In this way he raised a good cow-house, two piggeries, a shed for keeping roots, a brick laid drain and tank, and keeps “adding as he requires” buildings, of which, even for two acres, he finds himself still deficient. It is with excusable pride, that he says, “This I did with my own hands at leisure times.”

How he was called “mad” for breaking up his pasture; how he keeps cows, and fattens and rears calves; how he manages his “dairy;” and how he produced four crops from the same piece of ground within the year; he discourses with the authority derived from actual experiment.

“I had not long begun my labours,” he continues, “before I was beset by my neighbours. They were quite sure I did not know what I

was about; and that I should soon get tired of it. I am proud to say that by adhering to the principles of temperance, frugality, and industry, I have for the last seven years been enabled to support myself and my family, in a comfortable and respectable manner." And all upon two acres of land, entirely managed by his own head, and cultivated by his own hands.

His family have as many potatoes as they can eat. They annually use up sixteen bushels of wheat. This he explains is consumed in brown bread, in his family, instead of white—that is whole meal bread, just as the wheat is ground, without the coarse bran being taken out. "I do not practise this from necessity, but from choice, feeling convinced that it is more beneficial to my health, and more wholesome than the finest flour." By this expedient, he adds sixteen stone of meal to the whole quantity he consumes. Unstinted in their consumption of butter, vegetables, and milk, his family yearly consumed, besides, one of their two pigs weighing eight stone, and a portion of the "fatted calf," they kill in the house, and sell among the neighbours.

"I can hardly express in terms sufficiently strong," observes this village patriarch, "the pleasure I feel in subsisting upon all the necessaries of life—manufactured, as it were, by my own hands—pure, fresh, and free from adulteration. I am proud to say, that I am in possession of an abundance of all the good living that any rational man ought to wish for."

By this mode of life our Suffolk sage escapes all indirect taxes—and to show how much he thus saves, he quotes the weekly expenditure of William Blaxland, a working man of Birmingham, who, out of an outlay of seven shillings and seven-pence halfpenny, hands over to the Government no less a proportion than five shillings and three-pence. "I was," continues John, "so astounded at this statement, that I thought if I could see the time when I should be enabled to produce my own food, and be content with Adam's rib, what a considerable sum I should be saving in taxes, in the course of a year. I have lived to accomplish my purpose, to the full extent I can desire."

But now for the two acre budget—the most surprising particulars of ways and means that, probably, ever Chancellor of Exchequer exhibited.

"The following is a correct statement of the produce sold after the family's consumption, keeping two cows, fattening one calf and rearing one, and fattening two pigs, besides reserving seed for next year's cropping. The calf I fatted weighed nine stone of fourteen pounds to the stone, at seven weeks' old, which I had killed in the house, and sold it amongst my friends and neighbours. The price I made of it was seven-pence per lb. at eight and two-pence per stone of 14 lbs.

SOLE PRODUCE OF THE YEAR 1847.

Produce of two cows, after family's consumption,			
Fattening one calf, and weaning one	£39	12	8
One calf fatted—weighed 9 stone, at			
8s. 3d. per stone of 14 lbs.	£3	12	8
Skin, head, feet, &c.	0	16	0
One year old heifer	4	8	0
One fat pig of 8 stone at 8s. per stone	5	0	0
Twenty sacks of potatoes at 8s.	2	4	0
Twelve bushels early ditto at 6s.	8	0	0
Seven thousand cabbages at one halfpenny	14	11	8
Twelve pecks of onions at 1s.	0	12	0
Various seeds, vegetables, &c.	5	16	0
Deduct rent for land, at five per cent.	£74	8	10
on purchase money (including ex-			
penses) 250l.	£12	10	0
Rent of House	8	0	0
Rates, Taxes, &c.	2	12	0
	23	2	0
Net profit for the year	£51	1	10

This statement is an under, rather than over estimate of the actual annual results of this experiment. In fact, it is not an account of what John's ten fingers and two acres of land produce, but of what is left over after feeding, housing, and taxing the family. The rent is extravagant in the extreme. The best land in England may be rented at forty shillings per acre, so that there is here an overcharge of eight pounds ten shillings. The rent of the house is no charge upon the land. The consumption of the family should, of course, be added to the credit side of the account; and therefore the real net produce stands thus:—

As before stated	£74	8	10
One fat pig consumed by family	3	4	0
Two quarters of wheat at 4s. per quarter	4	10	0
Potatoes, butter, milk, vegetables, &c. say	10	0	0
Manure of two cows, two pigs, and two calves; no credit being taken for straw, hay, or food	6	0	0
	97	7	10
Deduct rent, &c., Taxes 1l. 6s.	5	6	0
Net profit of the year of two acres	£82	11	10

Here is the proof of the "might that's in a peasant's arm;" not that all peasants are John Silletts. Since the age of the Peripatetics, the world has seldom produced such a practical philosopher. Indeed, while the Greek sages but talked, the English Wise Man has acted all his own precepts, and proved them to be such as man can live by. He has solved the vexed problem of the economics of small farms, and spade husbandry. He shows that the system is not only the most productive in the gross yield, but also in the real profit. While the large farmers, and extensive proprietors, protest that they cannot afford to farm at present prices, even if they got the land for nothing, here is a man, bred a haberdasher, and so ignorant of agriculture, that, until he resorted to it in despair, late in life, he tells the reader that "he never saw a sow have a litter, till he had his own," who can afford a fair rent, pay all taxes, and have a return of forty guineas per acre for his labour.

THE FOREST TEMPLE.

Why hath man raised to thee his crumbling
temples?

Which pass away like drifting clouds above!
When thy pure worship were in bright examples
Of holy Charity, sweet Peace, and Love!

For there is, deep within the heart's recesses,
Devotion, thy all-seeing eye defines,
Unbreathed, O God, which thy observance blesses
Before the pomp of consecrated shrines!

Will tapers, temples, priests in robes that glisten
With jewelled splendour—pageantry's array,
Incline thine ear, O God, the more to listen,
Than to the simplest prayer without display!

Let man go forth to the primeval forests,
Their cloistered solitudes, their leafy aisles,
And list the voices of thy feathered choirists,
Their grateful hymn, in which no art beguiles!

Vistas, adorned with gorgeous fringe and tassel
Of glowing blossom—graceful, pendant flower,
Where triumphant thought becomes a willing vassal,
And owns the wondrous glory of thy power!

Their floors, encrusted with brocaded splendour
Of golden, silver, azure, purple bloom,
Their velvet verdure to the knee more tender
Than all the cushioned pomp of cunning loom;

In their green glades is many a "niche," whose
beauty
Nor saint adorns in quaintly-carven stone,
Where, may be paid—*unspoken*—all the duty
The contrite spirit feels, unseen, unknown!

There, are meet shrines amid their pomp cathedral,
And rich mosaics where the reverent knee
May bend, O God, in faithful fervor federal,
In homage pure, with prostrate heart to thee!

In the still night, amid thy giant altars,
Thy everlasting hills—all silent—where,
Trembling on the lip, weak language falters,—
Each glance is worship—every thought a prayer!

The stars that tessellate the vault of heaven,
Their chastened glory on those altars pour,
Lighting the soul from paths of earthly leaven,
To those bright shrines where angel eyes adore!

Bright, everlasting lamps, celestial tapers,
Twinkling and beaming from the dome of night,
Till upward roll the silver-clouded vapours
To curtain, Lord, thy realms of living light.

On their white wings they bear, to thee ascending,
The grateful incense of earth's fairest bowers,
The heart's pure orisons—in silence—blending
The morning breath of thy sweet censer-flowers.

PLEB-BIDDLECUMB EDUCATION.

ON looking at the History of the County of Scrubshire, by Squancy (who has devoted twenty pages out of ninety-four, to the Squancys of Blutter), you find honourable mention of the little village of Pleb-Biddlecumb. The people down here, call it more romantically a "hamlet;" and I am bound to

say that it has "rude forefathers" enough to please Gray, or any of Gray's admirers. They rather pride themselves on their simplicity. They have no lamp on the green, and there is a fine homely rusticity in the extent to which you tumble over the pigs at night, which is highly rural. The railway which threads the county a few miles off (the trains look just like volleys of musketry in the distance), has no station at all accommodating Pleb-Biddlecumb. The county town is only accessible by very narrow lanes, which it is awkward to have to pass, in election time.

Elections are managed very simply (like everything else) at that county town. The whole population are drunk for three days, and some gentleman of fortune is declared duly returned at the expiration of that period. This gave rise, once, to a fine piece of humour. The Honourable Mr. Banneret, having spent about twenty thousand pounds in contesting a county against a peer, and being determined to be more economical for the future, came down and bought our county town, out of hand, for a fourth of the money. On the hustings, when returning thanks, this gentleman (who is what is called "eccentric,") said:

"Gentlemen, you are the most disinterested and independent body of electors in the empire; for you'll vote for any man who gives you five pounds more than his rival." The people applauded the new member vociferously, and drank his health (at his expense) with much cordiality.

Pleb-Biddlecumb social, tallies exactly with Pleb-Biddlecumb topographical. It lets improvement pass by it—just as it lets the train pass; it sees, in fact, smoke, where other people see progress. The Sunday attendance in the little old flinty-towered church, averages fourteen, besides certain old alms-people of the neighbouring almshouse (built by Mr. Priggy of Priggy Park, as you can read on the outside of it, half a mile off), whose stipend depends on the rather hard condition of their never missing a single service. The curate has preached, for the last year or two, some sermons bearing on the controversy between Horsley and Priestley, which took place in the time of his grandfather, the dean, and which were left as an heirloom for the use of that learned man's family. Some time ago, it was resolved to have an organ; but, although three men can bring an organ (of our size) to the church, ten can't make it play! It was set up, but couldn't be set going. The handle (it being of the barrel description) turns briskly enough; the sound, however, is a distracted hubbub, and that's all. And I live in daily dread of being called on for a subscription to keep it in repair.

With public business we do not much concern ourselves in Pleb-Biddlecumb. Occasionally, we send up a petition, signed by six, for a duty on grain; and several old ladies in

the neighbourhood have got up one for the removal of Rubens' Graces from the National Gallery. Though how in the name of goodness these Graces can injure the said old ladies (whom they nowise resemble) I—Pleb-Biddlecumbian as I am—have not yet been able to make out!

In this sort of way, Pleb-Biddlecumb has been jogging on ever since the Reformation. But, I clearly perceive a change to be at hand. The demon of intelligence is among us. Not that we have much to fear from him, however,—as you will agree when I describe our "Mutual Improvement" Society.

Some time ago, the neighbouring village of South Slumms got a North of England curate in among them. This gentleman arrived, armed with a galvanic battery, an air pump, microscopes, and other instruments of war. At first, he kept himself perfectly quiet. But he soon began to break out—showing hideous chemical preparations to the farmers, which he recommended as manures—with which none of them would have anything to do. Then, he delivered a lecture, at the school-room, on the "circulation of the blood." This threw the whole parish into a state of excitement, for nobody knew that his blood did anything in the circulating way, before. One farmer wanted to know what his blood was to him? But the intrepid curate persisted. Week after week, he perched himself before a large board, armed with a piece of chalk, whereon he described the interior arrangements of the entire parish (as a cottager remarked to me with a look of admiration), and demonstrated everything he chose. To say, when he was disserting on the heart, that he made a joke, applicable to his female audience, thereon, is but to say that he was human.

This went on. The North of England Curate became a greater, and greater man. A certain air of importance marked the *savant*. Occasionally, he gave dim hints that the mysteries of nature were not quite insoluble. No; South Slumms might yet see. Here, he would fall into a fit of musing before the wondering rustics; and then, awaking suddenly, "exhaust" a frog, with severe determination, and look round, as much as to say, "what do you think of that!"

At last, we in Pleb-Biddlecumb, in emulation of the progress of South Slumms (which we detect in our hearts), and in fulfilment of a magnificent resolve to beat South Slumms out of the field at one blow, and without any preparation of ourselves, formed a "Mutual Improvement Society." The rustics were to assemble in the schoolroom, every Thursday evening, to "converse." Our Curate; Mr. Hobby, a retired doctor; and Squire Snubb, took their seats. The villagers sat round on benches, and everybody began to improve himself, mutually, out of hand. I was there, as a spectator. I am a mere, quiet, old reading-man, who pass among the neighbours as a harmless "natural."

Fancy, the benches crowded with the farmers, and fancy the graceful air of condescension, majestically blowing round the curate and his friends, while the outsiders look awfully on.

Curate. Pray, Mr. Snubb, have you, of late, paid much attention to the phenomena of the malady which has affected our potatoes? (*Rustics, understanding the word "potatoes," prick up their ears.*)

Squire Snubb. Some attention, sir

Curate. Atmospheric in origin; or a leguminous decadence from unavoidable causes?

Squire (himself hazy as to clause last). Atmospheric, I think.

Curate (to Respectable Farmer). What say you, sir?

Respectable Farmer (very red about the ears). I agree with the Squire, sir. (*Rustics look at each other—note Rustics draw in their legs.*)

Doctor Hobby. I remember, when I was in practice, the case of a patient of mine being seriously injured by eating potatoes. (*Rustics frightened.*)

Curate. Since the disease, of course?

Doctor. Why, no—

Onnes (not seeing at all what his remark has to do with the subject). Exactly so!

Curate (looking benevolently round). We should all study those objects which have anti-septic qualities. (*Doctor nods knowingly. Female rustic, who is timid, uses her pocket-handkerchief largely.*)

And so the company go on to improve themselves, and the poor country folks are very puzzled and sleepy, and think the curate and his friends have a "mortal lot o' learning—they have." There is something very touching to a speculative man in seeing how very anxious our labouring people are to get knowledge, and what a reverence they have for those who seem to possess it. But, down in Pleb-Biddlecumb, our teachers (unlike the North of England Curate, who has studied the science of teaching) serve them as they do the frogs they illustrate by—pump the natural air out of their life, to show the ingenuity of their apparatus—and leave them to gasp at leisure!

I think (if ever I overcome my natural bashfulness) I shall get up a petition to the Directors of the Great Boreas Railway, for a station near us. I wish somebody would only persuade our neighbouring peer to pull down his gamekeeper's lodge in those quarters, and take to "preserving" his tenantry.

[PRICE 2d.]

RED TAPE

YOUR public functionary who delights in Red Tape—the purpose of whose existence is to tie up public questions, great and small, in an abundance of this official article—to make the neatest possible parcels of them, ticket them, and carefully put them away on a top shelf out of human reach—is the peculiar curse and nuisance of England. Iron, steel, adamant, can make no such drag-chain as Red Tape. An invasion of Red Ants in innumerable millions, would not be half so prejudicial to Great Britain, as its intolerable Red Tape.

• Your Red Tapist is everywhere. He is always at hand, with a coil of Red Tape, prepared to make a small official parcel of the largest subject. In the reception room of a Government Office, he will wind Red Tape round and round the sternest deputation that the country can send to him. In either House of Parliament, he will pull more Red Tape out of his mouth, at a moment's notice, than a conjuror at a Fair. In letters, memoranda, and dispatches, he will spin himself into Red Tape, by the thousand yards. He will bind you up vast colonies, in Red Tape, like cold roast chickens at a rout-supper; and when the most valuable of them break it (a mere question of time), he will be amazed to find that they were too expensive for his favorite commodity. He will put a girdle of Red Tape round the earth, in quicker time than Ariel. He will measure, from Downing Street to the North Pole, or the heart of New Zealand, or the highest summit of the Himalaya Mountains, by inches of Red Tape. He will rig all our ships in the British Navy with it, weave all the colors in the British Army from it, completely equip and fit out the officers and men of both services in it. He bound NELSON and WELLINGTON hand and foot with it—ornamented them, all over, with bunches of it—and sent them forth to do impossibilities. He will stand over the side of the steamship of the state, sounding with Red Tape, for imaginary obstacles; and when the office-seal at the end of his pet line touches a floating weed, will cry majestically, "Back her! Stop her!" He hangs great social efforts, in Red Tape, about the public offices, to terrify like evil-minded reformers, as great highwaymen used to be hanged in chains on

Hounslow Heath. He has but one answer to every demonstration of right, or exposition of wrong; and it is, "My good Sir, this is a question of Tape."

He is the most gentlemanly of men. He is mysterious; but not more so than a man who is cognisant of so much Tape ought to be. Butterflies and gadflies who disport themselves, unconscious of the amount of Red Tape required to keep Creation together, may wear their hearts upon their sleeves; but he is another sort of person. Not that he is wanting in conversation. By no means. Every question mooted, he has to tie up according to form, and put away. Church, state, territory native and foreign, ignorance, poverty, crime, punishment, popes, cardinals, jesuits, taxes, agriculture and commerce, land and sea—all Tape. "Nothing but Tape, Sir, I assure you. Will you allow me to tie this subject up, with a few yards, according to the official form? Thank you. Thus, you see. A knot here; the end cut off there; a twist in this place; a loop in that. Nothing can be more complete. Quite compact, you observe. I ticket it, you perceive, and put it on the shelf. It is now disposed of. What is the next article?"

The quantity of Red Tape officially employed in the defence of such an imposition (in more senses than one) as the Window-Tax; the array of Red Tapists and the amount of Red Taping employed in its behalf, within the last six or seven years; is something so astounding in itself, and so illustrative of the enormous quantities of Tape devoted to the public confusion, that we take the liberty, at this appropriate time, of disentangling an odd thousand fathoms or so, as a sample of the commodity.

The Window-Tax is a tax of that just and equitable description, that it charges a house with twenty windows at the rate of six shillings and twopence farthing a window; and houses with nine times as many windows, to wit a hundred and eighty, at the rate of eightpence a window, *less*. It is a beautiful feature in this tax (and a mighty convenient one for large country-houses) that, after progressing in a gradually ascending scale of charge, from eight windows to seventy-nine, it then begins to descend again, and charges a house with five hundred windows; just a farthing a-window more, than a house with

nine. This has been, for so many years, proved—by Red Tape—to be the perfection of human reason, that we merely remark upon the circumstance, and there leave it, for another ornamental branch of the subject.

Light and air are the first essentials of our being. Among the facts demonstrated by Physical Science, there is not one more indisputable, than that a large amount of Solar Light is necessary to the development of the nervous system. Lettuces, and some other vegetables, may be grown in the dark, at no greater disadvantage than a change in their natural colour; but, the nervous system of Animals must be developed by Light. The higher the Animal, the more stringent and absolute the necessity of a free admission to it of the Sun's bright rays. All human creatures bred in darkness, droop, and become degenerate. Among the diseases distinctly known to be engendered and propagated by the want of Light, and by its necessary concomitant, the want of free Air, those dreadful maladies, Scrofula and Consumption, occupy the foremost place.

At this time of day, and when the labours of Sanitary Reformers and Boards of Health have educated the general mind in the knowledge of such truths, we almost hesitate to recapitulate these simple facts: which are as palpable and certain as the growth of a tree, or the curling of a wave. But, within a few years, it was a main fault of practical Philosophy, to hold too much herself apart from the daily business and concerns of life. Consequently, within a few years, even these truths were imperfectly and narrowly known. Red Tape, as a great institution quite superior to Nature, positively refused to receive them—strangled them, out of hand—labelled them Impositions, and shelved them with great resentment.

This is so incredible that our readers will naturally enquire, when, where, and how? Thus. In the Spring of 1844, there sat enthroned, in the office of the Chancellor of the Exchequer, Downing Street, London, the Incarnation of Red Tape. There waited upon this enshrinement of Red Tape in the body and flesh of man, a Deputation from the Master Carpenters' Society, and another from the Metropolitan Improvement Society: which latter, comprising among its members some distinguished students of Natural Philosophy, took the liberty of representing the before-mentioned fact in connexion with Light, as a small result of Infinite Wisdom, eternally established before Tape was. And, forasmuch as the Window Tax excluded light from the dwellings of the poor in large towns, where the poor lived, crowded together in large old houses; by tempting the landlords of those houses to block up windows and save themselves the payment of duty, which they notoriously did—and, forasmuch, as in every room and corner thus made dark and airless, the poor, for want of space, were fain to huddle beds

—and, forasmuch, as a large and a most unnatural per-centage of them, were, in consequence, scrofulous, and consumptive, and always sliding downward into Pauperism—the Deputation prayed the Right Honourable Red Tape, M. P., at least so to modify this tax, as to modify that inhuman and expensive wrong. To which, the Right Honourable Red Tape, M. P., made reply, that he didn't believe that the Tax had anything to do with scrofula; "for," said he, "the window-duties don't affect the cottager; and I have seen numerous instances of scrofula in my own neighbourhood, among the families of the agricultural peasantry." Now, this was the perfection of what may be called Red Tapeosophy. For, not to mention the fact, well known to every traveller about England, that the cottages of agricultural labourers, in general, are a perfect model of sanitary arrangement, and, are in particular remarkable for the capacious dimensions of their windows (which are usually of the bay or oriel form: never less than six feet high, commonly fitted with plate glass, and always capable of being opened freely), it is to be carefully noticed that such cottages always contain a superabundance of room, and especially of sleeping-room: also, that nothing can be farther from the custom of a cottager than to let a sleeping-room to a single man, to diminish his rent: and to crowd himself and family into one small chamber, where by reason of the dearth of fuel he stops up crevices, and shuts out air. These being things which no English landlord, dead or alive, ever heard of, it is clear—as clear as the agricultural laborer's cottage is light and airy—that the exclusion of light and air can have nothing to do with Scrofula. So, the Right Honourable Red Tape, M. P., gave the lie (politely) to the Deputation, and proved his case against Nature, to the great admiration of the office Messengers!

Well! But, on the same occasion, there was more Red Tape yet, in the back-ground, ready, in nautical phrase, to be paid out. The Deputation, rather pertinaciously dwelling on the murderous effects of a prohibition of ventilation in the thickly-peopled habitations of the poor, the same authority returned, "You can ventilate them, if you choose. Here is Deputy Red Tape, from the Stamp Office, at my elbow; and he tells you, that perforated plates of zinc, may be placed in the external walls of houses, without becoming liable to duty." Now, the Deputation were very glad to hear this, because they knew it to be a part of the perfect wisdom of the Acts of Parliament establishing the Window Tax, that they required all stopped-up windows to be stopped up with precisely the same substance as that of which the external walls of a house were made; and that, in a variety of cases, where such walls were of stone, for example, and such windows were stopped up with wood, they were held to be chargeable

with duty: though they admitted no ray of light through that usually opaque material. Besides which, the Deputation knew, from the Government Returns, that, under the same Acts of Parliament, a little unglazed hole in a wall, made for a cat to creep through, and a little trap in a cellar to shoot coals down, had been solemnly decided to be windows. Therefore, they were so much relieved by this perforated-zinc discovery, that the good and indefatigable Doctor Southwood Smith (who was one of the deputation) was seen, by PRIVATE JOHN TOWLER of the Second Grenadier Guards, sentry on duty at the Treasury, to fall upon the neck of Mr. TOYBREE (who was another of the deputation) and shed tears of joy in Parliament Street.

But, the President of the Carpenters' Society, a man of rule and compasses, whose organ of Veneration appears (in respect of Red Tape) to have been imperfectly developed, doubted. And he, writing to the Stamp Office on the point, caused more Red Tape to be spun into this piece of information, "that perforated plates of zinc would be chargeable if so perforated as to afford light, but not if so as to serve the purpose of ventilation only!" It not being within the knowledge of the Carpenters' Society (which was a merely practical body) how to construct perforations of such a peculiar double-barreled action as at once to let in air and shut out light, the Right Honorable Red Tape, M.P., himself, was referred to, for an explanation. This, he gave in the following skein, which has justly been considered the highest specimen of the manufacture. "There has been no mistake, as the parties suppose, in stating that openings for ventilations might be made which would not be chargeable as windows, and I cannot think it at all inconsistent with such a statement to decline expressing, beforehand, a general opinion as to whether certain openings when made would or would not be considered as windows, and as such liable to charge."

To crown all, with a wreath of blushing Tape of the first official quality, it may be briefly mentioned, that no existing Act of Parliament made any such exception, and that it had no existence out of Tape. For, a local act, for Liverpool only, was afterwards passed, exempting from the Window Tax circular ventilating apertures, not exceeding seven inches in diameter; provided, that if they were made in a direct line, they should be protected by a grating of cast-iron, the interstices thereof not exceeding one quarter of an inch in width.

One other choice sample of the best Red Tape presents itself in the nefarious history of the Window Tax. In July of the same year, LORD ALTHORP—whose name is ever to be respected, as having, perhaps, less association with Red Tape than that of any Minister whomsoever—made a short speech in the House of Commons, descriptive of an enactment he then introduced, for allaying some-

thing of the indignation which this tax had raised. It was, he said, "a clause, enabling persons to open fresh windows in houses at present existing, without any additional charge. Its only effect is, to prevent an increase of the revenue, in the case of houses already existing." On the faith of this statement, numbers of house-occupiers opened new windows. The instant the clause got into the Government offices, it was immeshed in a very net of Red Tape. The Stamp Office, in its construction of it, substituted existing occupiers, for existing houses; into the clause itself were introduced, before it became law, words, confining this privilege to persons "duly assessed for the year ending 5th April, 1835." What followed? Red Tape made the discovery that no one who took advantage of that clause, and opened new windows, was duly assessed in 1835—the whole Government Assessment: made, be it remembered, by Government Assessors: having been loosely and carelessly made—and all those openers of new windows, upon the faith of that plain speech of a plain gentleman, were surcharged; to the increase of the revenue, the dishonour of the public character of the country, and the very canonisation of Red Tape.

For the collection and clear statement of these facts, we are indebted to an excellent pamphlet reprinted, at the time, from the "WESTMINSTER REVIEW." The facts and the subject are worthy of one another.

O give your publicfunctionary who delights in Red Tape, a good social improvement to deal with! Let him come back to his Tape-wits, after being frightened out of them, for a little while, by the ravages of a Plague; and count, if you can, the miles of Red Tape he will pile into barriers, against—a General Internment Bill, say, or a Law for the suppression of infectious and disgusting nuisances! O the cables of Red Tape he will coil away in dispatch boxes, the handcuffs he will make of Red Tape to fetter useful hands; the interminable perspectives of Exchequers, Woods and Forests, and what not, all hung with Red Tape, up and down which he will languidly wander, to the weariness of all whose hard fate it is, to have to pursue him!

But, give him something to play with—give him a park to slice away—a hideous scarecrow to set up in a public place, where it may become the ludicrous horror of the civilised earth—a marble arch to move—and who so brisk as he! He will rig you up a scaffolding with Red Tape, and fall to, joyfully. These are the things in which he finds relief from unlucky Acts of Parliament that are more troublesome improvements than they were meant to be. Across and across them, he can spin his little webs of Red Tape, and catch summer flies: or, near them, litter down official dozing-places, and roll himself over and over in Red Tape, like the Hippopotamus wallowing in his bath.

Once upon a time, there was a dusty dry old shop in Long Acre, London, where, displayed in the windows, in tall slim bottles, were numerous preparations, looking, at first sight, like unhealthy macaroni. On a nearer inspection, these were found to be Tapeworms, extracted from the internal mechanism of certain ladies and gentlemen who were delicately referred to, on the bottles, by initial letters. Doctor Gardner's medicine had effected these wonderful results; but, the Doctor, probably apprehensive that his patients might "blush to find it fame," enshrined them in his museum, under a thin cloud of mystery. We have a lively remembrance of a white basin, which, in the days of our boyhood, remained, for eight or ten years, in a conspicuous part of the museum, and was supposed to contain a specimen so recent that there had not yet been time for its more elaborate preservation. It bore, as we remember, the label, "This singular creature, with ears like a mouse, was last week found destroying the inside of Mr. O—in the City Road." But, this was an encroachment on the province of the legitimate Tapeworms. That species were all alike except in length. The smallest, according to the labels, measured, to the best of our recollection, about two hundred yards.

If, in any convenient part of the United Kingdom, (we suggest the capital as the centre of resort,) a similar museum could be established, for the destruction and exhibition of the Red-Tape-Worms with which the British Public are so sorely afflicted, there can be no doubt that it would be, at once, a vast national benefit, and a curious national spectacle. Nor can there be a doubt that the people in general would cheerfully contribute to the support of such an establishment. The labels might be neatly and legibly written, according to the precedent we have mentioned. "The Right Honorable Mr. X—from the Exchequer. Seven thousand yards." "Earl Y—from the Colonial Office. Half as long again." "Lord Z—from the Woods and Forests. The longest ever known." "This singular creature,"—not mentioning its ears—"was found destroying the patience of Mr. John B—in the House of Commons." If it were practicable to open such an Institution before the departure of All Nations (which can scarcely be hoped) it might be desirable to translate these abstracts into a variety of languages, for the wider understanding of one of our most agreeable and improving sights.

THE BROKEN CHAIN.

CAPTIVES, bound in iron bands,
Have well-nigh learned to love their chain;
Slaves have held up ransomed hands,
Praying to be slaves again;
So, doth usage reconcile,
Soothing even Pain to smile;
So, a madness will remain
In the breaking of the chain.

But, if chains were woven, shining,
Firm as gold, and fine as hair,
Twisting round the heart, and twining,
Binding all that centres there,
In a knot that, like the olden,
May be cut, yet ne'er unfold—
Would not something sharp remain
In the breaking of the chain?

TWO SCENES IN THE LIFE OF JOHN BODGER.

SCENE THE FIRST.

In the year 1832, on the 24th December, one of those clear bright days, that sometimes supersede the regular snowy sleety Christmas weather, a large ship lay off Plymouth; the Blue Peter flying from her mast-head, quarters of beef hanging from her mizzen-booms, and strings of cabbages from her stern rails; her decks crowded with coarsely-clad blue-nosed passengers, and lumbered with boxes, barrels, hen-coops, spars, and chain-cables. The wind was rising with a hollow, dreary sound. Boats were hurrying to and fro, between the vessel and the beach, where stood excited groups of old people and young children. The hoarse impatient voices of officers issuing their commands, were mingled with the shrill wailing of women on the deck and the shore.

It was the emigrant ship, "Cassandra," bound for Australia during the period of the "Bounty" system, when emigration recruiters, stimulated by patriotism and a handsome per centage, rushed frantically up and down the country, earnestly entreating "healthy married couples" and single souls of either sex to accept a free passage to "a land of plenty." The English labourers had not then discovered that Australia was a country where masters were many and servants scarce. In spite of poverty and poorhouse fare, few of the John Bull family could be induced to give heed to flaming placards they could not read, or inspiring harangues they could not understand. The admirable education which in 1832, at intervals of seven days, was distributed in homœopathic doses among the agricultural olive branches of England, did not include modern geography, even when reading and writing were imparted. If a stray Sunday School scholar did acquire a faint notion of the locality of Canaan, he was never permitted to travel as far as the British Colonies.

To the ploughman out of employ, Canaan, Canada, and Australia, were all "*furrin parts*;" he did not know the way to them; but he knew the way to the poorhouse, so took care to keep within reach of it.

Thus it came to pass that the charterers of the good ship "Cassandra," were grievously out in their calculations; and failing to fill with English, were obliged to make up their complement with Irish; who, having nothing to fall upon, but the charity of the poor to

the poorer, are always ready to go anywhere for a daily meal.

The steamers from Cork had transferred their ragged, weeping, laughing, fighting cargoes; the last stray groups of English had been collected from the western counties; the Government officers had cleared and passed the ship. With the afternoon tide two hundred helpless, ignorant, destitute souls were to bid farewell to their native land.

The delays consequent on miscalculating the emigrating tastes of England, had retarded until mid-winter, a voyage which should have been commenced in autumn.

In one of the shore-boats, sat a portly man—evidently neither an emigrant nor a sailor—wrapped in a great coat and comforters; his broad brimmed beaver secured from the freezing blast, by a coloured bandanna tied under the chin of a fat whiskerless face. This portly personage was Mr. Joseph Lobbit, proprietor of "The Shop," farmer, miller, and chairman of the vestry of the rich rural parish of Duxmoor.

At Duxmoor, the chief estate was in Chancery, the manor house in ruins, the lord of it an outlaw, and the other landed proprietors absentees, or in debt; a curate preached, buried, married, and baptised, for the health of the rector compelled him to pass the summer in Switzerland, and the winter in Italy; so Mr. Lobbit was almost the greatest, as he was certainly the richest man in the parish.

Except that he did not care for anyone but himself, and did not respect anyone who had not plenty of money, he was not a bad sort of man. He had a jolly hearty way of talking and shaking hands, and slapping people on the back; and until you began to count money with him, he seemed a very pleasant liberal fellow. He was fond of money, but more fond of importance; and therefore worked as zealously at parish-business, as he did at his own farm, shop and mill. He centered the whole powers of the vestry in his own person, and would have been beadle, too, if it had been possible. He appointed the master and matron of the workhouse, who were relations of his wife; supplied all the rations and clothing for "the house;" and fixed the prices in full vestry (viz., himself, and the clerk, his cousin), assembled. He settled all questions of out-of-door relief, and tried hard, more than once, to settle the rate of wages too.

Ill-natured people did say that those who would not work on Master Lobbit's farm, at his wages, stood a very bad chance if they wanted anything from the parish, or came for the doles of blankets, coals, bread, and linsey-woolsey petticoats; which, under the provisions of the tablets in Duxmoor Church, are distributed every Christmas. Of course, Mr. Lobbit supplied these gifts, as chief shopkeeper, and dispensed them, as senior and

perpetual churchwarden. Lobbit gave capital dinners: plenty smoked on his board, and pipes of negro-head with jorums of gin punch followed, without stint.

The two attorneys dined with him—and were glad to come, for he had always money to lend, on good security, and his gin was unexceptionable. So did two or three bull-frog farmers, very rich and very ignorant. The doctor and curate came occasionally; they were poor, and in his debt at "The Shop," therefore bound to laugh at his jokes—which were not so bad, for he was no fool—so that, altogether, Mr. Lobbit had reason to believe himself a very popular man.

But there was—where is there not?—a black drop in his overflowing cup of prosperity.

He had a son, whom he intended to make a gentleman; whom he hoped to see married to some lady of good family, installed in the Manor House of Duxmoor, (if it should be sold cheap, at the end of the Chancery suit), and established as the squire of the parish. Robert Lobbit had no taste for learning, and a strong taste for drinking, which his father's customers did their best to encourage. Old Lobbit was decent in his private habits; but, as he made money wherever he could to advantage, he was always surrounded by a levee of scamps, of all degrees—some agents and assistants, some borrowers, and would-be borrowers. Young Lobbit found it easier to follow the example of his father's companions than to follow his father's advice. He was as selfish and as greedy as his father, without being so agreeable or hospitable. In the school-room he was a dunce, in the playground a tyrant and bully; no one liked him; but, as he had plenty of money, many courted him.

As a last resource his father sent him to Oxford; whence, after a short residence, he was expelled. He arrived home drunk, and in debt; without having lost one bad habit, or made one respectable friend. From that period he lived a sot, a village rake, the king of the tap-room, and the patron of a crowd of blackguards, who drank his beer and his health; hated him for his insolence, and cheated him of his money.

Yet Joseph Lobbit loved his son, and tried not to believe the stories good-natured friends told of him.

Another trouble, fell upon the prosperous churchwarden. On the north side of the parish, just outside the boundaries of Duxmoor Manor, there had been, in the time of the Great Civil Wars, a large number of small freehold farmers; each with from forty to five acres of land; the smaller, fathers had divided amongst their progeny; the larger had descended to eldest sons by force of primogeniture. Joseph Lobbit's father had been one of these small freeholders. A right of pasture on an adjacent common was attached to these little freeholds; so, what with

goats and sheep, and a cow or so, even the poorest proprietor with the assistance of hardest work, managed to make a living, up to the time of the last war. War prices made land valuable, and the common was enclosed; though a share went to the little freeholders, and sons and daughters were hired, at good wages, while the enclosure was going on, the loss of the pasture for stock, and the fall of prices at the peace, sealed their fate. John Lobbit, our portly friend's father, succeeded to his little estate, of twenty acres, by the death of his elder brother, in the time of best war prices, after he had passed some years as a shopman in a great seaport. His first use of it was to sell it, and set up a shop in Duxmoor, to the great scandal of his farmer neighbours. When John slept with his fathers, Joseph, having succeeded to the shop and savings, began to buy land and lend money. Between shop credit to the five-acred and mortgages to the forty-acred men, with a little luck in the way of the useful sons of the freeholders being constantly enlisted for soldiers, impressed for sailors, or convicted for poaching offences, in the course of years, Joseph Lobbit became possessed, not only of his paternal freehold, but, acre by acre, of all his neighbours' holdings, to the extent of something like five hundred acres. The original owners vanished; the stout and young departed, and were seen no more; the old and decrepit were received and kindly housed in the workhouse. Of course it could not have been part of Mr. Lobbit's bargain to find them board and lodging for the rest of their days at the parish expense. A few are said to have drunk themselves to death; but this is improbable, for the cider, in that part of the country, is extremely sour, so that it is more likely they died of colic.

There was, however, in the very centre of the cluster of freeholds which the parochial dignitary had so successfully acquired, a small barren plot of five acres with a right of road through the rest of the property. The possessor of this was a sturdy fellow, John Bodger by name, who was neither so be coaxed nor bullied into parting with his patrimony.

John Bodger was an only son, a smart little fellow, a capital Thatcher, a good hand at cobhouse building—in fact, a handy man. Unfortunately, he was as fond of pleasure as his betters. He sang a comic song, till people's eyes ran over, and they rolled on their seats; he handled a single-stick very tidily; and, among the light weights, was not to be despised as a wrestler. He always knew where a hare was to be found; and, when the fox-hounds were out, to hear his view-halloo, did your heart good. These tastes were expensive; so that when he came into his little property, although he worked with tolerable industry, and earned good wages, for that part of the country, he never had a shilling to the fore, as the Irish say. If he had been a prudent man, he might have laid

by something very snug, and defied Mr. Lobbit to the end of his days.

It would take too long to tell all Joseph Lobbit's ingenious devices—after plain, plump offers—to buy Bodger's acres had been refused. John Bodger declined a loan to buy a cart and horse: he refused to take credit for a new hat, umbrella, and waistcoat, after losing his money at Bidcot Fair. He went on steadily slaving at his bit of land, doing all the best thatching and building jobs in the neighbourhood, spending his money, and enjoying himself without getting into any scrapes; until Mr. Joseph Lobbit, completely foiled, began to look on John Bodger as a personal enemy.

Just when John and his neighbours were rejoicing over the defeat of the last attempt or the jolly parochial, an accident occurred which upset all John's prudent calculations. He fell in love. He might have married Dorothy Paulson, the blacksmith's daughter—an only child, with better than two hundred pounds in the Bank, and a good business—a virtuous, good girl, too, except that she was as thin as a hurdle, with a skin like nutmeg-grater, and rather a bad temper. But instead of that, to the surprise of every one, he went and married Carry Hutchins, the daughter of Widow Hutchins, one of the little freeholders bought out by Mr. Lobbit, who died, poor old soul, the day after she was carried into the workhouse, leaving Carry and her brother Tom destitute—that is to say, destitute of goods, money, or credit, but not of common sense, good health, good looks, and power of earning wages.

Carry was nearly a head taller than John, with a face like a ripe pear. He had to buy her wedding gown, and everything else. He bought them at Lobbit's shop. Tom Hutchins—he was fifteen years old—a tall spry lad, accepted five shillings from his brother-in-law, hung a small bundle on his bird's-nesting stick, and set off to walk to Bristol, to be a sailor. He was never heard of any more at Duxmoor.

At first all went well. John left off going to wakes and fairs, except on business; stuck to his trades; brought his garden into good order, and worked early and late, when he could spare time, at his two little fields, while his wife helped him famously. If they had had a few pounds in hand, they would have had "land and beeves."

But the first year twins came—a boy and girl; and the next another girl, and then twins again, and so on. Before Mrs. Bodger was thirty she had nine hearty, healthy children, with a fair prospect of plenty more; while John was a broken man, soured, discontented, hopeless. No longer did he stride forth eagerly to his work, after kissing mother and babies; no longer did he hurry home to put a finishing stroke to the potato patch, or broadcast his oat crop; no longer did he sit whistling and telling stories of bygone feats at the fireside, while mending some wooden

implement of his own, or making one for a neighbour. Languid and moody, he lounged to his task with round shoulders and slouching gait; spoke seldom—when he did, seldom kindly. His children, except the youngest, feared him, and his wife scarcely opened her lips, except to answer.

A long, hard, severe winter, and a round of typhus fever, which carried off two children, finished him. John Bodger was beaten, and obliged to sell his bit of land. He had borrowed money on it from the lawyer; while laid up with fever, he had silently allowed his wife to run up a bill at "The Shop." When strong enough for work there was no work to be had. Lobbit saw his opportunity, and took it. John Bodger wanted to buy a cow, he wanted seed, he wanted to pay the doctor, and to give his boys clothes to enable them to go to service. He sold his land for what he thought would do all this, and leave a few pounds in hand. He attended to sign the deed and receive money; when, instead of the balance of twenty-five pounds he had expected, he received one pound ten shillings, and a long lawyer's bill *received*.

He did not say much; for poor countrymen don't know how to talk to lawyers, but he went towards home like a drunken man; and, not hearing the clatter of a horse behind him that had run away, was knocked down, run over, and picked up with his collar bone and two ribs broken.

The next day he was delirious; in the course of a fortnight he came to his senses, lying on a workhouse bed. Before he could rise from the workhouse bed, not a stick or stone had been left to tell where the cottage of his fathers had stood for more than two hundred years, and Mr. Joseph Lobbit had obtained, in auctioneering phrase, a magnificent estate of five hundred acres within a ring fence.

John Bodger stood up at length a ruined, desperate, dangerous man, pale, and weak, and even humble. He said nothing; the fever seemed to have tamed every limb—every feature—except his eyes, which glittered like an adder's when Mr. Lobbit came to talk to him. Lobbit saw it and trembled in his inmost heart, yet was ashamed of being afraid of a *pauper*!

About this time Swing fires made their appearance in the country, and the principal Insurance Companies refused to insure farming stock, to the consternation of Mr. Lobbit; for he had lately begun to suspect that among Mr. Swing's friends he was not very popular, yet he had some thousand pounds of corn stacks in his own yards and those of his customers.

John Bodger, almost convalescent, was anxious to leave the poor-house, while the master, the doctor, and every official, seemed in a league to keep him there and make him comfortable, although a short time previously the feeling had been quite different. But the old

rector of Duxmoor having died at the early age of sixty-six, in spite of his care for his health, had been succeeded by a man who was not content to leave his duties to deputies; all the parish affairs underwent a keen criticism, and John and his large family came under investigation. His story came out. The new rector pitied and tried to comfort him; but his soothing words fell on deaf ears. The only answer he could get from John was, "A hard life while it lasts, Sir, and a pauper's grave, a pauper widow, pauper children: Parson, while this is all you can offer John Bodger, preaching to him is of no use."

With the wife, the clergyman was more successful. Hope and belief are planted more easily in the hearts of women than of men, for adversity softens the one and hardens the other. The rector was not content with exhorting the poor, he applied to the rich Joseph Lobbit on behalf of John Bodger's family, and as the rector was not only a truly Christian priest, but a gentleman of good family and fortune, the parochial ruler was obliged to hear and to heed.

Bland and smooth, almost pathetic, was Joseph Lobbit: he was "heartily sorry for the poor man and his large family; should be happy to offer him and his wife permanent employment on his Mill farm, as well as two of the boys and one of the girls."

The eldest son and daughter, the first twins, had been for some time in respectable service. John would have nothing to do with Mr. Lobbit.

While this discussion was pending, the news of a ship at Plymouth waiting for emigrants, reached Duxmoor.

The parson, and the great shopkeeper were observed in a long warm conference in the rectory garden, which ended in their shaking hands, and the rector proceeding with rapid strides to the poor-house.

The same day, the lately established girls' school was set to work sewing garments of all sizes, as well as the females of the rector's family. A week afterwards, there was a stir in the village; a waggon moved slowly away, laden with a father, mother, and large family, and a couple of pauper orphan girls. Yes, it was true; John and Carry Bodger were going to "Furrin parts," "to be made slaves on." The women cried, and so did the children, from imitation. The men stared. As the emigrants passed the Red Lion there was an attempt at a cheer from two tinkers; but it was a failure; no one joined in. So staring and staring, the men stood until the waggon crept round the turn of the lane and over the bridge, out of sight; then bidding the "wives" go home and be hanged to 'em, their lords, that had two-pence, went in to spend it at the Red Lion, and those who had not, went in to see the others drink, and talk over John Bodger's "bouldness," and abuse Master Lobbit quietly, so that no one in top boots should hear them;—for they were poor

ignorant people in Duxmoor—they had had no time to teach them, or to care for them, and after the fever, and the long hard winter, they cared little for their own flesh and blood, still less for their neighbours. So John Bodger was forgotten almost before he was out of sight.

By the road-waggon which the Bodgers joined when they reached the highway, it was a three days' journey to Plymouth.

But, although they were gone, Mr. Lobbit did not feel quite satisfied; he felt afraid lest John should return and do him some secret mischief. He wished to see him on board ship, and fairly under sail. Besides, his negotiation with Emigration Brokers had opened up ideas of a new way of getting rid, not only of dangerous fellows like John Bodger, but of all kinds of useless paupers. These ideas he afterwards matured, and although important changes have taken place in our emigrating system, even in 1851, a visit to Government ships, will present many specimens of parish inmates converted, by dexterous diplomacy, into independent labourers.

Thus it was, that, contrary to all precedent, Mr. Lobbit left his shopman to settle the difficult case of credit with his Christmas customers, and with best horse made his way to Plymouth; and now for the first time in his life, floated on salt water.

With many grunts and groans he climbed the ship's side; not being as great a man at Plymouth as at Duxmoor, no chair was lowered to receive his portly person. The mere fact of having to climb up a rope ladder from a rocking boat on a breezy, freezing day, was not calculated to give comfort or confident feelings to an elderly gentleman. With some difficulty, not without broken shins, amid the sarcastic remarks of groups of wild Irishmen, and the squeaks of barefooted children—who, not knowing his awful parochial character, tumbled about Mr. Lobbit's legs in a most impertinently familiar manner—he made his way to the captain's cabin, and there transacted some mysterious business with the Emigration Agent over a prime piece of mess beef and a glass of Madeira. The Madeira warmed Mr. Lobbit. The captain assured him positively that the ship would sail with the evening tide. That assurance removed a heavy load from his breast: he felt like a man who had been performing a good action, and almost cheated himself into believing that he had been spending *his own* money in charity; so, at the end of the second bottle, he willingly chimed in with the broker's proposal to go down below and see how the emigrants were stowed, and have a last look at "his lot."

Down the steep ladder they stumbled into the misery of a "bounty" ship. A long, dark gallery, on each side of which were ranged the berths; narrow shelves open to every prying eye; where, for four months, the inmates were to be packed, like herrings in a

barrel, without room to move, almost without air to breathe; the mess table, running far aft the whole distance between the masts, left little room for passing, and that little was encumbered with all manner of boxes, packages, and infants, crawling about like rabbits in a warren.

The groups of emigrants were characteristically employed. The Irish "coshering," or gossiping; for, having little or no baggage to look after, they had little care; but lean and ragged, monopolised almost all the good-humour of the ship. Acute cockneys, a race fit for every change, hammering, whistling, screwing and making all snug in their berths; tidy mothers, turning with despair from alternate and equally vain attempts to collect their numerous children out of danger, and to pack the necessaries of a room into the space of a small cupboard, wept and worked away. Here, a ruined tradesman; with his family, sat at the table, dinnerless, having rejected the coarse, tough salt meat in disgust: there, a half starved group fed heartily on rations from the same cask, luxuriated over the allowance of grog, and the idea of such a good meal daily. Songs, groans, oaths: crying, laughing, complaining, hammering and fiddling combined to produce a chaos of strange sounds; while thrifty wives, with spectacle on nose, mended their husbands' breeches, and unthrifty ones scolded.

Amid this confusion, under the authoritative guidance of the second mate, Mr. Lobbit made his way, inwardly calculating how many ponchers, pauper refractories, Whiteboys, and Captain Rocks, were about to benefit Australia by their talents, until he reached a party which had taken up its quarters as far as possible from the Irish, in a gloomy corner near the stern. It consisted of a sickly, feeble woman, under forty, but worn, wasted, retaining marks of former beauty in a pair of large, dark speaking eyes, and a well carved profile, who was engaged in nursing two chubby infants, evidently twins, while two little things just able to walk, hung at her skirts; a pale, thin boy, nine or ten years old, was mending a jacket; an elder brother, as brown as a berry, fresh from the fields, was playing dolefully on a hemlock flute. The father, a little round-shouldered man, was engaged in cutting wooden buttons from a piece of hard wood with his pocket-knife; when he caught sight of Mr. Lobbit he hastily pulled off his coat, threw it into his berth, and, turning his back, worked away vigorously at the stubborn bit of oak he was carving.

"Hallo, John Bodger, so here you are at last," cried Mr. Lobbit; "I've broken my shins, almost broken my neck, and spoilt my coat with tar and pitch, in finding you out. Well, you're quite at home, I see: twins all well?—both pair of them? How do you find yourself, Missie?"

The pale woman sighed and cuddled her

babies—the little man said nothing, but sneered, and made the chips fly faster!

"You're on your way now to a country where twins are no object: your passage is paid, and you've only got now to pray for the good gentlemen that have given you a chance of earning an honest living."

"No answer."

"I see them all here except Mary, the young lady of the family. Pray has she taken rue, and determined to stay in England after all; I expected as much—"

As he spoke, a young girl, in the neat dress of a parlour servant, came out of the shade.

"Oh! you are there, are you, Miss Mary? So you have made up your mind to leave your place and Old England to try your luck in Australia; plenty of husbands, there, ha, ha!"

The girl blushed, and sat down to sew at some little garments. Fresh, rosy, neat, she was as great a contrast to her brother, the brown ragged ploughboy, as he was to the rest of the family, with their flabby, bleached complexions.

There was a pause: the mate having done his duty by finding the parochial dignitary's protegées, had slipped away to more important business; a chorus of sailors "yo heave ho-ing" at a chain cable had ceased, and for a few moments, by common consent, silence seemed to have taken possession of the long dark gallery of the hold.

Mr. Lobbit was rather put out by the silence, and no answers; he did not feel so confident as when crowing on his own dunghill, in Duxmoor; he had a vague idea that some one might steal behind him in the dark, knock his hat over his eyes, and pay off old scores with a hearty kick: but parochial dignity prevailed, and, clearing his throat with a "hem," he began again—

"John Bodger, where's your coat?—what are you shivering there for, in your sleeves?—what have you done with the excellent coat generously presented to you by the Parish—a coat that cost, as per contract, fourteen shillings and fourpence—you have not dared to sell it, I hope?"

"Well, Master Lobbit, and if I did, the coat was my own, I suppose?"

"What, sir?"

The little man quailed; he had tried to pluck up his spirit, but the blood did not flow fast enough. He went to his berth and brought out the coat.

It was certainly a curious colour, a sort of yellow brown, the cloth shrunk and cockled up, and the metal buttons turned a dingy black.

Mr. Lobbit raved; "a new coat entirely spoiled, what had he done to it?" and as he raved, he warmed, and felt himself at home again, Deputy Acting Chairman of the Duxmoor Vestry. But the little man, instead of being frightened, grew red, lost his humble mien, stood up, and, at length, when his tormentor paused for breath, looked him

full in the face, and cried, "Hang your coat!—hang you!—hang all the parochials of Duxmoor! What have I done with your coat? Why I've dyed it; I've dipped it in a tan-yard; I was not going to carry your livery with me. I mean to have the buttons off before I'm an hour older. Gratitude you talk of;—thanks you want, you old hypocrite, for sending me away. I'll tell you what sent me,—it was that poor wench and her twins, and a letter from the office, saying they would not insure your ricks, while lucifer matches are so cheap. Ay, you may stare—you wonder who told me that; but I can tell you more. Who is it that writes so like his father the Bank can't tell the difference!"

Mr. Lobbit turned pale.

"Be off!" said the little man; "plague us no more. You have eaten me up with your usury; you've got my cottage and my bit of land; you've made paupers of us all, except that dear lass, and the one lad, and you'd well-nigh made a convict of me. But never mind. This will be a cold, drear Christmas to us, and a merry, fat one to you; but, perhaps, the Christmas may come when Master Joseph Lobbit would be glad to change places with poor, ruined John Bodger. I am going where I am told that sons and daughters like mine are better than 'silver, yea, than fine gold.' I leave you rich on the poor man's inheritance and poor man's flesh and blood. You have a son and daughter that will revenge me. 'Cursed are they that remove landmarks, and devour the substance of the poor!'"

While this, one of the longest speeches that John Bodger was ever known to make, was being delivered, a little crowd had collected, who, without exactly understanding the merits of the case, had no hesitation in taking side with their fellow-passenger, the poor man with the large family. The Irish began to inquire if the stout gentleman was a tithe-proctor or a driver? Murmurs of a suspicious character arose, in the midst of which, in a very hasty, undignified manner, Mr. Lobbit backed out, climbed up to the deck with extraordinary agility, and, without waiting to make any complaints to the officers of the ship, slipped down the side into a boat, and never felt himself safe, until called to his senses by an attempt on the part of the boatman to exact four times the regular fare.

But a good dinner at the Globe (at parochial expense) and a report from the agent that the ship had sailed, restored Mr. Lobbit's equanimity; and by the time that, snugly packed in the mail, he was rattling along toward home by a moonlight Christmas, he began to think himself a martyr to a tender heart, and to console himself by calculating the value of the odd corner of Bodger's acres, cut up into lots for his labourers' cottages. The result, fifty per cent., proved a balm to his wounded feelings.

I wish I could say that at the same hour John Bodger was comforting his wife and

little ones; sorry am I to report that he left them to weep and complain, while he went forward and smoked his pipe, and sang, and drank grog with a jolly party in the fore-castle—for John's heart was hardened, and he cared little for God or man.

This old, fond love for his wife and children seemed to have died away. He left them, through the most part of the voyage, to shift for themselves—sitting forward, sullenly smoking, looking into vacancy, and wearying the sailors with asking, "How many knots to-day, Jack? When do you think we shall see land?" So that the women passengers took a mortal dislike to him; and it being gossiped about, that when his wife was in the hospital, he never went to see her for two days, they called him a brute. So "Bodger the Brute" he was called until the end of the voyage. Then they were all dispersed, and such stories driven out of mind by new scenes.

John was hired to go into the far interior, where it was difficult to get free servants at all; so his master put up with the dead-weight encumbrance of the babies, in consideration of the clever wife and string of likely lads. Thus, in a new country, he began life again in a blue jersey and ragged corduroys, but the largest money income he had ever known.

SCENE THE SECOND.

In 1842, my friend Mrs. C. made one of her marches through the bush with an army of emigrants. These consisted of parents with long families, rough country-bred single girls, with hero and there a white-handed, useless young lady—the rejected ones of the Sydney hirers. In these marches she had to depend for the rations of her ragged regiment on the hospitality of the settlers on her route, and was never disappointed, although it often happened that a day's journey was commenced without any distinct idea of who would furnish the next dinner and breakfast.

On one of these foraging excursions—starting at day-dawn on horseback followed by her man Friday, an old *lag* (prisoner), in a light cart to carry the provender—she went forth to look for the flour, milk, and mullet, for the breakfast of a party whose English appetites had been sharpened by travelling at the pace of the drays all day, and sleeping in the open air all night.

The welcome smoke of the expected station was found; the light cart, with the complements and empty sack despatched; when musing, at a foot-pace, perhaps, on the future fortune of the half-dozen girls hired out the previous day, Mrs. C. came upon a small party which had also been encamping on the other side of the hills.

It consisted of two gawky lads in docked smock frocks, woolly hats, rosy sleepy countenances; fresh arrivals, living monuments of the care bestowed in developing the intelligence of the agricultural mind in England. They were hard at work on broiled mutton.

A regular hard-dried Bushman, had just driven up a pair of blood mares from their night's feed, and a white-headed brisk kind of young old man, the master of the party, was sitting by the fire trying to feed an infant with some sort of mess compounded with sugar. A dray heavily laden with a bullock-team ready harnessed, stood ready to start under the charge of the bullock-watchman.

The case was clear to a colonial eye; the white-headed man had been down to the port from his Bush-farm to sell his stuff, and was returning with two blood mares purchased, and two emigrant lads hired; but what was the meaning of the baby? We see strange things in the bush, but a man-nurse is strange even there.

Although they had never met before, the white-headed man almost immediately recognised Mrs. C.—, for who did not know her, or of her, in the Bush?—so was more communicative than he otherwise might have been, and so he said,

"You see ma'am, my lady, I have only got on my own place this three years; having a long family, we found it best to disperse about where the best wages was to be got. We began saving the first year, and my daughters have married pretty well, and my boys got to know the ways of the country. There's three of them married, thanks to your ladyship; so we thought we could set up for ourselves. And we've done pretty tidy. So, as they were all busy at home, I went down for the first time to get a couple of mares and see about hiring some lads out of the ships to help us. You see I have picked up two newish ones; I have docked their frocks to a useful length, and I think they'll do after a bit; they can't read, neither of them—no more could I when I first came—but our teacher, (she's one my missis had from you,) will soon fettle them; and I've got a power of things on the dray; I wish you could be there at unloading; for it being my first visit, I wanted something for all of them. But about this baby is a curious job. When I went aboard the ship to hire my shepherds, I looked out for some of my own country; and while I was asking, I heard of a poor woman whose husband had been drowned in a drunken fit on the voyage, that was lying very ill, with a young baby, and not likely to live.

"Something made me go to see her; she had no friends on board, she knew no one in the colony. She started, like, at my voice; one word brought on another, when it came out she was the wife of the son of my greatest enemy.

"She had been his father's servant, and married the son secretly. When it was found out, he had to leave the country; thinking, that once in Australia, the father would be reconciled, and the business that put her husband in danger might be settled.

For this son was a wild, wicked man, worse than the father, but with those looks and ways that take the hearts of poor lasses. Well, as we talked, and I questioned her—for she did not seem so ill as they had told me—she began to ask me who I was, and I did not want to tell; when I hesitated, she guessed, and cried out, 'What, John Bodger, is it thee!'—and with that she screamed, and screamed, and went off quite light-headed, and never came to her senses until she died.

"So, as there was no one to care for the poor little babby, and as we had such a lot at home, what with my own children and my grandchildren, I thought one more would make no odds, so the gentleman let me take it, after I'd seen the mother decently buried.

"You see this feeding's a very awkward job, ma'am—and I've been five days on the road. But I think my missis will be pleased as much as with the gown I've brought her."

"What," said Mrs. C., "are you the John Bodger that came over in the 'Cassandra,'—the John B.?"

"Yes, ma'am."

"John, the Brute?"

"Yes ma'am. But I'm altered sure-ly."

"Well," continued John, "the poor woman was old Joseph Lobbit's daughter-in-law. Her husband had been forging, or something, and would have been lagged if he'd staid in England. I don't know but I might have been as bad if I had not got out of the country when I did. But there's something here in always getting on; and not such a struggling and striving that softens a poor man's heart. And I trust what I've done for this poor babby and its mother, may excuse my brutish behaviour. I could not help thinking when I was burying poor Jenny Lobbit (I mind her well, a nice little lass, about ten years' old); I could not help thinking as she lay in a nice cloth covered coffin, and a beautiful stone cut with her name and age, and a text on her grave; how different it is even for poor people to be buried here. Oh, ma'am! a man like me with a long family can make a-head here, and do a bit of good for others worse off. We live while we live; when we die, we are buried with decency. I remember, when my wife's mother died, the parish officers were so cross, and the boards of the coffin barely stuck together, and it was terrible cold weather, too. My Carry used to cry about it uncommonly all the winter. The swells may say what they like about it, but I'll be blessed if it be'nt worth all the voyage to die in it."

Not many days afterwards Mrs. C. saw John at home, surrounded by an army of sons and daughters; a patriarch, and yet not sixty years' old; the grandchild of his greatest enemy the greatest pet of the family.

In my mind's eye there are sometimes two pictures. John Bodger in the workhouse, thinking of murder and fire-raising in the presence of his prosperous enemy; and John

Bodger, in his happy bush home, nursing little Nancy Lobbit.

At Duxmoor the shop has passed into other hands. The ex-shopkeeper has bought and rebuilt the manor-house. He is the squire, now, wealthier than ever he dreamed; on one estate a mine has been found; a railway has crossed and doubled the value of another; but his son is dead; his daughter has left him, and lives, he knows not where, a life of shame. Childless and friendless, the future is, to him, cheerless and without hope.

CHIPS.

DEGREE DAY AT CAMBRIDGE.

NONE but those who have been educated at Cambridge can wholly understand the excitement which pervades that old university town on "Degree Day." Graduates, solicitors about the honour of their respective colleges, and their own credit as tutors; undergraduates, anxious for their friends' success, as prophetic of their own; incepting bachelors, dreading, yet nervously expecting, the decree which shall decide their university fate for good or for evil; town-residents, actuated by feelings of local interest, and perhaps con-nected by ties of friendship or otherwise with the collegiate world; look out, with equal curiosity, for the Friday morning's list. This is hung within the Senate House upon one of the pillars that support the east gallery, and is supposed to be proclaimed aloud by the Senior Moderator at the fixed hour, 9 A.M. It is true that he begins to read the list simultaneously with the opening of the doors, but, almost before he has pronounced the first name, he is swept back into the hall by the resistless crowd of men which pours in. The scene of confusion; the struggling and crushing, on the steps and at the doors; the complete discomfiture of all hats, caps, and gowns; the shouts and cheers that arise as each man catches the name and place of a friend, from some one who, for a moment, has gained access to the suspended placard; the vain efforts of individuals to extricate themselves from the crowd, and to pass out with the intelligence which they have obtained—set all powers of description at defiance.

At Cambridge, the examination for Mathematical Honours takes place but once a year—in January, when, upon an average, about one hundred and ten men pass creditably. Their names are divided into three classes, Wranglers, Senior Optimes, and Junior Optimes; and, in each class, are arranged in order of merit. The first place among the Wranglers, the Senior Wrangler as it is termed, is the very highest honour which the University can bestow; he who earns it, may indeed be proud of his position. These three classes complete the Friday morning's list; the hubbub attendant upon its publication soon subsides; and the quieter business of mutual congratulation and

letter-writing, takes its place. In the evening of the same day, is made known the list of successful candidates for ordinary degrees; this list contains about one hundred and sixty names, and is also divided into three classes; but in these the names are arranged alphabetically, in order to take away all appearance of honour.

But, the morrow is the true "Degree Day." At ten o'clock, the Senate House doors are thrown open, and its beautiful hall is speedily filled with a most brilliant assemblage. Along the sides, and far into the body of the room, are tiers of gaily dressed ladies; fair faces fill a portion of the galleries; caps and gowns innumerable take possession of the remainder; while the floor is occupied by Doctors, Masters of Arts, &c., in their various dresses; and last, not least, the heroes of the day, or, as they are called, Inceping Bachelors, wearing their picturesque hoods. The ceremony of conferring the degrees is somewhat long and tedious; but, omitting details, it may be observed that each man is led up, by the proper officer of his College, to the Vice-Chancellor of the University, who sits in state at the head of the hall—and that he returns, a Bachelor of Arts.

The Senior Wrangler has the distinguished honour of receiving his degree before any proceedings are taken with his less successful rivals; the deafening and universal applause which thereupon breaks forth from all parts of the building, is almost overpowering in its heartfelt earnestness; it is a worthy tribute to youthful talent and perseverance, and goes far to reward the happy student for his years of toil and drudgery.

A WELSH WEDDING.

THE ancient festivities connected with marriage are still retained in the rural parts of Wales. When the day for that ceremony has been fixed, "bidding papers" are dispatched to all friends, within possible distance. The Squire generally finds one laid on his table, and usually responds to the pecuniary part of the invitation. The following is a specimen of one of these papers:—

"CARMARTHENSHIRE, Nov. 15th, 1850.

"As we intend to enter the MATRIMONIAL STATE, on WEDNESDAY, the 4th day of December next, we are encouraged by our Friends to make a BIDDING on the occasion, the same day, at the Young Woman's Brother's House, at which time and place the favour of your very good and most agreeable company is respectfully solicited; and whatever donation you may be pleased to bestow on us then, will be thankfully received, warmly acknowledged, and cheerfully repaid, whenever called for on a similar occasion.

"By your most obedient Servants,

"DAVID PRICE,

"ELIZABETH JONES.

"The Young Man, with his Brother and Sister (Richard and Mary Price), desire that all gifts of the above nature due to them be returned to the Young Woman on the above day, and will be

thankful, together with his Uncle, and his Brothers-in-law and Sisters, and their Wives, for all additional favours.

"The Young Woman and her Sister (Anne Jones) desire that all gifts of the above nature due to them be returned to the Young Woman on the above day, and will be thankful, together with her Brothers and Sisters-in-law, and her Uncles and Aunts, for all favours granted."

As soon as the heroine of the day makes her appearance in bridal array among the assembled guests at her father's house, her friends proceed to hide her in the most unattainable place possible. Should the dwelling not afford such accommodation, the cow-house and stables are invaded, or even a neighbour's domicile. When hidden, notice is given to the bridegroom's chosen representatives, who are four or five in number; they advance to the door, and demand the fair prize from her father. The bride's chosen spokesmen reply to those outside. All the stock of wit possessed by either party is exchanged, amidst general hilarity, until the claimants are admitted to seek the lost one. Sometimes, she is so hopelessly concealed, that time creeps most alarmingly near twelve. When matters assume this serious aspect some kind friend is found to act as guide, and she is found, amidst universal acclamations. The bride's perils are, by no means, over; for, instead of going quietly to church, where the bridegroom has been waiting, his delegates make an attack upon her appointed body-guard. The poor girl often gets very rough handling, between the combatants; and, should the opposing one be victorious, she is carried off to some place of concealment, until again rescued. When, at last, the lady reaches the church gate, her betrothed comes forward, attended by two girls, determined, apparently, to make the most of his last unfettered minutes. He then, having shaken hands with his future father-in-law, receives and conducts his bride to the altar.

The instant the ceremony is over and the names registered, a furious scene of racing commences—very dangerous at a "horse wedding." The fleetest courier wins the pint of ale awarded to the bearer of the first intelligence from church to those at home.

On the arrival of the new couple they are seated at a table, each holding a plate for the reception of "bidding money;" and beside them a friend with a little book, in which are entered the names of the lenders, and the amount—for the promise to return, in kind, is taken *au pied de la lettre*. The debt is strictly one of honour, and if not repaid on the marriage of the creditor, is sure to be demanded. This ceremony over, the bride retires to change her dress—or make some alterations in it—and, on her return, attends upon her guests. A table is laid out with a very simple cold collation—bread, cheese, and butter—of which all partake, who choose. This may seem but poor hospitality, especially

when we add that the beer and ale are sold to the guests; but, any reader, who knows the poverty of the Welsh peasantry, and their simple habits, will find excuse sufficient. The beer is supplied by the young woman's father, and the profits form part of her dower.

Drinking is kept up, until a late hour, amid singing and music. Welsh vocal melodies are generally rather dismal. Few get beyond psalms, which are pretty enough, set to Ar-hyd-y-nos, &c., but national psalmody partakes very much of the cow-killing tune of general notoriety. Dancing is often indulged in. When the bride retires to rest, if a wary woman, she investigates the arrangements of her bed-room, for her friends consider it their duty to conclude the amusements with a practical joke.

A melancholy catastrophe is said to have been the result of one of these practical jokes. On the afternoon of a wedding-day, what was supposed to have been a dead viper was put into the bride's bed. Her husband, on joining her, found her a corpse! The viper lay in her bosom, with its head elevated to her mouth. She had not been stung, but had died, it was thought, from fear.

SAINT VALENTINE.

I THINK if old Saint Valentine but knew

The way his fête day now's commemorated;
And if the strange productions met his view

That fill our picture-shops, at any rate he'd
Be much amused, and, no doubt, marvel too,

At fame he surely scarce anticipated—
A fame as great as any of the sages
Of Greece, or Rome, or of the Middle Ages.

I wonder what his Saintship had to do

With flaming hearts, or with the cooing dove,
With little bows and arrows, and the true

Entangled lover's knot (fit type of love);

With chubby, flying Cupids, peeping through
The leaves of roses, or through clouds above,
Faintly sketched on paper, with lace edges,
To be perhaps of timid love the pledges.

The Sacred Nine, by many a youthful poet,

Are now invoked, and many a wasted quire
Of cream-laid note-paper will serve to show it,

Covered with scraps of wild poetic fire,
And bursts of eloquence! No doubt you know it,

By observation, or experience dire.

What crooked stanzas will be perpetrated
By Bards and Rhymesters uninitiated!

They'll scarce improve upon the doggerel verse,

That galls of "roses red and violets blue;"

And ends by saying in a style most terse,

That the "carnation's sweet, and so are you."

I have seen modern rhymes that are much worse,

But then I have seen better, it is true;

Exquisite songs and sonnets bright and pure,
The gems of minstrelsy and literature.

How many hearts are throbbing with emotion,

How many eyes are sparkling with love-light,

As loving words are read; and what commotion

When postmen knock! What ill-concealed
delight,

When these mysterious tokens of devotion,

Tinted and scented meet the dear one's sight!

But I'm on dangerous ground and rather
blundering,

So I'll return to where I left off wondering.

Wondering about Saint Valentine's connection

With all this sort of thing so unmonastic,

Suggesting something like a dereliction

From the prescribed high roads ecclesiastic,

'Twould seem his heart was in the wrong direction,

And for an ancient Bishop far too plastic;

He's certainly the Cupid of Theology,

Rivalling the rosy boy of Old Mythology.

Perhaps he had a taste for wedding-cake,

Or orange blossoms in a white clip bonnet;

Perhaps the marriage fees he liked to take;

At least he never did (depend upon it),

Treat marriage like St. Paul, who seemed to make

A point of throwing ice-cold water on it.

I wonder whether, too, he wrote epistles,

Or spent his time illuminating missals!

If he did write at all, it was a lecture

On love I think, or something of the kind;

And much less calculated to correct your

Follies and foibles, than distract your mind:

But this is only founded on conjecture,

For not a line of his can I yet find,

Though I have searched through many darksome
pages

Of the Church History of the Middle Ages.

And there I read, that, in the Eternal City,

Now nearly one thousand six hundred years ago,

Saint Valentine, the subject of my ditty,

Was doomed to death by Claudius Caesar,—so

Our Saint was martyred!—what a dreadful pity!

What it was for, I don't exactly know,

(He didn't know perhaps); indeed his history

Remains to me a most intricate mystery.

Long live thy mem'ry, Great St. Valentine!

Still lend thy ancient name to lovers' lays,

And with thy spirit anigate each line,

And still may poets celebrate thy praise,

And yearly help to make that name of thine

"Familiar in our mouths," as Shakespeare says,

"As Household Words."—(This wish is loyal too,

For Valentines increase the Revenue.)

THE MARTYRS OF CHANCERY.

SECOND ARTICLE.

SYDNEY SMITH, with his wise wit, remarked that there never was a great abuse brought to light in England, but there certainly arose some men prepared to contend not only that it was no abuse at all, but that it was something to be admired, and glorified, and boasted about. Such folks are tender, we presume, even of the Court of Chancery.

On the 7th of December we published an article bearing the above title. It was a statement of facts, respecting certain individuals imprisoned in the Queen's Bench by the Court of Chancery, for contempt of its decrees. A month afterwards, a letter appeared in the Times newspaper, the object of which was to deny the truth of the *historiettes* we published;

to prove that the Court of Chancery is blameless in such matters; and that Chancery prisoners, though incarcerated by that Court in the first instance, become

"So pleased with ruin and in love with jail,"

that "the great difficulty" always has been to tear them away from their beloved cells! This, we believe, was, more than once, the case in the Bastille of Old France, also.

"When the Fleet Prison was cleared," says Sir Edward Sugden, in this letter to the Times, "the great difficulty was to compel the prisoners to leave the prison. They filled the offices of cook, hotel-keeper, &c., and it was absolutely necessary, when their costs had been paid for them, and their discharges obtained, to turn them out of the Fleet; and some, after having been sent comfortably home to their friends, returned after a time, and, knocking at the Fleet gates, begged to be re-admitted! One man who had a large room, which he let out in lodgings, resorted to many contrivances to remain in prison, and when at last his discharge was obtained in spite of his resistance, several detainers for debt were lodged against him, which upon inquiry turned out to be fabrications: no such persons as the attorneys or creditors could be found. He contrived to remain in the Fleet for a considerable time longer, and, when ejected by force, was found to have amassed a considerable sum of money. Nor is this to be wondered at, considering how long many of them had been there, and that, in fact, it had become *their home*!"

It would seem to be nearly impossible, according to Sir Edward Sugden's plea, for any Chancery prisoner to remain long in prison, except from his own wilfulness. Sir Edward Sugden, to his honour, framed, in 1830, chapter 36 of 1 William IV. He says of it:—

"The object of that act was to render it impossible for any man to be detained in prison for contempt from poverty or ignorance, and to enable every man, by paying his debts as far as he could, to obtain his liberty. For this purpose the act provides that every person shall, within thirty days, be brought to the bar of the Court of Chancery for his contempt, or in default thereof the gaoler is at once to discharge him out of custody without payment of the costs of contempt, which are to be paid by the person who issued the process. This was an effectual remedy against the abuse of leaving a poor man to die in a county gaol. The act then provides, that if a person being brought before the Court shall make oath in court that he is unable, by reason of poverty, to employ a solicitor to put in his answer, the Court may appoint a solicitor and counsel for him to put in his answer, and may pay the costs out of the suitors' fund. This, therefore, fully provided for the poor man. The act then provides for a visitation by one of the Masters of the Court of Chancery of the Fleet every three months, who is to examine the prisoners for contempt and report on their respective cases to the Court, and the Court itself is authorised to direct the costs of the contempt of every such prisoner to be paid out of the

suitors' fund, and to assign a solicitor and counsel to such prisoner for putting in his answer and defending him *in forma pauperis*, and to direct any such prisoner, having previously done such acts as the Court shall direct, to be discharged out of custody."

This thorough purgation of Chancery prisoners, provides for the expulsion of those, even, who are afflicted with a morbid love of confinement:—

"The act goes still further; for in any other case of commitment for contempt not specially provided for, the Court may discharge the prisoner upon such terms, and making any costs, costs in the cause, as the Court may deem proper. And, which is not the least valuable part of the act, when any contempt prisoner shall be entitled to his discharge upon applying to the Court, but shall omit to make such application, the Court may compulsorily discharge him from the contempt and from custody."

Nothing can be plainer, more humane, or more summary. "There is no class of prisoners," says Sir Edward Sugden, farther on, "of whose liberty the law is so tender." His Ejectment Act reaches the prisoner, whether he be poor, or ignorant of his offence, or in love with imprisonment.

If Sir Edward Sugden's facts had supported his arguments, he would have made out a case against us; but, they do not. In October last, he visited the Queen's Bench Prison. "I found," he narrates, "twenty-four prisoners for contempt!" The dates of most of the committals, he adds, range from 1827 to 1841, and a few from that year to last October. The fact of twenty-four persons being still in prison for contempt, in spite of Sir Edward Sugden's excellent Act, confutes him; and makes in direct contradiction to his assertion, that "the Court of Chancery appears to be free from all blame, as regards the legislative provisions of the poor, unwary, and ignorant, and even as regards the obstinate and dishonest debtor."

The vice of Sir Edward Sugden's plea for the Immaculate, is simply this:—he confounds the law with its administrator. He borrows the lustre of his own statute to blind us to the mal-administration of it in the Court of Chancery. The truth is, that Sir Edward Sugden's Act is nearly inoperative in the present condition of that "hell" (Lord Brougham); of that "scourge to the country" (the Vice-Chancellor Knight Bruce); of that arena of torture "in which the unhappy suitor is tossed from judge to master, and from master to judge, often terminating the game by despair, insolvency, and death" (Mr. Commissioner Fane); that system which "not merely operates to delay justice, but gives rise to fraud and oppression" (Lord Langdale); by whose decrees "estates are destroyed, according to law" (Vice-Chancellor Shadwell).

Were the High Court of Chancery the purest and promptest fount of justice, on this

side of Lord Brougham's *Hades*, the provisions of the Sugden Act, if carried out, would yet demand an amount of leisure, gratuitously employed, which the High Court of Chancery would not probably have the power to bestow. In January last, a nightmare of arrears sat upon the Lord Chancellor, of eighty-two appeals; the Master of the Rolls was haunted by four undelivered judgments and one hundred and twenty-five "matters of all sorts" undisposed of. Five hundred and twenty-eight "matters of all sorts" in arrears oppressed Mr. Knight Bruce; whilst Lord Cranworth came into a *quadruply* legacy of two hundred and twenty-one "matters of all sorts" then to be dealt with.* These arrears go on increasing! The Masters in Chancery, whose alternate duty it is to visit the prisons, four times a year, to investigate each prisoner's case (which has perhaps lasted through four successive reigns), are described as working harder than day labourers. The appointment of two extra Vice-Chancellors, caused fifty per cent. additional "references to the master." Yet, no additional masters were appointed. Subsequently, the working of the Joint Stock Companies Winding-up Act was thrown on the same shoulders. It has, therefore, happened that, with the ordinary avenues to Chancery justice thus choked up, the provisions of Sir Edward Sugden's measure have not been complied with, upon his own showing, in at least twenty-four cases.

The case of a gentleman, who attracted public attention about Christmas, by his discharge from the Queen's Bench and a subsequent indulgence in intoxication, explains how it is that Chancery prisoners become so much more attached to prison walls than mere prisoners for debt. Sir Edward Sugden tells us, that this man was committed in 1835, but that his contempt was, in effect, purged in 1837. Here, were two years' isolation from friends and connexions, to the severance of every tie, to the destruction of every chance of livelihood without the walls. Meanwhile, he had found, perhaps, means, by industry within the walls, to earn money; and objected to be released. His counsel, in applying, at last, for his emancipation, said he had remained in custody so long, "from ignorance, and the oversight of those who visited the prison under Sir Edward Sugden's Act." Sir Edward answers, that it was of no use for the Court to cause the contempt to be purged, because there were detainers for debts. Why of no use? Had the Court discharged the contempt, is it not possible that the creditors might have ejected the man under the compulsory clause of the Insolvent Act, and obtained his assets? But their answer to such a suggestion would naturally have been Sir Edward Sugden's answer to the converse of their case—"No use.

* By "matters of all sorts" is meant causes for original hearing; causes which having been once heard and referred to the Master, are to be re-heard upon the Master's Report on further directions; Exceptions to such Reports, Exceptions to Answers, Pleas, Demurrers, Petitions, &c.

What will it avail us, to make such an application to the Insolvent Court, against a prisoner for contempt?" His case was "no doubt regularly reported fifty-six times," says Sir Edward; yet, it appears that the contempt had been effectually satisfied in 1837, and that the merest form was only necessary, to discharge its victim any day afterwards! How searchingly the visitors, and the court, must have done their duty under Sir Edward's Act, in their fifty-six visitations and their fifty-six reports!

Some seventeen years ago, a cavalry officer drove up to the Fleet Prison in great style. He was in contempt, and remained so for five years. During that time, his commission, his friends, his hopes, his ordinary means or obtaining an existence "outside" had worn away. He might have been free; but, having, meantime, kept life and soul together by performing menial offices for his fellow-prisoners, he preferred a sure crust, in gaol, to an uncertain subsistence out of it. For the last twelve years, he has made a living by cleaning boots and shoes!

Some of the "twenty-four" are similar cases. Even the committals after the passing of the 1st William IV., c. 36, engender the same kind "fondness" for gaol life. A man in humble circumstances is thrust into durance for contempt, and remains long enough, in spite of the most vigilant visitation, and the quickest subsequent (Chancery) proceedings, to be utterly ruined, from mere absence from his connexions and means of livelihood. Is not he a Chancery martyr? Is it not special pleading to urge that, because the whole duration of his confinement be not due to Chancery, it was not Chancery that struck him down, and destroyed him?

But, there are cases in which the old grievance of "Chancery delays," locks the door upon the prisoner for years. We mentioned, in our former article, that an individual who had been recently discharged, had been confined, for seventeen years, upon a mistake. Captain Hudson, the Governor of the Queen's Prison, informed Sir Edward Sugden, that he knew of no such case. We will now particularise the case, as an instance how thoroughly the intentions of the Sugden Act are defeated by the mere force of delay.

Mr. George Pyne Andrews, himself a solicitor in the Court of Chancery, and Notary Public, residing in Birch Lane, had a dispute with the owners of the premises in which he carried on his business, and filed a bill in Chancery against them. In June 1831, the Vice-Chancellor decreed against him, on a matter of form, with costs: expressing, that but for such bar, he thought the plaintiff's agreement with the defendants gave him the right he sought. Mr. Andrews appealed to the Lord Chancellor, who also decreed against him; subsequently, he carried his appeal to the House of Lords, where it at present remains, still undecided.

In January, 1833, Mr. Andrews was attending at the Register Office, for settling minutes of the order on appeal, by appointment of the solicitors of the defendants, when they caused him to be arrested there, on a Middlesex writ. This is, in itself, a high contempt; the person of a solicitor being, while in an office of the Court on the business of a suit, held sacred. The attachment was for one hundred and seven pounds; but, on the 16th of the same month, whilst the plaintiff was preparing to apply to the Court for immediate release, on the above ground, a discharge, in the usual form, from the Sheriff's Office, was brought, and plaintiff's liberation (freely, voluntarily, and unconditionally,) followed. In March, the plaintiff was again arrested, for the same costs, on a London writ, which ran concurrently with the Middlesex one, returnable at the same time as the writ from which he had been discharged. The prisoner petitioned for his discharge continually, until July, 1834, when he got himself brought up before Lord Brougham; who part heard him in person, stopped him to keep an official appointment, and, soon afterwards, went out of office. Mr. Andrews renewed this application, repeatedly, before the succeeding Lord Chancellor, Lyndhurst—then, before the Lords Commissioners—then, before Lord Chancellor Cottenham—next, before Lord Lyndhurst, again—and, finally, (several times) before Lord Cottenham. All to no purpose; until, on the 24th December, 1849, Mr. Andrews was set at large, with all his rights about him; these rights being, liberty to carry on certain appeals to the House of Lords, which are still pending. He could have been liberated some time earlier, had he chosen to forego an appeal upon an injunction to restrain him from bringing an action against his opponents for false imprisonment. This he declined to do; for, by that time, his ruin had been completed.

The inability of some prisoners to obtain their liberation by any "acts or concessions of their own," is well illustrated by another case we previously stated. Sir Edward Sugden furnishes some notes made by himself during a recent visit to the Queen's Prison. The first case he mentions, is that of the gentleman committed for the non-transfer of certain stock, and for not delivering up certain deeds;—in fact, the unhappy individual who invested his legacy in Spanish Bonds. "For this case," Sir Edward remarks, "as matters at present stand, there appears to be no remedy." In spite of Sir Edward Sugden's own statute.

This gentleman then cannot liberate himself "by any acts or concessions of his own." We apprehend this to be not a solitary case. We repeat, therefore, that he is in the catalogue of the doomed, and is doomed accordingly, and cannot be restored to society.

Sir Edward Sugden lays great stress on the expression in our former article, that there is

no Insolvent Debtors' or Bankrupts' Court to release the martyr of Chancery. There lies before us a letter to the "Times" newspaper, signed "George Stephen;" the writer of which declares that he was for some time appointed solicitor to pauper Chancery prisoners. Amongst other things, he tells us that it has sometimes occurred "that prisoners were detained in contempt for non-payment of costs, and, though reported by the master as fit objects for relief, being paupers not worth five pounds, they were left to obtain their discharge by the Insolvent Debtors' Court, as provided by the act, but were unable to resort to the Insolvent Court because that involved payment of fees to the amount of six pounds." Does Sir Edward Sugden term these men "self-elected" martyrs?

Great good was, doubtless, effected during the earlier years of the operation of Sir Edward Sugden's Act: and to Sir Edward Sugden, as its author, we render all due commendation; but, it is rather a curative after mischief done than a preventive measure. The power of the Court of Chancery for committing for contempt will, we trust, be abridged. There is no reason why the non-payment of a Chancery lawyer's bill, for instance, should bring down condign punishment on the head of the defaulter, any more than any other debt.

A PRISON ANECDOTE.

In the year 1834, a widow lady of good fortune (whom we shall call Mrs. Newton) resided with her daughter in one of the suburbs nearest to the Metropolis. They lived in fashionable style, and kept an ample establishment of servants.

A very pretty young girl, nineteen years of age, resided in this family in the capacity of lady's-maid. She was tolerably educated, spoke with grammatical correctness, and was distinguished by a remarkably gentle and fascinating address.

At that time Miss Newton was engaged to be married to one Captain Jennings, R.N.; and Miss Newton (as many young ladies in the like circumstances have done before,) employed her leisure in embroidering cambric, making it up into handkerchiefs, and sending them and other little presents of that description, to Captain Jennings. Unhappily, but very naturally, she made Charlotte Mortlock, her maid, the bearer of these tender communications. The captain occupied lodgings suited to a gentleman of station, and thither Charlotte Mortlock frequently repaired at the bidding of her young mistress, and generally waited (as lovers are generally impatient) to take back the captain's answers.

A strange sort of regard, or attachment (it is confidently believed to have been guiltless) sprung up between the captain and the maid; and the captain, who would seem to have deserved Miss Newton's confidence as little

as her maid did, gave as presents to Charlotte, some of the embroidered offerings of Miss Newton.

It happened that a sudden appointment to the command of a ship of war, took Captain Jennings on a trans-Atlantic voyage. He had not been very long gone, when the following discovery threw the family of the Newtons into a state of intense agitation.

In search of some missing article in the absence of her maid, Miss Newton betook herself to that young woman's room, and, quite unexpectantly, opened a trunk which was left unlocked. There she found, to her horror, a number of the handkerchiefs she had embroidered for her lover. The possibility of the real truth never flashed across her mind; the dishonesty of Charlotte seemed to be the only solution of the incident. "Doubtless," she reasoned, "the parcels had been opened on their way to Captain Jennings, and their contents stolen."

On the return of Charlotte Mortlock, she was charged with the robbery. What availed the assertion that she had received the handkerchiefs from the captain himself? It was no defence, and certainly was not calculated to soften the anger of her mistress. A policeman was summoned, the unhappy girl was charged with felony, underwent examination, was committed for trial, and, destitute of witnesses, or of any probable defence, was ultimately convicted. The judge (now deceased) who tried the case, was unsparingly denounced by many philanthropic ladies, for the admiration he had expressed for the weeping girl, and especially for his announcement to the jury, in passing sentence of one year's imprisonment with hard labour, "that he would not transport her, since the country could not afford to lose such beauty." It was doubtless, not a very judicial remark; but an innocent girl was, at all events, saved from a sentence that might have killed her.

Consigned to the County House of Correction, Charlotte Mortlock observed the best possible conduct—was modest, humble, submissive, and industrious—and soon gained the good-will of all her supervisors. To the Governor she always asserted her innocence, and told, with great simplicity, the tale of her fatal possession of those dangerous gifts.

She had been in prison a few months, when the Governor received a visit from a certain old Baronet, who with ill-disguised reluctance, and in the blunt phraseology which was peculiar to him, proceeded to say, that "a girl named Charlotte Mortlock had quite bewitched his friend Captain Jennings, who was beyond the Atlantic; and that a letter he produced would show the singular frame of mind in which the Captain was, about that girl."

Assuredly, the letter teemed with expressions of anguish, remorse, and horror at the suffering and apparent ruin of "a dear innocent girl," the victim of his senseless and

heartless imprudence. However, the Baronet seemed to be anything but touched by his friend's rhapsodies. He talked much of "human nature," and of "the weakness of a man when a pretty girl was in the case;" but, in order to satisfy his friend's mind, asked to see her, that he might write some account of her appearance and condition. Accordingly, he *did* see her, in the Governor's presence. After a few inappropriate questions, he cut the interview short, and went away, manifestly disposed to account his gallant friend a fool for his excitement.

The incident was not lost upon the Governor, who listened with increased faith to the poor girl's protestations. In a few months more he received a stronger confirmation of them. Apparently unsatisfied with the Baronet's services, Captain Jennings wrote to another friend of his, a public functionary, formerly a Captain in the renowned Light Division; and that officer placed in the Governor's hands a letter from the Captain, expressing unbounded grief for the dreadful fate of an innocent young woman. "He could not rest night or day; she haunted his imagination, and yet he was distant, and powerless to serve her." His second messenger was touched with pity, and consulted the Governor as to the proper steps to pursue. However, under the unhappy circumstances of the case, Captain Jennings being so far away, no formal document being at hand, and the period of the poor girl's release being then almost come, it was deemed unadvisable to take any step. Charlotte Mortlock fulfilled the judgment of the law.

She had been carefully observed, her occupation had been of a womanly character; she had never incurred a reproof, much less a punishment, in the prison; and her health had been well sustained. She, consequently, quitted her sad abode in a condition suitable for active exertion. Such assistance as could be extended to her, on her departure, was afforded, and so she was launched into the wide world of London.

She soon found herself penniless. Happily, she did not linger in want, pawn her clothes (which were good), and gradually descend to the extreme privation which has assailed so many similarly circumstanced. She resolved to act, and again went to the prison gates. Well attired, but deeply veiled, so as to defy recognition, she inquired for the Governor. The gate porter announced that "a lady" desired to speak to him. The stranger was shown in, the veil was uplifted, and, to the Governor's astonishment, there stood Charlotte Mortlock! Her hair was neatly and becomingly arranged about her face; her dress was quiet and pretty; and altogether she looked so young, so lovely, and, at the same time, so modest and innocent, that the Governor, per force, almost excused the inconstancy (albeit attended with such fatal consequences) of Captain Jennings.

With many tears she acknowledged her grateful obligations for the considerate and humane treatment she had received in prison. She disclosed her poverty, and her utter friendlessness; expressed her horror of the temptations to which she was exposed; and implored the Governor's counsel and assistance. Without a moment's hesitation, she was advised to go at once to a lady of station, whose extensive charities and zealous services, rendered to the outcasts of society at that time, were most remarkable. She cheerfully acquiesced. She found the good lady at home, related her history, met with sympathy and active aid, and, after remaining for a time, by her benevolent recommendation, in a charitable establishment, was recommended to a wealthy family, to whom every particular of her history was confided. In this service she acquitted herself with perfect trustfulness and fidelity, and won the warmest regard. The incident which had led to her unmerited imprisonment, broke off the engagement between Captain Jennings and Miss Newton; but whether the former had ever an opportunity of indemnifying the poor girl for the suffering she had undergone, the narrator has never been able to learn. This is, in every particular, a true case of prison experience.

THE CHEMISTRY OF A PINT OF BEER.

At a late meeting of a very useful little Metropolitan Mechanics' Institution, which it is not necessary to our present purpose to name, a discourse on the subject above-mentioned was delivered by Mr. James Saunders, practical plumber and glazier, amateur chemist and natural philosopher.

Mr. Saunders commenced his lecture by observing, that much ado was being made just now about the Papal Aggression. This remark might appear foreign to his subject, but, in fact, led up to it; for the Pope of Rome had occasioned a fermentation in this country; and without fermentation there could be no such thing as that which he was about to have the pleasure of discussing—a pint of beer. He should say no more on the fermentation caused by the Pope, except that he hoped it would be followed by the usual results of that process as observed in brewing—a sinking of the dregs; a going off of flighty volatile gas; and strength communicated to the good stuff in the barrel.

"For many of the observations I'm about to make, Ladies and Gentlemen," continued Mr. Saunders, "I shall have to apply to my notes; for which I'm beholden to our worthy Doctor, who is now amongst us; and I hope he'll excuse me for any mistakes I may make in pronouncing some of his words.

"In the first place, what is a pint of beer? 'Twopenny,' says some of you, 'and a deal too much!' That's not the question. There's a great many beers. There's porter, there's heavy, or brown stout, and there's

strong beer, and ales of ever so many sorts, and, then, there's swipes. Which is it to be? Well; please to take beer as meaning malt-liquor in general—a fermented drink made out of malt and hops. In a chemical sense, it don't much matter what tap it is. Here I may be asked, perhaps, what chemistry has to do with beer? Everything. Brewing's a regular chemical operation. Of course, I haven't time to go into the whole art and mystery of brewing. I shan't attempt more than to give you some sort of notion of the science of that beautiful process. Well; now then we'll begin by inquiring what beer is made of?

"The answer most of you would make to this question, I take it, would be, 'Malt, hops, and water.' Some would add, perhaps, 'and a little isinglass, for finings.' That's what it ought to be made of, to be sure. But there's more things in ale and beer, ladies and gentlemen, than is dreamt of in your society—However, let us take beer as brewed simply of water, malt, and hops—what you may call Utopian Entire; though, mind, 'tis in the power of all of us to realise this salubrious and agreeable beverage, if so be as we've got the means, and will take the trouble ourselves, for to brew the same.

"We'll say, then, that beer is made of malt, hops, and water. Very good. But now comes another query. What is water, and hops, and malt made of?

"First, what is water made of? Ah!—there was a time when heads, with big wigs on 'em, would have been shook at me for asking that question. I should have been thought mad—perhaps worse. But we live in better times, thanks be. You've been told afore, most of you, no doubt, that water, when quite neat, which you can't get except by distilling of it, is made of oxygen and hydrogen, which are two sorts of gas; that is, when separated one from the other, as can be done by galvanism and other ways and means, and collected apart. Rain-water, fresh from the clouds, contains a little fixed air besides; the same air that comes out of soda-water and ginger-beer: what they call carbonic acid; namely, carbon, the same thing as charcoal, turned into gas by being combined, as the word is, with oxygen. What river-water contains depends a good deal on what goes into the river; the idea whereof may be left to imagination, with the hope it won't disorder the stomach. Same with well-water drawn from high sewers and churchyards. Besides these things, which have no business in water, both river and well-water contain various salts, more or less. There's carbonate of lime in 'em, carbonate of magnesia, carbonate of potash, now and then sulphate of iron, and so on, according to the soil they run through, or spring out of. Sulphate and carbonate of lime (in other words, plaster of Paris and chalk) cause water to be, what is called, hard; which is bad and wasteful for making tea;

but whether it is the worse or no for brewing beer is a dispute among brewers; and who's to decide when brewers disagree. It stands to reason that the quality of the water must have more or less effect upon the quality of beer; so, no doubt, the difference between the beers of different places depends, for one thing, on the kind of water they are brewed from.

"Next, as to the hops. The hop-flower, belonging to the vegetable creation, is made of carbon, oxygen, and hydrogen. Besides, there's a bitter extract in it, and likewise a drowsy-fying sort of principle, something like what there is in opium, called *Humulin*.

"Now for the malt. What is malt? Not many of you, I suppose, are such Cockneys as not to know that malt is barley, steeped in water, laid out on a floor, let be there till it is just about to sprout, and then dried on a kiln, at a heat high or low, according to the colour you want it to be; pale, or amber, or brown. Here begin the chemical manœuvres required to produce a pint of beer. Malting is a process of chemistry that goes on in each grain of barley inside of the husk. What are the chemical ingredients of barley? Carbon, oxygen, hydrogen, and a little nitrogen. Malt has the same. But the difference between barley and malt is, that the carbon, oxygen, and hydrogen in the barley are in the shape of starch; whereas, in the malt they are in the state of sugar. In going to sprout, the barley gets sweet. The starch in it changes into sugar. Both sugar and starch have the same proportions of carbon, oxygen, and hydrogen; twelve of carbon, ten of oxygen, and ten of hydrogen, in each—that is to say, water and charcoal. The difference between starch and sugar is thought to depend on the carbon, oxygen, and hydrogen in the one, being ranged together in a different way from what they are in the other. The 'ultimate particles' of carbon, oxygen, and hydrogen, being 'grouped together,' as the phrase is, in one way, form starch, and in another, sugar. So with gum, and several other things, that have the same elements—as chemists say—and in the same proportions as sugar, but differ from it in look and taste, and feel, and some other properties. It seems as though, whilst they are the same in point of chemical ingredients, they differ as to chemical texture. So they are the same things in different forms. All these things turn very easily into sugar. You can make sugar of linen rags, by boiling them gently in oil of vitriol. Dame Nature makes the sugar for us in malting. She always does make sugar in grain for the young sprout to start from. The change of starch into sugar goes by the name of the 'saccharine fermentation;' about which there's a curious fact I have to mention presently.

"The rest of the carbon, oxygen, and hydrogen in the malt is in the shape of gum or mucilage, and colouring-matter. In the barley, before it became malt, there was a small

quantity of a substance called *diastase*. This contains the other chemical element of things that live and grow; animals and plants: nitrogen. There is very little *diastase* in barley: not more than one part in five hundred; but without it the change of starch into sugar could not be set a going.

"Now, Chemistry says, that there are such and such things in malt; but it does not follow that there may not be more. Those niceties in the composition of things, that make flavours and perfumes, most of them, are not to be laid hold of or shown up by the art and instruments of philosophers, at least at present, and all we know about them, is by their effect on our palates and our noses: as the Doctor says, 'on our gustatory and olfactory nerves.' But, however, all this does not signify for our present purpose; and to understand the chemical part of brewing, we need only to look upon malt as so much grain turned into so much sugar.

"Seeing then that we know, in a general way, what water, and malt, and hops, are made of, and that we've got them to make beer with: the question is, how to use them for that important purpose. As I said before, I am not going to describe the process of brewing. Talking as I am to the wives and daughters of England, which latter will of course, become the former in good time, I should as soon think of lecturing on the darning of stockings or sewing of buttons on; to say nothing of the *crochet* which is so favourite a fancy just at present. No: I trust that the practice of brewing, and let me add of baking, and of cookery in all its branches, is as familiar to all young ladies as geography, astronomy, and the use of the globes, callisthenic exercises, elocution, dancing, and deportment; and if I pretended to teach them how to brew, the next piece of conceit I should be guilty of, would probably be, in the words of my learned friend the Doctor, 'instructing my parent's maternal parent in the art of applying the power of suction, in order to extract the contents of gallinaceous ova.' After which trying quotation, ladies and gentlemen, you'll perhaps allow me to take a sip of a beverage, which by name comes under the head of this discourse; however 'tis only the celebrated Adam's Ale: and no bad thing neither, when genuine, which is hard to get in these times, except in your cottage near a wood, if you happen to be so fortunately situated, in a sanitary point of view."

Having refreshed himself with a glass of water, the lecturer proceeded:—

"The first step in brewing consists in making an infusion of malt. Never mind about the physicky sound of this phrase. In other words, we will say mashing, if you like. But I use it because, in doctors' language, the word infusion means a liquor made by steeping a thing in hot water, to soak the goodness out of it, as counter-distinguished from boiling out the virtue; which last process is

called decoction. Infusion is enough to extract the goodness from malt; the goodness being the sweet, or sugar, whereinto the starch of the barley was turned, when it was changed to malt. It is a great point to make the infusion properly. The water ought to be of the right degree of heat, which, to make good beer, in a general way, is one hundred and seventy degrees by Fahrenheit's thermometer to begin with. A mistake in this particular may occasion the beer to turn sour, or become *blinkey*, which when it used to be afore the thermometer was known, was often set down to witchcraft by the wisdom of our ancestors, in the times of priestcraft and superstition.

"Water enough to stir and separate the malt, is first poured into a proper vessel—that is, a mash-tub;—the malt is now put into it and stirred about: more water is then added at a greater heat; the mash, or mixture of malt-and-water, is let stand for two hours, at the end of which it is drawn off, and is now called wort, or sweet-wort, in the vulgar tongue, and infusion of malt, or 'solution of the saccharine and extracted matter of malt,' by the learned.

"Now, to make wort it is not necessary that the grain used should all have been malted. About one part of malt mixed with two of raw grain in the mash-tub, will communicate the nature of malt to the whole quantity of goods. The raw grain or barley, must be cut into fine meal; meal powdered to dust, does not answer the purpose. This is a curious instance of 'saccharine fermentation,' and is the fact, concerning it, that I alluded to just now: how to account for it, nobody knows, I believe, further than that through contact with the sweet of the malt, a movement takes place in the starch of the grain, between its particles of carbon, oxygen, and hydrogen; they altering their places with respect to each other, in such a way as to take that form of vegetable matter which we call sugar. But this is little more than merely stating a circumstance we can't explain.

"The starch in rasped potatoes even, may be turned into sweet or saccharine stuff, in the same way, by means of mashing or steeping with malt; and then a sort of beer may be made from it, and was made from it, so Mr. Booth says, in his 'Treatise on the Art of Brewing,' published under the superintendence of the Society for the Diffusion of Useful Knowledge. By his account, beer was so brewed from potatoes by a Monsieur Dubrunfaut, a Frenchman; and we are told it 'resembled the beer which is made in Paris.' Perhaps it may resemble, and something more, not a little of the beer that is sold in London, too.

"Brewers seem to approve of brewing from raw grain; though I believe that, on their part, is against the laws, which however don't prevent private persons from so doing, if they choose. But one, who was a tolerable authority on the subject, William Cobbett, doesn't

hold with it at all. He says, "As to using barley in the making of beer, I have given it a full and fair trial, twice over; and I would recommend it to neither rich nor poor. The barley produces *strength*, though nothing like the malt; but the beer is *flat*, even though you use half malt and half barley; and flat beer lies heavy on the stomach, and of course, besides the bad taste, is unwholesome." Cobbett's 'Cottage Economy,' page 26, paragraph 38. How the truth may be, I can't say; but I can easily understand how the sort of sugar made in the sprouting of a seed, or 'germination,' may yield beer, different in point of taste and flavour from what that does which is produced in the mash-tub; the principles of flavour and taste being so very delicate, and perhaps, also, roasting or drying the malt may have some influence in the same particulars. I should be inclined to apply these remarks, likewise, to beer brewed from sugar and treacle, as it may be, and under certain circumstances is sometimes allowed to be, by the Excise. For the subject of a chemical discourse such beer is just as good beer as any other, and I've no objection to it whatever, as a lecturer; but, as a consumer, if I am to have a choice, I should say, 'If you please, I should rather prefer the genuine original commodity, provided it's all the same to you.'

"When you have got your wort, or sweet-wort, the next step in brewing is to boil the hops with it: thereby making a decoction of hops in infusion of malt. By this operation you get out the bitter principle of the top; and there is no chemical change in it requiring particular notice.

"The liquor, strained from the hops, having been brought down in the coolers to the proper temperature, which is about seventy degrees, is now put into the tun-tub. In that respect it undergoes the great change that converts it into beer. This is called, fermentation. The process of fermentation is set a-going, as you know, by mixing yeast with the wort.

"Now, for fermentation to take place, it is necessary, that besides carbon, oxygen, and hydrogen, there should be nitrogen present in the liquor or substance to be fermented. Wort, from the small quantity of nitrogen still left in the malt, may be made to ferment of itself with some trouble; but, to save that, the yeast is mixed with it. Yeast is the froth of a previous fermentation; and contains nitrogen enough to make the fermentation sufficiently quick. It is a sort of stuff in which you see a continual motion is going on. According to the German chemist Liebig, yeast causes fermentation by communicating its own motion, in a mechanical manner, to the particles of carbon, oxygen, and hydrogen, that compose sugar, dissolved in the wort, for instance. The hydrogen and oxygen, in sugar, as I said above, stand, in sugar, each to each, in the proportions of twelve; carbon;

ten, hydrogen; and ten, oxygen—though some reckon the two last at eleven. In fermentation these elements are dislodged, so to speak, from the position they hold, one to another, and then a re-arrangement of them takes place. Part of the carbon of the sugar unites with most of the oxygen so as to form carbonic acid, which flies off in gas. The rest of it combines with all the hydrogen and some of the oxygen, and becomes alcohol, or spirit, the production whereof in infusion of malt, converts it into that generous and invigorating beverage on the philosophy of which I have now the honour of addressing you. Alcohol consists of four proportionals of carbon, six of hydrogen, and two of oxygen. The proportions of these elements one to another in sugar and alcohol, as well as other things, are made out by separating one from the other according to art, in ways which it would take too long to describe, called Analysis. Well; you see fermentation is a sort of inward commotion ending in a new constitution; a sort of natural revolution in point of fact. Alcohol is formed in making wine, and all strong drinks, in the same manner as in brewing. A certain quantity of it, perhaps you may know, is even produced in fermenting bread. This is mostly lost in the baking; but some years ago there was a company formed to supply the Public with cheap bread, in the hopes of being enabled to afford to sell it at a lower price by collecting the spirit that is generally wasted. Whereupon a baker, who was up to snuff a great deal more than to chemistry, set up a shop where he professed to sell bread at the same rate as the company, with the gin in it!

"The carbonic acid given off from beer while fermenting, is what makes it so dangerous to go down into vats, and sometimes occasions death by this being done without precaution.

"The proper plan is to send a candle down first; if there is much carbonic acid it puts it out. So, if you let a light down into the tun-tub, over the fermenting liquor. All the inside of the tub, above the liquor, while it is working, is full of carbonic acid gas; and if you dip a cup into the gas gently, you can ladle it out, and then if you turn the cup upside down over a candle you extinguish it as completely as if you were to pour water upon it, by that means astonishing the weak minds of spectators in a considerable degree.

"When the froth, or yeast, ceases to be formed on the surface of the liquor in the tun-tub, your wort has become beer, which you allow to get cold, and then put it into the cask or barrel. Here the fermentation still goes slowly on, as is shown by the yeast, that keeps gradually working out of the cask, till all the sugar, or as much of it as can be, is changed into spirit. Beer that tastes sweet, owes its sweetness to containing sugar not decomposed, or changed into spirit.

Bottled beer is beer in which the carbonic acid, made by the decomposition of the sugar, or other vegetable matter in the beer, is prevented from escaping by being corked down.

"A liquor, to ferment, requires a certain amount of heat, not lower than between fifty-five and sixty-five degrees. It likewise grows hotter during fermentation; and as carbonic acid gas is thrown off at the same time, as from a fire, this makes fermentation seem somewhat like a burning or combustion. Only this, which is called the vinous fermentation, is a sort of burning independent of the air, the oxygen that feeds it being contained in the liquor.

"All fermentation in beer—or wine either—ought to stop with the change of sugar into spirit. But by being exposed to the air, or to the action of electricity, and some other causes, a second fermentation is set up in it. The alcohol takes in oxygen from the air, and is changed into acetic acid, or vinegar. This is the reason why it is so necessary to have beer-casks thoroughly air-tight; for though what is called the acetous fermentation is interesting as a matter of science, to have one's beer turn sour is a great misfortune, in a domestic and economical point of view. What is termed hard beer is beer in which vinegar, or acetic acid, has begun to form.

"Good beer, then, is a mixture of alcohol and water, more or less undecomposed sugar, mucilage, and other extractive matter, carbonic acid, in greater or less quantity, and those delicate principles on which flavour depends, besides the bitter of the hop. To these things there is added colouring-matter, which is given by the malt. In porter this is got by malt that has been roasted almost to charcoal. The carbonic acid in beer is what its briskness depends upon. The little bubbles you see in sparkling ale are composed of this gas, and without it the beer tastes flat. Old beer is beer wherein the vegetable matter has been wholly or mostly decomposed. In mild beer the decomposition has not been quite completed. It is a pleasing relish to a pot of beer to reflect on the chemical facts which that particular taste in it, which you fancy, depends upon.

"So much, ladies and gentlemen, for the chemistry of beer. Now for a word or two about the *druggistry* of it. Instead of malt, sugar, treacle, honey, and other sweet things may be used—though contrary to law in the case of brewers—and are so, I fancy, more or less; without much harm. Wormwood, quassia, and other bitters, may, in like manner, be employed in lieu of hops, without poisoning the consumer. Buckbean, or *Menyanthes trifoliata*, is another substitute—to be marked 'dangerous.' Aloes has likewise been used for the same purpose; but, being physic, I think it had much better be confined to regular medicinal purposes and not used to doctor beer with.

"I won't say, however, that beer may never

require a little doctoring. It is apt to be rather indisposed at times; that is, to turn somewhat sour. When slightly afflicted with this complaint, a few egg-shells, which, in fact, are so much chalk, to absorb the acidity, may not be injurious. A little salt is supposed to make beer keep: there can be no great harm in that. Some have given their beer jalap, in the proportion of two or three ounces to twenty barrels; the reason for which proceeding is unknown; it may not do harm; but I don't see that it can do much good. Copperas is used for the sake of giving porter a frothy top. For this purpose, there need not be used more than would lie on a half-crown piece for a barrel. But I, for my part, should be disposed to think that so much copperas as would affect the head of a pot of beer, would be not unlikely also to affect the human stomach; and I would, therefore, prefer not to have any copperas in my beer, if I knew it.

"However, this copperas, or sulphate of iron, is found in a great many springs of water, which the Excise does not prevent brewers from brewing from, although it forbids them to put the same quantity of copperas as what there is in those springs into the common water which they use. But this only proves that the law knows nothing about chemistry; and I'm afraid it don't know much more about philosophy and science of any sort.

"The root of the sweet flag, coriander and carraway seeds, orange-peel, and other aromatics, are also used to give beer that flavour, which, if properly made, it would derive, without any such medical treatment, from malt and hops.

"Lastly, there are drugs which are put into beer merely to increase its fuddling power—*Cocculus Indicus*, *St. Ignatius's Bean*, *Nux Vomica*, or Ratsbane, *Opium* and *Tobacco*. Concerning which, I shall only make the brief remark, that though in this age of enlightenment and civilisation, we must be naturally averse to capital punishments, I wish every brewer who puts any such stuff into his liquor, was condemned to drink his own beer, and nothing else, till he died—which I fancy he would in no very long time.

"I feel that I have not exhausted the subject of beer; but I am afraid I may have exhausted your patience. However, if my discourse has occasioned on your parts a feeling of dryness, the subject of it no doubt will suggest to you a ready means of relieving that uncomfortable sensation."

The lecture of Mr. Saunders was listened to with marked attention by a crowded auditory. At its conclusion, a teetotaller stepped forward, and begged to ask the lecturer's opinion on the relation of beer to health and morality? To which Mr. Saunders replied, that he considered it highly favourable to both, provided moderation—a virtue in itself—was observed in the use thereof. Too

much of any good thing was bad; and this remark was as true of tea as of any malt liquor.

A SALT GROWL.

—SALT, because I am an Old Salt. I am brine, from head to foot. I am an officer of old standing, and, by a singular chain of circumstances, one of the most unlucky men in the profession. I can compare myself to nothing but a cat that has been sent up by an experimentalist in a balloon. I have been a victim to Admiralty experiments all my life. Sir Charles Napier's book, "The Navy: Its Past and Present State," has set all my wounds bleeding, by touching up my memory—and here goes for a spell of lamentation!

I am all over grievances. I represent wrongs in my proper person—as the South Sea Islanders do the customs of their country by the nature of their tattoo. I mean no personal offence to any one, but to those who feel themselves aggrieved, I present my card (that card which I have left so often at an official's when unable to get an interview)—Captain Jeremiah Jigger, R.N.

First of all, I entered as a mere boy, during war; and, when still unable to tolerate the birch with anything like Spartan patience, was armed with a sword, and expected to resist that of a ferocious enemy! Our captain, who was subject to gout (being *celat*, sixty when he got the "Bruiser") was a noted Tartar. Men would not enter his vessel; consequently we were obliged to resort to rigorous impressment. You moderns don't know what impressment really was. I have lived a good deal in the country since; and I tell you what it is exactly—it is *poaching*. Poaching for men! You set snares for them in public houses, just as you set snares for hares in hedges. You catch them asleep, as you would catch a pheasant on a tree at night, and sulphur him. Many a time we pinned an outward-bound merchantman on the wing. We were resisted, wounded, ex-crated; nevertheless, no system of manning the Navy is adopted to this day; and if we have a war again we must press. What will the sea-ports say to that?

The "Bruiser" went to sea in a hurry—some guns short, and with a hundred landsmen among the crew—in the thick of the American war. Jonathan was, just then, beginning to pick up our frigates—with better manned, better armed, and bigger frigates of his own. What did the Admiralty do? They issued secret orders not to engage the large American frigates—which was a capital remedy. I wish you had seen our skipper, reeking with indignation and rum, when this reached us! He had been licking Frenchmen the whole of his gunpowdery life, and didn't believe it was possible that the "Bruiser" could be taken. Captain Snagg, of the U.S.N.; commanding the "Locofoco," thought other-

wise. We fought him, one fine morning, at sunset; we were unpleasantly wet, on the lower deck; in fact, we were sinking, when H.M.S. "Oberon" came up and saved us. The Yankee went off, playing "Yankee Doodle."

We were all tried by court-martial, and acquitted. To be sure, we had lost a third of our crew, and four officers; which showed that we had made a fight, and was considered highly satisfactory. The skipper's turn for a flag came on some time afterwards, when he was a brisk young admiral of sixty-five; but he never got a command. They were afraid of youthful enthusiasm. When we were paid off, I was attacked, one night, by a party of Amazons whose husbands we had pressed, and lost the use of a finger. I applied to the Admiralty, in the hope of smart-money, but got none; when I wrote again, I was informed that their lordships "had nothing to add to their former communication." It is a curious circumstance that they never have anything to "add." What does this arise from? Is each communication perfect *per se*? I consoled myself with reflecting that their former communication had been quite dull enough, and cold enough, without any addition.

I was now on shore, unemployed. My relations were not much pleased with me, for I had brought home my legs, and had not brought home any prize-money, and was, therefore, neither an object of personal nor pecuniary interest. I kept applying for employment, and after a long time, just as I was married (Jeremiah, be firm!), came my appointment to H.M.S. "Blunderer." Poor dear Emily! That long, coffin-like letter, "On Her Majesty's Service," did eclipse our honeymoon into an eclipse that would have startled Kepler.

The "Blunderer" was one of those peculiar vessels, a "fir thirty-two;" which class of vessels had this odd peculiarity that they could neither stand up under canvas, nor sail. Fancy an umbrella that would neither shut up, nor keep out wet, and you have a good notion of the utility of a fir thirty-two. The "Blunderer," sir, was made of raw fir—gummy, sir, positively! We used to expect to see her, leafy, in spring-time! She was as cranky as a parasol in winter weather. Half our time was spent in wishing we dare set the top-gallant sails. She was as liable to capsize, as a boy's boat on the Serpentine. One day, I had the watch, and set the top-gallant sails in a fresher breeze than usual. A squall came, and the masts went over the side. The Admiralty made me pay for them out of my pay; and poor Emily had to sell her piano to make up the difference.

I left the "Blunderer" a mate (she afterwards was taken aback, in a squall, with the mainsail on her, and went down stern foremost), and joined a twenty-eight-gun-ship. She was, also, a peculiar ship, belonging to another strange class, that could neither fight nor run away. I was made an acting-lieutenant in her; shortly afterwards I joined

one of a really fine class of brigs. Will the reader believe that the authorities took the whim of putting a third mast in her, which spoiled her—and did the same to a dozen, before finding out their mistake!

For this is a standing principle with the naval authorities—always "to go the entire animal" (I am too polite to say *what animal*) and to multiply a blunder in arithmetical progression. One foolish experiment makes many; and each bad vessel produces a whole set of them—as the fox that had lost his tail sought for companions. Accordingly, our beautiful eighteen-gun-brig, the "Violet," had a third mast put into her, and was spoiled. And the same process was gone through with several others at a cost of nine hundred pounds each. This process of addition, I may say, is as sensible as it would be for a man with two good legs to add a wooden one by way of improving his walk!

I was paid off in the "Violet," this time, and, though I had been an acting-lieutenant some years, had to go back again to the rank of mate. You see I was not a man of family, neither had I interest in a borough. The first lord, a civilian, wanted patronage; I had no patrons. Off I went to sea in H.M. Brig;—what do you suppose?—"Jowler." She was one of a number of flat-bottomed, bad brigs, named by the Admiralty after Lord Spencer's hounds. There was "Rucher," and "Badger," and "Bang;" and the sea was turned into a kennel. Since the days of Scylla, who

"Chid his barking waves into attention,"

—as Milton, I think, says—the ocean had seen nothing so canine! We were yelping and galloping about, over the world—but by no means too good hands at biting. But, my luck on board the "Jowler," was better than that of my old mesmate Blocksby. He joined one of the new ten-gun-brigs, begun in 1808—when the kennel lot began to be seen to be useless. The Admiralty built them, like wild-fire, as usual, and launched sixty-four. Four foundered at sea; and two hundred and sixty men perished; six, turned into packets, were lost with one hundred and sixty-eight men, beside passengers. Poor Blocksby went down, all standing, in command of one of the last. It was an awful winter, that, and he never expected to come back from Halifax. He had left all his plate on shore at Falmouth, in order that his family might not lose *that*, at all events!

Well! I got made a lieutenant, and I commanded a revenue cutter—which put me in the way of seeing a good deal of what went on in the dockyards, when I was in harbour. Sometimes, I have gone round a dockyard with the first lord, who (of course) wanted somebody to put him up to the differences between the various sorts of ships, and another, (a kind of interpreters between him and his business!) while he was making a tour of inspection.

HOUSEHOLD WORDS.

"That's a fine ship—that—Ahem!"

"Frigate, my lord."

"Ah, yes.—Ahem! I like the stern—"

"I beg your pardon, my lord, the bow!"

"True!—Ahem, I had forgot. Ask them to bring my carriage round to the gates, will you, Mr. Jigger!"

You see, there *must* be an appearance of attention to the sea-port towns—they return members. Thus, you see, it would not do, for instance, to make too much fuss about the shameful waste in dismantling a ship when she's paid off—it's convenient to let the dock-yard people rush at her, as if she were a vessel of the enemy's.

One thing often amused me—the trouble they take, and the expense they go to, about ships' sterns. Surely, *that's* not the part of our ships that we're anxious to show! Yet, just read this little bit from the book of Sir Charles Napier's that I mentioned above.

"No less than twenty-eight ships had their sterns altered on Sir Robert Seppings's plan, by a return of the 24th of April, 1846 but the expense was not stated. I suppose they were ashamed of it. Twenty-six ships, of different sizes, by the same return, had their sterns altered on another plan; some of them twice, and the "Boscawen" three times, some also that had been altered by Sir Robert Seppings before, were again altered on the second plan." (Page 196)

I got so disgusted at all this, years ago, that I was very nearly ruining my chances of success in the profession, by trying to improve its condition! You don't, perhaps, know, reader, that it's a punishable offence to write on a naval matter when you're on full pay. You, who know best, must say nothing. You, who suffer, must not cry out—the authorities being like the shoemaker in the fable, who says to the customer, "That shoe pinch you! I made it. I know better."

I'm not vain, but I once did send a plan of a very tidy vessel to Somerset House. They took no notice of it for a long time; at last I heard that "my idea had been anticipated," and she made her appearance soon afterwards.—I have my suspicions on the matter though!

While we are talking about ship-building, let me give you another little bit from the Admiral's book—and then you will scarcely wonder at the results, when you see the organisation.

"In general our attempts at improvement have turned out failures; and certainly the Admiralty took an odd manner to get information; for when a committee of reference was appointed, the instructions were as follow:—'In the event of any nautical difference of opinion, between the surveyor and the committee thus constituted, the report of the surveyor is to be referred to the committee, and that of the committee to the surveyor, who are to state, after having duly weighed the arguments in favour of their respective views, whether or not they still adhere to their respective

opinions.' I wonder whether the surveyor ever attended to such an absurd instruction. I should think not; and the committee of reference has been abolished." (Page 190.)

This was the oddest plan to get wisdom, I ever heard of. It was surely suggested by the idea of rubbing two sticks together, to produce fire—though it was never so successful. Are we surprised at official eccentricities, after this? Need we wonder that we so often turn out a ship, which (to imitate Sir John Falstaff's phrase) is like a ship "cut out of a cheese-paring after supper?"

I am not going to trouble the reader with the details of an unfortunate career. Some years ago, I was made a commander, on which occasion I received the hearty congratulations of my grand-children. Oddly enough, and quite consistently with my strange naval experiences, I got, the very same day, the news that "the *Mimantur*, costing seventy-six thousand six hundred and sixty two pounds, had been converted into a convict ship without being at sea;" and that the "*Black Prince*" and "*Defence*" had suffered the same "sea-change." My eldest grandson, a rather small boy, observes that the transformation of the ships into nymphs, in *Virgil*, is the only metamorphosis of a naval character worthy of comparison with our modern ones. He also, occasionally, sings what he calls "a parody," to the following effect, on our ships.—

"Nothing of them but doth change
Into something rich and strange
Dockyards hourly ring their knell—
There goes the money!—ding, dong, bell."

The line-of-battle-ships and frigates built since 1815, and cut down and converted, without being at sea, have cost six hundred and nineteen thousand seven hundred pounds. Judge of the expense of these operations, when I tell you that the expense of cutting down and repairing the "*Dublin*" was fifty-two thousand eight hundred and thirty-nine pounds. All this is not very remarkable, when we remember that a great many ships are built by "amateurs." Did any man, wanting a house, ever employ an "amateur" to build it? Would any one trust the stability of his first-floor, to the caprices of a speculative gentleman educated for the Bar or the Pulpit?

A few years ago, I was nearly rolled to pieces in a Symondite line-of-battle-ship. I served some time in an iron steam-vessel; which class of vessels has proved an entire blunder, and been, apparently, condemned as useless. A model shell exploded in one of them, when I was in her, and killed two men. In the hope, however, of a reform in the constitution of the Admiralty, and some abstinence from this horrible wasting of money, I conclude here. I still keep up my spirits—for I shall, under the present system, be an admiral, if I live to a hundred and twenty!

"Familiar in their Mouths as HOUSEHOLD WORDS."—*SCOTT'S*

HOUSEHOLD WORDS.

A WEEKLY JOURNAL:

CONDUCTED BY CHARLES DICKENS.

No. 48.]

SATURDAY, FEBRUARY 22, 1851.

[Price 2d.]

"BIRTHS. MRS. MEEK, OF A SON."

My name is Meek. I am, in fact, Mr. Meek. That son is mine and Mrs. Meek's. When I saw the announcement in the Times, I dropped the paper. I had put it in, myself, and paid for it, but it looked so noble that it overpowered me.

As soon as I could compose my feelings, I took the paper up to Mrs. Meek's bedside. "Maria Jane," said I (I allude to Mrs. Meek), "you are now a public character." We read the review of our child, several times, with feelings of the strongest emotion; and I sent the boy who cleans the boots and shoes, to the office, for fifteen copies. No reduction was made on taking that quantity.

It is scarcely necessary for me to say, that our child had been expected. In fact, it had been expected, with comparative confidence, for some months. Mrs. Meek's mother, who resides with us—of the name of Bigby—had made every preparation for its admission to our circle.

I hope and believe I am a quiet man. I will go farther. I *know* I am a quiet man. My constitution is tremulous, my voice was never loud, and, in point of stature, I have been from infancy, small. I have the greatest respect for Maria Jane's Mama. She is a most remarkable woman. I honour Maria Jane's Mama. In my opinion she would storm a town, single-handed, with a hearth-broom, and carry it. I have never known her to yield any point whatever, to mortal man. She is calculated to terrify the stoutest heart.

Still—but I will not anticipate.

The first intimation I had, of any preparations being in progress, on the part of Maria Jane's Mama, was one afternoon, several months ago. I came home earlier than usual from the office, and, proceeding into the dining-room, found an obstruction behind the door, which prevented it from opening freely. It was an obstruction of a soft nature. On looking in, I found it to be a female.

The female in question stood in the corner behind the door, consuming Sherry Wine. From the nutty smell of that beverage pervading the apartment, I have no doubt she was consuming a second glassful. She wore a black bonnet of large dimensions, and was

copious in figure. The expression of her countenance was severe and discontented. The words to which she gave utterance on seeing me, were these, "Oh git along with you, Sir, if you please; me and Mrs. Bigby don't want no male parties here!"

That female was Mrs. Prodigit.

I immediately withdrew, of course. I was rather hurt, but I made no remark. Whether it was that I showed a lowness of spirits after dinner, in consequence of feeling that I seemed to intrude, I cannot say. But, Maria Jane's Mama said to me on her retiring for the night: in a low distinct voice, and with a look of reproach that completely subdued me: "George Meek, Mrs. Prodigit is your wife's nurse!"

I bear no ill-will towards Mrs. Prodigit. Is it likely that I, writing this with tears in my eyes, should be capable of deliberate animosity towards a female, so essential to the welfare of Maria Jane? I am willing to admit that Fate may have been to blame, and not Mrs. Prodigit; but, it is undeniably true, that the latter female brought desolation and devastation into my lowly dwelling.

We were happy after her first appearance; we were sometimes exceedingly so. But, whenever the parlor door was opened, and "Mrs. Prodigit!" announced (and she was very often announced), misery ensued. I could not bear Mrs. Prodigit's look. I felt that I was far from wanted, and had no business to exist in Mrs. Prodigit's presence. Between Maria Jane's Mama, and Mrs. Prodigit, there was a dreadful, secret, understanding—a dark mystery and conspiracy, pointing me out as a being to be shunned. I appeared to have done something that was evil. Whenever Mrs. Prodigit called, after dinner, I retired to my dressing-room—where the temperature is very low, indeed, in the wintry time of the year—and sat looking at my frosty breath as it rose before me, and at my rack of boots: a serviceable article of furniture, but never, in my opinion, an exhilarating object. The length of the councils that were held with Mrs. Prodigit, under these circumstances, I will not attempt to describe. I will merely remark, that Mrs. Prodigit always consumed Sherry Wine while the deliberations were in progress; that they always ended in Maria Jane's being in wretched spirits on the sofa; and that Maria Jane's Mama always received me, when I

was recalled, with a look of desolate triumph that too plainly said, "Now, George Meek! You see my child, Maria Jane, a ruin, and I hope you are satisfied!"

I pass, generally, over the period that intervened between the day when Mrs. Prodgit entered her protest against male parties, and the ever-memorable midnight when I brought her to my unobtrusive home in a cab, with an extremely large box on the roof, and a bundle, a handbox, and a basket, between the driver's legs. I have no objection to Mrs. Prodgit, (aided and abetted by Mrs. Bigby, who I never can forget is the parent of Maria Jane), taking entire possession of my unassuming establishment. In the recesses of my own breast, the thought may linger that a man in possession cannot be so dreadful as a woman, and that woman Mrs. Prodgit; but, I ought to bear a good deal, and I hope I can, and do. Huffing and snubbing, prey upon my feelings; but, I can bear them without complaint. They may tell in the long run; I may be hustled about, from post to pillar, beyond my strength; nevertheless, I wish to avoid giving rise to words in the family.

The voice of Nature, however, cries aloud in behalf of Augustus George, my infant son. It is for him that I wish to utter a few plaintive household words. I am not at all angry; I am mild—but miserable.

I wish to know why, when my child, Augustus George, was expected in our circle, a provision of pins was made, as if the little stranger were a criminal who was to be put to the torture immediately on his arrival, instead of a holy babe? I wish to know why haste was made to stick those pins all over his innocent form, in every direction? I wish to be informed why light and air are excluded from Augustus George, like poisons? Why, I ask, is my unoffending infant so lodged into a basket-bedstead, with dimity and calico, with miniature sheets and blankets, that I can only hear him snuffle (and no wonder!) deep down under the pink hood of a little bathing-machine, and can never peruse even so much of his lineaments as his nose.

Was I expected to be the father of a French Roll, that the brushes of All Nations were laid in, to rasp Augustus George? Am I to be told that his sensitive skin was ever intended by Nature to have rashes brought out upon it, by the premature and incessant use of those formidable little instruments?

Is my son a Nutmeg, that he is to be grated on the stiff edges of sharp frills? Am I the parent of a Muslin boy, that his yielding surface is to be crimped and small-plaited? Or is my child composed of Paper or of Linen, that impressions of the finer getting-up art, practised by the laundress, are to be printed off, all over his soft arms and legs, as I constantly observe them? The starch enters his soul; who can wonder that he cries?

Was Augustus George intended to have limbs, or to be born a Tomco? I presume

that limbs were the intention, as they are the usual practice. Then, why are my poor child's limbs fettered and tied up? Am I to be told that there is any analogy between Augustus George Meek, and Jack Sheppard?

Analyse Castor Oil at any Institution of Chemistry that may be agreed upon, and inform me what resemblance, in taste, it bears to that natural provision which it is at once the pride and duty of Maria Jane, to administer to Augustus George! Yet, I charge Mrs. Prodgit (aided and abetted by Mrs. Bigby) with systematically forcing Castor Oil on my innocent son, from the first hour of his birth. When that medicine, in its efficient action, causes internal disturbance to Augustus George, I charge Mrs. Prodgit, (aided and abetted by Mrs. Bigby) with insanely and inconsistently administering opium to allay the storm she has raised! What is the meaning of this?

If the days of Egyptian Mummies are past, how dare Mrs. Prodgit require, for the use of my son, an amount of flannel and linen that would carpet my humble roof? Do I wonder that she requires it? No! This morning, within an hour, I beheld this agonising sight. I beheld my son—Augustus George—in Mrs. Prodgit's hands, and on Mrs. Prodgit's knee, being dressed. He was at the moment, comparatively speaking, in a state of nature; having nothing on, but an extremely short shirt, remarkably disproportionate to the length of his usual outer garments. Trailing from Mrs. Prodgit's lap, on the floor, was a long narrow roller or bandage—I should say, of several yards in extent. In this, I saw Mrs. Prodgit tightly roll the body of my unoffending infant, turning him over and over, now presenting his unconscious face upwards, now the back of his bald head, until the unnatural feat was accomplished, and the bandage secured by a pin, which I have every reason to believe entered the body of my only child. In this tourniquet, he passes the present phase of his existence. Can I know it, and smile!

I fear I have been betrayed into expressing myself warmly, but I feel deeply. Not for myself; for Augustus George. I dare not interfere. Will any one? Will any publication? Any doctor? Any parent? Any body? I do not complain that Mrs. Prodgit (aided and abetted by Mrs. Bigby) entirely alienates Maria Jane's affections from me, and interposes an impassable barrier between us. I do not complain of being made of no account. I do not want to be of any account. But, Augustus George is a production of Nature, (I cannot think otherwise) and I claim that he should be treated with some remote reference to Nature. In my opinion, Mrs. Prodgit is, from first to last, a convention and a superstition. Are all the faculty afraid of Mrs. Prodgit? If not, why don't they take her in hand and improve her!

P. S. Maria Jane's Mama boasts of her

own knowledge of the subject, and says she brought up seven children besides Maria Jane. But, how do I know that she might not have brought them up, much better? Maria Jane herself, is far from strong, and is subject to headaches, and nervous indigestion. Besides which, I learn from the statistical tables that one child in five, dies within the first year of its life; and one child in three, within the fifth. That don't look as if we could never improve in these particulars, I think!

P. P. S. Augustus George is in convulsions.

THE TYRANT OF MINNIGISSENGEN.

"Your Serene Highness must not forget that the eyes of Europe are upon us!" exclaimed the Baron Von Brobrecht, Prime Minister, Commander of the Forces, Privy Councillor, and Minister of Foreign Affairs of the principality of Hesse Minnigissen-gen.

"But, my dear Baron," returned the Prince, pointing out the passage, "my cousin's letter expressly states that his visit is to be without ceremony."

The Baron Von Brobrecht proudly drew himself up to his full height. It being a court-day he was in full dress; the "Reception"—which lasted exactly eight minutes—was just over. The display upon the Baron's small round person, would have led a stranger to believe, that, in him, were concentrated the highest honours of the greatest realm in Europe. His coat was stiff with embroidery; and, would have been, but for the dimming ravages of Time, gorgeous with gold; it was fastened at the waist with a rainbow of sashes, girdles, and lace; while a grotesque menagerie of honorific animals dangled at his breast. Having expanded his person to its utmost dimensions, to give the greater impressiveness to his arguments, he proceeded to say, "Your Highness will permit me to observe, that in this affair, your Highness's consequence and consideration, in the eyes of foreign courts, are in question. When I had the honour to be attached to the person of the late Prince, your father, we were, under similar circumstances, accustomed to spare no expense."

"Very true; and more than once you were obliged to pledge to the Jews the diamonds of the Princess, my late beloved mother."

"But, then," interrupted the First Minister, eagerly, "we enjoyed, amongst the neighbouring principalities, the reputation of being the most polished and elegant court in Germany. And," persisted the Baron, "to what did we owe your illustrious predecessor's marriage; which brought him a revenue of ten thousand florins? Why, to the magnificence of his court, when your august uncle visited it. Dazzled by his brilliant reception, the Grand Duke of Saxe Kissankumagen bestowed on us his sister in marriage."

At the word "marriage" the Prince sighed, and said, abstractedly, "Well, Brobrecht; receive my cousin, as you think best:" and

then sighed again, and was soon plunged into a reverie.

"Nine of the palace servants must have new liveries," said Brobrecht, commencing his arrangements. "Your Serene Highness will excuse my absence. I must hasten to the tailor!"

That announcement suddenly aroused the royal dreamer.

"To the tailor?" he repeated.

"To the tailor," said the functionary, ~~and~~ more.

"Then I will accompany you."

Popularity was thought at that time—to the great discomfort of that thorough absolutist, the Baron Von Brobrecht—to be a necessary adjunct to the throne of Hesse Minnigissen-gen. Revolution was stalking rapidly over Germany; and it was necessary that the Prince should be familiar with his people. This was not difficult; for his capital consisted of seventy-eight houses, and a population that did not exceed three hundred and two souls; ten per cent. of whom were babies in arms.

The tailor's house was, beyond contradiction, the prettiest dwelling in Minnigissen-bourgh; it was approached by a quadruple row of acacias, which were then in full bloom. Under these trees his Serene Highness expressed his intention of taking "a turn," while his Prime Minister entered the house to negotiate the transaction in liveries.

"The business I have come upon is this," said Brobrecht to Herr Hubert Oberschneider; "we require fifteen new state liveries complete by the end of the week."

"Impossible!" said the tailor, drily.

"Nevertheless," rejoined the Baron, haughtily, "we must have them. His Serene Highness's cousin, his Royal Highness the Prince of Saxe Kissankumagen is about to pay us a visit."

"I, too, am expecting a visitor," rejoined the tailor; "my nephew—and the two or three first days after his arrival are destined to merry-making.—No work will be done."

"So!" exclaimed Brobrecht, with severity.

"These are the fruits of that excessive familiarity with which his Highness indulges his subjects. It renders them impertinent."

Mr. Oberschneider lit his pipe. "Baron Brobrecht," he said, with the utmost composure, "you have the option of giving the Prince's custom to any other tailor you please; I do not seek it. I do not even demand payment of my little bill of four hundred and odd florins. Thank Heaven, I am not in need of them at present. But," continued the tailor, "why do you require fifteen suits, since there are only nine domestics at the palace; one of whom is, to my certain knowledge, bed-ridden?"

"Because," replied Brobrecht, "we are going, provisionally, to double the number of our retainers." As the tailor went on smoking his pipe, with an irreverent indifference which

resolute obstinate firmness, the Baron found a mollifying tone expedient. "Come, good Master Hubert," he coaxed, "do this for the Prince, and we will not quarrel about price." "I am actually expecting my nephew," was the Baron's next remark. "He is coming from abroad after having completed his studies at Göttingen. He is a young man who, to judge by the money he has cost me, must be a wonderful genius. I cannot think of your fifteen suits; all that I can do is to lend his Highness my people's clothes. My nephew, I dare say, will not care about being received in grand liveries."

The Baron groaned inwardly, "I must," he thought, "lower our dignity before this miserable tailor's money-bags!" The Minister of State then tapped his snuff-box, and cogitated profoundly. At length he caught an idea. "You will exchange the collars and facings to our colour?" he asked.

"Willingly," and Master Hubert held out his hand to the Baron, for the purpose of clinching the bargain. The latter, though deeply shocked at this familiarity, thought it better, under present circumstances, to swallow his resentment; and, extending a gentle violence over his pride, he mildly shook the outstretched digits of the independent tailor.

"Ah!" thought Rrobrecht, as he proceeded to rejoin the Prince. "If I could only persuade his Highness to impose some sort of income, or property-tax, we should soon pull down the pride of these monied gentlemen."

As he advanced under the acacias, Rrobrecht discovered that the Prince was not alone. He was too discreet a courtier to interrupt a *tête-à-tête* , and bent his steps where numerous and pressing engagements required his presence. The sex and beauty of the Prince's companion explained, perhaps, the eagerness with which he accompanied his Minister to the spot. He was long in quitting it. For more than an hour he and Albertina, the tailor's daughter, paced the avenue.

Early on the morning of the day appointed for their visitor's arrival, the Baron Von Rrobrecht, magnificently attired, and glittering in the effulgence of all his orders, presented for the Prince's signature a closely-written parchment: it was the royal consent to the sale of a farm.

"The means are violent, I must admit," said Rrobrecht; "but, then, our peculiar position demands the sacrifice; we shall thus be enabled to receive your august cousin with proper pomp and splendour."

The Prince signed without reading.

About eleven o'clock in the forenoon, Rrobrecht again made his appearance, to announce that some peasants had seen a horseman of distinguished mien, but evidently travelling incognito, enter the inn at Zweibrücken, on the frontier—about a quarter of a league distant—having previously inquired his way to Minnigsmenbourgh.

The Prince mounted his charger, and set

off to meet the visitor, accompanied by Rrobrecht, the soldiery, and the band. To tell the truth, his Serene Highness was delighted at getting away from home for a short time, under whatever pretext it might be; for during the last two or three days all had been at sixes and sevens in the palace. His own valet had been metamorphosed by the Baron into a sort of grand chamberlain. A horrible noise rendered the palace unbearable. All the old state-rooms had been furnished up with the furniture which but scantily garnished the private apartments.

As they approached the frontier, they beheld a dense cloud of dust at a short distance. Rrobrecht drew up his forces in open order, and the band began to tune their instruments. The Prince was an amateur, and out of the seventy men of which his army consisted, forty-five were musicians. In a few minutes the cloud of dust increased in volume and proximity. Rrobrecht gave the signal, and the band struck up Spontini's *marche triumpnale*.

Then there issued from the cloud, a horse covered with foam. A figure was seated on it, clad precisely in the way, in which a peasant would suppose noblemen go about. The costume was ultra-fashionable and gaudy; consisting partly of the dress of the German students, and partly of that of the young Parisian exquisites of the day.

He halted. Rrobrecht, who had dismounted, walked solemnly up to the side of the horse, and commenced reading an address of welcome. The soldiery presented arms.

The new comer stood erect in his stirrups with surprise. The Prince laughed. Rrobrecht had not got further in his recitation than—"Penetrated with a sense of delight at the honour conferred by your Royal Highness's presence, we cordially—" when the horseman, with a look of alarm, expressed a hope to the Prince that the old gentleman was not a "dangerous" lunatic; for a lunatic of some sort he assuredly thought him.

"This is all a mistake," said the Prince.

"I should think it was," asserted the stranger. "Don't you know who I am, old fellow?"

These expressions assured the Baron that their utterer was not his Royal Highness.

"I am Heinrich, nephew to Master Hubert (Oberschneider)," continued the free-and-easy student. He then cantered off, leaving the soldiery at "present arms;" the band playing the march of triumph, and the Prince almost reeling with laughter.

The Lord High Chamberlain and Commander-in-Chief pocketed his address in disgust, and set the army in motion towards home. On arriving at the palace, a letter was put into the Prince's hand by the postman (who had passed them on the road) announcing that his cousin had been obliged to change his route.

Everything was in readiness for the *fête* which was intended to dazzle and surround his

Royal Highness the young Prince of Saxe-Kimankumigen; and the Premier was in despair! The Prince, on the contrary, took no pains to conceal his delight. "Baron," he said, "your talent for arranging and managing a *fête* shall not be thrown away. The festival shall still be held. You have my permission to invite every soul in the city." His Serene Highness then sat down, and wrote an autograph letter to Mr. Oberschneider, inviting him, his daughter, and nephew, to dinner. At this democratic proceeding Rrobrecht stood aghast. He trembled for the security of the throne of Hesse Minnigsen. But the Prince was peremptory, and the state servant was obliged to obey.

The invitation set every member of the establishment near the acacias in an exceedingly flutter, except Heinrich. That young gentleman, having imbibed the politics of the least respectable of the Parisian estaminets, told his uncle that he would never sit at the table of a "tyrant."

Oberschneider, who was tying on his whitest neckcloth at the glass, made a grimace expressive of the most condign ridicule; to which his nephew retorted that he—Hubert Oberschneider, tailor—was a worshipper of power, and a sycophant! The uncle—an easy-going, but shrewd man, who regularly read the papers, and knew what was going on in the world—said to his daughter, while escorting her to the palace, "The truth, is, my dear, your cousin has got hold of those egregious notions which are so flattering to people who prefer amusement or idleness to work. Property is robbery; restraint, tyranny; government, brigandage."

"How very odd!" said Albertina; who knew nothing of politics, and was thinking of the Prince.

The tailor went on, warming as his subject expanded. "Confounding such silly theories with the glorious acts of the true patriots, who have burst the bonds of royal chicanery in France, and of tyranny in some portions of this empire; Heinrich has, I fear, brought notions home to my shop which will unsettle the heads of all my journeymen."

"How very naughty of him!" said Albertina; because she felt it was necessary she must say something just then.

When they arrived at the palace, the Prince received them in the throne-room, with marked distinction. The Baron Rrobrecht grinned (like one of the heraldic hyenas on his breast) and bore it, with wonderful fortitude.

The dinner went off well; because the rain, which fell in torrents, could not spoil that. But, although the fire-works proved utterly un-inferable, the thunder-storm drowned the music, and nobody could dance on the lawn; yet Albertina was there, and the Prince was delighted. She wore his favourite colours—white with blue ribbons.

"Rrobrecht," said he that night after his

guests had departed, "your *fête* was charming and amused me immensely. You may sell another farm to-morrow."

"Something must be done," returned the Prime Minister, who, to his other multifarious places, added that of Chancellor of the Exchequer; "our coffers are exhausted, and two years' revenues have been already anticipated. Only one resource remains—"

"Which is?"—"interrogated the Prince, as he folded up a piece of blue ribbon and put it inside his vest.

"Marriage!" answered the principal privy councillor solemnly: "you have a crowd of wealthy and noble cousins, out of which you might choose a wife—a rich wife."

The Prince yawned. He was tired. Would Rrobrecht ring for his valet?

Many days had not elapsed since the grand *fête* at the palace, in honour of the prince who did not arrive, before old Hubert's fears about his nephew proved but too true. He had originally conceived the idea of getting up a match between Heinrich and Albertina; but, in addition to the young student's coarse and turbulent manners—which were in the highest degree displeasing to the girl—he himself made no efforts to overcome this visible antipathy. He passed his time in the public-houses, uttering a variety of common-places to a pack of young fellows, as idle and ill-disposed as himself. He formed them into a club, and explained to them his political creed. He spoke a great deal about Brutus and a "bloated oligarchy;" by which he meant the first minister, who united in his own podgy little person all the aristocratic and oligarchical power of the state. He denounced the Prince merely as an incarnation of royalty, against which he made war in the abstract; but—because, perhaps, he found the roll of the baron's name tell with effect in his harangues, (for he had learned at Paris to revel in the canine letter, and called the baron "R-r-r-robrecht!") to him, his enmity was relentlessly personal. Every misfortune that happened to anybody, he attributed to the Government—otherwise to the bloated oligarchy—oth "wise to R-r-r-robrecht. The storm on the night of the *fête* he traced to the vengeance of Heaven for the atrocious vices, corruptions, and oppressions of the Court. When Hans Illicup, the cobbler, reduced himself to beggary by beer, and nobody would trust him with their boots, Heinrich held him up as a martyr to political oppression, and demanded an organisation of labour. When Madame Maggschifter's baby took the small-pox, Heinrich had no manner of doubt that the infant had been infected by a secret emissary of Government. The club spread the sentiments which their leader originated, and obtained the sympathies of all the idlers in Minnigsenborough.

Yet, for a people ground down by all manner of social and political oppressions, the more respectable citizens did not seem an

happy or discontented community. Each lived in the bosom of his family. In the evening, under the acacias or lime-trees that overshadowed these miserable people's porches, might be heard the cheerful song with its accompaniment of flute or harpsichord.

It happened about this time that a violent hail-storm did some damage to the crops. This was an opportunity not to be lost; accordingly, Heinrich and his acolytes spread themselves over the principality (this was soon done, and at a cost for travelling expenses quite nominal), bewailing the loss of the husbandmen. They insinuated—without, however, daring openly to avow it—that one of the rights of the agricultural interest was that of not having their fields cut up by the hail.

This doctrine soon became popular; for, decidedly, the most disagreeable of all human misfortunes are those which we are unable to lay at our neighbour's door. We would all of us rather be stoned by a man upon whom we can be revenged; than receive a couple of aerolites, for the fall of which no one is responsible. Urged on, therefore, by the Club, the farmers profited by the hailstorm to neglect paying their rents, and to utter loud complaints and woeful lamentations.

The consequence of such defalcations was, that the State Treasury became more and more impoverished; and Rrobrecht was obliged to discharge more servants, and sell two of the three horses which his royal master still possessed. Under these disagreeable circumstances, however, the Prince had his consolations. He practised new symphonies with his musicians; he passed his time in angling, and in botanising expeditions into the woods, close to the dwelling of Master Hubert Oberschneider; and where, by some extraordinary "concentration of circumstances, he had very frequently the pleasure of meeting Albertina.

One day the student Heinrich, mounted upon a table covered with pots of beer and drinking-horns, spoke thus to his followers, at what he was pleased to term a Monster Meeting. Thirty-seven were actually present.

"It is time, my friends, that a corrupt and bloated oligarchy should cease from fattening themselves upon our substance! It is cowardice that produces the insolence of kings! Let us rend asunder the chains that have too long held captive our beautiful fatherland. Let us break the yoke of tyranny! Let us proceed at once to the palace, where the tyrant gives himself up to impure delights, surrounded by his ferocious satellites: let us reclaim our rights and liberties, or perish in the attempt!"

By the time the peroration was finished, the crowd had increased considerably.

When these affairs, big with the fate of Minnie's neighbourhood, were passing at the Bierhaus, the Prince was sauntering in his garden amusing himself with plucking the dead

leaves from four favourite carnations, and angling for rhymes for a sonnet to Albertina's blue eyes. "Desires" and "fears" were just arranging themselves prettily at the ends of a couplet, when the conspirators—to the number of eighty-three—burning with beer and patriotism, arrived at the palace gates.

The ferocious satellites, of whom Heinrich had spoken, were at that moment represented by one old sentry, who was then busily engaged in practising on the flute his part in the new symphony of Beethoven's, which the band was to perform on the following day. This warrior permitted the revolvers to pass, on their stating that they desired to speak to the Prince. But, as a preliminary precaution, he shouldered his forelock, "dressed himself" up in line with his sentry-box; and asked the invaders to be so good as to keep on the gravel-walks, and not to pluck the flowers.

The Prince, though a little surprised at this great gathering, turned his calm and indifferent countenance carelessly on the troop; and, when he demanded what they wanted with him; no one had sufficient nerve to speak. They replied only by confused and almost unintelligible cries; amongst which, however, might be detected a timid stammering, which sounded like—"Down with the tyrant!"

The Prince smiled, and in a voice which was clearly audible above the whispered clamour of the disaffected, said—

"Let some one among you speak for the whole; for if you all speak in turns it will take up too much time; and, if altogether, the noise will be deafening."

At these words there was a dead silence. All recoiled a few paces; leaving by common assent to the student Heinrich, the right of explaining those grievances, of which none were exactly cognisant.

"We stand here," said Heinrich, "in the name of —"

"Will you take a seat?" interrupted the Prince, pointing to a rustic chair.

"We come," continued the orator, not heeding the polite invitation, "to protest against abuses too long suffered. We come in the name of the People!"

"My good friend," said the Prince. "My people are not so numerous as to have need of delegates; they might very well speak for themselves. Let them assemble to-morrow in the great court of the palace, and, if they wish it, we will have a chat together."

"The People have no time to wait!" exclaimed the orator fiercely.

"Believe me, Monsieur Heinrich, my calling of Prince is not such a delightful one that I should desire to play it every day. I shall be a prince to-morrow; to-day I am but a private individual, very anxious respecting the fate of a beautiful carnation of which I have just set a cutting. As a private individual, therefore, I desire to be master in my own house. So, my friends, be advised by

me, and go home; and, above all things, do not tread upon my carnations."

Heinrich turned towards his friends. "Are you content," said he, "with the evasive, the ferocious irony, which has dictated the tyrant's words?"

"My worthy friend, Heinrich," said the Prince quietly, "you really *must* be so obliging as to leave my garden. It would give me great pain to use force, even with my cane."

"I see," said Heinrich, "that the end of the career which I have embraced, will bring me but a martyr's crown; but I am ready to shed my blood for the People. Take my head!"

"Your head? What should I do with your head? I am sure I should find it as utterly useless as you do," responded the Prince. "I shall expect my people to-morrow. I have some excellent beer; and we will talk over our affairs. In case of rain, there shall be an awning."

When the delegates had departed, the Prince made a bouquet of his finest carnations for Albertina, and wrote to remind her that she had promised to waltz with him on the ensuing evening.

At daybreak, on the following morning, the band assembled at the palace, for the final rehearsal of Beethoven's symphony, which was to be performed for the first time in public, that evening.

"What on earth can my people want with me?" thought Richard; "and what unfortunate accident can have recalled to their minds that I am a prince? However," he exclaimed to a servant, "rinse out some glasses for my People! Happy the sovereign who can thus hob-nob with his subjects!"

At the appointed hour, an assemblage of about one hundred persons made their appearance at the palace. After them came a second hundred to see what the first were about; and finally, the whole of the remaining inhabitants of the capital, who were capable of locomotion, brought up the rear, anxious to ascertain the cause of the unaccustomed gathering.

"My friends," said his Serene Highness, "drink your beer while it is fresh."

The people did as they were told.

When the barrels had to be tilted, the Prince asked his people what they wanted? "Have I," he said, "ever interfered with your pleasures or your affairs? Do I even know what you do, or how you pass your time?"

"Down with the tyrants!" said Heinrich.

"Down with the tyrants!" shouted the Club in cuckoo chorus.

"Why is the Prince surrounded with guards?" demanded Heinrich.

"I am surrounded by my musicians," replied the Prince; "the rest of the soldiers are gone out to take a walk.—Pray be silent for one moment and listen to me.—Have you anything to complain of? Are you unhappy?"

"I am not rich; but he among you, whoever he be, who has wished to partake of my soup or my beer, has he not ever been welcome?"

"We desire," said Heinrich, the "liberty of the press."

"Yes, we desire the liberty of the press," repeated the Club.

"Well," replied the Prince, "buy a press if you want one. You have my full liberty to use it if you know how. But, alas, I am afraid that there are a great many of you who cannot read."

Something was then said about "dying for liberty and fatherland," but, during the parley, Rrobrecht had succeeded in collecting the scattered forces, and now disposed them round the court-yard. "I beg to acquaint your Highness," said he pompously, "that our troops hem in the rebels on all sides, and that they are now in our power."

"I am sorry to hear it," said Richard; "for what am I to do with rebels? I have no place to put them in. There is but one prison in Mummigsenborough, and that I converted long ago into an orangery. Dismiss the soldiers!"

"But if I might suggest to your Highness—your personal safety—"

"Pray don't alarm yourself about trifles, Rrobrecht, and do as I bid you."

"Treachery!" shouted Heinrich, as the soldiers dispersed.

"Treachery!" echoed the Club.

"The palace of the tyrant is about to be reddened with the blood of patriots!" screamed Heinrich hoarsely.

But no denunciative enthusiasm was to be infused into the other patriots; too much of whose attentions were rivetted on the Prince's beer. When they found the casks producing nothing but lees, they sauntered peaceably home.

After the signal failure of this "demonstration," all went on well for some time. But the liberty of the "Press" was taken advantage of—only the pen supplied its place. Heinrich started a newspaper in manuscript; although never was a place so destitute of news as Mummigsenborough; however, even for the few occurrences, there were "leaders" ready-made. "Hr-r-r-robrecht," above all, was never spared; and the latter came one day to the Prince to request his permission to start a newspaper also.

"They have desired the liberty of the press," said his Highness; "you have it, and may use it as you think proper."

Then began the great paper war between Rrobrecht and Heinrich. The journals appeared every morning. Heinrich expressed in every number his conviction that all princes were criminals; Rrobrecht inculcated that a sovereign's most trivial action was angelic.

As there was scarcely any news stirring in the city from month's end to month's end, the Baron's journal was a sort of court

Heinrich. One day he announced "that His Serene Highness was in excellent health and spirits; no addition was made to the illustrious dinner circle; and His Serene Highness ate French beans." On the next Heinrich's paper came out with, "How long will an enslaved people suffer tyranny to eat French beans!" In the succeeding number of Rrobrecht's paper it was replied, "that the Prince's fondness for French beans showed his unflinching desire to encourage agriculture."

"It is," retorted Heinrich, in Number three, "a bitter mockery of the people, who cannot afford such expensive luxuries."

One evening the Prince was walking under the lime-trees; Albertina happened (accidentally, of course) to be passing that way. She showed the rival papers to the Prince. He laughed heartily at Heinrich's denunciations, and commanded Rrobrecht to discontinue his "organ" altogether.

In the meanwhile Prince Richard's affairs went from bad to worse, until they brought him to the condition of a gentleman in very embarrassed circumstances. He had hardly a florin to bless himself with. Retrenchment was imperative. He therefore assembled his army and addressed his brave soldiery in the following terms:—

"My friends, I have no longer the means of paying you your wages. I have, accordingly, disposed of your services to a great power, who will lead you into Africa. You will have double pay."

The Commissariat arrangements were neither extensive nor intricate; and the entire force was soon in heavy marching order (band included) with drums beating and colours flying. The departing army made its first halt, on its way to Africa, at Zwéibrücken, a village celebrated for the excellence of its malt liquor; as Heinrich was always ready to testify.

Hené of Anjou has said, that a king without music is a crowned ass; and the Prince, after the departure of his brave band, became the most unhappy of potentates. Albertina alone consoled him; but in a very short time she also took her departure, accompanied by a female attendant. The alleged reason for the journey was a visit to an old relation.

The loss of his farms, of his fortune, of his army, and even of his band, did not affect the Prince, it was observed, so much as this; and the Prince placed in Rrobrecht's hands a letter addressed to his uncle, without, however, desiring him to take it to its destination without loss of time. The letter ran as follows:—

"My dear Uncle,

"I neither can, nor do I any longer desire to remain a Prince.

"When you receive the letter I shall have taken my departure from my dominions. I abandon to you all my rights; requiring only at your hands, as a compensation for the same, a yearly pension of one thousand five hundred florins. I will let you know when you are to

forward me my pension. Keep Rrobrecht near your person, he is a good and loyal servant.

"I embrace you affectionately,

"AUGUSTUS-RICHARD-PRINCE OF HESSE-ALBERTINA."
ALPHONSE HARRIS-ALBERT.

And the following morning, as soon as the rising sun had tinged with its first rosy beams the muslin curtains of his bed-room windows—silk curtains were used only in the throne-room—his Serene Highness sprang from his couch, dressed himself hastily, and proceeded to pack into a small valise his four most precious articles. To wit:—

A small canvas bag containing thirty crowns.

A blue sash which had formerly encircled the taper waist of the pretty Albertina.

Albertina's letters.

His favourite flute.

This done, he glided down stairs, placed the valise upon his horse, mounted, and took his departure from Minnigisambourgh, never to return.

When he had reached the outskirts of the town, he paused and looked round, and his eyes rested upon the acacias which overshadowed the tailor's dwelling. After a long gaze, he sighed and went his way.

His horse paddled on steadily; till, towards evening, he arrived at a little forest retreat, surrounded by acacias, and fronted by a nicely-mown grass-plot, dotted with several flower-beds, each containing a variety of plants in full bloom. He thought of his own carnations, and wished they could be transplanted.

He entered the cottage, and an aged domestic received him politely. He had scarcely sat down near the window, when he perceived, at a turning of the gravel walk, two ladies approaching. One of them was old, of a gentle and prepossessing countenance; the other was Albertina.

In a few words the ex-Prince put the ladies in possession of all that had occurred. "Albertina," said the Prince, "how sweet would be a life spent here with you! I cannot now demand your hand after having foregone the possession of it when I was a prince. Behold to day my entire fortune!—I have thirty ducats in my valise, and I am assured a pension of fifteen hundred florins a-year."

"My Prince," said the aunt, "you have no cause for despair. Albertina loves you. Remain here. She shall come to see me every month; and when I shall have been assured that your resolution of marrying her is not the result of a momentary enthusiasm; when I am convinced that you do not regret your palace and power; then we will arrange all for the best."

Richard could make no other reply than that of kissing the wrinkled hand of the kind old lady.

When she presented to him, a month later, the little hand of Albertina, he exclaimed, as he pressed it to his lips, "Adieu, adieu, Hesse Minnigisambourgh; adieu the sad

past; and yet blessings be upon it, if it has been the price of the future!" The future was happiness both to him and to Albertina.

As plain unostentatious man and wife, they henceforth lived in the cottage part of the year, and in the finest seasons took pleasant tours to different parts of Europe.

The conclusion of the history of the great political movement which caused the ultimate downfall of the amiable "tyrant" of Hesse Minnigissengen is soon told. By twelve o'clock on the day upon which the Prince fled there were eight princes of Hesse Minnigissengen; that evening there were exactly thirty-two. On the following morning, the Prince's uncle—who had gladly accepted his nephew's offer—sent over to Minnigissengembourg an armed force, consisting of a corporal and ten men; which, in the brief space of two hours, effectually, and for ever, nipped the budding germs of the great Minnigissengembourg revolt.*

THE BUILDER'S HOUSE, AND THE BRICKLAYER'S GARDEN.

BY AN EYE-WITNESS AND SUFFERER.

I LIVE in a damp house. Nothing can cure it. The form, or outline, of my house is in the usual bad modern taste, or rather the usual no-taste of the great mass of trading builders of the day; and at the back there is a bit of garden, enclosed by three walls, and "laid out" for me in the usual no-taste of hard straight lines. My second floor back window commands a view of a long row of new houses, which will inevitably be as damp as my own. Each has its garden—all exactly alike, and as hard-favoured and graceless as mine. This is no sort of consolation to me. On the contrary, by reason of my sympathy with those who will become their tenants, they multiply my own grief and indignation. As I have watched the rise and progress of the whole row, day by day, from the very first brick (every morning during the intervals of shaving), I am enabled to record the same, in the hope that it may be of some little public service.

I should premise, that by the term of "builder," I do not so much refer to the regularly trained master of the craft, who often works under an architect, and always upon sound regular principles (though he is frequently guilty, like the rest), as to that very large class, who, having risen by their industry and skill as master bricklayers, ought to have remained in that position, and not to have started forward as the builders of heaps of houses and innumerable streets, filling our extensive suburbs with ill-drained, incommensurable, damp, and shapeless abodes. "Living in a free country," of course this cannot be prevented; the only way, therefore,

to bring about a salutary reform in these matters, is to make the public more alive to the evil, and more wary than people usually are—in taking a house. It is more especially needful to be cautious at this time, when the expectation of a million or two of additional visitors in London, from the provinces no less than from the continent of Europe (Mr. Thomas Miller, of Edinburgh, has put forth a calculation that there will be seven millions of visitors), is causing new blocks of houses, and streets upon streets, to be "run up" with a rapidity which may very well accord with the new building principles of iron and glass, but is very unsuitable to the old principles of bricks and mortar.

But, to the point. I live in a damp house—ugly in shape, with a shapeless garden—and I have taken it for a lease of seven years. A friend of mine recently took a house in the country on a lease. It was in the summer that he took it, as I did mine, and it was then dry enough; but in winter was so damp that he was obliged to shut it up, and when he went to look at it in the spring, mosses and fungus had grown from the ceilings on the ground-floor, and a colony of toadstools had risen up in the dining-room corners. I am more fortunate than that. By dint of fires in almost every room, I can live in my house all through the winter; but there is a thick mist and bloom upon the painted walls and wainscots—the walls of all the rooms are so damp that prints mildew upon them, and the paper bulges and wants to be peeled off; while the painted stair-case walls are covered over with caricatures and other finger-drawings made by my children in the moisture, as high as they can reach, and these are duly obliterated by the rills and streams that, every now and then, pour down from above. Paper will not hold at all on the walls of the ground-floor; there is a mist or a fog in every room, except the kitchen, and wherever there is a mat or a bit of carpet laid down upon the bricks, it becomes perfectly mouldy in the course of a week, and covered over with red worms, and slugs, or other creatures, who get through the crevices beneath, and cling to it for warmth. Such is the house, which I took one fine summer's day on a seven years' lease; two only having at present expired.

My garden is enclosed by five walls, of unequal length and height, and, instead of the beds and walks, being "laid out," with some view to this necessary outline, and to hide it, or make the best of it, the very reverse of this is done;—the eye being either led up to each wall by the bed or walk, repeating the same angle, or else a bed is made having no relation to anything, and a shapeless patch or heavy lump in itself. Then, in digging in any of these beds, the most unlooked-for impediments have been encountered. Broken bricks, of all sizes, and fragments of stone innumerable; bits of wood (lying cross-ways beneath the

* The outline of this tale is taken from an amusing French novellet.

heads of the spade, of course), and masses of gravel, road drift, horse-hair, and rusty straw. Three old shoes, with the remains of nailed soles; a piece of rotten waistcoat, with rusty metal buttons; some old rope, and a broom-handle; broken crockery, such as bits of tea-cups and basins, and brown delf-ware; a rusty knife or two; an old hat (a very difficult thing, indeed, for a spade to deal with, at twelve or thirteen inches below the surface); a number of clothes-pegs; half a prop; a battered pewter-pot; and here and there a complete bed, or mine, of broken laths, shavings, and miscellaneous rubbish,—buried at nearly the depth of a spade, or a spade and a half. As for altering the shape and direction of the walks, let the reader think of the expense, and trouble, and time of that—all the gravel to be raised with a pickaxe, and carried elsewhere, and fresh mould, for two feet depth, to be brought from a nursery. In the country, these matters are not difficult to manage, with the help of a single gardener; but, in a small suburb-garden, such "improvements" are seldom to be ventured.

I have said that my back second-floor window commanded a view of a very long row of new houses and gardens, which I had seen manufactured from the very earliest stage. A brief account of the principal processes will explain all that has been previously related, and a great deal more; the truth of which tens of thousands of householders will recognise, but too readily. I shall begin at the beginning.

My dressing-room window overlooks an irregular piece of fallow land, which extends from the furthest end of my garden wall over an extent of some five hundred yards in length, by one hundred in breadth. This land is covered with a sort of rank grass, which gives it the look of a neglected field, like the "sluggard's garden;" but the soil of this vegetation is only a few inches deep, the whole piece of land being of yellow clay. Except in the hottest season of the year, it is always in a damp condition, and whenever there has been rain the whole surface reeks, and a fog rises all over it.

On this "very desirable plot of ground for a building lease," Mr. Roomy, the builder, of Lambago Place—a respectable, business-like man—determines to build a row of houses, each with a good strip of garden, and makes contracts with his bricklayer and carpenter that the entire row, extending the full length of the desirable plot of land, shall be completed, and made, what is considered by builders, "habitable," on or before the beginning of next March. It is now November. They must be all ready to receive visitors of the Great Exposition—so there's no time to be lost.

The ground is forthwith measured off, and levelled, and cart-loads of bricks, and scaffolding poles, and planks arrive. That damp clay land will need a pretty good foundation

for the houses, of broken brick-rubbish, and gravel. We look in vain for the depositing and arrangement of anything of this kind. Can it be?—is it possible they can intend?—yes—and my shaving-water has got cold from my continually stopping to look down upon the bricklayers' operations—it is a fact, that, after merely cutting off the grass for turf, they have begun to build upon the bare clay! The first house has actually been placed upon the bare damp soil, without even the pretence of any intermediate foundation whatever.

The construction of the house-drains, I perceive, is upon the old bad plan. Instead of glazed earthenware pipes of some four inches diameter in the bore, they are laying down the old fashioned brick-built drains, of twelve or fourteen inches square, and with the branch drains intersecting them at right angles, instead of long acute angles in the direction of the outward flow. Moreover the drains are constructed on a level, or nearly so, and with no calculation for the proper degree of fall, or graduated descent, so that on any occasion of a temporary stoppage, owing to improper substances having got into the drain, or a flooding from heavy rains, the whole of the sewage having no downward pressure from its own weight, will inevitably flow back to the house, and deluge the cellars and ground floors most odoriferously.

I believe they intend to make the out-fall of the drains, according to the new regulations, and drain down into the main sewers. But I have seen several consultations in certain curious spots, where a cesspool would have been preferred, but for the salutary fear of a visit from the Metropolitan Commissioners of Sewers, whose surveyors are worthy of far better masters. The builder, however, does the "next best thing;" he builds a brick dust-hole close under the kitchen window, and in a line beneath the dining-room window.

Of the materials of which the house is built, as of its slight and rapid structure, I shall not pause to speak, nor of its inward inconveniences in the arrangement of the rooms, and general clumsiness, and want of forethought and contrivance; because these things so much depend on circumstances, that they are almost beyond the pale of influence except inasmuch as one can put people on their guard to look well into all such matters before buying or tenanting any house. It is a question for individuals. Let their eyes be widely opened to it. But the external form of a house, row, or street, is a public question of taste. The character of the nation in respect of its buildings, is, more or less implicated in it, as every "Prospect Place," and "Paradise Row," attests, not to mention the average run of all suburban "Terraces," and "Streets."

The form of the house that has grown up before my eyes is that of a box, or chest set upright. It has four walls, or sides, with a

top and bottom. It is nearly a square, and the only thing that interrupts this cube-like outline is a row of chimney-pots, which they are now placing upon it. This is no ordinary outtage or lodge; it is what is called a good, substantial, brick-built, eight-roomed house.

As to any such thing as "design," the builder has evidently no more thought of it than if architecture had never existed in the world, and men had always made houses simply to "cover them." It is as though we were living in a primitive state of nature, in respect to house building, while possessing all the materials of art and civilisation.

A second house is rapidly rising, like the first; a third is commenced; the ground for a fourth and fifth is being levelled. Each one is exactly like the other; placed, without further foundation, upon the bare damp clay. Square brick box after box, they rise, and Mr. Roomy rubs his hands as he speculates on the rent he shall demand, and their speedy occupancy by a tenant desiring a nice airy residence on the outskirts of London.

But now for the "garden." The ground at the back of the house was levelled and enclosed by walls, in the shape of the house, as nearly as possible. It would have been a square by choice, but circumstances have caused it to be somewhat too long. In short, it is of that well-known outline, called a "strip," being, of all others, the most difficult to deal with for the picturesque or graceful laying out of a garden, even when the dimensions are of some extent; but when small, needing the greatest exercise of ingenuity to prevent ugliness and awkwardness, or the hardest lines that can offend the eye. But what is the gardener about? He has got a bricklayer's line, and is drawing it along parallel with the wall, for the formation of a long border, thus repeating the hard outline; and instead of carrying the eye away from it, or endeavouring to conceal it, he is literally forcing it into the most rivetting attention. Gardener did I call him?—no, it is one of the bricklayers, assisted by a hodsman. Several cart-loads of mould are now brought into the garden, and shot down, and to work they go in "laying-out."

Each strip of ground is separated from that belonging to the next house by a long wall. The wall of the first one is only half finished, and a bricklayer is at work upon the other side, while the gardening bricklayer on this side is laying down the mould for a border. Numerous pieces of broken and chopped-off brick, with corresponding dabs of mortar, consequently fall over and are mixed up with the border mould, which the bricklayer on this side carefully buries, and then proceeds to make the border very fine on the surface. A path is next measured off by the bricklayer's line, parallel with the border, thus again repeating the sharp outline of the wall; and this path is covered with brick-rubbish and stones, and well trodden and beaten down, so that it

would be no small trouble to change the form and direction of the path, if any tenant had the taste and moral courage to attempt it. By way of making this laying out perfect of its kind, a long central bed is now marked off, and covered with mould, parallel with the previous lines, and being an exact counterpart of the outline of the entire strip, only some sizes less.

The gardening bricklayer manages his spade very assiduously, and neatly too, considering it is not his proper tool,—in fact, from his general handiness, I conjecture him to be an Irishman; and also, I must add, from his want of forethought: for this morning I perceive he is about to finish the top row of the wall bricks, to do which he stands on this side, thus trampling down all his fine surface of border-mould as he goes, besides strewing it all over with a second fall of fragments of brick and mortar. By night he has done. Next morning he is there again; not with his trowel, but his spade, carefully burying all the bits of brick and rubbish, and once more working the surface of the mould very fine to look at.

Morning after morning have I watched these various operations during three months, and now, finally, I behold, a long row of new square brick-boxes, set upon damp clay—drained on an old and very bad system, and having in other respects, the most inconvenient arrangement—a succession of dust-holes close under the kitchen-windows, and in a line beneath the back dining-room window—and I am presented with a succession of some eighteen straight walls, enclosing straight strips of garden, each lined out by the bricklayer, in parallel lines, as a bricklayer naturally would do, and each one being the exact counterpart of the other. The whole set are made neat and sightly for letting, by the use of the broom to sweep out all manner of rubbish from the houses,—and the spade to bury it carefully in the garden beds and borders.

Some poor woman, a bankrupt laundress, a servant-of-all-work out of place, or a charwoman with her family, is put in to "mind the house," and open the door to those who are looking out for a house. The rubbish and refuse she and her family will accumulate during her stay, perhaps of one month, perhaps of six, must not be thrown into the dust-hole, for that has to be kept tidy for letting; she therefore gets a man, or her husband when he comes home in the evening, to bury it "somewhere" in the garden.

The extreme ends of these garden walls are met by the ends of other garden walls on the opposite side. I turn my gaze on them very often while sitting at my dressing-table, but gain little consolation from what I see. On this side, the outline of the garden walls is nearly the same as those I have been describing, and the laying out displays no better taste. Several of these strips are laid out in three round puddings of beds, one after

the other, with the largest round pudding in the middle. Others have great beds made like acres of diamonds; three of them have made hard-favoured sets of little beds, like furrows cut across the whole width of the garden, with narrow walks between, like ruled copy books; and two of them have fairly given up the matter, and allowed the whole strip to lie like the fallow-field of rank grass, from which they were originally separated by the builder's walls.

To look at the great mass of our houses and streets—suburban houses and streets in especial—a foreigner would suppose we had no architects among us. "What!" cries Mr. John Bull, "do you mean to compare any foreign houses with English houses for convenience, comfort, and snugness?" Certainly not, Mr. Bull, with regard to the inside domestic arrangements; but those are not the builder's department—they are the work of the carpenter, the cabinet-maker, the upholsterer, and the ironmonger. I am speaking of the external form and appearance of our modern houses, and I affirm that it would never occur to a foreigner that such persons as architects were ever consulted, except on particular occasions, and that, in fact, nearly all our houses are the product of the brains of wealthy, enterprising, master-bricklayers, or builders who, like my friend Mr. Roomy, have risen into "builders" from that questionable foundation. For this reason, a house with us is in shape nothing more than a square box, and a street is a succession of boxes. There is no more external "design" in them than goes to the construction of a box, or a rabbit-hutch—a child's first drawing of "a house" on a slate; and a street is often no better to look at than a set of menageric cages—take away the bars, and place windows in the front, and add a door, with steps, and some chimneys, and there you have our modern houses. Sometimes an attempt is made to get over the heavy squareness by an ornamental door-way, a flight of stone steps, or an enormous entrance-porch, or by sticking a small bit of a wing to one side, like a house and its little one. But there's the "box" amidst all the awkward half-conscious attempts to hide it. Frequently, a variation is yet more obviously sought by a screen or parapet at the top; and yet more frequently by a rising roof, in imitation of a haystack in single houses, and of a barn in a small row of houses. But, after all, there is the builder's box, standing with sturdy utilitarianism in the middle of all these vain attempts, as one should say doggedly (not to add stupidly), "Well—and a good strong box too."

A CHRISTIAN PAYNIM.

A LEGEND.

ROUND Malaga's fair city
Is drawn the pride of Spain;
And morn and night, they hotly fight,
Its battlements to gain.

But, still the valiant Fagans
Full stoutly held their own,
And from many a height is the oncoming bright,
In fierce defiance shown.

And lo! the wide gates opening
Send forth a dense array;
In the sun's bright beams their armour gleams,
And their war-steeds shrilly neigh.

From their saddle-bows down-bending
They sweep to meet the foe—
But is it from fear that their full career
Is check'd even as they go!

It is not fear that checks them,
But pity's gentle sway;
For an infant train on the verdant plain
Are group'd in frolic play.

The host they view with wonder!
Admire their trappings gay,
Their plumes of white and their lances bright,
And their steeds that court the fray.

With greeting and with pleasure
They clap their little hands;
And laugh and shout as the warlike rout
Whirl high their deadly brands.

Then spake the Chief Zenete—
Valiant and gentle knight!
"To your mothers begone, each truant one,
And screen ye from the fight!"

"Revoke that word, Zenete,"
Then spake his comrades forth;
"For this infant band is placed in our hand
As hostages of worth."

"Now shame on ye, by Allah!
Shame on all such!" cried he:
"May bearded men by us be ta'en,—
Not smiling infancy!"

OUR PHANTOM SHIP.

CENTRAL AMERICA.

Now that Central America is very generally looked to as a Land of Hope, the imagination glows over the picture of what it is destined to become. Though most of us like to know as much as travellers will tell us, about the country of the Incas, very few of us care to experience what it now actually is. Fleas, fevers, and frijoles, to say nothing of convulsions, political and natural, earthquakes and revolutions, go far to quench the spirit of the traveller. Only the other day war was declared with the small state of Honduras by the small states of Guatemala and San Salvador. Valiant ragamuffins by the dozen will form armies, dodge each other, march and countermarch. There will be universal crisis, as our neighbours call it. Never mind. We travel in our Phantom Ship, and we will wander through the land as phantoms.

Already we have traversed the Atlantic in our Phantom Ship, and have been drenched by a good sheet of rain within the tropics by the time we reach Belize. As Britons, we will first visit Belize, the British settlement.

Belize is on the coast of the free Indians, in the Bay of Honduras. South of it lie the five independent and quarrelsome states forming the Republic of Central America. Guatemala and Honduras side by side; Guatemala with a coast-line on the Pacific, and a bit of coast on the Atlantic; Honduras with Atlantic coast along the bay named after it. Under these lies first, San Salvador, with the Pacific forming its sea-margin. Then Nicaragua, with a long coast on the Pacific, and containing lakes, but with a very little piece of coast on the Atlantic. The great part of the Atlantic coast line from Honduras southward is in possession of the Mosquito Indians. Costa Rica in the narrowest part of the Central American Isthmus, occupies the breadth from sea to sea, but has by a great deal its longest coast line on the Pacific side. Then comes the remainder of the Isthmus, including the line of railway between Chagres and Panama, but Central America does not extend so far. We will begin our travels at Belize and ramble southward, until we take ship again in Costa Rica at Punta Arenas on the Pacific side, for reasons hereinafter to be mentioned.

Here we are, then, near the British settlement, as we before said, after having felt how water can dash down between the tropics; raining, not cats and dogs, but tigers and rhinoceroses. Belize appears to rise out of the sea as we approach; a range of white houses running for a mile along the shore—government house at one end, barracks at the other; a picturesque bridge, somewhere about the middle, crosses a river which divides the settlement. At the mouth of the river, on an island, is a little fort. There is a church spire, and, behind all, a background made by groves of cocoa-nuts. Vessels at anchor in the harbour, rafts of mahogany, canoes paddled to and fro, and there is the government dory made out of the trunk of a mahogany tree. Belize lives upon mahogany. The mahogany cutters are free blacks, who form the staple population of the town. There is a Court of Justice in Belize. Seven Judges sitting on heavy mahogany chairs, seven ordinary men of business, sit to hear causes. There are plenty to be tried; there is a jury to try them, but there's not a lawyer in the settlement. The merits of each case are fairly brought out, by mutual explanations, and shrewd questioning. The decisions are founded upon homely common sense, and the strict purpose of protecting honest men. The suitors have a right of appeal from this court to England, but they make no use of it. How many appeals would there be in the English courts if every suitor knew, that go into what court he might, he would find the law to be the synonym of justice?

We walk among the bustle of Belize, then step into our Phantom Ship, and sailing slowly up the Belize River, one turn shuts the bridge from sight—and we are in the

deepest solitude. The dense forest, motionless, and silent, the swift river by which but a few miles farther up, the aboriginal Indians are dwelling; the sky obstructed by thick boughs; these are the scenes in which no living thing appears to be astir, except a quiet pelican. The solitudes beyond are almost unexplored; we did not come out to explore them, so we let the current float us back into the bustle of Belize, and through Belize, till we can hoist our ghostly white sail and put out to sea again.

Our voyage is a short one. In the extreme corner of Honduras Bay we find the Rio Dolce. Mountains clothed up to their very summits with the brightest foliage, are parted by an ample stream; we pass between them, we are enclosed on all sides by a forest wall. The course of the broad stream is hidden by its windings; trees, piled upon trees environ us, the rocks are hidden by luxuriance of shrubs that burst forth out of every crevice. The air is odorous of fruits and flowers. The plumage of the cocoa-nut, the huge stems of the cotton trees, are bound together by a network of parasites, whose crimson blossoms cover them, whose runners hang in festoons from the boughs and dip into the placid water. There are orange trees and lemons, pineapple, banana, plantain; but there is no song of birds. We float for nine miles, buried thus within a scene of solemn beauty, catching now and then a gleam of sunset on our faces, and then the mountains part on either hand; for we have reached the broad lake, Golfo Dolce, into which the River Dolce first flows from the heights of Guatemala. The lake, studded with islands, is now glorious before the setting sun. We steer for the little port of Isabel—a port, of Guatemala, on the Gulf—behind which mountain rises above mountain—there we land. The removal of a mud bar from the mouth of the harbour would make this one of the best ports in the world. The small population here at present is composed of Indians, negroes, people of mixed blood, and a few Spaniards. Not far from Isabel there is another port, St. Thomas, with a sheltered harbour. We wait for morning and pass on, leaving our ship to find its way without a pilot or a crew, round Cape Horn and wait for us on the Pacific coast of Costa Rica. We are now in Guatemala, the most northern state, and on the high road to its capital. This road takes high ground at the very outset, for it begins by running up the Mico Mountains.

Starting from Isabel, and passing a small suburb, we cross a marshy plain, and then in a few minutes drive into primeval forest. In central America, roads mean lanes cut by axe into the otherwise impenetrable wood, just wide enough to give room for the mules to meet and pass each other. The stems of the trees are not dug out, the path is not made level by an artificial process, but it is trodden into by the mules, washed into by the rains, and bristles with a *chevaux-de-frise* of mighty

Guatemala. The high road from Isabel to Guatemala upon which we are now travelling is an example. We, travelling phantoms, take no harm, we may amuse ourselves with watching more substantial wayfarers. Here is a party floundering on mules that sink in mud at every step, up to their knees or shoulders. The wood grows thicker, and so does the mud; the shade is deeper and so are the holes. We come to a stream rattling over stones, the whole party plunges in and clatters up its bed. The mules are perpetually falling. The trees meet overhead; it is like a cathedral aisle, only instead of organ music there is the cursing and swearing of the muleteers. Out again into the road, that is to say, into the mud-holes, and among the roots of trees. The colossal roots of the mahogany trees get sadly in the way. It is almost dark under the dense branches, but we can all contrive to see the mud-holes into which our friends are tumbling. We are working our way up the Mico mountain at the conclusion of the rainy season. At length we reach a little clearing on the top, the only ground on which the sun can shine, and this is dry. We rest here for a little while, and then follow to watch the general tumble of our party down the other side. They are down at length; in ten hours they have got through those twelve miles of road, and they are in a grove of palm trees on the plain. Plastered from head to foot with a thick layer of mud, the party we have watched attain a kindred shelter, a small rancho, built of mud. Here they eat frijoles, that is to say, black beans fried in hog's lard, which are the roast beef of Central America. Now we may note that those who do not like hog's lard must not travel in this part of the world. Lard is to the natives here what palm oil is to negroes. It enters into every dish, and if you ask for bread and are able to get it, it will be brought to you as a matter of course, smeared with lard, unless you are extremely vigilant. Good wheat bread can be got, but it is about three times dearer than it is in England. Maize is the grain in common use; they grind it between stones into a pulp, the women pat it into cakes, and bake them on a "griddle." These cakes are called *Tortillas*, and the daily manufacture of them forms a good part of the women's household work. Rounds of beef, and shoulders of mutton are not to be met with in this country. An ox is cut up into long strips, in villages, and dried without any reference to steaks or sirloins; so that the beef is then bought by the yard, and eaten, fried in hog's lard naturally. The upper classes live much upon vegetables, fruit and sweet-meat. Chocolate is in common use, and coffee in the neighbourhood of the plantations. Tea has scarcely penetrated into this part of the world. So now you know what you can get to eat if you should chance to visit Central America, not as a phantom but in hungry flesh.

We travel on—along the summit of a

mountain range—on either side of the delicious valleys, whereon winter never trod; here and there a scenery reminding us of English parks. The next hour is enlivened by a heavy rain. It ceases, and we see beneath us the Motagua, the finest river in Central America, which forms in the lower part of its course the boundary between the states of Guatemala and Honduras. We descend by a steep, romantic path, and stand upon the margin of the torrent, where huge mountains compass us about. A naked Indian sits on the other bank before a few huts roofed with palm leaves. He pushes across for us in his canoe.

We turn aside from the high road to Guatemala—not very far aside—to trace the Copan River. Copan is but a little village—of Honduras, for we have just crossed the borders of that state. It lies in a district famous for its good tobacco. In Central America the whole population smokes, men, women, and children; standing, sitting, and reclining. The wife goes to bed, on the ox-hide, with a cigar in her mouth, and the husband with his cigar will lie with his head at her feet sometimes, for mutual convenience. Copan is their best tobacco district.

What Titanic wall is that whose image is reflected in the river? By the shrubs and creepers we can climb up to the summit. It looks like a portion of some massive ruin. We have climbed, and we stand spell bound. Step below step, broken by trees, loaded with shrubs, and lost at last in the luxuriance of forest, we see the traces of a theatre of masonry. But from a pillar of broken stone below, the fixed stare of an enormous sculptured head encounters us. We descend wondering, and stand before an altar richly carved. We seek for more, and find at our first plunge into the forest a colossal figure frowning down upon us; it is a statue twelve feet high, loaded with hieroglyphic and with grotesque ornament. The grand face seems to be a portrait—but of whom? We explore farther, and find more and more of these stone giants, elbowed from their places by the growth of trees, some of them buried to the chest in vegetation, staring through the underwood with their blind eyes. Monkeys in troops pass to and fro among them. Who are these gods or heroes buried in the dark recesses of the wood? Who raised their monuments? What Temple, what great city, has existed here? No man can tell. These figures frowned before their altars when the Spaniards came. They speak, as the monuments of Egypt, about that time when man exulted most in wrestling against matter, when glory lay in strength of hand and magnitude of handiwork. These are the ruins of Copan, and tell of a past whose history is totally effaced. Along a row of death's heads, carved in stone, by other monuments, we pass back to the outer wall. From the suggestion of what has been, we return to the examination of what is. We get back into the high road for Gua-

temala, and bid good-bye to Honduras, in which state we shall not travel.

We should have found it a land of valley and mountain (for "Honduras" is by interpretation "valleys") rugged and barren. It has gold and silver mines, but hath also revolutions, and the mines are almost abandoned. It has, as everybody knows, mahogany, bought by the Belize merchants of the Honduras government, at the rate of about ten dollars per tree. It exports hides and a little sarsaparilla. Then we leave Honduras, and float swiftly on through Guatemala till we reach its capital; that is called Guatemala too, and once was regarded as the capital of all Central America.

Guatemala, the town, at a distance looks extremely handsome. It has many churches, many gardens interspersed among the houses. The streets, on entering, we find to be all straight, and the houses all one story high. Well, there's an earthquake now, at any rate! We have been very fortunate in getting all the way from Isabel without one. The sensation is like that which we have on ship-board when the vessel lurches. There are two or three rolls, and the sudden settling is the worst part of the shock. We see that a good many people have jumped out of their houses. It is on account of the frequent earthquakes that they are built only one story high. Earthquakes are disagreeable; folks do not become used to them, but, on the contrary, are said with each experience to acquire some increase of dread. This very town is a place begotten of an earthquake. It was founded no longer ago than the year 1773, when the old capital—Old Guatemala—suffered from a disastrous earthquake that eventually tired its patience. Before that, in 1717, the volcano of fire—for the old capital stood between two volcanoes, and one was of fire, the other of water—the volcano of fire had been extremely active, and its eruption had been accompanied with a dose of earthquake and devastation, which was continued for four months. Before that, in 1686, a tenth part of the population had been swept off by an epidemic. Before that, in 1651, there was an extraordinary earthquake, and the wild beasts came to town to be protected. Before that, in 1601, there was a pestilence. Before that, in 1585-6, there was for months incessant fire from the volcano, and earthquakes; in December, 1580, numbers of the people were buried under ruins, the ridges of mountains were torn off, and there were great chasms in the ground. Before that, in 1581, the volcano threw up such a load of ashes, that lights were required in the houses at mid-day. Before that, in 1575-6-7, there were ruinous earthquakes. Before that, in 1558, there was an epidemic. Before that, in 1542, the capital was founded, because another capital before that had been swept into ruins by the descent of a huge torrent, bearing with it rocks and trees, down the sides of the volcano of water.

The new Guatemala is built like all towns of what has been Spanish America, in square blocks, so that all the streets are straight and cross each other at right angles. The houses are, as we saw, one story high; but spacious, with large doors and windows, and iron balconies. There is a public market square, with a fountain in the middle, and on one side the Cathedral, a fine structure, with the archbishop's palace and a school; opposite that the government house and some law courts; on a third side, guard-house and barracks; and on the fourth, a corridor, occupied by the chief shops of the city, which are all "general stores." The water of the fountain comes from a distance of twelve miles, by an aqueduct, which supplies all Guatemala, and yields a surplus which plays about the town in fifty public fountains. These supply water freely to the poor, and many of them are covered with stone buildings and partitioned off into stone troughs, for washing clothes. Hear this—O, London!—of the land of frijoles!

The chief amusement in Guatemala consists in letting off fireworks in the streets, every Saint's day. This is a Saint's day, and the fireworks come after the earthquake. We will look to a hotel for shelter. Alas, there is no hotel, no inn. Possibly we may get a lodging. A lodging in Central America means a room. A room—four walls, and nothing else. We'll borrow a bed, to see what that is like. It is an ox-hide, full of fleas. Not that fleas matter in the ox-hide, for the floor, of baked clay, broken, is full of fleas in every crevice. Phantoms though we are, we will not sleep in Guatemala. Guatemala is the best town in Central America; and the Mica Mountain is not the worst road.

We float off to the deserted capital. Not quite deserted; many clung to it when the new town was built, for it is situated in a fertile district; the new town is not. It has a desolate appearance, its fine old cathedral cracked from top to bottom—ruined houses with huts planted in the corners of them. We will go on a few miles, to the city of Amatitlan. Old Guatemala and Amatitlan are the centres of the cochineal plantations. Each house in Amatitlan has its cactus ground, as, in English villages, each cottage has its cabbage garden. In Central America you have the cactus at home, in all its glory. On unfrequented mountains there, we wander among cactus blossoms. Five varieties of cactus are employed to feed the cochineal insect. The valley of Amatitlan is covered with cochineal estates. In this valley is a lake whereinto two streams flow, and out of which there flows a river. On the lake floats pumice-stone, springs of boiling-water bubble round it. Steam pours out of crevices, here and there, in the adjacent mountains. The whole ground is volcanic. In some parts of the valley well-diggers almost burn their

ends at twenty yards, and at thirty-two
find the water boiling.

We must not stop too long in Guatemala.
Its cochineal plantations in Old Guatemala
and Amatitlan are its only scenes of reason-
able industry. It produces a little coffee and
a little cocos; it can produce very fine vanilla
and large quantities of caoutchouc. Its chief
products now are robbers and revolutions.

We cross the River Paz, southward, within
sight of the Pacific, and have found our way
into the state of San Salvador. One of the
first things upon which we tumble, is a
volcano; that of Isolco, above Sonsonate.
This was born—sprouted out of the plain—
about eighty years ago, and has not yet done
growing. There used to be a cattle estate
where it now stands. It is continually in
eruption, and signalises the period of its
youth by throwing a large number of stones.
It is very regular in its habits, exploding
every sixteen minutes and three seconds, with
reports like a discharge of artillery, smoke
and stones, which fall upon its flank, and
that is how it grows. In Sonsonate, only
three leagues distant, this business-like vol-
cano, might be made a partial substitute for
clocks.

We go on to the capital, San Salvador.
Town on the usual model. Thieves on the
watch, soldiers asleep on the pavement,
covered with ants, very ragged, less respect-
able than English beggars, and a revolution
come or coming. Where there is offal there are
turkey buzzards. Of course a volcano just
outside; the volcano of San Salvador, quiet
of late years. We hasten to San Miguel, the
seat of an annual trading market, which is
generally either spoilt or put off by the same
month's political convulsion. We pass through
a fine tobacco district; then by a volcano at
San Vicente; travel through the usual forest
tracks—the homes of pumas, parrots, snakes,
bees, scorpions, and ticks; cross the Lempa,
the chief river of the state, and go on through
the woods again until we are brought to a
stand-still by a wall twenty feet high, of
burning scorice, covered with charred trees,
a souvenir from the volcano of San Miguel.
The lava has come all this way, though we
are five leagues from the base of the volcano,
and ten leagues from its crater. We follow
a new roundabout path which has been made
regulate by this obstruction. Through
indigo plantations we come to San Miguel.

We will get a fever at San Miguel. It's
time to have a fever. Every traveller in
Central America must have a fever and get
well, or die. Being a phantom fever we can
soon get rid of it. We travel a few leagues,
and ascend the extinct volcano of Conchagua.
From there the view is fine. The Pacific, the
Bay of Conchagua, studded with islands,
tropical forests, rivers and mountains, and
eighteen volcanoes. On coming down we
find there is a fresh revolution, and take
flight by boat across the bay into the state of

Nicaragua. We don't wish to be ferried over
to the volcano of Cosigüina on the bay. That
is the volcano which broke out suddenly in
1835, breaking through a reputation for ex-
tinctness, with shocks perceptible to all the
country round as far as Mexico, New
Granada, and Jamaica. It filled the air
with a fine powder, obscuring sun and stars,
so that there was a thick darkness for forty-
three hours, in which the light of torches was
not visible at three yards distance. The
lizards and the reptiles came to man for help,
and all was destroyed for leagues around the
fatal centre of activity. No, we don't visit
Cosigüina.

The chief produce of the State of San Sal-
vador is indigo, cultivated near San Vicente,
San Miguel, and San Salvador. From the
neighbourhood of Sonsonate, in this state,
comes all our Balsam of Peru. San Salvador
can produce, also, vinegar, ginger, and vanilla.

Across the Bay of Chinandega we are
floated to Nacoacolo, in the State of Nica-
ragua—and travel by the usual mule track to
the chief town, Leon. Riding on these tracks
must be much like tossing in a blanket. We
come to Chinandega, a pretty town (near
an extinct volcano), in a country able to pro-
duce large quantities of sugar and cotton.
We are now only three leagues from the
harbour of Realejo, the proposed Pacific
terminus to the grand ship canal; but we go
on to Leon. Leon is, after Guatemala, the
largest city in Central America, and contains,
perhaps, twenty-four thousand inhabitants;
it has contained twice as many. These towns
being all built on the same plan, one is
enough to look at. Here, as before, we
find rectangular streets, a square, a foun-
tain, ragged soldiers, thieves, a crisis, and a
revolution.

We quit Leon for Realejo; and our way
lies over level country, through thick forest,
on the usual mud-and-stump mule track.
Realejo, the town, is about two leagues
distant from Realejo, the harbour: it is a
mere collection of mud huts. The harbour is
a safe and good one, suited for large vessels,
and completely sheltered. This harbour will
perhaps be chosen on the Pacific side, as the
terminus of the proposed canal. San Juan
del Sur, a little further to the south, has also
its advocates.

Several fresh water streams run into the
creek which forms the harbour of Realejo.
One of these flow from within three leagues
of a lake—the Lake of Managua—over a
gentle slope. Let us imagine this stream on
the track of the canal; let us, indeed, imagine
the canal cut from Realejo into that lake.
With Lake Managua, the larger lake of
Nicaragua is connected already by a river,
which we will suppose transformed into canal.
We float then into the great Lake of Nica-
ragua. A wind sweeps over it, and it is
rolling like a sea; before us there is no land
visible. From islands upon it, and from the

shores, arise magnificent volcanoes. Wild-
fowl fly over the water; deep woods clothe
the bank. The lake is ninety-five miles long,
and thirty miles broad, in its broadest part.
We reach the River St. John, which leads out
of the lake into the Atlantic Harbour of San
Juan del Norte. The river, with its windings,
is about seventy-nine miles long, flowing
through dense forest. This we imagine con-
verted into canal, and we have traversed one
of the proposed routes. Returning by the
St. John into the Lake of Nicaragua, we have
only to cross the lake, to reach a spot where
we are separated by no more than sixteen
miles of land from the Pacific harbour of San
Juan del Sur. This is by far the shortest
route, but there are forcible objections to
it. Across the path of those sixteen miles,
there runs a range of hills, to be traversed
only by a deep cutting or a tunnel, or both.
And deep cuttings or tunnels are neither of
them quite safe in the society of volcanoes,
however matter-of-fact they may seem to
Englishmen. Furthermore, it is said that the
Port of St. John del Sur, is not an eligible
one, swept during five months of the year by
an adverse north wind. The harbour of
Realejo forms an admirable terminus, per-
fectly embayed, and sheltered by an island at
its mouth, while the proposed canal route,
although longer, presents much less engi-
neering difficulty. Not that it is difficult to
engineers to operate just as they please, upon
dead matter; but that to make a tunnel or a
cutting is one thing, and to insure it against
earthquakes, is another. In May, 1844, a
series of violent earthquake shocks passed
over the precise site of this projected cutting,
and did great damage to the town of
Nicaragua.

The unhealthiness of the Atlantic coast—
the danger to European overseers during
that part of the operation which will concern
the river Saint John; the worthlessness of
native labour, the question of the necessity
of negro free labour, and all such matters,
we need not discuss. It may be noted, how-
ever, that in making the new railway from
Chagres to Panama, the works have been
imprudently commenced, on the unhealthy
side. Commencement at the other end
might have given some time to the labourers
in which they could become better accli-
matised.

Now we are about to quit the state of
Nicaragua. It is a country of rich, fertile
plains and slopes, freely besprinkled with
volcanic peaks. It can produce fine indigo,
cotton, sugar, and cocoa. Mahogany, cedar
and Brazil wood, abound in its forests;
thieves, ragged soldiers, and political convul-
sions abound in its towns.

We enter Costa Rica, the most southern
state, which, for some years past has been
quietly indolgent, and given up the revolu-
tionary business. Here we traverse wild
rocks and forest-covered glens until we reach

the high table-land in the centre of the state,
which is the cultivated part of Costa Rica.
Here are three towns—San Jose, the capital,
Alhajuela, and Heredia. Sugar is grown here,
but coffee-plantations are the chief source of
prosperity.

San Jose, like Guatemala, is a new capital.
We visit the old city, Cartago; it is a mass of
ruins, made by an earthquake in 1841. The
old volcano looks down on the mischief
smoking quietly.

The coffee of Costa Rica sent to Europe, is
not shipped on the Atlantic side. The moun-
tains, valleys, marshes, and prevailing rains
of the Atlantic coast, make that side so im-
practicable, that although they have a port
on the Atlantic, the Costa Ricans shudder
at the difficulty and expense of making roads
to it for transport of their produce. There-
fore they make roads suitable for country
carts—better than mule tracks, to their port
on the Pacific, Punta Arenas, in the Gulf of
Nicoza. This port is formed by a sandpit
about two leagues long, running out from the
main land, enclosing a harbour sheltered by
two islands, and accessible to small vessels,
which can receive and land cargo only by
boats. The village is built upon the sandpit,
and from hence the coffee is exported. Here,
too, there is a Pearl Fishery. The Costa
Ricans think it better to sell their coffee in
Europe at the disadvantage of three pounds a
ton, by paying freight for the circumnaviga-
tion of South America, than to make roads
to their port of Matinas, on the Atlantic,
which, in point of mileage merely, is no
farther distant from the coffee-grounds than
Punta Arenas.

Now we are at our journey's end, and
waiting on the sandpit for our Phantom Ship.
We have seen the surface of the land. Beneath
the surface are abundant deposits of gold,
silver, and iron. We have seen something of
the wealth lavished by Nature upon that
district of the world, whose part in the world's
history is destined to be hereafter as large as
it now is little. The present inhabitants of
Central America—Spanish, mixed or coloured
—know no more of the use which they might
make of their unlimited resources, than a baby
knows what it can buy with half-a-crown.
An industrious and settled population, in
the first place—no more revolutions—in the
second place, good roads, are the great wants
of Central America. Nothing but Anglo-
Saxon energy will ever stir this sluggish pool
into life. There is no vigour in the revolu-
tions even; they are not an active ebullition
of the feelings, but a chronic malady.

Who is to fell the trees, to destroy the sick-
liness of an excessive vegetation? Who is to
form the roads, to work the mines, to make
the cultivated soil yield its best treasures in
their full abundance? When the commerce
of Europe shall flow into the Pacific, through
the Nicaraguan Canal, those questions will be
answered readily.

Now we step into our Phantom Ship, to come by the country of the Patagonians; and in a minute you are landed safely by your own fireside.

THE QUEEN'S BAZAAR.

THE articles displayed for sale at the Queen's Bazaar are brought together under peculiar circumstances. Some of them are handed over by Her Majesty's Revenue officers, who obtain them from passengers as they step ashore from foreign steamers. Some, are thus unwillingly contributed by full-figured dowagers; by young ladies carrying poodles; by well-cloaked gentlemen; or by those individuals encumbered with protuberant brandy-bottles, formed like the "stuffing" adopted by actors when they play Falstaff.

It is, however, a pity that the smuggling propensities of Mrs. Brown, Miss Robinson, or Mr. Bombigs, should be a cause of annoyance to the thousands of passengers who land weekly on our coasts. It is a pity, that because Miss Bumble cannot resist the temptation of secreting a bottle or two of Eau de Cologne between the folds of her packed-up draperies; that because Mr. Fitz-Fink must put Galignani's edition of "Astoria" in his hat-box; their fellow-passengers should be subjected to the annoyance of having their wardrobes tumbled out upon a counter, for the amusement of the curious. It is distressing to witness the performance of the searcher's duties. Mrs. Tiplic's boxes are thrown upon the counter, uncorded, unlabeled. The searcher commences by removing huge piles of silk dresses; Mrs. Tiplic looking on in a state of the greatest excitement. The searcher vigorously rams his arm to the bottom of the trunk, and by a dexterous twist tumbles its contents into a condition of the most picturesque confusion. Mrs. Tiplic feels that she will faint, if the man does not desist at once. But, he regards neither her confusion nor her expostulations. He rolls a dozen pairs of stockings upon the counter; he rattles her jewel-case and asks for the key; he minutely inspects her supply of linen; he brings to public light all kinds of little secret cosmetics and artifices, which gentlemen are not usually privileged to see. He hopes that there is no contraband article secreted in her needlecase. He trusts that there is nothing but cotton in her work-box; and having chalked a huge hieroglyphic upon the trunk, pushes the whole tumbled exposed heap from before him, and turns to another victim. Now and then he ruthlessly seizes a bottle of brandy, a few yards of lace, or a pair of new shoes; but generally finds nothing worth touching. The value of his contributions to the Queen's Bazaar scarcely covers the amount of his salary.

In another part of the Custom House are officials keeping up the Queen's Bazaar stock by unloading the merchants. It is necessary

to prevent importers from understating the value of goods upon which an *ad valorem* duty is charged. To check this tendency, a system has been adopted of buying those goods which the Custom House officers hold to be undervalued. Thus, when a merchant declares the value of a bale of goods, and the officer believes the declaration to be understated, he pays the value the merchant has declared to the owner, and retains the goods. This course furnishes the chief articles which figure at the periodical Custom House sale. Very often, Her Majesty loses by these transactions. Thus, a merchant imported a quantity of soiled goods lately, which he declared at the value he honestly believed they would fetch. This declaration being, to the mind of the officials (who disregarded the damaged condition of the goods), understated, they paid the merchant his price on the part of Her Majesty, and subjected them to the hammer, in the expectation that a round sum would be realised by the bargain. It turned out, however, that the merchant had rather overstated the value; and, the consequence was, that the goods were sold for about one hundred and fifty pounds less than the Custom House authorities had paid for them. As a large proportion of the goods sold under the authority of the Customs Commissioners are detained and paid for as undervalued, the bazaar is in some sort a Government speculation; and one, probably, that does not return a large per centage of profit. The pickings from trunks, form items which it is easy to trace; the articles wrenched from the grasp of professional smugglers are for the most part either tobacco or spirits.

Having thus briefly reviewed the systems which fill Her Majesty's Bazaar with all kinds of valuable commodities, we may enter the Queen's Warehouse, situated on the ground-floor of the Custom House. The Queen's Warehouse is not an imposing apartment, either in its decorations or extent. It is simply a large square room, lighted by an average number of windows, and consisting of four bare walls, upon which there is not the most distant approach to decoration. Counters are placed in different directions, with no regard to order or effect. Here and there, masses of drapery for sale are hung suspended from cords, or, to all appearance, nailed against the wall. Across one corner of the room, in the immediate vicinity of a very handsome inlaid cabinet, two rows of dilapidated Bath chaps are slung upon a rope. Close under these delicacies, stands a rosewood piano, on which a foreign lady, supported by a foreign gentleman, is playing a showy fantasia. The effect of her brilliant and vehement performance is, however, unhappily marred by the presumption of a young gentleman who is trying a gross of accordions, situated at the further end of the row of chaps, by playing the first few notes of the National Anthem upon each, with utter disregard of time and

tune. At the elbow of this young gentleman an old gentleman is rubbing some raw silk—as though he longed to wash it—and then stroking it with a touching fondness. He carries a catalogue in his hand, and when he has completed his inspection, hastens to make some hieroglyphics in it.

Advancing a little more into the bazaar, and edging our way between all kinds of men in earnest conversation who “think one and a quarter enough,” or who “wouldn’t mind taking the damaged with the sound,” or who are confident “there is no longer any home market for such goods”—we reach the first long counter. Here, we discover a rich assortment of objects piled about in hopeless confusion.

Eighty-nine opera glasses: three dozen “companions”—more numerous than select, perhaps. Forty dozen black brooches—ornamental mourning, sent over probably by some foreign manufacturer, relying in the helplessness of our Woods-and-Forests-ridden Board of Health, and in the death-dealing fogs and stenches of our metropolis. Seventeen dozen daguerreotype plates, to receive as many pretty and happy faces. Eighty dozen brooches; nineteen dozen pairs of ear-rings; forty-two dozen finger-rings; twenty-one dozen pairs of bracelets. The quantities and varieties are bewildering, and the ladies cluster about in a state of breathless excitement, or give way to regrets that the authorities will not sell less than ten dozen tiaras, or half a dozen clocks.

The French popular notion, that every Englishman has an exhaustless store of riches, seems to hold as firmly as ever; for, here we find about three hundred dozen *portres monnaies*, and countless purses, evidently of French manufacture. Presently we are shown what Mr. Carlyle would call “a gigantic system of shams,” in five hundred and thirty-eight gross of imitation turquoises. We stroll on, amused at the variety of the scene—the intent looks with which men are peering into all kinds of packages, testing all kinds of manufactures in all sorts of ways, and making notes eagerly in their catalogues. We pause before seven crosses, and nine crucifixes, “mounted.” A particular interest attaches to these gaudy ceremonial trinkets of Berlin ware. They were put up to auction with a cigar-holder, and eleven finger-rings, for the sum of three pounds fifteen shillings. At the farther end of the long counter before which we have been pausing, are some very finely-executed bronzes, and Dresden, and other vases, marked at exceedingly low prices. Yet, according to the catalogue, they have all been undervalued, and the sale of them is a Government speculation.

To realise an idea of the Queen's Bazaar on the morning of sale, it is necessary to have a vivid sense of the unpleasantness of hearing every imaginable air played at short intervals on every kind of instrument, by performers of

various degrees of skill. We were suddenly attracted to the second counter in the room by a few loud notes played upon an oboe, by a short gentleman with a long moustache. The counter was loaded with brass instruments, lying in confused heaps: some packed in papers, some bursting through their covers, and others glittering in the sun, in all the nakedness of polished brass. We began to think that a brass band had been seized by the ruthless searchers of the Custom-house; but, on referring to our catalogue, we learnt that this heap of cornopeans, clarionets, ophicleides, trombones, clarions, violoncelli, and guitars, had been undervalued according to the Custom-house authorities, and had been bought on behalf of Government. An organ with sixteen barrels had also fallen into the hands of Government, for something under fifty-three pounds. A solitary drum had been resigned to the authorities, as an undervalued article: it was the only instrument which remained untouched.

Near these musical instruments, lay a great variety of china from all parts of the world. Designs the most graceful, and distortions the most grotesque, were huddled together. Two salt-cellars, which had been undervalued, were inside of two butter-boats, that had been similarly treated; while two egg-cups, detained by the majesty of English law, stood modestly beside some of the splendid pottery of Dresden. Near all this china, were about one hundred-and-twenty party-coloured Chinese lamps, in the immediate neighbourhood of twenty-eight cottages (dolls), napkin-rings, pincushions, nut-crackers, paper-knives, &c., all of the celebrated Swiss carving, of which some splendid specimens are promised for the Great Exhibition.

Tired with the endless variety of the Government Bazaar, we must pass over—seventy-six dozen scissors, seventeen dozen bellows, and even ninety-five coffee biggins, to say nothing of nineteen larding-skewers, thirteen scoops, fifty thousand tickets in sheets, and one thousand box tops—to come to a few parcels over which we saw many gentlemen pause, and to which ladies hastened with eager steps. Here they are;—sixty thousand gross of buttons! Two hundred and fifty-two dozen ink-stands; hundred and fifty gross of hair pencils. Of the stocks of shawls, barèges, and handkerchiefs, we do not pretend to say anything; but it appears rather trifling to squabble over the value of two embroidered aprons, and one scarf. However, the authorities appear to be excellent judges of the value of a light crust, and the cost of confectionery: inasmuch as they have thought fit to detain, as undervalued, no less than fifty-five *patés de foies gras*, and a very promising consignment of *caviare*.

Among the seizures which we find in the Queen's Bazaar, is a muslin dress skirt, embroidered; one robe with body; one scarf; twelve collars; innumerable dress pieces; and

bonnets. The agony of the respective owners of these elegancies need not be dwelt upon. But, perhaps the most melancholy lot in the Government Bazaar was a packet of pamphlets, "weighing one hundredweight, two quarters, twenty-one pounds," according to the catalogue, to be sold for the "benefit of the Crown." This direct appeal from the Commissioners of Customs to the trunk-makers of the country, cannot be contemplated by any lover of literature with other than feelings of strong antipathy. Various old trunks, boxes of old clothes, hundreds of tattered volumes, hundreds of pairs of dice, clocks innumerable, countless watches, stivers of wine spirits, tons of tobacco, may be added to our list of the stock which Her Majesty has periodically on sale. On the particular occasion to which we have been all along referring, three hundred gross of lucifer matches figured in the Bazaar; besides several acres of East India matting; forty-nine gallons of Chutney sauce; eighteen gallons of curry paste; thirty millions of splints; seventy-seven hundredweight of slate pencils; sixty-eight gallons of rose-water; one package of visiting cards; one ship's long-boat; and "four pounds" of books in the English language!

Truly, the gentlemen who test the prices of these various articles of commerce—who can hit upon the precise value of slate pencils and caviare, dolls' houses and fat liver paties—must have extraordinary experience! That they are, after all, human, and are subject to mistakes like the rest of us, is indisputable.

The Queen's Bazaar is a specimen of the profitableness and policy of the whole system. Smuggling, of which it is the parent, is not looked upon by the community with much horror; on the contrary, by some, as rather a meritorious means of making bargains. "To pretend to have any scruple about buying smuggled goods," Adam Smith tells us, "would in most countries be regarded as one of those pedantic pieces of hypocrisy which, instead of gaining credit with anybody, serve only to expose the person who pretends to practise them, to the suspicion of being a greater knave than the rest of his neighbours."

The danger of maintaining laws which it is held by many well-meaning persons, not inglorious to break, has forced itself upon the governments of most countries; and it may be safely stated that the reduction of duties on foreign goods has done more to put down smuggling than fleets of revenue cutters, armies of coast guards, and the quick eyes of searchers. It is now believed that "when-ever duties exceed thirty per cent *ad valorem*, it is impossible to prevent a contraband trade." The experience of the present time points to this conclusion, and further tends to show that, economically, high duties are less productive to the revenue than low duties; inas-

much as to levy high duties, a large protective force must be maintained, whereas, with low duties, smuggling sinks to a losing game, and is quickly abandoned. In 1681, Lord Congleton estimated the cost of protecting the revenue, at from seven hundred thousand to eight hundred thousand pounds. In 1832, upwards of one hundred and eighty-one thousand pounds were expended in building outposts for the officers and men of the Coast Guard in Kent and Sussex. Yet, while duties are imposed, however paltry in amount, people of an economical turn will do a little smuggling on their own account—as much for the popular glory of defrauding the revenue, as for the irresistible impulse of saving a few shillings.

LIKENESS IN DIFFERENCE.

THERE was a tale of feeling,
Told at eve, in a stately room,
Where the air was an odour stealing,
And the light was a gorgeous gloom;—
And there was a story whispered,
At a window, whose only blind
Was of wet vine-leaves, that glistered
And shook in the swaying wind:
Two tales that were diverse spoken,
Yet their import one, I know,
And the language of each was broken—
And both were true!

There was a maiden queenly,—
Through bright halls gliding came,
Which grew brighter, as still serenely
She smiled o'er an unbreathed Name:
And there sat a maiden lonely
On the hearth, striving, line by line
By the light of the embers only,
To spell out a Valentine.
Two hearts that were keeping duly
One time and one tune in each breast,
Both true-loved and loving truly—
And both were blest!

A CHILD'S HISTORY OF ENGLAND.

CHAPTER II.

THE Romans had scarcely gone away from Britain, when the Britons began to wish they had never left it. For, the Roman soldiers being gone, and the Britons being much reduced in numbers by their long wars, the Picts and Scots came pouring in over the broken and unguarded wall of Severus in swarms. They plundered the richest towns, and killed the people; and came back so often for more booty and more slaughter, that the unfortunate Britons lived a life of terror. As if the Picts and Scots were not bad enough on land, the Saxons attacked the islanders by sea; and, as if something more were still wanting to make them miserable, they quarrelled bitterly among themselves as to what prayers they ought to say, and how they ought to say them. The priests, being very angry with one another at these

questions, cursed one another in the heartiest manner; and (uncommonly like the old Druids) cursed all the people whom they could not persuade. So, altogether, the Britons were very badly off, you may suppose.

They were in such distress, in short, that they sent a letter to Rome, entreating help: which they called The Groans of the Britons, and in which they said, "The barbarians chase us into the sea; the sea throws us back upon the barbarians; and we have only the hard choice left us of perishing by the sword, or perishing by the waves." But, the Romans could not help them, even if they were so inclined; for they had enough to do to defend themselves against their own enemies, who were then very fierce and strong. At last, the Britons, unable to bear their hard condition any longer, resolved to make peace with the Saxons, and to invite the Saxons to come into their country, and help them to keep out the Picts and Scots.

It was a British Prince named VORTIGERN who took this resolution, and who made a treaty of friendship with HENGIST and Horsa, two Saxon chiefs. Both of these names, in the old Saxon language, signify Horse; for, the Saxons, like many other nations in a rough state, were fond of giving men the names of animals, as Horse, Wolf, Bear, Hound. The Indians of North America,—a very inferior people to the Saxons—do the same to this day.

HENGIST and Horsa drove out the Picts and Scots; and VORTIGERN, being grateful to them for that service, made no opposition to their settling themselves in that part of England which is called the Isle of Thanet, or to their inviting over more of their countrymen to join them. But, HENGIST had a beautiful daughter named ROWENA; and when, at a feast, she filled a golden goblet to the brim with wine, and gave it to VORTIGERN, saying, in a sweet voice, "Dear King, thy health!" the king fell in love with her. My opinion is, that the cunning HENGIST meant him to do so, in order that the Saxons might have greater influence with him; and that the fair ROWENA came to that feast, golden goblet and all, on purpose.

At any rate, they were married: and, long afterwards, whenever the king was angry with the Saxons, or jealous of their encroachments, ROWENA would put her beautiful arms round his neck, and softly say, "Dear king, they are my people! Be favourable to them, as you loved that Saxon girl who gave you the golden goblet of wine at the feast!" And, really, I don't see how the king could help himself.

And, we must all die! In the course of years, VORTIGERN died—he was dethroned, and put in prison; first, I am afraid—and ROWENA died; and generations of Saxons and Britons died; and events that happened during a long, long time, would have been quite forgotten

but for the tales and songs of the old Britons, who used to go about from feast to feast, with their white beards, recounting the deeds of their forefathers. Among the histories of which they sang and talked, there was a famous one, concerning the bravery and virtues of KING ARTHUR, supposed to have been a British Prince in these old times. But, whether such a person really lived, or whether there were several persons whose histories came to be confused together under that one name, or whether all about him was invention, no one knows.

I will tell you, shortly, what is most interesting in the early Saxon times, as they are described in these songs and stories of the Britons.

In, and long after, the days of VORTIGERN, fresh bodies of Saxons, under various chiefs, came pouring into Britain. One body, conquering the Britons in the East, and settling there, called their kingdom Essex; another body settled in the West, and called their kingdom Wessex; the Northfolk, or Norfolk people, established themselves in one place; the Southfolk, or Suffolk people, established themselves in another: and gradually seven kingdoms or states arose in England, which were called the Saxon Heptarchy. The poor Britons, falling back before these crowds of fighting men, whom they had innocently invited over as friends, retired into Wales and the adjacent country, into Devonshire, and into Cornwall. Those parts of England long remained unconquered. And, in Cornwall now—where the sea-coast is very gloomy, steep, and rugged—where, in the dark winter-time, ships have been often wrecked close to the land, and every soul on board has perished—where the winds and waves howl drearily, and split the solid rocks into arches and caverns—there are very ancient ruins, which the people call the ruins of KING ARTHUR'S Castle.

Kent is the most famous of the seven Saxon kingdoms, because the Christian religion was preached to the Saxons there (who domineered over the Britons too much, to care for what *they* said about their religion, or anything else) by AUGUSTINE, a monk from Rome. KING ETHELBERT of Kent was soon converted; and the moment he said he was a Christian, his courtiers all said *they* were Christians; after which, ten thousand of his subjects said *they* were Christians too. AUGUSTINE built a little church, close to this king's palace, on the ground now occupied by the beautiful cathedral of Canterbury. SEBERT, the king's nephew, built on a muddy marshy place near London, where there had been a temple to Apollo, a church dedicated to Saint Peter, which is now Westminster Abbey. And, in London itself, on the foundation of a temple to Diana, he built another little church, which has risen up, since that old time, to be Saint Paul's.

After the death of ETHELBERT, SEBERT, King

Northumbria, who was such a good king, that it was said a woman or child might openly carry a purse of gold, in his reign, without fear, allowed his child to be baptised, and held a great council to consider whether he and his people should all be Christians or not. It was decided that they should be. COFFI, the chief priest of the old religion, made a great speech on the occasion. In this discourse, he told the people that he had found out the old gods to be impostors. "I am quite satisfied of it," he said. "Look at me! I have been serving them all my life, and they have done nothing for me; whereas, if they had been really powerful, they could not have decently done less, in return for all I have done for them, than make my fortune. As they have never made my fortune, I am quite convinced they are impostors!" When this singular priest had finished speaking, he hastily armed himself with sword and lance, mounted a war-horse, rode at a furious gallop in sight of all the people to the temple, and flung his lance against it as an insult. From that time, the Christian Religion spread itself among the Saxons, and became their faith.

The next very famous prince was EGBERT. He lived about a hundred and fifty years afterwards, and claimed to have a better right to the throne of Wessex than BEORTRIC, another Saxon prince who was at the head of that kingdom, and who married EDBURGA, the daughter of OFFA, king of another of the seven kingdoms. This QUEEN EDBURGA was a handsome murderess, who poisoned people when they offended her. One day, she mixed a cup of poison for a certain noble belonging to the court; but, her husband drank of it too, by mistake, and died. Upon this, the people rose in great crowds, and running to the palace, and thundering at the gates, cried, "Down with the wicked queen, who poisons men!" They drove her out of the country, and abolished the title she had disgraced. When years had passed away, some travellers came home from Italy, and said that in the town of Ravenna they had seen a ragged beggar-woman, who had once been handsome, but was then shrivelled, bent, and yellow, wandering about the streets, crying for bread; and that this beggar-woman was the poisoning English queen. It was, indeed, EDBURGA; and so she died—without a shelter for her wretched head.

EGBERT, not considering himself safe in England, in consequence of his having claimed the crown of Wessex (for, he thought his rival might take him prisoner and put him to death), sought refuge at the court of CHARLEMAGNE, King of France. On the death of BEORTRIC, so unhappily poisoned by mistake, he came back to Britain; succeeded to the throne of Wessex; conquered some of the other monarchs of the seven kingdoms; added their territories to his own; and, for the first time, called the country over which he ruled, England.

And now, new enemies arose, who, for a long time, troubled England sorely. These were the Northmen, the people of Denmark and Norway, whom the English called the Danes. They were a warlike people, quite at home upon the sea, not Christians, very daring and cruel. They came over in ships, and plundered and burned wheresoever they landed. Once, they beat EGBERT in battle. Once, EGBERT bent them. But, they cared no more for being beaten than the English themselves. In the four following short reigns, of ETHELWULF, and his three sons, ETHELBALD, ETHELBERT, and ETHERED, they came back, over and over again, burning and plundering, and laying England waste. In the last-mentioned reign, they seized EDMUND, King of East England, and bound him to a tree. Then, they proposed to him that he should change his religion; but he, being a good Christian, steadily refused. Upon that, they beat him, made cowardly jests upon him, all defenceless as he was, shot arrows at him, and, finally, struck off his head. It is impossible to say whose head they might have struck off next, but for the death of KING ETHERED, from a wound he had received in fighting against them, and the succession to his throne of the best and wisest king that ever lived in England.

ALFRED THE GREAT was a young man, three-and-twenty years of age, when he became king. Twice in his childhood, he had been taken to Rome, where the Saxon nobles were in the habit of going, on journeys which they supposed to be religious; and, once, he had stayed for some time in Paris. Learning, however, was so little cared for, then, that at twelve years old, he had not been taught to read; although, of the four sons of KING ETHELWULF, he, the youngest, was the favourite. But, he had, as most men who grow up to be great and good are generally found to have had, an excellent mother; and, one day, this lady, whose name was OSBURGA, happened, as she was sitting among her sons, to read a book of Saxon poetry. The art of printing was not known until long and long after that period, and the book, which was written, was what is called "illuminated," with beautiful bright letters, richly painted. The brothers admiring it very much, their mother said, "I will give it to that one of you four princes who first learns to read." ALFRED sought out a tutor that very day, applied himself to learn with great diligence, and soon won the book. He was proud of it, all his life.

This great king, in the first year of his reign, fought nine battles with the Danes. He made some treaties with them too, by which the false Danes swore that they would quit the country. They pretended to consider that they had taken a very solemn oath in swearing this upon the holy bracelets that they wore, and which were always buried with them when they died; but, they cared little for it, for they thought nothing of breaking

outlets and treaties too, as soon as it suited their purpose, and coming back again to fight, plunder, and burn, as usual. One fatal winter, in the fourth year of KING ALFRED's reign, they spread themselves in great numbers over the whole of England; and so dispersed and routed the king's soldiers that the king was left alone, and was obliged to disguise himself as a common peasant, and to take refuge in the cottage of one of his cowherds who did not know his face.

Here, KING ALFRED, while the Danes sought him far and wide, was left alone, one day, by the cowherd's wife, to watch some cakes which she put to bake upon the hearth. But, being at work upon his bow and arrows, with which he hoped to punish the false Danes when a brighter time should come, and thinking deeply of his poor unhappy subjects whom they chased through the land, his noble mind forgot the cakes, and they were burnt. "What!" said the cowherd's wife, who scolded him well when she came back, and little thought she was scolding the king, "You will be ready enough to eat them by-and-by, and yet you cannot watch them, idle dog?"

At length, the Devonshire men rose against a new host of Danes who landed on their coast; killed their chief, and captured their flag, on which was represented the likeness of a Raven—a very fit bird for a thievish army like that, I think. The loss of their standard troubled the Danes greatly, for, they believed it to be enchanted; woven by the three daughters of one father in a single afternoon—and had a story among themselves that when they were victorious in battle, the Raven stretched his wings and seemed to fly; and that when they were defeated, he would droop. He had good reason to droop, now, if he could have done anything half so sensible; for, KING ALFRED joined the Devonshire men, made a camp with them on a piece of firm ground in the midst of a bog in Somersetshire, and prepared to make a great attempt for vengeance on the Danes, and the deliverance of his oppressed people.

But, first, as it was important to know how numerous these pestilent Danes were, and how they were fortified, KING ALFRED, being a good musician, disguised himself as a gleeman or minstrel, and went, with his harp, to the Danish camp. He played and sang in the very tent of GUTHRUM the Danish leader, and entertained the Danes as they caroused. While he seemed to think of nothing but his music, he was watchful of their tents, their arms, their discipline, everything that he desired to know. And right soon did this great King entertain them to a very different tune; for, summoning all his true followers to meet him at an appointed place, where they received him with joyful shouts and tears, as the monarch whom many of them had given up for lost or dead, he put himself at their head; marched on the Danish camp,

defeated the Danes with great slaughter, and besieged them for fourteen days to prevent their escape. But, being as merciful as he was good and brave, he then, instead of killing them, proposed peace; on condition that they should altogether depart from that Western part of England, and settle in the East; and that GUTHRUM should become a Christian, in remembrance of the Divine religion which now taught this conqueror, the noble ALFRED, to forgive the enemy who had so often injured him. This, GUTHRUM did. At his baptism, KING ALFRED was his godfather. And GUTHRUM was an honourable chief who well deserved that clemency; for ever, afterwards, he was loyal and faithful to the King. The Danes under him were faithful too. They plundered and burned no more, but worked like honest men. They ploughed, and sowed, and reaped, and led good, honest, English lives. And I hope the children of those Danes played, many a time, with Saxon children in the sunny fields; and that Danish young men fell in love with Saxon girls, and married them; and that English travellers, benighted at the doors of Danish cottages, often went in for shelter until morning; and that Danes and Saxons sat by the red fire, friends, talking of KING ALFRED THE GREAT.

All the Danes were not like those under GUTHRUM; for, after some years, more of them came over, in the old plundering and burning way—among them a fierce pirate of the name of HASTINGS, who had the boldness to sail up the Thames to Gravesend, with eighty ships. For three years, there was war with these Danes; and there was a famine in the country, too, and a plague, both upon human creatures and beasts. But, KING ALFRED, whose mighty heart never failed him, built large ships nevertheless, with which to pursue the pirates on the sea; and encouraged his soldiers, by his brave example, to fight valiantly against them on the shore. At last, he drove them all away; and then there was repose in England.

As great and good in peace, as he was great and good in war, KING ALFRED never rested from his labors to improve his people. He loved to talk with clever men, and with travellers from foreign countries, and to write down what they told him, for his people to read. He had studied Latin after learning to read English; and, now, another of his labors was, to translate Latin books into the English-Saxon tongue, that his people might be interested, and improved by their contents. He made just laws, that they might live more happily and freely; he turned away all partial judges, that no wrong might be done them; he was so careful of their property, and punished robbers so severely, that it was a common thing to say that under the great KING ALFRED, garlands of gold chains and jewels might have hung across the streets, and no man would have touched

case. He founded schools; he patiently heard causes himself in his court of Justice; and the great desires of his heart were, to do right to all his subjects, and to leave England better, wiser, happier in all ways, than he found it. His industry in these efforts was quite astonishing. Every day he divided into certain portions, and in each portion devoted himself to a certain pursuit. That he might divide his time exactly, he had wax torches or candles made, which were all of the same size, were notched across at regular distances, and were always kept burning. Thus, as the candles burnt down, he divided the day into notches, almost as accurately as we now divide it into hours upon the clock. But, when the candles were first invented, it was found that the wind and draughts of air, blowing into the palace through the doors and windows, and through the chinks in the walls, caused them to gutter and burn unequally. To prevent this, the king had them put into cases formed of wood and white horn. And these were the first lanthorns ever made in England.

All this time, he was afflicted with a terrible unknown disease, which caused him violent and frequent pain that nothing could relieve. He bore it, as he had borne all the troubles of his life, like a brave, good man, until he was fifty-three years old; and then, having reigned thirty years, he died. He died in the year nine hundred and one; but, long ago as that is, his fame, and the love and gratitude with which his subjects regarded him, are freshly remembered to the present hour.

In the next reign, which was the reign of EDWARD, surnamed THE ELDER, who was chosen in council to succeed, a nephew of KING ALFRED troubled the country by trying to obtain the throne. The Danes in the East of England, took part with this usurper (perhaps because they had honored his uncle so much, and honored him for his uncle's sake), and there was hard fighting; but, the king, with the assistance of his sister, gained the day, and reigned in peace for four and twenty years. He gradually extended his power over the whole of England, and so the Seven Kingdoms were united into one.

When England thus became one kingdom, ruled over by one Saxon sovereign, the Saxons had been settled in the country more than four hundred and fifty years. Great changes had taken place in its customs during that time. The Saxons were still greedy eaters and great drinkers, and their feasts were often of a noisy and drunken kind; but, many new comforts and even elegancies of life had become known, and were fast increasing. Hangings for the walls of rooms, where, in these modern days, we paste up paper, are known to have been sometimes made of silk, ornamented with birds and flowers in needle-work. Tables and chairs were curiously

carved in different woods; were sometimes decorated with gold or silver—sometimes even made of those precious metals. Knives and spoons were used at table; golden ornaments were worn, with silk and cloth, and golden tissues and embroideries; dishes were made of gold and silver, brass and bone. There were varieties of drinking-horns, bedsteads, musical instruments. A harp was passed round, at a feast, like the drinking-bowl, from guest to guest, and each one usually sang or played when his turn came. The weapons of the Saxons were stoutly made, and among them was a terrible iron hammer that gave deadly blows, and was long remembered. The Saxons themselves were a handsome people. The men were proud of their long fair hair, parted on the forehead; their ample beards, their fresh complexions, and clear eyes. The beauty of the Saxon women filled all England with a new delight and grace.

I have more to tell of the Saxons yet, but I stop to say this, now, because, under the GREAT ALFRED, all the best points of the English-Saxon character were first encouraged, and in him first shown. It is the greatest character among the nations of the earth. Wherever the descendants of the Saxon race have gone, have sailed, or otherwise made their way, even to the remotest regions of the world, they have been patient, persevering, never to be broken in spirit, never to be turned aside from enterprises on which they have resolved. In Europe, Asia, Africa, America, the whole world over; in the desert, in the forest, on the sea; scorched by a burning sun, or frozen by ice that never melts; the Saxon blood remains unchanged. Wheresoever that race goes, there, law, and industry, and safety for life and property, and all the great results of steady perseverance, are certain to arise.

I pause to think, with admiration of the noble king who, in his single person, possessed all the Saxon virtues. Whom misfortune could not subdue, whom prosperity could not spoil, whose perseverance nothing could shake. Who was hopeful in defeat, and generous in success. Who loved justice, freedom, truth, and knowledge. Who, in his care to instruct his people, probably did more to preserve the beautiful old Saxon language, than I can imagine. Without whom, the English tongue, in which I tell his story, might have wanted half its meaning. As it is said that his spirit still inspires some of our best English laws, so, let you and I pray that it may animate our English hearts, at least to this—to resolve, when we see any of our fellow-creatures left in ignorance, that we will do our best, while life is in us, to have them taught; and to tell those rulers whose duty it is to teach them, and who neglect their duty, that they have profited very little by all the years that have rolled away since the year nine hundred and one, and are far behind the bright example of KING ALFRED THE GREAT.

"Familiar in their Mouths as HOUSEHOLD WORDS."

HOUSEHOLD WORDS.

A WEEKLY JOURNAL.

CONDUCTED BY CHARLES DICKENS.

No. 49.]

SATURDAY, MARCH 1, 1851.

[Price 2d.]

TEN MINUTES WITH HER MAJESTY.

In divulging the details of a highly distinguished honour, we are not, we hope and believe, committing any breach of confidence. A desire to gratify the pardonable curiosity of our readers, in common with all classes of the community, respecting the person of our admired and beloved Sovereign, will not, we feel sure, be construed harshly. We are, indeed, incapable of rudely bursting the golden bonds of Etiquette that doth hedge the throne.

To guard against the imputation of boasting of a higher privilege than that really extended to us, we think it right to mention at once, that the business which took us into the presence of the "Highest personage in the Realm," was not of a private nature.

The memorable morning was a bright one in February—the fourth of the month. The sky was cloudless; a brilliant sun gave to it that cheering character which—from the good fortune Her Majesty experiences whenever she travels, or appears publicly—has passed into a proverb, as "The Queen's Weather." The conveyance in which we were approaching the palace—that of Westminster—was suddenly stopped at Charing Cross. A great crowd had collected between that point and our destination. A long queue of carriages—of which our Hansom formed the last joint—had been brought to a stand; and when, after a time, we were permitted to move on, we perceived that not only the streets, but the fronts of the houses, were thickly lined. Individuals of every age, size, and condition, occupied the pavements. The houses were decorated with a bright variegation of lovely faces, prettily framed in bewitching bonnets. Every window was filled; every balcony crowded; even the roofs of the public offices were tenanted. Head over head appeared on the steps of doors; the owners of apple-stalls, fitting them up as temporary standing-places, realised small fortunes; and, on grades of seats protected by crimson awnings, and built over areas, reclined the beauty and chivalry of eighteen hundred and fifty-one; recalling the days of the "Tilt-yard," whose site they actually overlooked. The standing army of spectators gave the docile Life-Guards

and patient policemen but little trouble to keep the carriage-road clear; for they passed the time pleasantly in viewing the procession of ladies and great officers of state who were slowly drawn along on the same errand as ourselves.

The stopping of a hackney cabriolet at the entrance of that portion of Her Majesty's Palace of Westminster which is devoted to the deliberations of the second estate of the realm in Parliament assembled, is not calculated to produce such solemn impressions upon the attendant police and marshals' men, as when emblazoned panels are drawn up, under the auspices of a Court coachman and a full-bottomed wig. On alighting, therefore, the only mark of attention we received, was from an official; who, with the anxious look of one who thinks he has encountered an intruder, demanded a sight of our credentials. One glance at the signature of the Lord High Chamberlain, in the corner of our card sufficed to dispel his anxiety; and, with a bland smile of welcome, he waved his truncheon towards the staircase it was necessary for us to mount—the same which, at no distant period of time, was to be pressed by the feet of Royalty. In expectation of that event, more loyal subjects lined the avenues, and stood on the stairs. In fact, from the drawing-room door of Buckingham Palace, to the foot of the throne in the House of Lords, an unbroken lane of human beings ranged themselves to behold the Queen.

No one who enters the House of Lords for the first time can suppress an emotion. As an assemblage of florid ornament, as a specimen of gorgeous decoration, this chamber is, perhaps, unsurpassed in the world; but whether the emotion be that of sober reverence for the high functions performed in it, or such a flash of mental exhilaration as is called up by the first view of a surprisingly gaudy ball-room, it is not necessary to inquire. It must be owned, however, that a ceiling blazing with gold, a base of burning red, a throne of burnished brass, and galleries enamelled with coloured mosaics, can scarcely be consonant with, or expressive of the important interests gravely discussed by the Peers of Great Britain. Yet, at the performance of a state ceremony, when the whole house is surrendered to the Court

and to the fair sex, the scene is not inhospitable.

When we entered, the Peers' gallery was untenanted; but a group of privileged ladies, in full dress, had already assembled upon the back benches on each side of the floor. Both groups were fast augmented by fresh arrivals, who were ushered into seats by good natured individuals, in black silks and brass badges. The honest, familiar pleasantness of the most active of these ushers would have astonished those who associate Courts with nothing but stately formality. To one levy of beauties he smilingly observes, "Ah! you're on the Peers' benches—that will never do. *This way, if you please!*" And the ladies flutter after him to a back seat. "Will you sit a little closer, if you please?" he asks of several other ladies, regardless of the amplitude of brocades and the probable crushing of satins. Frigid formality—for which the vulgar invariably give the aristocracy credit—is not to be met with even in the House of Lords, on the opening of Parliament: a buzz of conversation commences, above which rises, now and then, the music of a merry laugh. Presently a few peers, in their red and ermined robes, drop in; then an ambassador or two; and conversation becomes general. As the appointed hour approaches, the House fills—the Peers' gallery is soon fully occupied.

The picture of a peeress, present to the imaginations of the million, is that of a tall lady, with a long train, a diamond stomacher, and jewelled hair glistening under an arch of ostrich feathers. That is an Old School portrait. It is all altered now. Only one arching plume could we spy; not a single train; a display of precious stones far from overwhelming;—an array of costume, in short, of which the hackneyed epithet, "an elegant simplicity," is the true expression. When you look round on an ordinary assemblage of ladies of middle rank at an evening party, you will see the same general appearance as that which is presented in the Peers' gallery, and in the body of the House, on the opening of Parliament.

The hands of the clock move on. Bishops, lay Peers, Judges, Ambassadors converse in knots, on the vacant spaces around the throne, the woolsack, and the clerks' table, and the hum of gossip grows louder and louder. "There," to borrow a sentence—not unworthy of a footman—from De Foe, "you see blue and green ribbons sitting [and standing] familiarly, and talking with the same freedom as if they had left their quality and degrees of distance at home." It is a huge conversation. The even tenor of the buzz, reverberating from every corner, is only interrupted by the clinking of the spurs and accoutrements of the military lords and the officers of the guard. The good-tempered little gentleman in black threads his way upon the floor of the House with increased

celerity. More visitors and less room! His invitations to his fair charges to economic sittings are redoubled. At length he has found the last visitor a seat, and many eyes are turned towards the clock;—the hands have passed the figure "II."

A alight but sudden hush denotes that experienced ears have heard the booming of distant cannon. Her Majesty has started from Buckingham Palace; and her approach is gradually heralded to us by the deadened sound of successive salutes. Conversation ceases, and a great fluttering ensues. Every peer finds his allotted place. The Lord Chamberlain, the State Officers, the Gentlemen at Arms, and other officials, retire into the Prince's chamber, through doors on each side of the throne, to receive their mistress.

Now, there is not a sound. So sudden and dead a silence in so dense a crowd—nineteenths of which (may they forgive us for adding!) are women—excites surprise. A pattering noise comes from outside. It can hardly be rain, for the sun floods the chamber with his light through the livid countenances and parti-hued figures of the glass kings and queens. Guess again!—Hail, perhaps? O, no;—so great is the stillness within, that what you hear from without are the wheels of passing vehicles grinding their gritty way on the gravel. The grinding increases, and then suddenly stops. You think you can distinguish a cheer, muffled by the thick walls. The Queen is alighting.

During a very few minutes all eyes are turned towards the little door on the right side of the throne. Silently, without the faintest note of preparation, it opens. Two heralds appear; then two more; then the Lord Chamberlain; and next, the Queen and Prince Albert, attended by the Mistress of the Robes, and the great Officers of State; including the Lord Chancellor and the Duke of Wellington.

Every being in the House rises. The Queen—her hand in that of Prince Albert—mounts the steps of the throne, her train borne by two pages, and spread over the back of the state chair by the Duchess of Sutherland. She sits; then rises; and, with graceful gesture, bids the assembly to be seated. The Prince reclines in the arm-chair on the left side of the throne.

The pause which ensues while the Usher of the Black Rod departs to summon the "Faithful Commons," would be painful, were we not occupied in taking a survey of the magnificent spectacle as it is now arranged. The Queen, richly, tastefully, and not gaudily robed—her head-dress a tiara of diamonds, formed like a mural crown—addresses a few pleasant whispers to the attendant Duchess. The Prince is not within speaking distance of his consort, and occupies the House in the glittering uniform and jack-boots of a Field-Marshal. The Duke of Wellington holds erect the sword of state on one side of the Queen; on

the other, the Marquis of Winchester displays the Cap of Maintenance, and beside him, upon the extended arms of the Marquis of Lansdowne, rest the cushion and the crown.

The sensation of beauty communicated through the eye when it dwells in an endless variety and exquisite groupings of colour, is that which predominates, on viewing the scene in the mass, from above. Below, two large patches of spectators, arrayed in every tint and texture of female attire, are fringed by the red robes of the lay peers on the bottom benches, and tapered off on one side by the lawn sleeves of the bishops; while, in the Peersesses' gallery, similar hues are repeated, from the black silk of the mourner to the white satin of the bride. On the right of the throne, in the Ambassadors' box, is a more compact kaleidoscope of colours. The red Fez cap of the Turkish envoy, and the sky-blue uniform of the Foreign Minister of one of the Northern Courts, tell out conspicuously from the rest. Opposite, on the left of the throne, a group of Life-Guards and Gentlemen-at-Arms make a gorgeous display of scarlet and gold. The Judges of the land, packed together on the woollack under their powdered wigs, look like a blooming bed of cauliflowers.

The almost painful silence of this gorgeous still-life is suddenly and rudely broken by disorderly sounds, like those which follow the opening of the pit door of a theatre, or which precede the battering in of a house at a riot. The Speaker of the House of Commons, answers the summons of his liege lady the Queen, as if he were a schoolmaster with a mob of unmannerly boys at his heels; and is propelled to the bar of the House with the frantic fear of being knocked down and trampled upon by the rush of M. P.'s. A transient cloud passes over the Royal countenance; but it is rapidly succeeded by a prolonged smile at the ludicrous efforts of a couple of hundred of her eager Commons to squeeze themselves into a space only ample enough for a hundred. The account of a sufferer in the scramble is amusing:—"I happened," said Mr. Joseph Hume, in his place in Parliament on the following evening, "to be the twenty-fifth from the Speaker; but both sides of the bar were so filled, that I neither saw the Queen, nor heard her voice. I was knocked against a corner; my head was knocked against a post, and I might have been much injured, if a stout member, to whom I felt much obliged, had not come to my assistance. (Hear, hear, and laughter). It was no laughing matter." Mr. Hume recollected, moreover, that on a similar occasion, the coat of a member of the House who now fills a high office abroad, had been torn, and that his shoulder was dislocated.

Before the hubbub at the bar has quite subsided, the Lord Chancellor, kneeling on a step of the throne, presents to the Queen the manuscript of the speech. Its appearance is that of a piece of muslin, so unskillfully stitched with

ribbon to a cover, that the royal reader is more than once interrupted by a difficulty in turning over the leaves. At the words, "My Lords and Gentlemen," increased efforts are made at the bar towards silence. The Queen pauses for an instant; but when she resumes, not a sound is heard but her voice.

In her clear, fresh, distinct tones, Queen Victoria expresses her satisfaction at again meeting her Parliament. She continues to maintain relations of peace and amity with Foreign Powers. She is much gratified that the German Confederation and the Government of Denmark are putting an end to hostilities which threatened the Peace of Europe, and that the Government of Brazil has taken new and efficient measures, to abolish the "atrocious" traffic in slaves. The "Gentlemen of the House of Commons" are assured, as usual, that the Estimates of the coming year have been framed with a due regard to economy, and to the necessities of the public service. "My Lords and Gentlemen" are again addressed in terms of satisfaction at the prosperity of the country, with the exception of the owners and occupiers of land; but a hope is expressed that the prosperous condition of all other classes will eventually diminish even their difficulties.

Here there is a short pause. And the following sentences are read with a slight elevation of tone:—

"The recent assumption of certain ecclesiastical titles conferred by a foreign power, has excited strong feelings in this country, and large bodies of my subjects have presented addresses to me, expressing attachment to the Throne, and praying that such assumptions should be resisted. I have assured them of my resolution to maintain the rights of my Crown, and the independence of the nation, against all encroachment, from whatever quarter it may proceed. I have, at the same time, expressed my earnest and firm determination, under God's blessing, to maintain unimpaired, the religious liberty which is so justly prized by the people of this country."

After announcing measures for the better administration of justice, and for the registry of deeds, the peroration closes the political brief. The cover is folded over; and the manuscript handed to the Lord Chancellor.

The elocution of the speech was perfect. Nature has combined in Queen Victoria's voice, sweetness, youthfulness, and fullness; and Art has taught her to deliver it with exceeding purity of tone, and without the smallest effort. Every syllable, therefore, entered every sound pair of ears in the House; except those placed, unhappily like Mr. Joseph Hume, more than twenty-five removes from the Speaker—not of the speech—but of the House of Commons.

The music of the last words has scarcely passed into silence before the Queen rises, and bows to the spectators; who, also, rise in a body. Prince Albert hands her from the throne, and the short procession retires into the Prince's

chamber in the same order as it entered. This ends the ceremony, which has lasted but very little over ten minutes. In five minutes more the House of Lords is left to the sole occupation of the dapper gentlemen in black.

We have heard a great deal of the powers of the Press, and have experienced the wonders of the electric telegraph; but those who had the privilege of spending ten minutes with Her Majesty, in opening Parliament, must have been a little startled on reaching Whitehall, to be offered an evening newspaper containing the Queen's speech; the last sentence of which from the Queen's lips had hardly died on the ear. Wonder, too, would be increased by the recollection that although the Reporters' gallery was filled, not one of the Gentlemen of the Press had taken a note. By what magic then, could the speech have been so quickly printed?

Everybody knows that the "Queen's Speech" does not deserve its name. It is not the Queen's; nor is it a speech;—it is a document. The First Minister sketches it, subsequent Cabinet Councils reduce it to shape, and it is then submitted to Her Majesty. When returned with her approval, the speech is divulged (at a ministerial dinner) to the non-cabinet members of the administration. Thus the mere topics of the manifesto ooze out at the Clubs the night before the Speech is spoken. But it is the actual text which the public is eager for; and, that no time may be lost, emissaries from the London evening papers appear at the Treasury about the time Her Majesty is preparing her toilette, at Buckingham Palace, for the ceremony. The moment the first gun announces that the procession is in motion, the evening paper envoys are obliged with copies of the document; and before the Queen has done speaking in the House her words are in type.

Formerly the Gentlemen of the Press were locked in a room in the Treasury till the carriage was on its way back. Some years ago an escape was made from this official dungeon, which caused some amusement. The editor of the Government paper in Dublin was most anxious to start for Liverpool by one o'clock, to catch the packet for Dublin. The Speech was handed some time before that hour, and the key was turned as usual. Presently, however, the clerks and messengers were alarmed by frantic cries of "Fire!" They opened the door—the room was filled with smoke. The editor, in the confusion, made his escape, leaving the frightened clerks to extinguish the harmless sheet of brown paper he had intentionally ignited.

We, of the present day, improve on the Irish Editor's plan. His was a fire escape; ours are lightning conductors. It is at such a time as this, that the wonders of the Electric Telegraph become startlingly apparent. The City of Edinburgh is about four hundred miles from Buckingham Palace. While the State

procession is wending its slow way back from Westminster, the wires are charged; and—marvellous fact!—at the same moment that Her Majesty is alighting at the steps of the Marble Hall, several of her lieges in the Scottish capital, are beginning to read her Speech; which has taken no more than fifteen minutes to transmit. She dines at Windsor; and before the banquet is over, the text, *verbatim et literatim*, of what she had uttered at a quarter past two, has reached Dublin. Before the royal family has retired to rest, the Speech is in every principal town in the Kingdom. In these cases there had been no anticipation, for the Speech was read off at the London Telegraph Station from the evening papers.

A DARK SUSPICION.

"TAKE steam, Capt'en!" cried a clear voice from the hurricane deck of a huge tug-boat, with two funnels; which—with a large ship under each arm, and a brig and a schooner astern—was majestically walking past our little schooner, up the broad current of the Mississippi.

"What'll you do it for, from here?" returned our old man, poking his head up the companion-way. The hoarse, heavy pantings of the steamer's engines ceased for a moment, as she stopped abreast of us.

"Five and twenty dollars."

"No!"

"Go on ahead!"—and away moved the steamer with her train, looming for a minute through the morning mist like a great castle. We, in the little schooner, were left lumping in the swell she made, against the branches of trees, snags, and drift, that bordered the river's bank, where we were lying with no other mooring than a single rope, fast round the trunk of a tree ashore. We had been a week from the Belize, trying to sail up against the current; and had not yet reached "English Turn," a bend in the river; where, once upon a time, "Britishers" were obliged to turn back about half way to New Orleans. The wind was again unfavourable, so we were eventually compelled to take steam at the price demanded; and, under the auspices of one of the numerous tugs continually panting past, we were soon steadily and rapidly shortening the distance to Orleans. The banks of the river, as we passed, presented nothing very striking in the way of scenery; here and there some pretty houses, in the midst of plantations—nearer the mouth the shore was mere swamp. The tug steam-boats attract most attention. Instead of two steamers to one ship—as you may see almost any day at the Nore, creeping up the river, or clawing round the Foreland—you observe five, six, and even seven vessels to one steamer; and she steaming handsomely against a current seldom flowing less than four miles an hour.

In due time we arrived, and moored the schooner to the Levee, as the artificially-raised quay on the river's bank is called. Here my connection with the little schooner ended; and, taking what dollars were due to me, exchanged her for a little home at a boarding-house, on the Levee, where they give three meals a day, and a little room, for three dollars a week. New Orleans, at this time—some six years ago—was the scene of as much debauchery and dissipation—to say nothing of worse crimes that are not included in the list these two headings comprise—as any city of its size in the world. My observation was certainly confined to classes not the wealthiest or most respectable; but that they reflected, with increased or diminished vividness, the vices of the higher portion of the community, the history of New Orleans tells plainly.

To see in every house that I entered a pack of cards in use, and a carouse in progress; to hear, every morning, of four, or perhaps five bodies found dead in bye-streets; and to be without a home or a friend, except what my boarding-house afforded, was my lot; as every day I walked from one end of the Levee to another, looking at the ships, and listening to the cheerful songs of the men at work, and longing for a home with them.

I had paid my last week's board, and had just twenty-five cents left in the world, when I turned out after breakfast for my usual walk.—“Shall I have a cigar or no?” I pondered while passing my usual place for that indulgence. “Yes, I will—something will turn up to-day, I feel sure;” so I invested a portion of my last coin; and walked along, puffing with as much satisfaction and complacency as if I had owned a tobacco plantation. “Hallo! Where did you spring from?” roared a voice, suddenly startling my meditations.

I looked up;—before I had time to answer, my hand was seized by a man whose face seemed familiar to me, though I could not, for the life of me, tell where I had seen it.

“Reckon you don't know me—eh?” added the stranger, observing the look of doubtful recognition I glanced at him. “Know you, though—you look just the same—may be a little better, in a straw hat and blue frock, than you used in your gold band and buttons, aboard the ‘Jumna’ Indianman.”

“Why, bless my soul, it's Myers!”

“Guess it is—what's left of him, least-ways. And what are you doing here in this rig, if I may make so bold?”

“Why, I'm looking for a ship, Myers.”

“Well, be darned if this don't beat all! Come in here, and have something to drink—yes, you must. Well by gracious!” continued he, lugging me along; “I've seen some queer starts since I was young gentleman's steward in the old ‘Jumna,’ but this beats everything by chalks.”

We required sundry glasses of bottled beer

to wash away enough of my friend Myers' astonishment and delight, to permit him to talk rationally; and then I ascertained that he was captain's steward of a vessel called the “Bohemian,” on board of which there was not a soul besides the captain and himself. She was lying at the opposite bank of the river, at “Algiers,” preparatory to going into dry dock for repairs.

“He's a first-rate sort of old man,” continued Myers; “and there's a capital chance for you if you like; for he's lookin' out for a ship-keeper—so say the word, and I'll be off and speak to him at once.”

“I am very much obliged to you, I said.”

“Stop here till I come back,” cried Myers, running off; and in half an hour he came again, out of breath. “It's all right—I was just in time; you can come aboard to-day, he says—the regular port wages—and all you've got to do is to order yourself about.”

I shook Myers by the hand, and thanked him cordially for what was the greatest service any one could have then done me.

“But I can't understand how it is you're here in this fashion,” continued he; “a young gentleman as used to sport gold lace, ain't no business to be rigged out in tarpaulin.”

“Why, you see, Myers—to make a long story short—I found that wearing a fine jacket would never teach me to be a good sailor; so I thought I had better begin at the right end of the ship at once; and, after a considerable deal of knocking about, I got into a Yankee craft, and was discharged only the other day.”

“Well, I believe you are just about right, sir. Flashing about in them buttons ain't the way to make a navigator; and they pays pretty dear for it, too, I reckon!”

“Now then, Myers, we will go on board the ‘Bohemian,’ if you are ready.”

On our way across the river to Algiers, in the little ferry-steamer that is continually plying, Myers told me the history of his wanderings since we had been shipmates—when I was one of the inmates of the so-called midshipman's berth of the “Jumna” East Indianman, and he was our steward—but there was nothing in it beyond the usual ups and downs of a sailor's life.

The Algiers side of the river is devoted entirely to yards and workshops, where everything connected with the fitting and repairing of ships and their rigging is carried on. Through this labyrinth of half-made masts, ropes, chains, and old boats, we made our way; and at length arrived opposite an old vessel, with her topmasts struck, that was lying grinding rustily against the quay.

“Here we are,” said Myers, stepping across the gangway-board. Following him, I found myself on the deck of the “Bohemian.” She was an old craft; the seams of her narrow planks were gaping with age, and the paint on her side was musty and

checked. The cabins were in the same condition, with the exception of one which the captain had rendered habitable for his occasional use. Shortly after our arrival, he came on board.

"Oh!—You're the man," Myers spoke about—the shipkeeper?"

"Yes, sir."

"Very well. There isn't much for you to do at present; you'd better make yourself as comfortable as you can."

And away he went below; and down I went too, to examine what sort of a place I had to do so in. On descending the "Bohemian's" fo'k'st'le-ladder, the prospect would not have presented itself to a landsman as auguring much comfort, even had he conceived it habitable. Perhaps the difference of a sailor's habits, or the force of necessity, made me view it more favourably. It was large, and had six bunks on each side, roomy enough to carry double; it was tolerably clean, and did not show any traces of leakage; so, upon the whole, I was tolerably well satisfied. Some of the bunks were filled with blocks, and coils of rope, and gear of all kinds; and, having cleared out one, which seemed, from its position, to receive more light than the others from the little scuttle, I arranged my bed in it as comfortably as I could, and returned on deck.

The "old man" was pacing his quarter-deck, smoking a cigar, and awaiting dinner, which Myers was busy cooking in the caboose on deck; whence, every now and then, he popped his head, glistening with warmth, to exchange a word or a joke with me. One feels a sort of guilty consciousness—at least I always do—when doing nothing in the presence of an employer, even although there is absolutely nothing to do. Everything was too far gone to be mended in any way, except by something new: so I sat on the windlass, and stared in desperation at the "old man," every time he turned his back in his walk.

"Here," said he, at last, perhaps divining my thoughts.

"Sir?"

"You may put the signal-flags to rights, if you like; you'll find 'em all in the cabin; and Myers will get you what bunting and thread you want."

I felt really glad to have something to do; so I went about my new task immediately.

"Of course you understand you are always to sleep on board?" added the captain, as I passed with a bundle of flags I had just brought up under my arm.

I replied in the affirmative; and, sitting in a corner, busied myself about my work. Nothing occurred during the day to interfere with my quiet studies; nor did there seem much chance of any interruption to our way of life. Myers and I had our chats, and the captain his dinner, as regularly as possible. Sometimes he would remain all

day and all night, and sometimes only one hour out of the twenty-four.

I felt lonely enough my first night in the old barque. I had one short piece of candle for my nightly allowance; and, when Myers had left me for the after-part of the ship, which was under his charge, I trimmed it up, and fixed it firmly in my bottle-candlestick, preparatory to having a read and a smoke; for, in tumbling over the things in the bunks, I had found, among other things, some pages of "Letters of Lord Byron." This was too great a prize in the present state of affairs for me to trouble myself how they got there. At last, after a long read, I fell asleep. Once I woke with the old ship's harsh grating against the quay, as a passing steamer rocked her. Then there were rats rummaging among the blocks and ropes in the bunk above me. One ran across my face. Presently I heard a footstep, I fancied, on the deck, making the empty ship re-echo. I jumped up the ladder, and looked round; but there was nothing visible in the quiet moonlight. Again I turned in and dozed; but a sounding noise, as if some one had fallen in the hold, again startled me. I felt certain some one was moving about in the ship, and was about getting up and rousing Myers, when I heard my shoes dragged across the deck by the rats, and another hullabaloo among the blocks overhead; so I put everything down to them, and fell asleep at last. The next morning I asked Myers if he had heard anything? He said he, too, had fancied he'd heard a noise in the night. However, we both accused the rats, and thought nothing more of it.

The after-part of the ship, which was partitioned off into cabins, and the midship part of the between-decks were divided by a bulkhead, through which there was a communication by means of two doors, now generally left unlocked. This intermediate space between the cabins and the bulkhead, called the steerage, was used as an indiscriminate sort of repository. Here, of an evening, I put my flags away when I had done work.

Day after day passed in the same manner as the first; except that the captain was sometimes not in the best of humours, as I could hear by his rating Myers, though he seldom said anything to me. Myers himself, too, of a morning, was sometimes in a tremendous way, for he discovered the loss of sundry eatables from the galley, which disappeared in a mysterious manner in the night. I heard noises, too, at times in the night; but had become too much accustomed to them to take any more notice; having once with Myers had, as we conceived, a thorough overhaul of the ship in consequence. I became accustomed to my solitary occupation of the fo'k'st'le, and used to lay in daybreak and watch the rats, or listen to the cries of some poor slave being flogged ashore; which latter was not at all an unfrequent occurrence. One day the

"old man" came on board in a worse humour than usual.—Myers had his share of abuse first; and then, to my astonishment, he commenced upon me.

"What! ain't those flags finished yet? If they'd been anything good to eat, they'd have been done long before this, I guess!"

"I've not been hurrying about them, sir," I rejoined, respectfully.

"So it appears," added he sharply. "Come, now; just bring 'em up here, and let's see what you've done."

I went below to the steerage at once, and brought up the bundle.

"Well! where's the rest of them?" said the captain, after looking through and counting them. "There ought to be four more."

I looked them through, and noticed that some I remembered working on were not there. So down I went again, to see if I had overlooked them. I could see no more below. I came and told the captain. He was striding up and down, and evidently working himself into a passion.

"So, there ain't any more, ain't there? Now I can tell you what it is, young fellow; if you think you've got a fool to deal with, you're mostarnation mistaken. Myers tells me he's missed a lot of things; and it's my belief them flags are gone with the rest. So the sooner you say where they are, the better; or else off you slope to the jail at Orleans alk."

I was, as may be supposed, rather taken by surprise at this.

"I know nothing about the flags," I said.

"Oh! of course not, I dare say you don't. We'll see if we can't make you know, though. Here, Myers—"

"Sir?"

"Get yourself ready to go over with me to the magistrate at Orleans, at once."

"What for, sir?" said Myers, looking from me to the captain with astonishment.

"Why, to put this young blackguard in prison," said the captain, striding up and down furiously.

"What!" shouted Myers. "What! put him in prison! It would be the worst piece of business you ever did in your life. Do you think he'd steal flags, or anything else? I'll go before the magistrate at once; but to swear he hasn't left the ship on any such errand as that, since he and I have been together."

"You're a pair of scoundrels," cried the captain, actually foaming with passion; "come along with you both—now—at once."

Accordingly, Myers and I prepared to cross the river with the captain, who was quite beside himself with rage at first; but soon got a little cooler. Just as we were about to leave the ship, two men came on board. They accosted the captain; "We're on the look-out, sir," said one of them, "for a runaway nigger—answers to the name of 'Tom'—marked R on the left arm—left Mr. Bandon's plantation, five miles up the river,

a-week ago. May we look through your ship, sir, as we hear he's been seen somewhere hereabouts?"

"Oh! yes, of course," said our captain, stopping his intended journey at once.

Lights were procured, and immediately the men commenced a strict search in every part of the ship. Myers and I remained on deck. At last, after the lapse of a quarter of an hour, we heard a great outcry below; and up came our captain, followed by the slave-hunters, dragging an unfortunate runaway they had found concealed behind a water-cask in the after-part of the ship's hold; and, in a corner of the transom that it would not have seemed possible for a human being to squeeze himself. The missing flags were found there. He had taken them for a bed and covering."

"Do not take me back; I shall be flogged again. Dear, good captain, help me!" said the poor wretch, as he sank on his knees on the deck, clasping his arms, and pitifully appealing to our captain.

"I wish I could help you," said our captain; and Myers and I looked on, too, now with intense interest; for, heedless of the poor fellow's prayers, tears, and cries, he was dragged away by the men. He never ceased appealing to us and our captain as he was carried off. Our "old man" wiped a sort of half tear away as he turned to us, and said,

"I beg your pardons, both of you. Will you stop with me after what has occurred? I am ashamed of myself; and if you can forget it, we'll say no more about it."

Myers looked at me, and I looked at Myers. Certainly, ten minutes before, I should have thought any one who had predicted that I should stay that day in the "Bohemian," a false prophet; but we could not refuse, nor had we afterwards any occasion to repent it.

The poor runaway threw himself overboard, and was drowned, on the way to the plantation.

BITS OF LIFE IN MUNICH.

THE FAIR.

I WONDER when there is not a fair in Munich. This, however, was *Die Drei-Königs Dult*, or the Fair of the Three Kings. By way of amusement, I thought I would go to it; but as I could not very well go alone, I invited Madame Thelka to accompany me, with which she was very well pleased, as I promised to treat her to the shows. As far as buying and selling, and the crowds of peasants, and townspeople, and students, and soldiers, go, it was like any other fair. At a little distance from the long array of booths, stood the shows—and thither we bent our steps.

The first thing we came upon was a small ladder-wagon, covered with an arched awning; and, bound to one side of the wagon, were tall poles, from which floated a series of ghastly pictures—hideous, raw-head-and-bloody-bone

pictures! There were murders, executions, beheadings in German fashion; the criminal extended on a horrid sort of rack; and his head being chopped off by a grim executioner, with a sword, whilst a priest stood by in his long robes; there were houses on fire; drownings, miraculous escapes; there were tall, smirking hussars, and weeping ladies in white—heroes and heroines in these bloody histories!

The subjects, the hideous drawing, the hard outlines, the goggle-eyes, the blood, the knives, the very fire, made you feel sick. A considerable crowd was collected, and listened breathlessly to the sounds of an organ, to which two Tyrolians sang their appalling tragedies. They sang in such clear, sweet, mountain tones, that you were strangely fascinated. Mournfully sang they, in a monotonous chaunt, of blood, and crime, and terror, till you felt your blood creep; and, by a frightful fascination, your eyes gloated on the disgusting pictures.

What a terribly immoral influence must such exhibitions have upon such an uneducated crowd as surrounded these syrens! Why should not a paternal government, which guards its people from immoral books and disgusting newspapers, not guard them equally from such a disgusting sight and sound as this Tyrolian exhibition? These Tyrolians sold printed histories of the fearful crimes and calamities which were depicted on their banners. These histories are very exciting and romantic reading, as you may believe when I give some of their titles:—"The History of the Great and Terrible Monster, who cruelly murdered his Beloved, his Child, his Father, his Mother, his two Sisters, and his Brother, on the 8th of July, 1850." "Heroic Self-sacrifice of a Bohemian Hussar Officer, and the Punishment of his Murderers." "A true and dreadful History which occurred on the 14th of March, 1850, in Schopka, near Milineck, in Bohemia." "The Might of Mutual Love: a highly remarkable event, which occurred at Thoulon, in the year 1849." "The Cursed Mill: a Warning from Real Life." "The Temptation; the Deed; the Consequences!"

If you care to know anything of the style of these remarkable productions, I will give you a specimen. One begins thus:—"In Ross-dort, in Hanover, lived the criminal Peter Naber. He was by trade a glazier, his father having followed the same calling. Peter was five-and-twenty years old, and was, from his earliest youth, addicted to every species of crime. He had a sweetheart, named Lucie Braun, a poor girl, &c., &c."

Again:—"Silent sat the miller, Levetm, in his garden; thoughtfully gazed he into the distant valley. He was scarcely thirty years of age, but heavy cares had bowed him, and robbed him of his fresh, youthful bloom. Beside him sat his wife, who cast many an anxious but affectionate glance on her

husband. How tender and lovely was this young wife! The inhabitants of the neighbourhood called her "The Rose of the Valley." In this way begins a most awful tragedy.

Of course we did not read these things in the fair. It was enough for us, there, to listen to the mournful chaunt of the mountaineers, till our blood was frozen in our veins. I took home with me these horrible printed histories, as many another simple soul did; and now, after I have read them, and been filled with horror and disgust by them, I have put them away from me as unholy things. But think of the effect they will have in many a lonely village, this winter—in many a desolate farmhouse or cottage—on the wide plain, or among the mountains! These papers are productive seeds of murder and crime; of that one may be certain.

The next wonder that stopped us in the fair, was a little fat man, who was shouting away at the top of his voice, whilst he briskly sharpened a knife on a long, rough board, which was smeared over with a black ointment. He was a vender of magical strop-salve! something in the fashion of Mechi. "Ladies and gentlemen;" shouted he, "witness my wonderful invention! The dullest knife, stick-knife, bread-knife, clasp-knife, table-knife, carving-knife, shaving-knife, (*rasier-messer*) pen-knife, pruning-knife, though dull as this knife—*though dull as this knife!*" and here he began hacking away upon the edge of a big knife with a strong piece of broken pitcher. "Yes, though dull, dull, dull as this knife!—when subjected to my wonderful salve," and here he smeared it with his black ointment, "will cut a hair, or the most delicate shaving of paper—as it now does!!" and with that he severed paper shavings as if they had been nothing. If it was really the *same knife*, his was a wonderful invention, and beat Mechi hollow.

Next, I had my fortune told at three different places, for six kreutzers, or two-pence each, and as I was promised pretty much the same fortune by all, I suppose I ought to believe in the truth of it. They foretold me lots of trouble in the way of love-crosses, false friends, and unkind relations, and such small trifles; but were equally liberal of rich lovers, and plenty of them, plenty of money, and a good husband to crown all, and good children to be the *props* of my old age; so I think I had, after all, a good sixpenny-worth.

Next we came upon a little caravan, on the steps of which vociferated a most picturesque Tyrolian, in broad-brimmed, sugar-loafed hat, adorned with champps hair, and eagles' feathers; in broad-ribbed stockings, and with a broad, gaily-embroidered band round his waist, which half covered his chest. He assured the crowd below that there was not in the whole of Bavaria, anything half as interest-

ing, half as extraordinary, half as astounding as the singularly-gifted, singularly beautiful, singularly intellectual being within; a being from another quarter of the globe, a being adapted to an entirely different mode of existence to ours; a being who could see in the dark, a being who only lived upon raw meat! A wonderful Albino who could speak the German tongue!

Of course we must see the Albino; so in we went, and some way or other I felt an unusual shock. There he sat, in a black velvet dress spangled with silver, the light coming in from the top of the caravan, and his transparent complexion, his burning, fiery eyes, like carbuncles, his long waves of white, silky hair, and his long, curling, snow-white, silky beard, gave him the appearance of some enchanted dwarf—some cobold or gnome out of a subterranean palace.

But I had not much time to lose myself in dreams about enchanted dwarfs or gnomes, for there was something else burning in the caravan besides the Albino's eyes, and that was Madame Thekla's grand silk cloak! She had come out with me in all her grandeur; and now, while we stood enchanted before the Albino, her fine silk cloak was singing at a little iron stove that stood behind the door. Poor Madame Thekla! Out we rushed, and she revenged herself by vociferating to the crowd outside, as the Tyrolian had done just before, and by exhibiting her unlucky cloak in a sort of savage despair.

An hour afterwards, we again passed the caravan, and the Tyrolian in the ribbed stockings was again holding forth on the steps, when, at sight of us, he interrupted his oration, and politely invited us to re-enter, and complete, *free of cost*, our inspection of the Albino. But Madame Thekla, pointing with stern dignity to her cloak, declined, and marched on.

After this we went to the *wüffeln*-booths, where we ate hot-baked *wüffeln*, a kind of gofre cake; and then, resisting a wonderful elephant show, we hastened to the monkey theatre, the poor elephant's rival exhibition; the "Grand Monkey Theatre from Paris," in which forty-two apes and poodles, the property of M. Le Cerf, would exhibit the most wonderful and artistic feats.

We had to wait some time till the four o'clock performance was over, which unfortunately had begun before we arrived; and whilst Madame Thekla and I stood impatiently waiting in the cold, up there came a merry-faced lad of about ten, and began, in great glee, to describe to us the glorious things that were performed by those "dear little monkeys and dogs." He was quite eloquent in his delight; and, "Oh!" said he, "if I had but another *sechser* (twopenny-piece), wouldn't I see it again?" "There is another *sechser*, then!" said I, and put one into his fat little hand. What an astonished, bright, face looked up into mine; and he seized my hand in both

his, and shook it almost off. And away he ran, up the steps for his ticket, flying down again to us, and keeping as close to us as possible, talking all the time, and fairly dancing for joy.

"You've quite bewitched that little fellow," said Madame Thekla; and I seemed to have bewitched all the little lads in the fair, for, by a strangely-mysterious power, they were drawn towards us in crowds, from all hands—little fellows in blouses, little fellows in little green and brown surtouts, little fellows in old-fashioned, and, in England, almost forgotten, buttoned-up suits—and all crept bashfully towards us! Oh, the wonderful magic of a twopenny-piece! Heaven only knows how the news of this munificent gift of a *sechser* had so swiftly spread through the fair! One little lad actually had the bravery to say to me that "children were admitted at half-price!" And was I not a cold-hearted wretch to reply, "Oh, indeed!" just as though it were a matter of perfect indifference to me, though, in truth, it was not; but I felt rather appalled at the sight of such a crowd of little eager heads, well knowing that my purse was not full to overflowing, even with twopenny pieces!

At length we were seated in the little theatre; and, after a fearful charivari from the orchestra, the curtain drew up, and we beheld, seated at a long table, a company of monkeys! It was a *table d'hôte*. A dandified young fellow—perhaps Monsieur Le Cerf himself—in the most elegant of cravats, the most elegant white wristbands, the most elegant ring, and the most elegant moustache, performed the part of host; the waiter and waitress were monkeys. The waiter—a most drunken, good-for-nothing waiter he seemed—a fat, big ape—drank behind the backs of the guests the very wine he was serving them with; he seemed so very tipsy, that he could hardly walk; he staggered backwards and forwards, and leaned against the wall for support, as he emptied the bottle he was bringing for the company. But the little waitress! She was a little darling; the tiniest of little monkeys, and she came skipping on the stage in a little broad-brimmed straw hat, and a bright-coloured little dress, with the daintiest of little white muslin aprons on; she looked just like a little fairy. Everybody was enchanted with her. Even Monsieur Le Cerf himself caressed her, and gave her not only, every now and then, a nut, but a kiss. She behaved beautifully. But as to the guests! They quarrelled, and even fought—Monsieur Le Cerf said it was about paying the bill.

I can't pretend to tell you half the clever things the monkeys did in the way of swinging, dancing, firing off muskets, riding on a pony, &c. Wonderful things, too, were performed by the dogs, splendid spaniels and setters. One large black-and-tan creature walked on his fore-legs, in the style of what

children call "playing at a wheelbarrow," only he himself, poor wretch, had to wheel the barrow. He walked demurely round and round the stage, carrying his two unlucky hind-legs up in the air; then he walked on three legs, and then, the most difficult task of all for a dog, as we were assured, upon two legs on the same side. Another beautiful white spaniel came walking in most grandly on her hind legs, as *Madame de Pompadour*, in a long-trained dress which was borne by a tiny monkey in livery, bearing a little lantern in his hand.

The finale was the besieging of a fortress; and to see some twenty milk-white spaniels rushing up and down the stairs of the burning fortress, illumined by brilliant rose-coloured, green, and blue lights, was very curious indeed. If I could have forgotten the terrible training through which these poor creatures must have gone, I should have enjoyed it much more. But I did not wonder, after seeing all their feats, that our little friend had been so enchanted. He sat behind us in the half-price seats, but for all that we continued to exchange many smiling glances during the performance. I only wished I could have seen a whole row of little fellows all equally delighted and surprised by their good fortune.

A PUBLIC BALL.

I WENT last night to one of the grand public balls; but not to dance, only into the gallery, to look on and enjoy the spectacle without the fatigue—or the pleasure. This ball was in the Odéon, one of the principal public buildings here, and where the Conservatorium is. The room where the ball was held was the same that I described to you once before, when a concert was given by the pupils of the Conservatorium. Myra F. and I mounted some dozen steep flights of stairs, and at length emerged into the gallery. We left a throng of carriages setting down ball-attired ladies and gentlemen at the principal entrance, and a throng of spectators admiring them.

Quite out of breath, from our long ascent, we found ourselves in the gallery which runs round the large hall, at an immense height from the floor. The gallery was crowded with people, all eagerly leaning, in a double row, over the railing; so that, from the ball-room below, the ceiling must have seemed adorned with a corrie of living faces. The gallery-crowd appeared to consist of friends of the ball-room company, who were anxiously watching or waiting the advent of their friends below; and of good citizens, and other people, who, not being themselves of the *haute volée*, had come to criticise and copy their betters—in rank.

It was with considerable difficulty that Myra and I found standing-room where we could see; yet it was only half past six. When we did, we looked down upon numberless chandeliers, which, with their circles of

starry lamps, illumined a very gay-looking company indeed. At the further end of the hall was a low platform, approached by a flight of steps covered with carpeting; and here stood a very fine grove of fir-trees, orange-trees, and greenhouse shrubs, behind which were concealed the musicians. The whole platform was in fact an elegant saloon; where stood couches, chairs, and tables, the crimson and richly-coloured coverings of which looked excessively pretty among the green trees and shrubs. Tapers burned in tall, branching candlesticks upon the tables, and groups of young ladies, in clouds of white muslin, or in pink gauze, looking like rose-buds among all the green leaves, stood or moved about; whilst gentlemen in gay uniforms, or in the less attractive civil costume, as it is called—black coat, white waistcoat, and hat in hand—crowded round them. There was no lack of more sober colouring in the dresses of the *chaperones*, in their velvets, silks, and satins. And all these gay people were thickly scattered, not only over the aristocratic platform, but the whole hall, a group of gentlemen clustering together in the very centre of the beautiful, inlaid floor, like a swarm of bees.

Many of the grantees of Munich were either already present, or were expected. King Max himself was looked for: Prince Adelbert had already arrived, and only to be distinguished from the company by wearing a *brown* instead of a *black* coat, such being his privilege as a prince of the blood.

And now, from the concealed orchestra, sounded the first note of the Polonaise; and the gentlemen hastened towards their partners, and all solemnly paraded, in stately procession, the ball-room; and now burst forth a waltz, and away flew the dancers.—Oh! it really was very tantalising to hear that beautiful music, and to see those dancers; and to be up in that hot and close gallery, in a merino dress and overshoes! There was a painful contrast. For the first few moments I declared to Myra, that, spite of all my philosophy, which had made me decline an invitation to this very ball, I now wished I had been there, and that I *must* and *would* go to the next, if it were only for the sake of old times! But soon after came a *Française*, or, as we call it, a quadrille; and then another waltz, and then a polka, and then a *Française* again; and, by that time, I began to feel that it to look on at a ball was at first tantalising, it became, after a while, very wearisome—"the greatest bore under the sun!" as I remember to have heard certain unhappy victims, who did not dance, declare—but which assertion I, at the time, did not appreciate.

But soon a pleasant excitement arrived for us. Madame F., Myra's mother, and her sister Anna, entered the ball-room. They came aristocratically late. How handsome they looked; Madame F. in black, with some-let flowers in her hair; and Anna looking a

very Hebe, in simple white muslin, with a scarlet sash and scarlet bows on her sleeves, and nothing whatever in her hair. She was the simplest, and, to my taste, the most elegantly-dressed girl, in the room. Her beautiful head, with its rich, dark hair, looked quite conspicuous, from the entire absence of all artificial ornament. Standing there in the gallery, in my stuff dress and overshoes, I felt really proud of them. They created quite a sensation as they came in; and as Anna stood beside an orange-tree on the platform, with all her simple beauty, in her white dress and scarlet ribbon, and with her beaming, happy face, I did not wonder at the host of gentlemen that made their way to her.

Myra and I, and their servant Elise, who by this time had joined us, grew quite excited. "There," said Myra, "is Count R. I know Anna will dance with him. And there is young S.: I think she has promised him a dance! And there is that little lieutenant; and there is the student from N.; but she won't dance with him—of that I am sure!"

And so we watched the dumb show of Anna's arrival, and subsided somewhat, when, leaving Madame F. quietly seated upon one of the couches among the orange-trees, we beheld Anna waltz away with a tall officer in blue uniform.

Again I began to grow desperately weary, and looked round with longing eyes for dear old Fraulein Sanchen's old-fashioned face. It seemed to me that she never would come! Fortunately, a little love-making in the foreground of our gallery made me forget my fatigue for the time. There sat just before us a very pretty girl, very young and childish-looking. I caught a glimpse of a sweet, child-like brow, and long, drooping eyelashes, as she sat in the front row with her married sister. Presently, one of the gentlemen from the ball-room below made his appearance. I fancy he was a student; but I did not admire his look at all. He was evidently desperately in love with the pretty girl; he forgot all about the ball, and talked most earnestly to her behind the married sister's back; she smiled, and said very little, but listened, and seemed also to forget the ball. Soon, another gentleman arrived from the ball-room below; and then jealousy was added to love. The first lover turned black as a thunder-cloud, and I thought looked more unpleasant than ever; he did not go away, but stood scowling like a jealous lover in a picture of Stephanoff's; and the girl listened with the same smile and the same innocent brow to the second lover, the married sister all the time looking down into the ball-room.

This amused me for a while, and then another group also amused me. A dowager, in her velvet and grandeur, attended by a queer little old officer, a regular German Major O'Dowd—with spectacles on, and a plumed hat in his hand—brought up a beauti-

ful young lady to speak to some dear friend in the gallery; and lots of other grandees from below found their way into our upper regions, till we also seemed all astir and gorgeous. But, O! joyful sight! amid all the grand arrivals, there was Fraulein Sanchen, with my shawl on her arm.

But the poor, dear old soul was in no hurry to go, now she was once here, and I could not find in my heart to deprive her of a glimpse of the gay world, which was such a novelty to her. Besides, she was very anxious to point out to me two grand gentlemen in whom she takes great interest, a young Herr Baron and the son of a certain Frau Geheimrätthin, who is a great lady. But I was too tired even to care about her favourites, though I have heard so much of them for the last several weeks, without having yet had the pleasure of seeing them. These two young fellows went to one of the court balls the other night; and the next morning I had, however, the pleasure of seeing the mother of one of them hanging out clothes in the garden. That is truly German! So is also the following *Household Festival*:—One evening, Fraulein S. came in to beg us to go down stairs to see something very beautiful, in their room. We of course went; and, in their strange curiosity-shop of a room, among painted saints, and gilt cabinets, and picture-frames, stood a little table, upon which was placed a very gaily-painted transparency, with queer pink angels fluttering about, and scrolls, and various extraordinary arabesques encircling a verse wishing health and happiness to the father: this being his name-day. Candles burned behind the transparency, pots of ivy and flowers were placed on either side, making a pleasant greenness; and in front lay a drawing, in a gilt frame, a very grand chalk head of a boy, with a falcon on his wrist, and in a very grand frame indeed! The transparency, the drawing, and the frame were all the work of little Wilhelm. And there he stood, as proud as could be! his black, sharp little eyes sparkling with delight; and there was his father, a tall and singularly handsome man, to-night with a smile of fatherly pride on his face, which made him look still more handsome; and there was Mrs. S. dressed all in her best and all the little brothers and sisters, and the old grandmother, with the baby in her arms, and several neighbours besides. It certainly was one of the prettiest little household festivals I ever saw.

Sometimes we send for little Wilhelm to play the "sitter" to us. He is about twelve, has a very brown, red face, black eyes, and ear-rings in his ears. He plays very prettily. His fat little hands, call forth such sweet, low music from that little instrument—music, like fairy voices, sounding in solitary green spots among the mountains. There is a peculiar spirit in the sitters, and it is wonderfully adapted for Alpine melodies—

For those tender, simple, peasant airs,
Through which ever runs with a plaintive
sentiment.

THE WASTE OF WAR.

Give me the gold that war has cost,
Before this peace-expanding day;
The wasted skill, the labour lost—
The mental treasure thrown away;
And I will buy each rood of soil
In every yet-discovered land;
Where hunters roam, where peasants toil,
Where many-peopled cities stand.

I'll clothe each shivering wretch on earth,
In needful; nay, in brave attire;
Vesture befitting banquet mirth,
Which kings might envy and admire.
In every vale, on every plain,
A school shall glad the gaze's sight;
Where every poor man's child may gain
Pure knowledge, free as air and light.

I'll build asylums for the poor,
By age or ailment made forlorn;
And none shall thrust them from the door,
Or sting with looks and words of scorn.
I'll link each alien hemisphere;
Help honest men to conquer wrong;
Art, Science, Labour, nerve and cheer;
Reward the Poet for his song.

In every crowded town shall rise
Halls Academic, amply graced;—
Where Ignorance may soon be wise,
And Coarseness learn both art and taste.
To every province shall belong
Collegiate structures, and not few—
Fill'd with a truth-exploring throng,
And teachers of the good and true.

In every free and peopled clime
A vast Walhalla hall shall stand;
A marble edifice sublime,
For the illustrious of the land;
A Pantheon for the truly great,
The wise, beneficent, and just;
A place of wide and lofty state
To honour or to hold their dust.

A temple to attract and teach
Shall lift its spire on every hill,
Where pious men shall feel and preach
Peace, mercy, tolerance, good-will;
Music of bells on Sabbath days,
Round the whole earth shall gladly rise;
And one great Christian song of praise
Stream sweetly upward to the skies!

THE CROCODILE BATTERY.

In the summer of 1846, when everybody in England was crazy with railway gambling, I was sojourning on the banks of the Rohan, a small stream in one of the north-western provinces of India. Here I first became acquainted with the Mugger, or Indian crocodile. I had often before leaving England, seen, in museums, stuffed specimens of the animal, and had read in "Voyages and Travels," all sorts of horrible and incredible

stories concerning them. I had a lively recollection of Waterton sliding close to the water's edge on the back of an American cayman, and I had a confused notion of sacred crocodiles on the banks of the Nile. I always felt more or less inclined to regard the whole race as having affinities with Sinbad's "roc," and the wild men of the woods, who only refrained from speaking for fear of being made to work.

My ideas respecting the natural history of crocodiles were in this stage of development when, one day, while paddling up the Rohan, I saw what appeared to be a half-burned log of wood lying on a sand-bank. I paddled close up to it. To my astonishment, it proved to be a huge reptile. The old stories of dragons, griffins, and monsters, seemed no longer fables; the speculations of geologists concerning *mososaurians*, *hylesaurians*, and *plesiosaurians*, were no longer dreams. There, in all his scaly magnificence, was a *real* saurian, nearly eighteen feet long. For a while I stood gazing at this, to me, new fellow-citizen of the world, and speculating on his mental constitution. The monster was, or pretended to be, asleep. I wondered if he dreamt, and what his dreams or reveries might be about; possibly he was dreaming of the same old world with which I associated him—possibly of the fish who were swimming in the waters below: or, he might be thinking of the men and women he had swallowed in the course of his existence. There was a snort; perhaps that was occasioned by the beugles and heavy brass ornaments which had adorned the limbs of some Hindoo beauty he had eaten, and which were lying heavy and indigestible on his stomach. But presently the brute lay so still, and seemed so tranquil and placid in his sleep, that it was difficult to imagine him guilty of such atrocities. He did not appear to be disturbed by remorse, or the twitchings of a guilty conscience: it may have been all a slander. I felt so kindly disposed towards him, that I could not imagine it possible that if awake he would feel disposed to eat me. Let us see!—so making a splash with my paddle, I awakened the sleeping beauty. He instantly started up, and opened, what appeared—what indeed proved to be—an enlarged man-trap; disclosing a red, slimy cavern within, fringed with great conical fangs. He closed it with a snap that made me shudder, and then plunged into the water, his eyes glaring with hate and defiance.

Some days after I had made this new acquaintance, I was sitting at home talking with my brother when a native woman came crying and screaming to the bungalow door, tearing her hair out in handfuls; she got down on the veranda floor and struck her head against it, as if she really meant to dash her brains out. A crowd of other women stood at a short distance, crying and lamenting as if they were frantic. What was the matter? Half-a-dozen voices made answer in a discordant chorus, that

while the poor woman was washing her clothes by the river side, her child—an infant about a year old—had been seized and swallowed by a Mugger. Although convinced that aid was now impossible, we took our guns and hastened to the spot where the accident happened; but all was still there, not a wavelet disturbed the surface of the stream. A small speckled kingfisher was hovering overhead, as if balanced in the air, with its beak bent down on its breast, watching the fish beneath; presently it darted like an arrow into the water; returned with an empty bill, and then went off, with its clear, sharp, twittering note, as if to console itself for the failure.

One day I was sitting on the high bank of the river, taking snap shots with my gun at the large fish who were every now and then leaping out of the water. A favourite spaniel was bringing a fish out of the water that I had hit. It had swam already half way across the stream, when the water about six yards below her became suddenly disturbed; and, to my horror, up started the head and open jaws of an enormous crocodile. The dog gave a loud shriek, and sprang half out of the water. The Mugger swam rapidly, and had got within a yard of his intended victim, when I raised my gun, and took aim at the monster's head. A thud, a splash, a bubble, and a dusky red streak in the water, was all that ensued. Presently, however, Juno's glossy black head emerged from the water; and, to my delight, began to make rapid progress towards me, and landed safely. The poor brute, wet and shivering, coiled herself up at my feet, with her bright hazel eyes fixed on mine with ineffable satisfaction. Poor Juno subsequently fell a victim to the Muggers, when her master was not at hand to succour her. I mention these facts, to show that the diabolical revenge with which I afterwards assisted in visiting these monsters, was not groundless. But the strongest occasion of it remains to be told.

Just as the "ruins" were beginning, my neighbour, Mr. Hall, sent me word that he intended paying me a short visit, and requested me to send a *syce* (groom), with a saddle-horse, to meet him at a certain place on the road. The *syce*, Sidhoo, was a smart, open-chested, sinewy-limbed little fellow, a perfect model of a biped racer. He could run—as is the custom in the East—alongside his horse at a pace of seven or eight miles an hour, for a length of time that would astonish the best English pedestrian I ever heard of.

Towards evening, Mr. Hall rode up to the bungalow, dripping with water, and covered with mud. I saw at once that some accident had happened, and hastened to assist him.

As soon as he got inside, he said, in answer to my bantering about his "spill"—

"I am in no humour for jesting. Your *syce* is lost!"

"Drowned!"

"No; eaten!—by an enormous crocodile!"

He added that, on arriving at a small nullah about two miles off, he found it so much swollen by rain, that he had to swim his horse across it, holding one end of the cord which Sidhoo, in common with most Hindoos, wore coiled round his waist, and which was used in drawing water from the deep wells of the country. Hall got safely across, and then commenced pulling Sidhoo over by means of the cord. The black face, with the white teeth and turban, were bobbing above the muddy water, when all at once the groom threw up his arms, gave a loud shriek, and sank below the surface. Mr. Hall, who had doubled the cord round his hand, was dragged into the water; where he got a momentary glimpse of the long serrated tail of a Mugger, lashing the water a short way ahead of him. In his efforts to save himself, he lost his hold of the string, and with much difficulty clambered up the slippery bank of the nullah. All was now still. Only Sidhoo's turban was to be seen floating loosely, a considerable way down the stream. Hall ran towards it, with the sort of feeling which makes a drowning man catch at a straw; and, by means of a stick he succeeded in fishing it out, and brought it with him, as the only remnant of Sidhoo he could give an account of.

Bad news soon spreads in an Indian village, and Sidhoo's fate was soon made known to his wife; and in a short time she came crying and sobbing to the bungalow, and laid her youngest child at our friend's feet. The tears glistened in the poor fellow's eyes as he tried to sooth and console her; which he did by promising to provide for her and her children.

Although Hall was generally running over with fun, we smoked our cheroots that evening in silence; except when we proposed schemes for the annihilation of the crocodiles. A great many plans were discussed—but none that offered much chance of success. The next day, after breakfast, I was showing my visitor a galvanic blasting apparatus, lately received from England, for blowing up the snags (stumps of trees) which obstruct the navigation of the river. I was explaining its mode of action to him, when he suddenly interrupted me with—

"The very thing! Instead of snags, why not blow up the Muggers?"

I confessed that there could be no reason why we should not blast the Muggers. The difficulty was only how to manage it; yet the more we talked of it, the more feasible did the scheme appear.

The brutes keep pretty constant to the same quarters, when the fish are plentiful; and we soon ascertained that poor Sidhoo's murderer was well known in the neighbourhood of the nullah. He had on several occasions carried off goats, sheep, pigs, and children; and had once attempted to drag a buffalo, whom he had caught sinking, into

the water; but, from all accounts, came off second best in this rencontre. There not being enough of water in the nulla to drown the buffalo, the Mugger soon found he had caught a Tartar; and after being well mauled by the buffalo's horns, he was fain to scuttle off and hide himself among the mud.

I had observed, when blasting the smags, that the concussion produced by the discharge had the effect of killing all the fish within a range of some twenty or thirty yards. After every explosion, they were found in great numbers, flocking on the surface of the water with their bellies uppermost. It now occurred to me, that if we could only get within a moderate distance of the Mugger, if we did not blow him to pieces, we would at all events give him a shock that would rather astonish him. An explosion of gunpowder under water communicates a much severer shock to the objects in its immediate vicinity, than the same quantity of powder exploded in the air; the greater density of the water enabling it, as it were, to give a harder blow.

Having made our arrangements, Mr. Hall, my brother, and myself, got into a small canoe, with the blasting apparatus on board, and dropt down the stream to where the nulla discharged its waters into the Rohan. He then got out and proceeded to a village close by, where we obtained for a few annas, the carcass of a young kid. A flask with about six pounds of gunpowder, and having the conducting wires attached, was then sewn into the kid's belly. Two strong ropes were also tied to this bait; and, to one of these, the conducting wire was firmly bound with small cord. The ropes were about thirty yards long, and had each attached to its extremities one of the inflated goat-skins used by water-carriers. Hall, with his goat-skin under his arm, and a coil of loose rope in his hand, took one side of the nulla, while my brother, similarly provided, took the other. My brother's rope contained the wire; so I walked beside him, while two coolies, with the battery ready charged, and slung to a pole which rested on their shoulders, accompanied me. A small float was also attached by a string to the kid, so as to indicate its position.

These arrangements being made, we commenced walking up the nulla, dragging the carcass of the kid in the stream, and moving it across from side to side so as to leave no part of the bed untried; and as the nulla was only about twelve yards wide, we felt pretty confident that if the Mugger were in it, we could scarcely fail of coming in contact with him. We had proceeded only about a quarter of a mile, when the float suddenly dipt. My brother and Hall threw the loose coil of ropes they carried on the water, along with the inflated skins. These made it soon evident by their motion that the Mugger had seized the kid. He was dashing across in a zig-zag direction down the stream. I ran after him as fast as I could;

and paying out the cord from the reel when I found it impossible to keep up with him. On reaching a place where the banks were steeper than usual he came to a stand still. I got on the top of the bank and commenced hauling in the rope. I did not, however, venture to lift the skin out of the water for fear of disturbing him, until the coolies with the battery had time to come up. This was a very anxious time; for, if the Mugger had shifted his quarters before they came up, a fresh run with him would have ensued, with the chance of his breaking the wires with his teeth. After a while I heard the coolies approaching, and my brother scolding them and urging them to hasten on. Just as their heads appeared above the bank the foremost coolie tripped his foot and fell, I groaned with disappointment—presently my brother came along with them and brought the battery to my feet; a good deal of the acid had been spilt, but with the aid of a bottle of fresh acid we had brought along with us, we soon got the battery up to the requisite power. Everything being now in order, I commenced pulling up the rope with the wire. I proceeded as cautiously as possible for fear of disturbing the Mugger; but, in spite of all my efforts, the inflated skin, in coming up the bank, dislodged some loose pieces of earth, and sent them splashing into the water. Fortunately, however, the Mugger had made up his mind to digest the kid where he was. I could not help chuckling when I at length got hold of the end of the wires. While my brother was fastening one of them to the battery, I got the other ready for completing the circuit. The Mugger all the while lying still at the bottom of the nulla with, most likely, a couple of fathoms of water over his head, unconscious of danger, and little dreaming that the two-legged creatures on the bank had got a nerve communicating with his stomach, through which they were going to send a flash of lightning, that would shatter his scaly hulk to pieces.

Everything being now ready, I made fatal contact. Our success was complete! We felt a shock, as if something had fallen down the bank—a mound of muddy water rose, with a muffled, rumbling sound, and then burst out to a column of dark smoke. A splashing and bubbling succeeded, and then a great crimson patch floated on the water, like a variegated carpet pattern. Strange-looking fragments of scaly skin were picked up by the natives from the water's edge, and brought to us amidst a very general rejoicing. The exploded Mugger floated down the stream, and the current soon carried it out of sight. We were not at all sorry, for it looked such a horrible mess that we felt no desire to examine it.

Our sense of triumphant satisfaction was, however, sadly damped, about a week afterwards, when we received the mortifying an-

nouncement, that Sidhoo's Mugger was still alive, and on his old boat, apparently uninjured. It was evident that we had blasted the wrong Mugger! We consoled ourselves with the reflection that if he were not Sidhoo's murderer, it was very likely he was not wholly innocent of other atrocities, and therefore deserved his fate.

Of course it was impossible to rest while Sidhoo's Mugger remained alive, so we were not long in preparing for a second expedition. This time we took the precaution of not charging the battery until we were certain that the bait was swallowed. The acid, diluted to the necessary strength, was, therefore, carried in one of those brown earthenware jars called grey-beards, which had come out to us full of Glenlivet whiskey. We commenced dragging the kid up the stream, as before; but, having walked more than a mile without getting a bite, we were getting rather disheartened, and sat down to rest, struck a light, and smoked a cheroot. Hall laid down, having manufactured an impromptu easy chair out of his coil of rope, with the inflated goat-skin placed above it. My brother was not long in imitating his example, and I laid down under the shade of some reeds, near to the water's edge. The heat was oppressive—and we were discussing the probability of getting a bite that day, and lamenting that we had not brought some pale ale along with us, when, all at once, I got a sharp blow on the leg, while my brother came spinning down the bank like a teetotum; a companion picture to Hall, who was revolving down the opposite bank. The ropes and skins went rushing down the nulla at a tremendous pace. As soon as we recovered from the laughter into which we were thrown by this droll contretemps, we set off in pursuit, guided by the track which the inflated skins made in the water. On they went, dashing from side to side, as they had done in our first attempt. On coming to a place where the nulla made a sharp turn, they stood still under the high bank, on the inner curve of the bend. It unfortunately happened that the bank, near to which the skins were floating, was too precipitous for us to get near them, without starting the Mugger from his present position. With much labour, we detached some loose sods from the top of the bank, and sent them with a loud splash into the water, directly over where we imagined him to have taken up his quarters. This had the desired effect, for the skins began to move slowly down the stream as if the Mugger were crawling leisurely along the bottom.

Leaving my brother with the coolies in charge of the battery, I ran on to where the bank was more shelving. By good luck, the stream was rushing up, after its sudden sweep, and sent a strong current against this bank. I had not waited many minutes, before the skins came floating round the

corner, to where I was standing. I seized the one to which the wire was attached, desiring my brother to charge the battery, and bring it down. This he did much sooner than I could have expected; for as the battery was now empty, one cooly was able to carry it on his head while my brother took the jar of acid in his hand. It was evident from the motion of the other skin in the water that the Mugger was still moving; so no time was to be lost. I made the connection with the battery with one of the wires. In another instant the circuit was complete, and the Mugger's doom sealed.

There was a momentary pause—owing, I suppose, to some slight loss of insulation in the wires—then came the premonitory shock; then the rumble, the smoke, and the sparks; and a great bloated mass of flesh and blood rose to the surface of the water. Hall called out to us to drag it ashore, and see whether we could get any trace of poor Sidhoo. We tried by means of a bamboo pole to pull it to the bank; but the glimpse we got of it as it neared was so unutterably disgusting, that we pushed it off again, and allowed it to float away down with the current.

That this was Sidhoo's Mugger, there could be no doubt; for he was never seen or heard of in the neighbourhood again.

CHIPS.

A ROYAL SPEECH BY JAMES THE FIRST.

As a strong contrast to the Speech from the Throne, mentioned in the first article of this Number, we are enabled to give—from a pamphlet which has fallen into our hands—a condensed report of a speech made by Her Majesty's pedantic ancestor, James the First, on the 20th of June, 1616. It was delivered in the Star Chamber, on the occasion of the Judges setting out on their several circuits. The report was drawn up by Edward Wakeman from his own notes taken, in the Star Chamber, from the Royal lips. He was the son of John Wakeman, Esq., of Beckford, in the county of Gloucester; and a Barrister of the Inner Temple, of which Society his father was also a member. The original is indorsed in the father's handwriting thus:—"The Kinges Speech in the Starre Chamber, 20th Junij 1616 taken by Ned Wakeman." It is believed that no report of this curious specimen of Royal eloquence had ever till lately been printed, although the fact of James the First having delivered a charge to the judges in the Court of Star Chamber has not entirely escaped the notice of historians.

The copy now before us was recently printed by Thomas Wakeman, Esquire, of Graig, near Monmouth, a descendant of the reporter.

The minutes commence by stating that the King, "in the beginninge of his Speech he remembered a peece of Davides Psalmes makeinge a briefe discourse concerning the exposition

himself wth by reason of the noise of the tumultuosity and the lowness of his voice at the entrance therunto I could not well hear." The Divine Right of Kings—a question which was so thoroughly discussed during the reign of the second James—was thus modestly handled by the Scottish Monarch:—

"As towchinge the dignitie of a kinge he seyde that they sitt in the throne of God and therefore are in scripture tearmed Gods and that good kinges are to imitate God in justice and sinceritie of hart but wthout private respect for the advancement of their owne endes or vaine glorie for otherwise they are but unjust and unrighteous. And that as good Judges they are to imitate Solomon and Davide the one in wisdom the other in holynes. Kinges are properlie Judges and all Judgem^{ts} are theirs how be it they are pronounced by their Judges as their ministers and substitutes by authoritie derived from them as from the ymoediat livetnant of God. And although the manner and formes of governm^t doe varie accordinge to the div^{ty}tie of Kingdomes yet the sentences pronounced by the mouthes of the Judges (elected by the Kinge as interpreters of his lawes) are his and he is to answer for them before God soe as there is a neere leagu and affinitie betwene the Kinge and God upward so is there as neere betwene the Kinge and the Judge downward whose office and dutie is to declare and expound lawes not to invent and make lawes."

After explaining why he had not delivered himself unto the Judges in the Star Chamber before (because, "when he came into this Kingdome he was an olde Kinge yet was he but a stranger to our lawes and govern^t and therefore like one of Pythagoras schollers he thought good to professe silence duringe the first seavⁿ yeres and to passe a prentishippe in lea^rn^g before he beganne to teache thinkinge himselfe conapt to ascende the seate of Judicature before he had learned how to judge," he divided his discourse into three heads:—

1. First the charge he was to give himselfe for a K. cannot give a good charge to his subjects except he doth first beginne wth himselfe for good waters flowe not but from good springes.

The second was a caveat to the Judges.

The third an admonition to his subjects."

The "caveat to the judges," James's reference to the Court of Chancery is interesting. In that year (1616) Sir Thomas Egerton, founder of the Ellesmere family, resigned the seals in favour of the great Francis Bacon. "Then he spake" continues the reporter, "of the Court of Chancery wth he sayd was ordayned for the mitigation of the rigor of the comon lawe and that the Chancellor was but the dispenser of his conscience that it was a highe Court, and that Peter de manes was most properly written there. That from thence was no appeale to any other Court, and that he was speciallie bound to maintayne this Court. But yett this Court must keepe it self wth in his limitts and the Chancellor was not to

exceede his authoritie as he sayd he had often given him in charge, but to procede accordinge as hath been used in the ancient and best times, and if he transgressed his limitts and bounds the Judges of other courts mst not reform it but complaynt thereof to be made to his ma^{ty}. For the p^{re}s^{ent} Chancellor he sayd at his cominge into the kingdome he found him in that place wherein he had ever sence contynewed him and wished he might longe contynewe therein and he sayd that the attempt to bringe the Chancellor within the compass of Premunire was odious and absurde for to indite him sittinge as it were in his owne place were to indite himselfe and to torne himselfe uppon the point of his owne sword."

The royal picture of the Justice of the Peace of that day, comes in full corroboration of Shakespeare's portraits of the same persons:—

"As towchinge the office of a Justice of Peace he s^ad that although yt seemed to some fantasticall greene headed gentlemen to be an office of litle reputacion, yet it was in his opinion both worshippingfull and honorable and of as great necessitie for the well orderinge of the affaires of the cuntry as the highest offices and places for managinge of matters of state in the court. But because Justices of the Peace were of two kindes the one good the other badde, his pleasure was that the judges should from timeto time advtise him of such as did well execute their offices. . . . Of these badde Justices he s^ad there were fower sortes. The first were such as were loyteringe Justices and laye at home and did nothinge. The second were busibodies, who did to much embracinge many businesses for the enlargem^t of their private gaigne and profits. The Thirde sorte were factious and contentious justices. The fowerth such as had a puritanicall itchinge to stirre the people against governem^t and discipline. All such justices (as unprofitable members and ministers) he would have casheered."

Papal aggression was dealt with much more summarily than it is in our day. "Then," quoth Mr. Wakeman, "the King declared his mind towchinge priests which he would have by all means possible extirpated":—

"Yet would he proceed wth greater severitie against some then against other soules for he protested he was lothe to hang a priest for stylinge of masse, or for the mere execution of their office or function. But for such as refused to take the oathe of allegiaⁿce wth he s^ad sette the Pope and all the divells of hell say what they will was but a moere temporall oathe) he would have despatched. In the like manner would he have them deafe wth such as haveinge binne formerly banished presume to retorne hether againe. His will was signified to the Judges that he would have those which broke prison taste of the same cuppe for as those men w^{ch} could not be kept wth in the walls of a prison, deserved to be helde in the stocks or a halter; moreover that they were not like St. Peter who went not out of prison before an angell of heaven called him whereas these are called forth by an angell of hell. Then he s^ad he had

given directions for the expiation of the pestilence remaining in Whitehall Castle, towards which he would proceed either favourable or severely according as they gave him occasion by their answers.

The King's next recommendation to the Judges has been imitated rather extensively in modern times. His suggestion "towchinges" public works has been superseded by the far less agreeable expedient of tolls:—

"Next of all he commanded them to pull downe all howses and poor cottages for s^e he as woodes and brakes are the denies and shelters of wilde beastes, soe are these places the receptacles and lurking holes of thieves, drunkardes, and pill-feridge vagaboundes. He alsoe willed them to see the lawes and statutes against roaguelinge beggers put in due execution. And that howses of correction should for that purpose be erected and mayntayned. And here he toke occasion to commend Justice Popham of whom he had hearde reported, that he was soe sharpe and severe against idle persons, that there was noe like thinge as a begger in all Som^{er}setteshire where he dwelt. And because high waies and bridges (amongest other thinges) were of great necessitie and use for his subjects, he gave the Judges a stricte charge that they should earnestly stirre uppe, and compelle the people to the mendinge and maintayninge of them, addinge further that the repayinge of these was none of the meanest workes of charitie and therefore he much mervayed that there haveinge binne soe much given towards the indowm^{en}t of hospitalls, almshouses, and the like (since his first cominge to the crowne) that there hath binne soe litle bestowed to these uses."

At the time King James spoke, London consisted of about sixty thousand houses, and a hundred and fifty thousand inhabitants, instead of the two millions and a quarter which are herded within its boundaries at present. About that time habitations began to be built of bricks; timber, filled up with plaster, having been the material previously in use. A building mania appears to have taken possession of the Londoners; and King James "didde with great vehemencie and earnestness declare himselfe concerninge

"the extraordinary buyldinge that hath of late times binne used in the citie and suburbs of London, w^{ch} excessive enlargem^{en}t of the body of this citie would (as he saide) in time tende to the utter ruine and undoeinge of the countrey and all other cities w^{thin} the realme. The cause of the great repaire and access to this towne he ascribed to the pride and vanitie of ludyes and gentlewomen. The effects whereof (he s^d) were noe lesse then the beggeringe of there husbandes, the losse of theyre owne credit (especially in younge women who while they come hether to be married forsooth doe but marre their reputacion). And finallye the impoverishinge and destruction of the poore countrey which by these meanes is forsaken and bereft both of the company and comfort of the better and abler ranke of people, to the utter overthrowe and decaye of all hospitallitie for w^{ch} this kingdome in auncient time hath binne renowned above all the nations of the earth for the

prevention of w^{ch} great mischiefe and inconvenience he s^d, his pleasure was that if any man went about or presumed to builde in or about the citie of London, that the builder together wth his workemen should be committed, and cast in prison and the buildinge overthrowne and abated."

Unhappy Cubitts and Peto of the seven-teenth century!

King James's peroration is as simple and concise as that of his successor, Victoria:—

"These he s^d were the same of those thinges w^{ch} he had at this time intended to give them in charge addinge further that although he had heretofore binne a stranger to that court and place (meaninge the Starre-chamber) yet should they hereafter enjoye his presence there more often."

NATIONAL-DEBT DOCTORS.

DR. PRICE, in the preface to his observations on Reversionary Payments as a means of paying off the National Debt, remarking on the prodigious power of Compound Interest, states, that a penny so improved from our Saviour's birth, as to double itself every fourteen years—or (which is nearly the same) put out to five per cent. compound interest—would in seventeen hundred and seventy-three years, have increased to more money than would be contained in one hundred and fifty millions of globes, each equal to the earth in magnitude, and all solid gold!

Mr. Morgan, a profound arithmetician, in checking this astounding calculation, discovered one of those errors which are meant—while falsifying details—to verify the general principle. A penny so improved at compound interest, as to double itself in fourteen years, would have accumulated *only*, Mr. Morgan declares, to one hundred and seven millions of golden globes; or forty-three millions fewer than Dr. Price computed! However correct these calculations may be, they bring to the mind of those who have no brains for complex masses of figures, the chronological computations quoted by Chevreau in his "Histoire du Monde," a couple of quarto volumes published in 1686. One of them gives as the result of a bewildering complexity of calculations, the precise day and moment at which the world was created. The calculator asserts, "without fear of contradiction," (for who is to check his astro-chronological computation?) that this great globe was created "on Friday afternoon, the 6th of September, at four o'clock precisely."

The Cockers, Walkingames, and De Morgans of Chevreau's time had no practical subject on which to expend their arithmetical fanaticisms. They, happy people, had no National Debt. Modern cypherers, on the contrary, need not, like them, wear out their slates and blunt their pencils with calculations of a purely speculative character. His late Majesty King William the Third set them that very large sum, the National Debt.

to them justice, they have been working all the while. The task of finding out a way of clearing off the National Debt by means of the arithmetic laws applicable to compound interest, have fascinated financial enthusiasts, including Dr. Price and Mr. Morgan, from the days of its imposition to that on which we write these lines. The latest is from a correspondent of our own:—

"One pound sterling, per annum, kept at compound interest," says our friend, "at the rate of three per cent. per annum, would give, in fifty-eight years, 157*l*.; in sixty-four years, 195*l*.; in seventy-three years, 255*l*.; in eighty-five years, 394*l*.; in one hundred and seven years, 790*l*.; and in one hundred and twenty-nine years, 1582*l*. The debt at present stands at about 780 millions of pounds sterling; consequently fifty-eight yearly payments of five millions of pounds each, with the interest accruing thereon, at the rate of three per cent. per annum, would, at par, pay it off. Sixty-four payments of four millions each; seventy-three of three millions each; eighty-five of two millions each; one hundred and seven of one million each; or one hundred and twenty-nine of half a million each; would accomplish the same object, in the respective number of years. Taking the interest, as now paid, at twenty-eight millions a year, the aggregate sums required to be paid by the public, in taxes, to cover the charge would be, respectively, *vis*:—

	In 58	64	73	85	107 and in 129 years.	
	1824	1792	2044	2380	2506	3612 millions.
Add annual payments as above	290	256	219	170	107	64½
Total	1914	2048	2263	2550	3103	3676½ millions

of pounds sterling; showing a difference between the first and last periods of 1762*l* millions; and, if interest were taken into account, the difference would amount to the enormous sum of 98,263 millions.

Leaving interest, however, out of the calculation, and taking two millions as the sum to be applied annually, for the purpose indicated, it appears that the debt could be totally extinguished in eighty-five years, at a cost to the public of 2550 millions; or 170 millions more than the amount of the interest, which under any circumstances, sort of repudiation or national bankruptcy, must be paid.

"I now mention the proposal made in Parliament last session, that two millions a year should be applied to the reduction of the debt; to contrast the one plan with the other. Two millions a year applied simply to the reduction of the debt, would not accomplish its extinction in less than 390 years, at a cost of 7125 millions (exclusive of interest, which I have not been at the trouble of calculating, but which would amount to an "appalling" sum); and in eighty-five years it would only be reduced to the extent of 170 millions

(the saving in interest being about 60,000 pounds a year); thus leaving the country, at the end of the period named, 610 millions in debt, and still subject to the annual charge of 22 millions for interest."

A CINNAMON GARDEN.

THE Englishman sips his coffee, enjoys sugar in his tea, and spices in his pastry, wondering why such things are not cheaper; and picturing Indian planters as princes, in white calico and straw hats, having little else to do than to smoke hookahs, drink brandy-pawney, and pocket their gains. A trip to some of the coffee, sugar, or cinnamon estates in Ceylon, would at once dispel the imaginary picture; none of the articles we have mentioned grow indigenous and without trouble, as a visit to the Kaderani Cinnamon Gardens would show.

Before, however, we start for them, it may be as well to mention that the aromatic spice called cinnamon, is the inner bark of the *Laurus Cinnamomi*, a beautiful tree, attaining the size, and something the appearance of a moderately large pear-tree. To produce fine bark—such as is required for purposes of commerce—the tree must be felled, and the root forced to grow in shoots, straight and smooth. These being cut when eighteen months or two years old, a fresh supply of young sticks rapidly appear after the first rains. A cinnamon plantation, therefore, is in reality a garden, and not a forest.

The English Government possess five cinnamon plantations in Ceylon, containing in the aggregate about twelve thousand acres. These have nearly all been sold to private individuals, some of whom allow their estates to be very much neglected; others keep them in a state of high cultivation. It is to one of the latter description, managed by the late Colombo Firm, of Ackland, Boyd and Co., that I am about to proceed. They were agents for and part proprietors of, some three thousand acres of cinnamon land, most of which lay at Kaderani, near Negombo, a town about thirty miles distance from Colombo, on the sea-coast.

The whole of the Ceylon coast is low and sandy, and generally favourable for the growth of cinnamon, which flourishes in a hot and damp atmosphere, such as is there found. To get to Negombo, the most pleasant and least fatiguing mode is by a native covered canoe, along the old Dutch canal, a small river which the Dutch deepened, so as to admit of loaded boats passing at all times. A passage canoe is as light as the trunk of a mango-tree can be made by adding out the interior. Stretched at full length on the matted deck, I watched the two boatmen haul in their little rush bag of tobaccos, jagery, and hoppers (a kind of light cakes), and proceed to hunt the enormous eel, held in its place by huge bones

bees. No sooner was this done, than the little canoe bounded off as swiftly and noiselessly as a deer; the breeze was fair, and the water smooth as a mirror. If anything can transport one in imagination to fairy land, it is to be wafted along in a Cingalese canoe, with its beautifully-transparent tall sail, floating jauntily amongst groves of wild, strange-looking trees, which nearly always fringe the banks of tropical rivers; and, catch occasionally the gorgeous rays of the sun amidst the dark, clustering foliage. The canal or river is as winding as a serpent, and in many places so narrow, that the bamboo mast gave a passing greeting to clusters of flowering shrubs that blossomed on the cool banks.

The Lake of Negombo, a fine sheet of water, was soon crossed, and landing at a little tope of cocoa-nut trees, I procured one of the common bullock-hackeries of the country, and made the best of my way to the gardens.

A first glance at the cinnamon plantations at Kaderani showed that drainage had been well seen to. This is a very important matter; for, although heat and moisture are both essential to the full development of the spice, stagnant water injures its flavour. The natives pay but little attention to this, nor to removing the young sticks before the bark thickens too much; hence the marked inferiority of all native-grown cinnamon.

Arrived at the superintendent's bungalow, a breakfast of fish, eggs, and curry was soon served up, and finished, with a bottle of Allsop's Pale Ale; for be it known that the dirty thick liquid served out as coffee by the Cingalese, is not drinkable by one European in a dozen; although it might have been expected that the island which produces the berry in such abundance should also furnish the beverage of fair quality. Breakfast over, I proceeded, with my host, to inspect the "works," or "peeling-houses."

In former days, both under the Dutch and English Governments, the cultivation, as well as the after preparation of the spice, was exclusively carried on by one particular caste of Cingalese, called "Chalias," who had headmen, or petty chiefs, of various grades placed over them, belonging to their own body. This system is now partly changed, and the preparation of the bark is alone carried on by the "Chalias." This being their hereditary occupation, they are, as might be expected, remarkably expert in their operations. Having spent two days amongst these Peelers, I was enabled to watch the whole process of cropping, in the various stages, from the green stick to the beautifully yellow pipe of prepared spice.

The "Chalias" are assembled at break of day in gangs of thirty, with a "Canghan," or native overseer of field work, over each. All are armed with a sharp, light bill-hook, or

"cattie," and a stout cord to tie up the sticks when cut. The European superintendent, having seen each gang properly equipped, accompanies them to the spot appointed for the day's cutting, to which they march in good order: each party is then placed, and, at a signal from the superintendent, the men, to the number of perhaps two hundred, rush amongst the bushes, "cattie" in hand, with loud shouts and cheers, and the work of destruction commences in good earnest. The peelers are paid according to the quantity of spice they prepare, and it may, therefore, be imagined how anxious each one is to secure a good bundle of sticks. A stranger seeing this large number of men rushing madly into the plantation, flourishing their sharp, shining weapons above their heads, with their long black hair floating over their shoulders, might easily fancy they were in pursuit of wild animals, or about to attack some hidden enemy. Very soon, however, the shouting ceases; not a sound is heard, save the sharp click of the "catties" against the tender green sticks, which may be seen toppling over in all directions. By ten or eleven o'clock the peelers had cut sufficient cinnamon to occupy them in the barking process for the remainder of the day; and, having collected all their sticks in bundles, they proceeded to the "peeling-house." Arrived there, not a moment was lost: the heavy bundle is flung upon the floor of the veranda, and the "Chalias," having hastily drank off the milky juice of a cocoa-nut, and wiped the perspiration from their foreheads, seated themselves cross-legged on a rush mat; and, with a curiously-shaped little knife, proceeded to strip the tender bark. It is scarcely to be believed how rapidly barking is performed. The little knife is first run down the stick on two opposite sides, from end to end, and then, by inserting the instrument at the thick part, between the bark and the stick, and running it quickly along, with a twisting motion, the long slip of fine bark falls off, without a slit or blemish, an object very desirable if the quality be in other respects fine. When the sticks are all stripped they are of no further use.

On the morning of the second day the scene was of a more lively character. The wives and children of the peelers again flocked to the peeling-house; and, seated in rows, commenced scraping off the green cuticle from the heaps of bark slips, which are brought to them by the younger children, who also remove the scraped spice to the men. These begin by assorting them into three qualities, according to thinness of bark and brightness of colour; the shorter pieces of each kind are set aside, to be placed in the interior of the pipe, whilst the longest are placed outside. The piping, or quilling, then commences, and by dexterous management, the peeler so selects the bark, that very little cutting at the ends is required to form them into the proper length. The

quills are made into uniform lengths of three feet and a half, and three layers of the bark, or quill, inside each other. The greatest vigilance of the superintendent and his native assistants, is needed in this stage of the process; for much of the value of the spice depends upon the proper division into qualities, and, not less, upon the rejection of all very coarse pieces; for it is to the interest of the peelers—who are paid by the weight—that as much as possible of the thick be placed in the quills; but the master's interest requires that as little as possible should be so hidden. The experiment was once made of paying the "Chalias" by the day, with a view of securing better work, but so little was there done in twelve hours, that it would have been ruinous to have continued the system. An active "Chalia," assisted by his wife and child, will prepare one hundred pounds of spice in a month, which will produce him one pound seventeen and sixpence, or seven pounds for the season, if of four months. Upon this they will idle away the rest of the year, though in some few cases other trifling occupations are followed.

The bark having a natural tendency to curl up, requires but little rolling; and, when made up on the second day, the pipes are laid out singly upon cords stretched across the upper part of the building. There they remain for two days, when they undergo a little more rolling up, or "handling," and are placed on stands outside, exposed to the action of the hot air, but carefully sheltered by cocoa-nut leaves from the rays of the sun.

Three or four days of this open-air drying will generally suffice. The pipes are then piled up on light stands of wood for a week or two, when they are weighed and paid for. Each party of "Chalias" keep their cuttings separate; and a good deal of emulation often arises amongst them as to who shall turn out the greatest quantity of the finest kind, called "*first sort*."

In the peeling-house which I inspected, the utmost order and decorum prevailed; not a word was allowed to be spoken by the work-people. The various headmen, clad in long white robes, and with high combs in their hair, passed on from one peeler to another in silence, pointing with the finger to any defective work. The only drawback to the agreeable features of the scene, was an old, gaunt Malay, with musket on shoulder, who paced the length of the building in grim dignity, to enforce order, if necessary, and to prevent pilfering. Still, altogether it was a pleasing sight; and I could not but contrast the well-ordered, business-like mode of work pursued here, with the uproar and confusion I witnessed the following day in a peeling-house on a native property, where all appeared to be masters.

The after-processes of assortment, packing, and baking, are carried on in the Colombo

establishments; as is also the distillation of the essential oil of cinnamon from the cuttings and rejected pieces of bark.

THE STORY OF GIOVANNI BELZONI.

ONE day in the beginning of the year 1803, Mr. Salt, whose name has since become so celebrated amongst the discoverers of Egyptian antiquities, observed before one of the public rooms of Edinburgh, a great crowd assembled. For almost every one there exists a mysterious attraction in the sight of a number of people, and Mr. Salt, no wiser than his neighbours, pushed his way, when the doors were opened, into the room. There, on a sort of stage, he saw a tall and powerfully-built young man, performing various gymnastic exercises, and feats of strength. While this Hercules in tinsel was lifting enormous weights, and jumping from a table over the heads of twelve men, a pretty, delicate-looking young woman, was arranging some hydraulic machines and musical glasses, with which the entertainment was to terminate. As the price of admission was nominal, she occasionally also handed round a small wooden bowl, in order to collect gratuities from the spectators.

Very few of those who were enjoying the exhibition gave anything; and, when the young woman approached her husband, and showed him the few coins she had received, he hastened to terminate his performance. Mr. Salt pitied the poor fellow, and as the young woman was passing, said to her,

"You forgot to present your bowl for my contribution.—Here it is."

He slipped a silver coin into her hand. Both she and her husband thanked him warmly; the latter in broken English, and with an Italian accent.

Mr. Salt, who had but just returned from Rome, replied in Italian; and, perceiving in the stranger's manner of expressing himself a degree of refinement not to be expected from a mountebank, asked him whence he came, and what was his history?

"Six months ago, sir," replied the man, "if any one had told me that I should be reduced to earn my bread by exhibiting my strength in public, I should have felt greatly inclined to knock him down. I came to England for the purpose of making known some hydraulic machines of my invention; but the spirit of routine, and the love of ignorance, closed every avenue against me. Previously, before losing all my hopes of success, I married this young girl. Had I been alone in the world, I verily believe that the bitter destruction of my expectations would have rendered me careless of supporting life; but how could I leave her in misery?"

"But why not try to display your really extraordinary strength and dexterity under

more favourable circumstances? Why do you not offer your services to some theatrical manager?"

"Hungry people, sir, cannot wait. I did not think of resorting to this method of earning a piece of bread, until I saw my wife ready to perish for the want of it."

The kind Mr. Salt not only relieved his immediate wants, but offered to recommend him and his wife to the manager of Astley's Circus, in London. Gratefully and eagerly did the wanderers accept this offer; and while, in company with their benefactor, who paid for their places on the coach, they journeyed towards town, the man related his history. Born at Padua, the son of a poor barber, and one of fourteen children, Giovanni Battista Belzoni felt from his earliest youth a longing desire to visit foreign lands. This "truant disposition" was fostered, if not caused, by the stories of maritime adventures told him by an old sailor; who was strongly suspected of having, during many years, practised the profession of a pirate.

The reading, or rather devouring, of a translated copy of "Robinson Crusoe" (and it is a most remarkable circumstance that the book which has for its avowed purpose the disheartening of restless adventurers, should have made wanderers and voyagers innumerable,) gave form and fixedness to his purpose of rambling; and, in company with his youngest brother, the boy set out one fine morning, without any intention but the somewhat vague one of "travelling to seek their fortune." The young fugitives walked several miles, without knowing, in the least, whither they were going, when a pedlar, who was riding slowly by in a cart, accosted them, and asked if they were going to Ferrara. Belzoni, although he never heard the name before, immediately answered in the affirmative. The good-natured merchant, pleased with the countenances, and pitying the tired looks of the children, not only gave them a place in his vehicle, but shared with them his luncheon of bread, cheese, and fruit. That night they occupied part of their companion's lodging; but next day, as his business required him to stop at the village where they slept, the two boys took leave of him, and pursued their journey. Their next adventure was not so fortunate. Meeting an empty return carriage, they asked the *vetturino* to give them a ride; and he consenting, they joyfully got in. Arrived at Ferrara, the *vetturino* asked them for money. Giovanni, astonished, replied that they had none; and the unfeeling man stripped the poor children of their upper garments, leaving them half naked and penniless in the streets of an unknown city. Giovanni's undaunted spirit would have led him still to persevere in the wild-goose chase which had lured him from his home; but his brother Antonio wept, and complained so loudly, that he was fain to console the child by consenting

to retrace their steps to Padua. That night, clasped in each other's arms, they slept beneath a doorway and the next morning set out for their native city, begging their food on the journey.

The severe chastisement which Giovanni, as the instigator of this escapade, received on his return, did not in anywise cure his love of rambling. He submitted, however, to learn his father's trade, and at the age of eighteen, armed with shaving and hair-cutting implements, he set out for Rome, and there exercised the occupation of a barber with success. After some time, he became deeply attached to a girl who, after encouraging his addresses, deserted him and married a wealthy rival. This disappointment preyed so deeply on Belzoni, that, renouncing at the same time love and the razor, the world and the brazen bowl of suds, he entered a convent, and became a Capuchin. The leisure of the cloister was employed by him in the study of hydraulics; and he was busy in constructing an Artesian well within the monastic precincts when the French army under Napoleon took possession of Rome. The monks of every order were expelled and dispersed; and our poor Capuchin, obliged to cut his own beard, purchased once more the implements of his despised calling, and travelled into Holland, the head-quarters of hydraulics, which were still his passion. The Dutch did not encourage him, and he came to this country. Here he met his future wife, and consoled himself for his past misfortunes by marrying one who proved, through weal and woe, a fond and faithful partner. The crude hydraulic inventions of a wandering Italian were as little heeded here, as on the Continent; and we have already seen the expedient to which Belzoni was obliged to have recourse when Mr. Salt met him in Edinburgh.

Having reached London, the kind antiquary introduced his *protégés* to the manager of Astley's. The practised eye of the renowned equestrian immediately appreciated at their value the beauty and athletic vigour of the Paduan Goliath, and he engaged both him and his wife at a liberal salary. He caused a piece entitled "The twelve labours of Hercules" to be arranged expressly for his new performers; and Mr. Salt had soon afterwards the satisfaction of seeing Giovanni Belzoni appear on the stage, carrying twelve men on his arms and shoulders, while Madame, in the costume of Cupid, stood at the top, as the apex of a pyramid, and waved a tiny crimson flag.

After some time, Mr. Salt went to Egypt as consul, and there became acquainted with Signor Drouetti. The two friends, equally enthusiastic on the subject of Egyptian antiquities, set to work to prosecute researches, with an ardour of rivalry which approached somewhat too nearly to jealousy. Each aspired to undertake the boldest expe-

machines, and to attempt the most hazardous excavations. But the great object of their ambition was an enormous bust of Memnon, in rose-coloured granite, which lay half buried in the sand on the left bank of the Nile.

Signor Drouetti had failed in all his attempts to raise it, nor was Mr. Salt a whit more successful. One day, while the latter was thinking what a pity it was that such a precious monument should be left to perish by decay, a stranger asked to speak with him. Mr. Salt desired him to be admitted; and immediately, despite his visitor's oriental garb and long beard, he recognised the Hercules of Astley's.

"What has brought you to Egypt?" asked the astonished consul.

"You shall hear, sir," replied the Italian. "After having completed my engagement in London, I set out for Lisbon, where I was employed by the manager of the theatre of San Carlo to perform the part of Samson, in a Scriptural piece which had been arranged expressly for me. From thence I went to Madrid, where I appeared with applause in the theatre Della Puerta del Sol. After having collected a tolerable sum of money, I resolved to come here. My first object is to induce the Pasha to adopt an hydraulic machine for raising the waters of the Nile."

Mr. Salt then explained his wishes respecting the antiquities; but Belzoni, could not, he said, enter upon that till he had carried out his scheme of waterworks.

He was accompanied, he said in continuation, by Mrs. Belzoni, and by an Irish lad of the name of James Curtain; and had reached Alexandria just as the plague was beginning to disappear from that city, as it always does on the approach of St. John's day, when, as almost everybody knows, "out of respect for the saint," it entirely ceases. The state of the country was still very alarming, yet Mr. Belzoni and his little party ventured to land, and performed quarantine in the French quarter; where, though really very unwell, they were wise enough to disguise their situation; "for the plague is so dreadful a scourge," he observed, "and operates so powerfully on human fears and human prejudices, that, during its prevalence, if a man be ill, he must be ill of the plague, and if he die, he must have died of the plague."

Belzoni went straight to Cairo, where he was well received by Mr. Baghos, interpreter to Mahommed Ali, to whom Mr. Salt recommended him. Mr. Baghos immediately prepared to introduce him to the Pasha, that he might come to some arrangement respecting the hydraulic machine, which he proposed to construct for watering the gardens of the seraglio. As they were proceeding towards the palace, through one of the principal streets of Cairo, a fanatical Mussulman struck Mr. Belzoni so fiercely on the leg with his

staff, that it tore away a large piece of flesh. The blow was severe, and the discharge of blood copious, and he was obliged to be conveyed home, where he remained under cure thirty days before he could support himself on the wounded leg. When able to leave the house, he was presented to the Pasha, who received him very civilly; but on being told of the misfortune which had happened to him, contented himself with coolly observing, "that such accidents could not be avoided where there were troops."

An arrangement was immediately concluded for erecting a machine which was to raise as much water with one ox as the ordinary ones do with four. Mr. Belzoni soon found, however, that he had many prejudices to encounter, and many obstacles to overcome, on the part of those who were employed in the construction of the work, as well as of those who owned the cattle engaged in drawing water for the Pasha's gardens. The fate of a machine which had been sent from England taught him to augur no good for that which he had undertaken to construct. Though of the most costly description, and every way equal to perform what it was calculated to do, it had failed to answer the unreasonable expectations of the Turks,—because "the quantity of water raised by it was not sufficient to inundate the whole country in an hour!—which was their measure of the power of an English water-wheel."

When that of Belzoni was completed, the Pasha proceeded to the gardens of Soubra to witness its effect. The machine was set to work, and, although constructed of bad materials, and of unskilful workmanship, its powers were greater than had been contracted for; yet the Arabs, from interested motives, declared against it. The Pasha, however, though evidently disappointed, admitted that it was equal to four of the ordinary kind, and, consequently, accorded with the agreement. Unluckily, he took it into his head to have the oxen removed, and, "by way of frolic," to see what effect could be produced by putting fifteen men into the wheel. The Irish lad got in with them; but no sooner had the wheel begun to turn than the Arabs jumped out, leaving the lad alone in it. The wheel, relieved from its load, flew back with such velocity, that poor Curtain was flung out, and in the fall broke one of his thighs; and, being entangled in the machinery, would, in all probability, have lost his life, had not Belzoni applied his prodigious strength to the wheel, and stopped it. The accident, however, was fatal to the project and to the future hopes of the projector.

At that time the insolence of the Turkish officers of the Pashalic was at its height, and the very sight of a "dog of a Christian" raised the ire of the more bigoted followers of the Prophet. While at Soubra, which is close to Cairo, Belzoni had a narrow escape

from assassination. He relates the adventure in his work on Egypt.

"Some particular business calling me to Cairo, I was on my ass in one of the narrow streets, where I met a loaded camel. The space that remained between the camel and the wall was so little, that I could scarcely pass; and at that moment I was met by a *Binbashi*, a subaltern officer, at the head of his men. For the instant I was the only obstacle that prevented his proceeding on the road; and I could neither retreat nor turn round, to give him room to pass. Seeing it was a Frank who stopped his way, he gave me a violent blow on my stomach. Not being accustomed to put up with such salutations, I returned the compliment with my whip across his naked shoulders. Instantly he took his pistol out of his belt; I jumped off my ass; he retired about two yards, pulled the trigger, fired at my head, singed the hair near my right ear, and killed one of his own soldiers, who, by this time, had come behind me. Finding that he had missed his aim, he took a second pistol; but his own soldiers assailed and disarmed him. A great noise arose in the street, and, as it happened to be close to the *seraglio* in the *Esbakie*, some of the guards ran up; but on seeing what the matter was, they interfered and stopped the *Binbashi*. I thought my company was not wanted, so I mounted my charger, and rode off. I went to Mr. Baghos, and told him what had happened. We repaired immediately to the citadel, saw the Pasha, and related the circumstance to him. He was much concerned, and wished to know where the soldier was, but observed, that it was too late that evening to have him taken up. However, he was apprehended the next day, and I never heard or knew anything more about him. Such a lesson on the subject was not lost upon me; and I took good care, in future, not to give the least opportunity of the kind to men of that description, who can murder an European with as much indifference as they would kill an insect."

Ruined by the loss of all his savings, which he had spent in the construction of his water machines, Belzoni once more applied to Mr. Salt, and undertook the furtherance of his scheme, to convey to England the bust of Memnon. So eager was he, that the same day, the Italian set out for the ruins of Thebes, and hired a hundred natives, whom he made clear away the sand which half covered the stone colossus. With a large staff in his hand, Belzoni commanded his army of Mussulmen, directed their labours, astonished them with displays of his physical strength, learned to speak their language with marvellous facility, and speedily came to be regarded by them as a superior being, endowed with magical power.

One day, however, his money failed; and at the same time the rising of the Nile destroyed, in two hours, the work of three months. The

fellahs rebelled: one of them rushed towards Belzoni, intending to strike him with his dagger. The Italian coolly waited his approach, disarmed him; and then, seizing him by the feet, lifted him as though he had been a hazel wand, and began to inflict vigorous blows on the other insurgents with this novel and extemporary weapon of defence. The lesson was not thrown away: very speedily the *fellahs* returned to their duty; and after eighteen days' incessant labour, Memnon trembled at his base, and was moved towards the bank of the Nile.

The embarkation of this enormous statue presented difficulties almost as great as those which attended its disinterment and land transport. Nevertheless, the intelligence and perseverance of Belzoni surmounted every obstacle; and he brought his wondrous conquest to London, where its arrival produced a sensation similar to that caused more recently in Paris by the sight of the Obelisk of Luxor. Loaded with praise, and also with more substantial gifts, Belzoni, now became an important personage, returned to Egypt and to his friend Mr. Salt. The latter proposed to him to go up the Nile, and attempt the removal of the sand-hills which covered the principal portion of the magnificent temple of Ebsamboul. Belzoni readily consented, set out for Lower Nubia, ventured boldly amongst the savage tribes who wander through the sandy desert; returning to Thebes, he was rewarded, not only by the success of his special mission, but also by discovering the temple of Luxor.

In all his undertakings, however enterprising, Belzoni was aided and cheered by the presence of his wife. The expedition to Nubia was, however, thought too hazardous for her to undertake. But in the absence of her husband she was not idle; she dug up the statue of Jupiter Ammon, with the ram's head on his knee, which is now in the British Museum.

The temple of Luxor had been so completely, and for so long a period, buried in sand, that even its existence remained unsuspected. It had been dedicated to Isis by the Queen of Rameses the Great; and the descriptions which travellers give of it, resemble those of the palaces in the "Arabian Nights." Four colossal figures, sixty-one feet in height, are seated in front. Eight others, forty-eight in height, and standing up, support the roof of the principal inner hall, in which gigantic bas-reliefs represent the whole history of Rameses. Sixteen other halls, scarcely smaller than the first, display, in all their primitive splendour, many gorgeous paintings, and the mysterious forms of myriads of statues.

After this discovery, Belzoni took up his temporary abode in the valley of *Biban-el-Moulok* (Tombs of the Kings). He had already remarked there, amongst the rocks, a fissure of a peculiar form, and which was evidently the work of man. He caused this

opening to the interior, and soon discovered the entrance to a long corridor, whose walls were covered with sculptures and hieroglyphical paintings. A deep noise and a wall barred the further end of the cave; but he broke a passage through, and found a second vault, in which stood an alabaster sarcophagus, covered with hieroglyphics. He took possession of this, and sent it safely to Europe. His own account of these difficulties is extremely interesting:—

"Of none of these tombs many persons could have withstood the suffocating air, which often caused fainting. A vast quantity of dust rises, so that it enters the throat and nostrils, and blocks the nose and mouth to such a degree, that it requires great power of lungs to resist it and the strong effluvia of the mummies. This is not all; the entry or passage where the bodies are is roughly cut in the rocks, and the falling of the sand from the upper part or ceiling of the passage causes it to be nearly filled up. In some places there is not more than the vacancy of a foot left, which you must contrive to pass through in a creeping posture, like a snail, on pointed and keen stones, that cut like glass. After getting through these passages, some of them two or three hundred yards long, you generally find a more commodious place, perhaps high enough to sit. But what a place of rest! surrounded by bodies, by heaps of mummies in all directions; which, previous to my being accustomed to the sight, impressed me with horror. The blackness of the walls, the faint light given by the candles or torches for want of air, the different objects that surrounded me, seeming to converse with each other, and the Arabs with the candles or torches in their hands, naked and covered with dust, themselves resembling living mummies, absolutely formed a scene that cannot be described. In such a situation I found myself several times, and when returned exhausted and fainting, till at last I became used to it, and indifferent to what I suffered, except from the dust, which never failed to choke my throat and nose; and though, fortunately, I am destitute of the sense of smelling, I could not say that the mummies were rather unpleasant to smell. After the exertion of entering into such a place, through a passage of fifty, a hundred, three hundred, or perhaps six hundred yards, nearly overcome, I sought a resting-place, found one, and contrived to sit; but when my weight falling on the body of an Egyptian, it crushed it like a hard pan. I naturally had recourse to my hands to support my weight, but they found no better support; so that I sunk altogether among the broken mummies, with a crash of bones, rags, and wooden cases, which raised such a dust as kept me motionless for a quarter of an hour, waiting till it subsided again. I could not remove from the place, however, without increasing it, and every day I took I crushed a mummy in some part or other. Once I was conducted from such a place to another resembling it, through a passage of about twenty feet in length, and no wider than that a body could be forced through. It was closed with mummies, and I could not pass without putting my face in contact with that of some decayed Egyptian; but as the passage inclined downwards, my own weight helped me on: however, I could not avoid being covered with bones,

teeth, and bones falling from above. Thus I proceeded from one cave to another, all full of mummies piled up in various ways, some standing straight, and some on their backs.

Afterwards, Belzoni travelled to the shores of the Red Sea, inspected the ruins of Berenice; then returned to Cairo, and directed excavations to be made at the bases of the great pyramids of Ghizeh; penetrated into that of Chephren—which had hitherto been inaccessible to Europeans—and discovered within it the sacred chamber where repose the hallowed bones of the bull Apis. The Valley of Faïoum, the Lake Moeris, the ruins of Arsinoë, the sands of Lybia, all yielded up their secrets to his dauntless spirit of research. He visited the oasis of El-Cassar, and the Fountain of the Sun; strangled in his arms two treacherous guides, who tried to assassinate him; and then left Egypt, and returned to Padua with his wife.

The son of the humble barber had now become a rich and celebrated personage. A triumphal entry was prepared for him; and the municipal authorities of his native city met him at the gate, and presented him with an address. Manfredini was commissioned to engrave a medal which should commemorate the history of the illustrious traveller. England, however, soon claimed him; and on his arrival in London, he was received with the same honours as in his own country. Then he published an account of his travels, under the following title: "Narrative of the Operations and recent Discoveries in the Pyramids, Temples, Tombs, and Cities of Egypt and Nubia, &c."

In 1822, Belzoni returned to Africa, with the intention of penetrating to Timbuctoo. Passing in the following year from the Bight of Benue towards Houssa, he was attacked with dysentery; was carried back to Gato, and thence put on board an English vessel lying off the coast. There, with much firmness and resignation, he prepared to meet his end. He entrusted the captain with a large amethyst to be given to his wife, and also with a letter which he wrote to his faithful companion through good and evil days. Soon afterwards, he breathed his last. They buried him at Gato, at the foot of a large tree, and engraved on his tomb the following epitaph in English:—

"Here lies Belzoni, who died at this place, on his way to Timbuctoo, December 2nd, 1823."

Belzoni was but forty-five years old when he died. A statue of him was erected at Padua on the 4th of July, 1827. Very recently the Government of Great Britain bestowed on his widow the tardy solace of a small pension.

Giovanni Belzoni, the once starving mechanic, became one of the most illustrious men in Europe:—an encouraging example to all those who have not only sound heads to project, but stout hearts to execute.

"Familiar in their Mouths as HOUSEHOLD WORDS."

HOUSEHOLD WORDS.

A WEEKLY JOURNAL.

CONDUCTED BY CHARLES DICKENS.

No. 50.]

SATURDAY, MARCH 8, 1851.

[Price 2d.]

A MONUMENT OF FRENCH FOLLY.

It was profoundly observed by a witty member of the Court of Common Council, in Council assembled in the City of London, in the year of our Lord one thousand eight hundred and fifty, that the French are a frog-eating people, who wear wooden shoes.

We are credibly informed, in reference to the nation whom this choice spirit so happily disposed of, that the caricatures and stage representations which were current in England some half a century ago, exactly depict their present condition. For example, we understand that every Frenchman, without exception, wears a pigtail and curl-papers. That he is extremely shallow, thin, long-faced, and lantern-jawed. That the calves of his legs are invariably undeveloped; that his legs fail at the knees, and that his shoulders are always higher than his ears. We are likewise assured that he rarely tastes any food but soup maigre, and an onion; that he always says, "By Gar! Ah! Vat you tell me, Sare?" at the end of every sentence he utters; and that the true generic name of his race is the *Monseccra*, or the *Parly-voos*. If he is not a dancing-master, or a barber, he must be a cook; since no other trades but those three are congenial to the tastes of the people, or permitted by the Institutions of the country. He is a slave, of course. The ladies of France (who are also slaves) invariably have their heads tied up in Belcher handkerchiefs, wear long ear-rings, carry tambourines, and beguile the weariness of their yoke by singing in head voices through their noses—principally to barrel-organs.

It may be generally summed up, of this inferior people, that they have no idea of anything.

Of a great Institution like Smithfield, they are unable to form the least conception. A Beast Market in the heart of Paris would be regarded as an impossible nuisance. Nor have they any notion of slaughter-houses in the midst of a city. One of these benighted frog-eaters would scarcely understand your meaning, if you told him of the existence of such a British byword.

It is agreeable, and perhaps pardonable, to indulge in a little self-complacency when our right to it is thoroughly established. At the

present time, to be rendered memorable by a final attack on that good old market which is the (rotten) apple of the Corporation's eye, let us compare ourselves, to our national delight and pride, as to these two subjects of slaughter-house and beast-market, with the outlandish foreigner.

The blessings of Smithfield are too well understood to need recapitulation; all who run (away from mad bulls and pursuing oxen) may read. Any market-day, they may be beheld in glorious action. Possibly, the merits of our slaughter-houses are not yet quite so generally appreciated.

Slaughter-houses, in the large towns of England, are always (with the exception of one or two enterprising towns) most numerous in the most densely crowded places, where there is the least circulation of air. They are often underground, in cellars; they are sometimes in close back yards, sometimes (as in Spitalfields) in the very shops where the meat is sold. Occasionally, under good private management, they are ventilated and clean. For the most part, they are unventilated and dirty; and, to the reeking walls, putrid fat and other offensive animal matter clings with a tenacious hold. The busiest slaughter-houses in London are in the neighbourhood of Smithfield, in Newgate Market, in Whitechapel, in Newport Market, in Leadenhall Market, in Clare Market. All these places are surrounded by houses of a poor description, swarming with inhabitants. Some of them are close to the worst burial-grounds in London. When the slaughter-house is below the ground, it is a common practice to throw the sheep down areas, neck and crop—which is exciting, but not at all cruel. When it is on the level surface, it is often extremely difficult of approach. Then, the beasts have to be worried, and goaded, and pronged, and tail-twisted, for a long time before they can be got in—which is entirely owing to their natural obstinacy. When it is not difficult of approach, but is in a foul condition, what they see and scent makes them still more reluctant to enter—which is their natural obstinacy again. When they do get in at last, after no trouble and suffering to speak of, (for, there is nothing in the previous journey into the heart of London, the night's endurance in Smithfield, the struggle out again, among the

crowded multitude, the coaches, carts, waggons, omnibuses, gigs, chaises, phaetons, cabs, trucks, dogs, boys, whoopings, roarings, and ten thousand other distractions), they are represented to be in a most unfit state to be killed, according to microscopic examinations made of their fevered blood by one of the most distinguished physiologists in the world, PROFESSOR OWEN—but that's humbug. When they are killed, at last, their reeking carcasses are hung in impure air, to become, as the same Professor will explain to you, less nutritious and more unwholesome—but he is only an uncommon counsellor, so don't mind him. In half a quarter of a mile's length of Whitechapel, at one time, there shall be six hundred newly slaughtered oxen hanging up, and seven hundred sheep—but, the more the merrier—proof of prosperity. Hard by Snow Hill and Warwick Lane, you shall see the little children, inured to sights of brutality from their birth, trotting along the alleys, mingled with troops of horribly busy pigs, up to their ankles in blood—but it makes the young rascals hardy. Into the imperfect sewers of this overgrown city, you shall have the immense mass of corruption, engendered by these practices, lazily thrown out of sight, to rise, in poisonous gases, into your house at night, when your sleeping children will most readily absorb them, and to find its languid way, at last, into the river that you drink—but, the French are a frog-eating people who wear wooden shoes, and it's O the roast beef of England, my boy, the jolly old English roast beef!

It is quite a mistake—a new-fangled notion altogether—to suppose that there is any natural antagonism between putrefaction and health. They know better than that, in the Common Council. You may talk about Nature, in her wisdom, always warning man through his sense of smell, when he draws near to something dangerous; but, that won't go down in the city. Nature very often don't mean anything. Mrs. Quickly says that prunes are ill for a green wound; but, whosoever says that putrid animal substances are ill for a green wound, or for robust vigor, or for any thing or for any body, is a humanity-monger and a humbug. Britons never, never, never, &c., therefore. And prosperity to cattle-driving, cattle-slaughtering, bone-crushing, blood-boiling, trotter-scraping, tripe-dressing, paunch-cleaning, gut-spinning, hide-preparing, tallow-melting, and other salubrious proceedings, in the midst of hospitals, churchyards, workhouses, schools, infirmaries, refuges, dwellings, provision-shops, nurseries, sick-beds, every stage and halting-place in the journey from birth to death!

These uncommon counsellors, your Professor Owens and fellows, will contend that to tolerate these things in a civilised city, is to reduce it to a worse condition than BRUCE found to prevail in AFRICA. For, there (say they) the jackals and wild dogs came at night to

devour the offal; whereas here there are no such natural scavengers, and quite as savage customs. Further, they will demonstrate that nothing in Nature is intended to be wasted, and that besides the waste which such abuses occasion in the articles of health and life—main sources of the riches of any community—they lead to a prodigious waste of changing matters, which might, with proper preparation, and under scientific direction, be safely applied to the increase of the fertility of the land. Thus (they argue) does Nature ever avenge infractions of her beneficent laws, and so surely as Man is determined to warp any of her blessings into curses, shall they become curses, and shall he suffer heavily. But, this is cant. Just as it is cant of the worst description to say to the London Corporation, "How can you exhibit to the people so plain a spectacle of dishonest equivocation, as to claim the right of holding a market in the midst of the great city, for one of your vested privileges, when you know that when your last market-holding charter was granted to you by King Charles the First, Smithfield stood in the SUBURBS OF LONDON, and is in that very charter so described in those five words?"—which is certainly true, but has nothing to do with the question.

Now to the comparison, in these particulars of civilisation, between the capital of England, and the capital of that frog-eating and wooden-shoe wearing country, which the illustrious Common Councilman so sarcastically settled.

In Paris, there is no Cattle Market. Cows and calves are sold within the city, but, the Cattle Markets are at Poissy, about thirteen miles off, on a line of Railway; and at Sceaux, about five miles off. The Poissy market is held every Thursday; the Sceaux market, every Monday. In Paris, there are no slaughter-houses, in our acceptance of the term. There are five public Abattoirs—within the walls, though in the suburbs—and in these all the slaughtering for the city must be performed. They are managed by a Syndicat or Guild of Butchers, who confer with the Minister of the Interior on all matters affecting the trade, and who are consulted when any new regulations are contemplated for its government. They are, likewise, under the vigilant superintendence of the Police. Every butcher must be licensed: which proves him at once to be a slave, for we don't license butchers in England—we only license apothecaries, attorneys, postmasters, publicans, hawkers, retailers of tobacco, snuff, pepper, and vinegar—and one or two other little trades not worth mentioning. Every arrangement in connexion with the slaughtering and sale of meat, is matter of strict police regulation. (Slavery again, though we certainly have a general sort of a Police Act here.)

But, in order that the reader may understand what a monument of folly these frog-eaters have raised in their abattoirs and cattle-markets, and may compare it with

what common counselling has done for us all these years, and would still do but for the innovating spirit of the times, here follows a short account of a recent visit to these places:—

It was as sharp a February morning as you would desire to feel at your fingers' ends when I turned out—tumbling over a chiffonier with his little basket and rake, who was picking up the bits of colored paper that had been swept out, over-night, from a Bon-Bon shop—to take the Butchers' Train to Poissy. A cold dim light just touched the high roofs of the Tuileries which have seen such changes, such distracted crowds, such riot and bloodshed; and they looked as calm, and as old, all covered with white frost, as the very Pyramids. There was not light enough, yet, to strike upon the towers of Notre Dame across the water; but I thought of the dark pavement of the old Cathedral, as just beginning to be streaked with grey; and of the lamps in the "House of God," the Hospital close to it, burning low and being quenched; and of the keeper of the Morgue going about with a fading lantern, busy in the arrangement of his terrible waxwork for another sunny day.

The sun was up, and shining merrily when the butchers and I, announcing our departure with an engine-scriek to sleepy Paris, rattled away for the Cattle Market. Across the country, over the Seine, among a forest of scrubby trees—the hoar frost lying cold in shady places, and glittering in the light—and here we are at Poissy! Out leap the butchers who have been chattering all the way like madmen, and off they straggle for the Cattle Market (still chattering, of course, incessantly), in hats and caps of all shapes, in coats and blouses, in calf-skins, cow-skins, horse-skins, furs, shaggy mantles, hairy coats, sackings, baize, oil-skin, anything you please that will keep a man and a butcher warm, upon a frosty morning.

Many a French town have I seen, between this spot of ground and Strasburgh or Marseilles, that might sit for your picture, little Poissy! Barring the details of your old church, I know you well, albeit we make acquaintance, now, for the first time. I know your narrow, straggling, winding streets, with a kennel in the midst, and lamps slung across. I know your picturesque street-corners, winding up-hill Heaven knows why or where! I know your tradesmen's inscriptions, in letters not quite fat enough; your barber's brazen basins dangling over little shops; your Cafés and Estaminets, with cloudy bottles of stale syrup in the windows, and pictures of crossed billiard-ends outside. I know this very grey horse with his tail rolled up in a knot like the "back-hair" of an untidy woman, who won't be shod, and who makes himself heraldic by clattering across the street on his hind legs, while twenty voices shriek and growl at him as a Brigand,

an accursed Robber, and an everlastingly-doomed Fig. I know your sparkling town-fountain too, my Poissy, and am glad to see it near a cattle-market, gushing so freshly, under the auspices of a gallant little sublimated Frenchman wrought in metal, perched upon the top. Through all the land of France I know this unswept room at The Glory, with its peculiar smell of beans and coffee, where the butchers crowd about the stove, drinking the thinnest of wine from the smallest of tumblers; where the thickest of coffee-cups mingle with the longest of loaves, and the weakest of lump sugar; where Madame at the counter easily acknowledges the homage of all entering and departing butchers; where the billiard-table is covered up in the midst like a great bird-cage—but the bird may sing by-and-bye!

A bell! The Calf Market! Polite departure of butchers. Hasty payment and departure on the part of amateur Visitor. Madame reproaches Ma'anselle for too fine a susceptibility in reference to the devotion of a Butcher in a bear-skin. Monsieur, the landlord of The Glory, counts a double handful of sous, without an unobliterated inscription, or an undamaged crowned head, among them.

There is little noise without, abundant space, and no confusion. The open area devoted to the market, is divided into three portions: the Calf Market, the Cattle Market, the Sheep Market. Calves at eight, cattle at ten, sheep at mid-day. All is very clean.

The Calf Market is a raised platform of stone, some three or four feet high, open on all sides, with a lofty over-spreading roof, supported on stone columns, which give it the appearance of a sort of vineyard from Northern Italy. Here, on the raised pavement, lie innumerable calves, all bound hind-legs and fore-legs together, and all trembling violently—perhaps with cold, perhaps with fear, perhaps with pain; for, this mode of tying, which seems to be an absolute superstition with the peasantry, can hardly fail to cause great suffering. Here, they lie, patiently in rows, among the straw, with their stolid faces and inexpressive eyes: superintended by men and women; boys and girls; here, they are inspected by our friends, the butchers, bargained for, and bought. Plenty of time; plenty of room; plenty of good humour. "Monsieur François in the bear-skin, how do you do, my friend? You come from Paris by the train? The fresh air does you good. If you are in want of three or four fine calves this market-morning, my angel, I, Madame Doche, shall be happy to deal with you. Behold these calves, Monsieur François! Great Heaven, you are doubtful! Well, sir, walk round and look about you. If you find better for the money, buy them. If not, come to me!" Monsieur François goes his way leisurely, and keeps a wary eye upon the stock. No other butcher jostles Monsieur

François; Monsieur François jostles no other butcher. Nobody is flustered and aggravated. Nobody is savage. In the midst of the country blue frocks and red handkerchiefs, and the butchers' coats, shaggy, furry, and hairy: of calf-skin, cow-skin, horse-skin, and bear-skin: towers a cocked hat and a blue cloak. Slavery! For our Police wear great coats and glazed hats.

But now the bartering is over, and the calves are sold. "Ho! Gregorie, Antoine, Jean, Louis! Bring up the carts, my children! Quick, brave infants! Hola! Hi!"

The carts, well littered with straw, are backed up to the edge of the raised pavement, and various hot infants carry calves upon their heads, and dexterously pitch them in, while other hot infants, standing in the carts, arrange the calves, and pack them carefully in straw. Here is a promising young calf, not sold; whom Madame Doche unbinds. Pardon me, Madame Doche, but I fear this mode of tying the four legs of a quadruped together, though strictly à la mode, is not quite right. You observe, Madame Doche, that the cord leaves deep indentations in the skin, and that the animal is so cramped at first as not to know, or even remotely suspect, that he is unbound, until you are so obliging as to kick him, in your delicate little way, and pull his tail like a bell-rope. Then, he staggers to his knees, not being able to stand, and stumbles about like a drunken calf, or the horse at Franconi's, whom you may have seen, Madame Doche, who is supposed to have been mortally wounded in battle. But, what is this rubbing against me, as I apostrophise Madame Doche? It is another heated infant, with a calf upon his head. "Pardon, Monsieur, but will you have the politeness to allow me to pass?" "Ah, Sir, willingly. I am vexed to obstruct the way." On he staggers, calf and all, and makes no allusion whatever either to my eyes or limbs.

Now, the carts are all full. More straw, my Antoine, to shake over these top rows; then, off we will clatter, rumble, jolt, and rattle, a long row of us, out of the first town-gate, and out at the second town-gate, and past the empty sentry-box, and the little thin square bandbox of a guardhouse, where nobody seems to live; and away for Paris, by the paved road, lying, a straight straight line, in the long long avenue of trees. We can neither choose our road, nor our pace, for that is all prescribed to us. The public convenience demands that our carts should get to Paris by such a route, and no other (Napoleon had leisure to find that out, while he had a little war with the world upon his hands), and we be betide us if we infringe orders.

Droves of oxen stand in the Cattle Market, tied to iron bars fixed into posts of granite. Other droves advance slowly down the long avenue, past the second town-gate, and the first town-gate, and the sentry-box, and the bandbox, throwing the morning with their

smoky breath as they come along. Plenty of room; plenty of time! Neither man nor beast is driven out of his wits by coaches, carts, waggons, omnibuses, gigs, chaises, phaetons, cabs, trucks, boys, whoopings, rearings, and multitudes. No tail-twisting is necessary—no iron pronging is necessary. There are no iron prongs here. The market for cattle is held as quietly as the market for calves. In due time, off the cattle go to Paris; the drovers can no more choose their road, nor their time, nor the numbers they shall drive, than they can choose their hour for dying in the course of nature.

Sheep next. The Sheep-pens are up here, past the Branch Bank of Paris established for the convenience of the butchers, and behind the two pretty fountains they are making in the Market. My name is Bull: yet I think I should like to see as good twin fountains—not to say in Smithfield, but in England anywhere. Plenty of room; plenty of time. And here are sheep-dogs, sensible as ever, but with a certain French air about them—not without a suspicion of dominoes—with a kind of flavor of moustache and beard—demonstrative dogs, shaggy and loose where an English dog would be tight and close—not so troubled with business calculations as our English drovers' dogs, who have always got their sheep upon their minds, and think about their work, even resting, as you may see by their faces; but, dashing, showy, rather unreliable dogs: who might worry me instead of their legitimate charges if they saw occasion—and might see it somewhat suddenly. The market for sheep passes off like the other two; and away they go, by their allotted road to Paris. My way being the Railway, I make the best of it at twenty miles an hour; whirling through the now high-lighted landscape; thinking that the inexperienced green buds will be wishing before long, they had not been tempted to come out so soon; and wondering who lives in this or that chateau, all window and lattice, and what the family may have for breakfast this sharp morning.

After the Market comes the Abattoir. What abattoir shall I visit first? Montmartre is the largest. So, I will go there.

The abattoirs are all within the walls of Paris, with an eye to the receipt of the octroi duty; but, they stand in open places in the suburbs, removed from the press and bustle of the city. They are managed by the Syndicat or Guild of Butchers under the inspection of the Police. Certain smaller items of the revenue derived from them are in part retained by the Guild for the payment of their expenses, and in part devoted by it to charitable purposes in connexion with the trade. They cost six hundred and eighty thousand pounds; and they return to the City of Paris an interest on that outlay, amounting to nearly six and a half per cent.

Here, in a sufficiently diamonded space is the Abattoir of Montmartre, covering nearly nine

acres of ground, surrounded by a high wall, and looking from the outside like a cavalry barracks. At the iron gates is a small functionary in a large cocked hat. "Monsieur desires to see the abattoir? Most certainly," State, being inconvenient in private transactions, and Monsieur being already aware of the cocked hat, the functionary puts it into a little official bureau which it almost fills, and accompanies me in the modest attire—as to his head—of ordinary life.

Many of the animals from Poissy have come here. On the arrival of each drove, it was turned into yonder ample space, where each butcher who had bought, selected his own purchases. Some, we see now, in these long perspectives of stalls with a high overhanging roof of wood and open tiles rising above the walls. While they rest here, before being slaughtered, they are required to be fed and watered, and the stalls must be kept clean. A stated amount of fodder must always be ready in the loft above; and the supervision is of the strictest kind. The same regulations apply to sheep and calves; for which, portions of these perspectives are strongly ruled off. All the buildings are of the strongest and most solid description.

After traversing these lairs, through which, besides the upper provision for ventilation just mentioned, there may be a thorough current of air from opposite windows in the side walls, and from doors at either end, we traverse the broad, paved, court-yard until we come to the slaughter-houses. They are all exactly alike, and adjoin each other, to the number of eight or nine together, in blocks of solid building. Let us walk into the first.

It is firmly built and paved with stone. It is well lighted, thoroughly aired, and lavishly provided with fresh water. It has two doors opposite each other; the first, the door by which I entered from the main yard; the second, which is opposite, opening on another smaller yard, where the sheep and calves are killed on benches. The pavement of that yard, I see, slopes downward to a gutter, for its being more easily cleansed. The slaughter-house is fifteen feet high, sixteen feet and a half wide, and thirty-three feet long. It is fitted with a powerful windlass, by which one man at the handle can bring the head of an ox down, to the ground, to receive the blow from the pole-axe that is to fell him—with the means of raising the carcass and keeping it suspended during the after-operation of dressing—and with hooks on which carcasses can hang, when completely prepared, without touching the walls. Upon the pavement of this first stone chamber, lies an ox scarcely dead. If I except the blood draining from him, into a little stone well in a corner of the pavement, the place is as free from offence as the Place de la Concorde. It is infinitely purer and cleaner, I know, my friend the functionary, than the Cathedral of Notre Dame. Ha, ha!

Monsieur is pleasant, but, truly, there is reason, too, in what he says.

I look into another of these slaughter-houses. "Pray enter," says a gentleman in bloody boots. "This is a calf I have killed this morning. Having a little time upon my hands, I have cut and punctured this lace pattern in the coats of his stomach. It is pretty enough. I did it to divert myself." "It is beautiful, Monsieur, the slaughterer!" He tells me I have the gentility to say so.

I look into rows of slaughter-houses. In many, retail dealers, who have come here for the purpose, are making bargains for meat. There is killing enough, certainly, to satiate an unused eye; and there are steaming carcasses enough, to suggest the expediency of a fowl and salad for dinner; but, everywhere, there is an orderly, clean, well-systematised routine of work in progress—horrible work at the best, if you please; but, so much the greater reason why it should be made the best of. I don't know (I think I have observed, my name is Bull) that a Parisian of the lowest order is particularly delicate, or that his nature is remarkable for an infinitesimal infusion of ferocity; but, I do know, my potent, grave, and common counselling Signors, that he is forced, when at this work, to submit himself to a thoroughly good system, and to make an Englishman very heartily ashamed of you.

Here, within the walls of the same abattoir, in other roomy and commodious buildings, are a place for converting the fat into tallow and packing it for market—a place for cleansing and scalding calves' heads and sheeps' feet—a place for preparing tripe—stables and coach-houses for the butchers—innumerable conveniences, aiding in the diminution of offensiveness to its lowest possible point, and the raising of cleanliness and supervision to their highest. Hence, all the meat that goes out of the gate is sent away in clean covered carts. And if every trade connected with the slaughtering of animals were obliged by law to be carried on in the same place, I doubt, my friend, now reinstated in the cocked hat (whose civility these two francs imperfectly acknowledge, but appear munificently to repay) whether there could be better regulations than those which are carried out at the Abattoir of Montmartre. Adieu, my friend, for I am away to the other side of Paris, to the Abattoir of Grenelle! And there, I find exactly the same thing on a smaller scale, with the addition of a magnificent Artesian well, and a different sort of conductor, in the person of a neat little woman with neat little eyes, and a neat little voice, who picks her neat little way among the bullocks in a very neat little pair of shoes and stockings.

Such is the Monument of French Folly which a foreignering people have erected, in a national hatred and antipathy for common counselling wisdom. That wisdom, assembled

the City of London, having ~~deliberately~~ refused, after a debate three days long, and by a majority of nearly seven to one, to associate itself with any Metropolitan Cattle-Market unless it be held in the midst of the City, it follows that we shall lose the inestimable advantages of common counselling protection, and be thrown, for a market, on our own wretched resources. In all human probability we shall thus come, at last, to erect a monument of folly very like this French monument. If that be done, the consequences are obvious. The leather trade will be ruined, by the introduction of American timber, to be manufactured into shoes for the fallen English; the Lord Mayor will be required, by the popular voice, to live entirely on frogs; and both these changes will (how, is not at present quite clear, but certainly somehow or other) fall on that unhappy landed interest which is always being killed, yet is always found to be alive—and kicking.

MY MAHOGANY FRIEND.

I FANCY the habit I have contracted of conversing with what we commonly call inanimate objects, or, at least, of listening to their long stories and unlimited confidences, (which they are much given to repose in me), arises, in some measure, from the solitary life I lead. I cannot indeed affirm, with truth, that I am altogether a solitary old fellow, seeing I am such a near neighbour to the Chase; neither can I pretend that I am the confidant of inanimate objects alone. You must know, by the way, that the Chase is the old house—the house in point of fact—of my neighbourhood.

How well I remember the time, now about seventeen years ago, when I first arrived to take possession of the "Den" as I, somewhat misanthropically, christened my new abode. I calmed myself with the reflection that, although Olivia (which I still think a pretty name) had turned out a flirt, and tried (but unsuccessfully) to break my heart, there was "balm in Gilead." The flutter and flurry of Life were over; no more long expectations, and slow disappointments; all "that sort of thing" was at an end; and, if I were occasionally dull, at least, I should be quiet.

But, talk of single blessedness, talk of having "no encumbrances," as our country-people say; I do not see that my old bachelorship has saved me from any of the anxieties to which fathers, with a whole house full of children, are subject! I am sure I might have had five sons, and a profession apiece to provide for them, and they need not have given me half the trouble or the heartache that that one little black-eyed gipsy at the Chase has occasioned me—not to mention Harry! Ah, I have had a pretty time of it at the Den, altogether! I have been a sort of barometer, entirely at the mercy of the

changes of atmosphere at the Chase! I believe a slight tendency to a pulmonary complaint has saved my life, or my reason, before now. I often think I should have been worried to death if I had remained at home without intermission. The Physician who recommended a southern climate, occasionally, did not know half the good he was doing me.

But, I am always running on in this way. I forget where I was.—No I don't! I remember. I began by alluding to inanimate objects. Well! I remember, distinctly enough, the day when, having taken possession of my Den, I went, for the first time, bemoaning my sad fate as the victim of social civility, up and down those tortuous paths that form the short cut from the Den to the Chase—dwarf avenues of stunted underwood, with here and there a large tree, ivy-clasped; but, the fern itself is as high, in some parts, as small trees, and quite thick enough to hide in; as the children at the Chase soon discovered, when they wished to waylay me. Of one thing I am quite sure; the birds sing nowhere so sweetly, or so late, or so early in the day, or in the season, as along that path; and the wild flowers are so bright and so luxuriant that the garden at the Chase looked dull to me after them; but, then, I always have loved wild flowers best.

I am wandering again. It's my way to lose my way. I proceeded to the Chase, for the purpose of returning the visit which the master of the Chase had made to me; and I was left in the hall, while the servant, with those troublesome scruples regarding the exact truth of "not at home" which I suppose are peculiar to country servants, hunted his unfortunate master and mistress into every possible nook and corner of house, pleasure-ground, and garden.

I spent the interim, patiently and pleasantly enough, in the hall. It was a picturesque old hall. Not on a large scale; not a fine hall; but, well fitted up, with a billiard-table in the middle, that had more of a social than a gambling aspect: with plenty of cricket-bats, and fishing-rods, and whips, and gardening utensils, and some out-of-door-children's toys, pleasantly scattered about.

"Something straightforward and honest, in a hall of this kind," thought I. "It gives you an insight into the character of the people you are going to meet." As I thought this, my eye fell on an old Hat-stand, whom I immediately took to my bosom as, and have ever since considered and called, my Mahogany Friend.

It was not a very old Hat-stand, then, I suppose; but, old or young, we made friends that minute.

I began our acquaintance by scrutinising the "tree," or, in other words, the arms of my mahogany friend, very narrowly. On the topmost branch, hung the master's hat—rather lower in the crown than the generality of hats, but, quite conventional enough to pass

must. I thought it had rather a stern look as it inclined downwards; but it was neat and well-brushed, and had a very respectable appearance altogether. On the left side, far lower down, hung a straw cottage bonnet crossed with a simple pale blue ribbon, round which clustered innumerable little caps, and hats, and bonnets, of different dimensions. I fitted a face into that bonnet as I stood there, and the event did honour to my powers of divination. A fair meek Madonna face, I made it, with eyes all love, and a mouth all gentleness. Too much love, and too little power, in that whole countenance, to fit it for this work-o'-day world.

The master and mistress coming in to receive me, I found my Mahogany friend quite right in these suggestions. I made a pleasant visit, and I thanked him with a courteous look as I went out. We understood each other. I did not frequent the Chase much in those days, comparatively speaking; but, before the year was out, there was a blank on the topmost branch of the tree that looked sad, even to me.

"Bad news!" said my Mahogany Friend, "you see!" And bad, indeed, it was. The small close crape bonnet of the widow which replaced the Cottage for a time, had mounted a degree higher; but, it seemed now as if it only peeped out of a little nest of mourning head-gear.

That was the winter I fell ill, and was ordered to a southern climate. I remained away, several years—a sufficiently long time, in fact, to lay in a good stock of health, so that I was better able, on my return, to encounter the damp air and clayey soil round my old Den.

Nothing could exceed the loquacity of my Mahogany Friend, when I went up to the Chase, on my return. Instead of allowing me to draw my own conclusions from what he showed me, he began to talk in a most unreserved manner.

"Look here!" says he, "don't you think the Cottage appears guyer than it ever did before, with dear old William's hat hanging close to it? That is William's, old William, or Sweet William, as we call him; see how manly it looks. Some people say it has grown very like the one I used to carry on my head some years ago; but, I know better. The quality is quite different, Sir. That cap very near the Cottage, that's young George's. George mounted that sort of cap because all the other Eton fellows do; an argument which black-eyed sister Katie does not admit. See that little tarpaulin hat just underneath the Cottage; that's Tom's. Tom, sir, is gone raving mad about sailing. I see the poor Cottage sometimes, peeping down so anxiously over that little hat! But, it's of no use, Mr. Mum; the boy's mind's made up. I suppose I need not tell you who owns this black hat, and feathers, eh? Has it not just such a pretty, jaunty, wayward, high-spirited

warm-hearted look, as Katie herself? It's the hat I love to carry, best of all! Though I have no objection to the broad straw hat with its fluttering ribbons, that sits like a thatched roof on the golden locks of little Minnie. Bless you, Mr. Mum, I have seen the people stoop down (and it's worth their while too) to look at the little fairy underneath! This is Harry's hat next to Katie's. Oh, you may be sure that, while they can, that brother and sister will be side by side! This brown wide-awake is Harry's too—mad-cap, we call him—and this green Tyrolese hat, with the peacock's feathers, is Harry's, too; and this Glengarry bonnet—all Harry's, Mr. Mum! Harry has no end of friends, and they all send him presents; and, as he spends almost all his time out of doors, what can be a more appropriate present than a covering for that wild head of his, eh, sir? These two neatly trimmed, ladylike bonnets, with a coarser one in the centre," continued my friend, nearly out of his mahogany breath, "these, Mr. Mum, belong to our twins and their governess. Katie, you see, has emancipated herself from that yoke, and Minnie has not put it on yet; but dear me, how I do chatter!"

"Not at all, my Mahogany Friend," I politely replied. His remark was strictly true, but I wished to encourage him; because, like many chatterers, he seemed instinctively to avoid the very point on which I felt some curiosity.

On one side of the stand, but much nearer the top than any of the others, was perched a large, determined, grim-looking Bonnet. It was very plain that Katie's Spaniard and Harry's Tyrolese tossed their feathers at it; that Minnie's ribbons trembled under it; that the twin bonnets, though too well disciplined and ladylike to be demonstrative, inclined nearer to each other, as if they shrunk from it; that William's hat seemed looking away; that George's was running away, and that Tom's was sailing away, from it.

The Cottage had a peculiar expression, or else I am much mistaken; it had a sort of upward look in the direction of the solitary bonnet, and it hung closer than ever to William's hat.

"That grim-looking bonnet is something new, my Mahogany Friend," I observed with some hesitation; for I felt it was rather a breach of taste to allude to the one only subject on which my friend had been silent.

"It may be new to you, Mr. Mum," was the reply, in a decidedly peevish tone, "who have been amusing yourself in Italy all these years; but, it is not new enough to have any charms for me. It is a beaver bonnet, you see. Maybe that is the reason it is so heavy. I know that side of me often aches with the weight of it."

"Why, how can that be?" I asked, determined to sift the matter, now that I had once begun, "almost all your weight is on the other side."

"So you think," grumbled my friend, "if you were but to know the relief it is to me, when the Beaver is taken down for its daily 'Constitutional,' you would think differently. Why, if I did not miss it, bodily, I should know it was gone, by the way the children come bounding and springing into the hall, and darting up to me; or by seeing old Nelson scamper across into the drawing-room with his muddy paws."

"But, to whom does it belong?" I insisted.

"Why, I tell you," answered the old Stand, gruffly, "it belongs to 'Aunt.' " (I positively affirm that he had never told me anything of the kind; but let that pass.)

"What do you think Harry did one day?" pursued my friend. "He stuck it up at the top of all (where, between ourselves, I have no doubt it will establish itself some day) and then he called Katie and Minnie to come and bow down before Gesler's hat. Minnie looked terrified, and kept watching 'Aunt's' door—it opens on the staircase, that she may come out at odd times and glare at us, to see what we are all about. Katie tossed her black locks, and said she did not care who came out, for she supposed Harry might put the things where he pleased, in his own mother's hall. There they stood, such a pretty group of rebels on a small scale, looking up at me! And do you know what those good-for-nothing little conspirators planned next day? Harry had a scarlet fez among his hoards, and they pinched it into a Cap of Liberty, and perched it up here immediately, over the Beaver. But William chanced to come down first to breakfast that morning, and he looked grave, and took it off, and said, 'that wasn't the way to go to work.' Harry and Katie, who had been dodging about, watching for some one else, looked rather disconcerted, but by no means cross, for they always listen to William; and dear old William is sure to be right."

For some time after this, I detected no great change in the expression of my Mahogany Friend, and he volunteered no new confidences. Sometimes, best hats went away; but, then, the none hats that still lingered gave a promise of return. The grim Beaver went on towering; the Cottage went on nestling; the two sets of feathers went on waving about, all much as usual, until William's hat went away, and staid away longer than usual. When it returned, it had rather a different look about it; and, not long after its return, came a strange straw hat, a Swiss hat; such as ladies (not peasants) wear in their excursions through Switzerland. It was a good hat, I dare say; indeed I know it was, because William said it was; but, to me, it looked strange at the Chase, and I am an old man and do not like what is strange. It always hung next to William's—very close indeed—and the two hats always went out and came in at the same time. At last, the Swiss hat flapped away, and what was worse for all of us, William's seen; followed it, and

since that day that corner of the old Hat-stand has had rather a desolate look, and the poor Cottage has never been the same; no, nor the Chase; no, nor the country round about. George's Eton cap, indeed, hung manfully by the Cottage in the holidays, but holidays do not last all the year; and Tom's little tappanlin was soon on blue water, as my Mahogany Friend (grown taciturn) informed me in expressive pantomime, by holding out his bare arm.

I went away too, much about the same time—not that I was much loss, though Katie *did* cry when I told her I was going. A threatening of my old complaint drove me across the Alps; no unpleasant drive either!

On my return, I found great changes in my Mahogany Friend. The Beaver had established itself much higher, immediately over the Cottage. My old friend informed me that, during my absence, Katie's and Harry's hat would sometimes approach it, or little Minnie's straw creep coaxingly up to it; but, that the moment the Beaver took this stride, all the smaller tribe flew off at a tangent, and there the Beaver remained in triumph, towering over its poor meek neighbour, the Cottage, whose blue ribbon was all faded and discoloured. The other side of the Stand was changed too, and I felt rather perplexed and uneasy at the species of confusion I saw there. The neutralising influence of the twins, and their inseparable companion, was removed to some school in France, I believe. As to Harry, he must have been a real Hydra, if he could wear all those hats and caps. Besides my old friends, there was an Oxford boating hat, and a velvet hunting cap, and a steeple-chase jockey cap, and a German travelling cap, and goodness knows how many more. I found about, like satellites, hung all manner of bad imitations, in the shape of visiting hats and caps, with all the reckless look and none of the genuine air of Harry's head-gear. In the midst of these, I searched anxiously for the girls', my girls' hats; Minnie's, I saw, had betaken itself into a little shy corner, and remained aloof with a sort of scared look. But, Katie's, of course that was there, in the very midst of the throng—not quite so close to Harry's as usual, because it hung on the same branch with a dark blue foraging cap.

Now, when this cap caught my eye, I understood a good deal, because I am in the habit of understanding what I see; but, certainly, I never anticipated all the trouble that foraging cap was destined to give me. The lectures I should have to throw away, the confessions I should be doomed to listen to, the tears and prayers I should have to withstand—or to fancy I withstood; the early and late walks with Kate it would cost me, when it would have been much more comfortable and respectable, at my time of life, to have been, either in bed, or sitting over the fire in my own chimney corner.

I confessed before, that I have no affection for what is strange; but, somehow, by degrees the cap in question grew more familiar to me than I thought likely at first. It began to have a good, honest, dashing, soldier-like expression about it; still I did not think it worth the coil my silly Katie made. Perhaps if the poor Cottage had had more influence than could be expected from a sick room, or if the Beaver had not made itself more than usually grim on the occasion, or if Harry's conduct had been a little more uniform towards the foraging cap (I mean no pun, for I hope I am incapable of such a thing), and had not shown quite such lofty irritation when it took to hanging about Katie's black feathers, with which nothing in Harry's sight could compare; above all, perhaps, if dear old William, with his clear sight, his gentle heart, and persuasive firmness, had been at hand, Katie might have been inclined to listen to reason. However, as it was, the oftener the foraging cap was ordered off the branch, the nearer Katie's black plume waved menacingly by it, looking as ferocious, on a small scale, as the famous plume of feathers on the helmet that came plump into the famous Castle of Otranto. There did come a day, however, when I missed the cap, and in its stead hung a beautiful little riding whip, with a motto in gold letters round the handle—old English letters. I believe I rose greatly in the estimation of my old friend, for reading the motto off so easily; he knew it by heart, he said, and so did Katie; she always repeated it aloud to him, when she took it down every day, and sometimes twice a day.

"No force can move
Affixed Love"

As to Beaver, she had puzzled over it for ever, and could not make it out. The whip was seldom out of Katie's hand; but, pretty as it was, the wilful child actually preferred the cap. There was a great deal of wet weather about that time, which I suppose caused my favourite's feathers to droop like weeping willows, so that I could scarcely bear to see them. But, I was obliged to bear it often enough, I can tell you; they would come nodding into my very study, in the middle of a quiet morning; they would come to luncheon, and to walk, without the slightest encouragement on my part; and actually one wild autumn night, when the curtains were drawn, and the fire made up, and I was sitting in false security with my glass of negus, and a new periodical; what should come dripping in, but that everlasting plume! Much ado I had to get rid of it at all, or to induce it to hang itself up on its own legitimate Hat-stand, that night; for, it had half a mind to spread its wild feathers and fly. Ah, Katie, Katie, the dark rainy walk, too, we had of it! You so provokingly holding out your ungloved hand to see if it rained, in answer to my lamentations, and both of us wet to the skin! I

spoke out to you, Katie; but, what was the use? The only answer you gave me, were "But I don't care for what they say, dear Growler," (that was my name at the Chase, and Katie was my godmother), "and I can't help it if people will be ill-natured, and I am much too unhappy to care about that sort of thing; and I love him." But the darling did care too. She did care very much when words passed between her and Harry for the first time in their lives. She did care when the Beaver went into the sick room to make grim mischief; and she did care when Growler, the present writer, looked really grave at last, and showed he plainly did not approve!

Just about this time, there arrived, and hooked itself on to an arm of my Mahogany Friend, at first so low that it used to get dusty, and then, by degrees, creeping nearer to the Beaver than any living hat (so to speak) had ever dared approach before, a species of sleek, damp, broad-brimmed nondescript. It had a sort of shy, squinting way of looking downwards, and yet, at the same time, inclining upwards in the direction of the Beaver. At last, oh joyful day, in our calendar at the Chase! it walked off with the Beaver, and never came back!

I shall never forget the long breath my Mahogany Friend drew, on that delicious occasion. "I feel as young and as buoyant, Mr. Mum," said he, "as on the day I was first put up. One wink, sir, from the old stick and fishing-rod, standing yonder, would send me whirling round the hall in a polka. What do you think the housekeeper said to Katie, in my hearing?—Well, to be sure, Miss, here's a pretty business, for to think as your aunt should have been and gone and got married to Sly-boots, and we who put up with her so long, for her money, to be cheated after all!" "I would never have put up with her," said Katie, with a cheek like those mountain-ash berries over the old fire-place. "I don't want her money. I hate the very sound of money. I never knew a person who was worth caring for, that had any money!" And up she bounced to my side, Mr. Mum, and tears off her hat, with very little respect for my feelings, I can tell you."

Little traitress, thought I to myself, when the Stand had done talking, I have half a mind to rush home and write a codicil! But, on the whole, I didn't. And not long after Beaver's departure (Katie always would say Aunt's elopement) what should hang itself in that very place, for weeks together, (but Growler's identical hat—mine—Mr. Mum's!) I can see Katie now, on tip-toe, with her arm embracing my Mahogany Friend, spinning and twisting my hat round and round, till I verily thought the brim and crown would part company. But, even if they had, it would have been good repayment to hear the child's merry laugh again, which had been hushed so long; and, after all, she gave me

a new hat herself, the day I went to church with her to give her away; for she said she was determined that her dear old growing father should look respectable. The truth is, after I had been domiciled at the Chase, by the express wish of the poor Cottage upstairs, the foraging cap came back, and Harry's hat (which had been away too long) came back also, and Katie's feathers moved and shook, and drooped and fluttered, and tossed and trembled; and—well! and I suppose it was all right! I only know I brought it about; it was a real feast, as the Italians say, that wedding with a pretty, pretty, bride; but I hate weddings, and will never go to another—no, not even to Minnie's. The foraging cap, you may suppose, did not go to church, but a bran new hat did (I hate bran new hats—mine was bran new too—they shine so) and the cap drove off afterwards, with as many bright hopes in it as ever filled a cap of any description, old, middle-aged, or new; before or since.

I went home again, to the Den, that very day. Home, did I say? Well; Katie allowed me to live there, and did not ask much rent, and I don't know who would be more likely to watch over the little wife's interests than her agent, Growler, while she was marching over the country from quarter to quarter.

A year and a half has passed since then, and times have changed with my Mahogany Friend, who was obstinately silent, and looked very blank, through all that term. William's hat has come back—not the old hat, but one of foreign manufacture—and Mrs. William's hat, (made for more sun than she will get here), has come along with it, and three or four little, outlandish, far-away, over-the-sea sort of head-dresses, for which I, who have never crossed the Line, or been farther south than Palermo, can find no name, cluster around them; and, better than all, for all would be incomplete without them, my Katie's black plume and the foraging cap have come back, and hang up with the rest—as the country-people say, "quite natural." What the puffy little cream-coloured hood, (much too small I should have thought for anything living), that hangs there too, may mean, or what tiny animal may be in the habit of wearing it, I don't know—but, I have no doubt Katie knows—and indeed she says I'm its godfather. The faded Cottage is bleached, and has a new ribbon, and comes out quite fresh; and there's a dreadfully suspicious young hat near Minnie's bonnet. In a word, my Mahogany Friend is perfectly radiant, and stood, but yesterday, with all his five-and-twenty arms a-kimbo, and all his hats cocked, looking at me with the jolliest aspect I ever observed in him.

"You consider," I began, addressing him familiarly, and presuming on our friendship—"To make short work with you, Mr. Mum," he replied, "I consider my history finished, and I never mean to say any more."

My opinion is, that he never will, and that he ought to blush French polish for having said so much, about so little.

A SUBURBAN CONNEMARA.

I WAS born and bred in Manchester. My earliest impression—which has hardly left me yet—that all rich men are mill-owners, and all poor men and women merely spinners. I am proud of being a Manchester man; for there is not a town more orderly or better lighted and paved, or (till lately) better swept, in England. Till I was four-and-twenty I had never been out of my native town. Early and late I toiled in my father's counting-house, without ever thinking of stirring out of it, or taking a holiday; for my father used to say, that God gave man one day out of every seven for rest, and He knew what was enough for him. I used to hear of London at that time, and to fancy that Watling Street was a kind of High Street to the Metropolis; for all our correspondents dated from Watling Street. When the railway opened, there came a great change in this respect. I made my first journey to London; and finding that I knocked off a good deal of business by the transaction, I began to run up to town nearly every week, which I have continued to do ever since.

Thus, though I am a Manchester man, I know the City as well as any Londoner. I know every court and alley of it, and can make short cuts, and find the nearest way from any one part of that great labyrinth to another. I confess I am not so well acquainted with the suburbs. I had always a favourable impression of the northern side of London, from the pretty villas and cottages which I had remarked on each side of the line, on coming up by the North-Western Railway. Therefore, having lately found it advisable to transfer my business altogether to Watling Street, City, I resolved to seek in that quarter for a residence for myself and family. Another reason induced me to select that spot. My goods are coming up continually by the North-Western Railway; and having some commissions in the West Riding, who send up parcels by the Great Northern line, I wished to be somewhere between Battle Bridge and Euston Square: in order, occasionally, to give an eye to my consignments at both stations. With this purpose I procured a new map, on a large scale, in order to see all the Victoria Crescents and Albert Terraces thereabouts.

I drew out my pocket-compasses, measured the line, reduced it one half; and, on finding the unknown locality, brought one point of the divider's plumb upon a spot which I at once read off from the map as "Agar Town." Looking more minutely, I observed that the particular point of the district indicated, was "Salisbury Crescent." I could not repress an exclamation of satisfaction, as Oxford and

Cambridge Crescents also met my eye. Without further delay, I struck a half-mile circle; and as I observed therein several streets and terraces bearing the names, Canterbury, Winchester, Durham, Salisbury, &c., I concluded that this was (as it eventually turned out to be) Church property; and, as a lover of order and decency, I congratulated myself on the felicitous idea that had suggested to me that neighbourhood; for I felt this circumstance to be a guarantee of an orderly and well-regulated estate.

From these high-sounding names, however, I had some misgivings that the houses in that neighbourhood might be of too expensive a class for a man of moderate means. Still, I resolved to proceed there, and reconnoitre, in the hope of finding a decent little place, at a moderate figure. So, with my map in my hand, I rode down to King's Cross, and proceeding along the old Pancras Road, entered the King's Road, which is the boundary of the property I was seeking. I had not gone far beyond a large building, which I found was the St. Pancras Workhouse, when I observed a woman and a number of ragged children drawing a truck. The truck contained a table, two or three old chairs, and some kitchen utensils, with a large bundle of bed-clothes tied up in a patchwork quilt. The entire strength of the company was exerted to draw the truck up the steep pathway of a turning on the right-hand side of the road, in which they succeeded at length; and the woman, struggling, with her hair about her face, and her bonnet hanging round her neck, the truck moved on, aided by the vigorous pushing of her young family behind. The pathway was some feet above the road, which was a complete bog of mud and filth, with deep cart-ruts; the truck, oscillating and bounding over the inequalities of the narrow pathway, threatened every moment to overturn with the woman, her family, and all her worldly goods.

There was something so painfully picturesque in the little group, and so exciting in the constant apprehension of an accident, that I could not help following. For a time, however, a special Providence seemed to watch over the party. I began to give up all fear of a mishap; when, suddenly, the inner wheel encountered a small hillock of dust and vegetable refuse at the door of a cottage, and finally shot its contents into the deep slough of the roadway. The woman turned back; and, having well thumped the heads of her family, seated herself upon the heap of ashes which had been the cause of her misfortune, to vent the rest of her rage in abuse of a miscellaneous character.

A dustman happening to pass at the time, helped the children to restore the chattels to the righted truck.

"How far have you to go?" he asked.

"Oh! not far," said she, "only to one of them cottages yonder. It's very aggravatin'."

arter draggin' them goods all the way from Smithses Rents, and all along that there nasty road, all right; just to upset when one's got here! This ain't no woman's work, this ain't; only my husband's got a job this mornin', and we was obliged to move out afore twelve; which is the law, they says."

"What is the name of this place?" I asked.

"This here, sir?" replied the woman; "why, Hagar Town."

"Agar Town?" I exclaimed, with astonishment, remembering how clean and promising it had appeared upon the map. "Do you mean to say that I am really in Agar Town?"

The dustman, who by this time had finished his job, and who sat upon the pathway smoking a short black pipe, with his legs dangling over the road, like a patient angler by a very turbid stream, ventured to join the conversation, by answering my question.

"You're as right," said he, "to the middle o' Hagar Town as you vell can be."

"And where," said I, "is Salisbury Crescent?"

"There's Salisbury Crescent!"

I looked up, and saw several wretched hovels, ranged in a slight curve, that formed some excuse for the name. The doors were blocked up with mud, heaps of ashes, oyster-shells, and decayed vegetables.

"It's a rum place, ain't it?" remarked the dustman. "I am forced to come through it twice every day, for my work lays that way; but I wouldn't, if I could help it. It don't much matter in my business, a little dirt, but Hagar Town is worse nor I can abear."

"Are there no sewers?"

"Sewers? Why, the stench of a rainy morning is enough fur to knock down a bullock. It's all very well for them as is lucky enough to have a ditch afore their doors; but, in general, everybody chucks everything out in front and there it stays. There used to be an inspector of noosances, when the cholera was about; but, as soon as the cholera went away, people said *they* didn't want no more of that suit till such times as the cholera should break out agen."

"Is the whole of Agar Town in such a deplorable state as this?" I asked.

"All on it! Some places, wuss. You can't think what rookeries there is in some parts. As to the roads, they ain't never been done nothink to. *They* ain't roads. I recollect when this place was all gardeners' ground; it was a nice, pootty place enough then. That ain't above ten or twelve year ago. When people began to build on it, they run up a couple o' rows o' houses opposite one another, and then the road was left fur to make itself. Then the rain come down, and people chucked their rubbidge out; and the ground bein' nat'rally soft, the carts from the brick-fields worked it all up into paste."

How far does Agar Town extend? I asked. "Do you see them cinder-heaps out yonder?"

I looked down in the distance, and beheld a lofty chain of dark mountains.

"Well," said the Dustman, "that's where Hagar Town ends—close upon Battle Bridge. Them heaps is made o' breeze; breeze is the stuffs of the dust what has been put there by the contractor's men, arter takin' away all the wallyables as has been found."

At this point, the woman, who had been combing her hair, arose, and the truck resumed its perilous journey. The dustman waited, and saw it arrive at its destination, in safety; whereupon the dustman having smoked his pipe, departed. As I had, by this time, given up all intention of seeking a residence in that neighbourhood, I continued my researches, like Dr. Syntax, simply in search of the picturesque.

Crossing another bridge—for the canal takes a winding course through the midst of this Eden—I stood beside the Good Samaritan public-house, to observe the houses which the dustman had pointed out, with the water "a flowin' in at the back doors." Along the canal side, the huts of the settlers, of many shapes and sizes, were closely ranged. Every tenant, having, as I was informed, his own lease of the ground, appeared to have disdained to imitate his neighbour, and to have constructed his abode according to his own ideas of beauty or convenience. There were this dog-kennel, the cow-shed, the shanty, and the elongated watch-box, styles, of architecture. To another, the ingenious residence of Robinson Crusoe seemed to have given his idea. Through an opening was to be seen another layer of dwellings, at the back: one, looking like a dismantled windmill; and another, perched upon a wall, like a guard's look-out on the top of a railway carriage. The love of variety was everywhere, carried to the utmost pitch of extravagance. Every garden had its nuisance—so far the inhabitants were agreed—but, every nuisance was of a distinct and peculiar character. In the one, was a dung-heap; in the next, a cinder-heap; in a third, which belonged to the cottage of a coal-monger, were a pile of whelk and periwinkle shells, some rotten cabbages, and a donkey; and the garden of another, exhibiting a board inscribed with the words "Ladies' School," had become a pond of thick green water, which was carefully dammed up, and prevented from flowing over upon the canal towing-path, by a brick parapet.

I remember to have seen, in a book written some time since, a chapter devoted to the *beau idéal* of an English villa and estate. The village church was, at that period, considered of some importance, and an approach thereto by a good road was treated as an element in securing the comfort and well-being of the villagers. I looked for the "heaven-directing

spire," and thought of the bog, sloughs, and dargmires that must necessarily be struggled through by a pious parishioner; and I wondered whether it was possible for any amount of courage and patience to prevail over the difficulties. The English Captain, who attended church at San Francisco, in fisherman's mud-jacks, with trousers close reefed up each leg, felt all his misgivings at his grotesque appearance vanish when he saw other men dressed like himself, and observed that the prevailing costume for ladies was Wellington boots; but, I should like to know what sympathy an inhabitant of Agar Town would get, if, on a Sunday morning, he presented himself before the parish beadle thus attired! The Rector of St. Pancras has endeavoured to meet his parishioners in this district, half-way; for, finding the difficulty of moving Agar Town to church, he moved the church to Agar Town; and a neat little structure, or temporary church, is now conveniently planted in the dirtiest part of the district.

The inhabitants themselves exhibit a genuine Irish apathy. Here and there, a barrow or two of oyster shells, broken bricks, and other dry materials, have been thrown into the mud. In Cambridge Row, I observed that some effort had been made to get a crossing; but, a sign-board indicated that it was to facilitate the approach to "The back door of the Good Samaritan."

Continuing my way until I came within the shadow of the great cinder-heaps of Mr. Darke, the contractor, I turned off at Cambridge Crescent, to make the hazardous attempt of discovering a passage back into the Pancras Road. At the corner of Cambridge Crescent are the Talbot Arms Tea Gardens, boasting a dry skittle-ground, which, if it be not an empty boast, must be an Agar Town island. The settlers of Cambridge Crescent are almost all shopkeepers—the poorest exhibiting in their rag-patched windows a few apples and red-herrings, with the rhyming announcement, "Table-beer, Sold here." I suspect a system of barter prevails—the articles sold there comprehending, no doubt, the whole of the simple wants of the inhabitants; a system, perhaps, suggested by the difficulty of communication with the civilised world.

A stranger in these parts immediately attracts the attention of the neighbourhood; and if he be not recognised for an Agarite, is at once set down for a "special commissioner," about to report to some newspaper upon the condition of the inhabitants. I met no one having the air of a stranger, except an unlucky gentleman, attempting to make a short-cut to the London and York Railway station; and a postman, vainly inquiring for Aurora Cottage. There were Bath, and Gloucester, Beauchamp, Tralee, and Shamrock Cottages; but Aurora Cottage, being probably in some adjoining street, was entirely unknown to the mud-bound inhabitants. The economy of space which I had observed from the bridge,

was also apparent here. Every corner of a garden contained its hut, well stocked with dirty children. The house of one family was a large yellow van upon wheels, thus raised above high mud-mark. This was the neatest dwelling I had observed. It had two red painted street doors, with bright brass knockers, out of a tall man's reach, and evidently never intended for knocking—the entrance being by steps at the head of the van; indeed, I suspect that these doors were what the stage managers call "impracticable." The interior appeared to be well furnished, and divided into bed-room and sitting-room. Altogether, it had a comfortable look, with its chimney-pipe smoking on the top; and if I were doomed to live in Agar Town, I should certainly like lodgings in the yellow van.

As I proceeded, my way became more perilous. The footpath, gradually narrowing, merged at length in the bog of the road. I hesitated; but, to turn back was almost as dangerous as to go on. I thought, too, of the possibility of my wandering through the labyrinth of rows and crescents until I should be benighted; and the idea of a night in Agar Town, without a single lamp to guide my footsteps, emboldened me to proceed. Plunging at once into the mud, and hopping in the manner of a kangaroo—so as not to allow myself time to sink and disappear altogether—I found myself, at length, once more in the King's Road.

It is not my wish to inquire into the affairs of the ground landlords, or to attempt to guess at their reasons for allowing such a miserable state of things to exist upon their property. I have understood that the fee of the estate is in the Ecclesiastical Commissioners, and that the present owners hold it only for a term of three lives; with a power of leasing for periods not longer than twenty-one years each. If this be the case, perhaps no respectable tenant could be induced to take the land for so short a term upon a building lease. Yet, when it is considered how much it would have been for the benefit of all parties that decent and comfortable dwellings should have occupied the ground, instead of the wretched huts to be found there, it is much to be regretted that some arrangement was not entered into for that purpose. The place, in its present state, is a disgrace to the metropolis. It has sprung up in about ten years. Old haunts of dirt and misery, suffered to exist in times when the public paid no attention to such matters, are difficult to deal with; but this is a new evil, which only began to come into existence about the time when Mr. Chadwick's Report first brought before the public a picture of the filthy homes and habits of the labouring classes, and of the frightful amount of crime and misery resulting therefrom.

In Agar Town we have, within a short walk of the City—not a gas-light panorama of Irish misery, "almost as good as being there," but

a perfect reproduction of one of the worst towns in Ireland. The land is well situated—being high for the most part—and therefore capable of good drainage; and, although too great a proximity to the cinder-heaps might make it an objectionable site for a superior class of dwellings, no spot could be better adapted for the erection of small tenements for labouring men and mechanics. It is close to the terminus of one of the great trunk railways, where a large number of men—officers of the company and labourers—are employed. There are, also, many large manufactories in the neighbourhood. The men employed in these places must reside near their work, and are consequently compelled to take any accommodation, however miserable, which the neighbourhood may afford, and at whatever cost. A respectable mechanic told me that he paid for his hut a rent of six shillings per week. This contained two rooms only—upon the ground, for there was no upper story. It appeared to have hardly any foundation, the boards of the floor being laid upon the earth, without a brick between, to prevent the dampness oozing through; a manner of building which has been repeatedly pointed out, by the Sanitary Commissioners, as productive of disease. The place was altogether of the rudest and most comfortless description, and could not, I was assured, have cost more in the erection—built as it was of old fragments of brick and plaster—than forty pounds.

It was not by choice, but by necessity, that this man lived in such a place. In various parts, a certain air of cleanliness in a dwelling, here and there, contrasting with the filthy state of the street, gave evidence of other inhabitants who had not been led by a mere taste for filth and wretchedness to take up their abode in Agar Town. These poor people cannot help themselves; toiling early and late, the struggle to provide for the ever-renewing wants of the day, exacts all their time and energies. Who will help them?

A WORLD AT PEACE.

SHAPING the shadows of dim times to come,
The thoughtful mind forecasts a scene of glory;
Blessings for all, no longer heap'd on some,
Brighten the chapters of man's future story.

The fiercer passions of the human breast
Melt into love, and swell the tide of kindness;
Mercy descends, a warmly welcomed guest,
To those who once had spurn'd her in their blindness.

War is the fashion of a former age,
Of which the scholar reads with solemn wonder;
And mutely pities, as he turns the page,
The madness that kept man and man asunder.

The weak dwell safely; right prevails o'er might;
Law binds its subjects with a moral fetter;
All for some end of general good unite,
And strive to make the world they live in better.

Is this the phantom of a poet's dream,
That mocks him with a fleeting thrill of pleasure?
Or does the future with such glories teem,
And even now give earnest of its treasure?

Heaven only knows!—Meanwhile, let's do our best
To leave this heir-loom when in dust we moulder;
Man may enjoy unbroken peace and rest,
Ere this fair globe has grown a century older.

DREAMS.

WHEN we picture to ourselves a person lying in a state of profound sleep—the body slightly curved upon itself; the limbs relaxed; the head reclining on its pillow; and eyelids closed;—it is wonderful to think what strange and startling imagery may be passing through the brain of that apparently unconscious being. The events of his whole life may hurry past him in dim obscurity; he may be revisited by the dead; he may be transported into regions he never before beheld; and his ideas, visibly assuming phantasmal shapes, may hover round him like shadows reflected from another and more spiritual state of existence.

Let us draw the curtains gently aside, and study the physiognomy of sleep.

The countenance may, occasionally, be observed lighted up, as it were, from within by a passing dream—its expression is frequently one of peculiar mildness and benignity; the breathing may be slow, but it is calm and uniform; the pulse not so rapid as in the waking state, but soft and regular; the composure of the whole body may continue trance-like and perfect. There is, indeed, no sign of innocence more touching than the smile of a sleeping infant. But, suddenly, this state of tranquillity may be disturbed; the dreamer changes his position and becomes restless; he moans grievously—perhaps sobs—and tears may be observed glimmering underneath his eyelids; his whole body now seems to be shaken by some inward convulsion; but, presently, the strife abates; the storm-cloud gradually passes; he stretches his limbs, opens his eyes, and, as he awakes, daylight, in an instant, dispels the vision, perhaps leaving not behind the faintest trace or recollection of a single incident which occurred in this mysterious state.

But what are dreams? Whence come they? What do they portend? Not man only, but all animals, it is presumed, dream, more or less, when they are asleep. Horses neigh, and sometimes kick violently; cows, when suckling their young calves, often utter piteous lowings; dogs bark in suppressed tones, and, from the motions of their paws, appear to fancy themselves in the field of the chase; even frogs, particularly during summer, creak loudly and discordantly until midnight, and then retire, and become silent. Birds also dream; and will sometimes, when frightened, fall from their roosting perch, or flutter about their cage, in evident alarm.

A bellfinch, says Bechstein, belonging to a lady, was subject to very frightful dreams, which made it drop off its perch; but no sooner did it hear the voice of its affectionate mistress than it became immediately tranquil and reascended its perch to sleep again. It is pretty certain that parrots dream. It is, indeed, a curious circumstance that the best way of teaching this bird to talk is to cover the cage over so as to darken it, and while he is going to sleep pronounce, audibly and slowly, the word he is to learn; if the winged pupil be a clever one, he will, upon the repetition of the lesson, in a morning or two, begin to repeat it.

Upon the same principle, school-boys commit their tasks to memory by reading them over the last thing before they go to bed. It is to be remembered that during sleep the mind may not be wholly under eclipse; for, although some of its faculties—such as perception, comparison, judgment, and especially the will, may be suspended—others, (for example, Memory and Imagination), are often more active than in the waking state. But some persons, it is said, never dream. We are assured by Locke that he knew a gentleman who had an excellent memory, yet could not recollect ever having dreamed until his twenty-sixth year. Dr. Reid, for many years before his death, had no recollection of having ever dreamed. Dr. Elliotson also relates, apparently upon good authority, the case of a man who never dreamed until after he had a fever, in his fortieth year; and we ourselves know several persons who are not conscious of ever dreaming. Nevertheless, many contend that in all such cases dreams really occur, but that they escape the recollection; for they contend that it is impossible that the mind cannot, being an independent principle, ever be in a state of absolute rest. This is arguing within a very narrow circle. We must not forget that the intimate alliance of the mind with the body, subjects it to its general laws; the "heat-oppressed brain" requires rest to renew its energies, and the mind, of which it is the organ, in the meantime, may, as in profound sleep, remain perfectly quiescent. The lids of the outward senses are closed; a veil is drawn over the immaterial principle of our nature; and mind and body alike, for a period, lie in a state of utter unconsciousness.

Here, however, it may fairly be asked, how happens it that the same persons will at one time remember, and, at another, forget his dreams? This circumstance may, we conceive, thus be explained:—

Those dreams which occur in very deep sleep, and in the early part of the night, are not so likely to be remembered as those which happen towards morning, when the sleep is less profound; hence the popular notion that our morning dreams—which are always best remembered—are likely to prove true. Then, again, the imagery of some

dreams is more striking, and actually makes a deeper impression than the incidents of other dreams. We are told by Sir Humphrey Davy, that, on one occasion, a dream was so strongly impressed upon his eye, that even after he had risen and walked out, he could not be persuaded of its unreal nature, until his friends convinced him of its impossibility. The effect of some dreams upon children is very remarkable; they are, it is believed, more liable to dreams of terror than grown persons, which may be accounted for by their being more subject to a variety of internal complaints, such as teething, convulsions, derangement of the bowels, &c.; added to which, their reasoning faculties are not as yet sufficiently developed to correct such erroneous impressions. Hence, sometimes, children appear, when they awake, bewildered and distressed, and remain for a considerable period in a state of agitation almost resembling delirium. The incidents which are conceived in dreams are indeed not unfrequently confounded by adults with real events; hence, we often hear people, in alluding to some doubtful circumstance, exclaim, "Well! if it be not true, I certainly must have dreamed it." We confess we have ourselves been puzzled in this way; the spell may be broken; but the impression made by the delusion still clings to us; its shadow is still thrown across our path.

The question therefore recurs, what are Dreams? Whence do they arise? We believe that the ideas and emotions which take place in the dreaming state may be ascribed to a twofold origin. They may arise from certain bodily sensations, which may suggest particular trains of thought and feeling; or they may be derived from the operations or activity of the thinking principle itself; in which case they are purely mental. The celebrated Dr. James Gregory—whose premature death was a great loss to science—states, that having gone to bed with a vessel of hot water at his feet, he dreamt of walking up the crater of Mount Etna, and felt the ground warm under him. He likewise, on another occasion, dreamt of spending a winter at Hudson's Bay, and of suffering much distress from intense frost; and found, when he awoke, that he had thrown off the bedclothes in his sleep, and exposed himself to cold. He had been reading, a few days before, a very particular account of this colony. The eminent metaphysician, Dr. Reid, relates of himself that the dressing of a blister, which he had applied to his head, becoming ruffled, so as to produce pain, he dreamt that he had fallen into the hands of a party of North American Indians, who were scalping him. These were dreams suggested by sensations which were conveyed from the surface of the body, through the nerves, until a corresponding impression was produced on the mind. Upon the same principle, very strong impressions received during the day may modify

and very materially influence the character of our dreams at night. Dr. Beattie states that once, after riding thirty miles in a very high wind, he passed a night of dreams which were so terrible, that he found it expedient to keep himself awake, that he might no longer be tormented with them. "Had I been superstitious," he observes, "I should have thought that some disaster was impending; but it occurred to me that the tempestuous weather I had encountered the preceding day might be the cause of all these horrors." Other and less obvious causes are in constant operation. A change in the weather—in the electrical state of the atmosphere—and its barometrical pressure—the temperature of the bed-room—arrangements of the bed-furniture—the adjustment of the bed-clothes—may, the position of the sleeper, particularly if he cramp a foot or benumb an arm, will at once affect the entire concatenation and issue of his dreams.

Furthermore. Impressions may be made on the mind during sleep, by speaking gently to a person, or even whispering in the ear. We ourselves, when in Italy, could on one occasion trace the origin of a very remarkable dream to our having heard, in an obscure and half-conscious manner, during sleep, the noise of people in the streets, on All Souls'-night, invoking alms for the dead. Dr. Beattie knew a man in whom any kind of dream could be produced if his friends, gently addressing him, afforded the subject-matter for his ideas. Equally curious is the circumstance that dreams may be produced by whispering in the ear. A case of this description is recorded by Dr. Abercrombie:—

"An officer, whose susceptibility of having his dreams thus conjured before him, was so remarkable, that his friends could produce any kind of dream they pleased, by softly whispering in his ear, especially if this were done by one with whose voice he was familiar. His companions were in the constant habit of amusing themselves at his expense. On one occasion they conducted him through the whole progress of a quarrel, which ended in a duel; and when the parties were supposed to meet, a pistol was put into his hand, which he fired off in his sleep, and was awakened by the report. On another, they found him asleep on the top of a locker or bunker in the cabin, when, by whispering, they made him believe he had fallen overboard; and they then exhorted him to save himself by swimming. He immediately imitated the motions of swimming. They then suggested to him that he was being pursued by a shark, and entreated him to dive for his life. This he did, or rather attempted, with so much violence, that he threw himself off the locker, by which he was bruised, and, of course, awakened." Dr. Abercrombie adds, that the most remarkable circumstance connected with this case was, that after these and a variety of other pranks had been played upon him,

"He had no distinct recollection of his dreams, but only a confused feeling of oppression or fatigue, and used to tell his friends that he was sure they had been playing some tricks upon him."

It appears, also—and the fact is very remarkable—that a similar kind of sensation will produce the same description of dream in a number of individuals at the same time. Hence different people will sometimes have the same dream: We read of a whole regiment starting up in alarm, declaring they were dreaming that a black dog had jumped upon their breasts and disappeared, which curious circumstance was explained by the discovery, that they had all been exposed to the influence of a deleterious gas, which was generated in the monastery. The effect of music, also, in exciting delightful dreams, has often been attested. A French philosopher whose experiments are reported by Magendie, according to the airs which he had arranged should be played while he was asleep, could have the character of his dreams directed at pleasure. "There is an art," says Sir Thomas Browne—in his usual quaint style—"to make dreams as well as their interpretations; and physicians will tell us that some food makes turbulent, some gives quiet dreams. Cato, who doated upon cabbage, might find the crude effects thereof; and Pythagoras might have had calmer sleeps if he had totally abstained from beans."

The influence of the day's occurrences, and the thoughts which have occupied the mind during the day, have been said to give a corresponding tone and colouring to our dreams at night. Thus the lover dreams of his mistress; the miser of his gold; the merchant of his speculations; the man of science of his discoveries. The poets of all ages and nations adopt this view. Virgil describes Dido forsaken by *Aeneas*, wandering alone on a desert shore in pursuit of the Tyrians. Milton represents Eve relating to Adam the dreams which were very naturally the repetition of her waking thoughts. Petrarch invokes the beauty of *Laura*. *Eloisa*, separated from *Abelard*, is again happy in his company, even amidst "dreary wastes" and "low-browed rocks."

There can be no doubt that the dreams of many persons are very greatly influenced by the reflections and emotions they have experienced the preceding day; but this is by no means invariably the case. We have known persons whose dreams refer habitually to events which occurred to them, perhaps, twenty years ago, and upon whom recent events seem to possess no such influence. We have often been told by ladies happily and affectionately married, that while they were engaged, although their thoughts were naturally much set on their engagement, they never dreamt of their lovers. So, also, the father of a family, habitually impressed with a sense of his responsibility and affection

towards his offspring, will sometimes dream often enough of his neighbour's children, but seldom, or, perhaps, never, of his own. Try to dream on a given subject—resolve and fix the attention upon it—going to sleep, and no sooner are our eyelids closed, than fantastic fancy will conjure up the most opposite and incongruous imagery. We have heard this dream-problem explained by referring it to a principle of *antagonism*, which, waking or sleeping, may be observed in the animal economy. If a limb become fatigued by remaining too long in one position, it will be relieved, by being thrown into the very opposite condition; if the eye fatigue itself by gazing intently on the disc of any bright colour, and the eyelids close, the very opposite, or antagonistic colour will be depicted upon the retina: in like manner, when our waking thoughts—in connection with the nerve matter, which is their material instrument—have exhausted their energy, we can easily conceive how the very opposite condition will be produced. Hence the most unconnected and preposterous train of imagery may arise from the very earnestness with which we desire a contrary effect. We dream of events which do not concern us, instead of those in which we are most deeply interested; we dream of persons to whom we are indifferent, instead of those to whom we are attached. But, in the midst of all this curious and perplexing contrariety, it is remarkable—and may be esteemed a proof of the immateriality of the mind—that we always preserve the consciousness of our own identity. No man dreams that he is woman, or any other person than himself;—we have heard of persons who have dreamt they were dead, and in a spiritual state; but the spirit was still their own—they maintained their identity. Sir Thomas Lawrence once made an interesting observation on this subject to Mrs. Butler—then Miss Fanny Kemble: he pointed out, in conversation, that he never heard of any lady who ever dreamed that she was younger than she really was. We retain in our dreams even the identity of our age. It has been said—we think by Sir Thomas Browne—that some persons of virtuous and honourable principles will commit, as they fancy, actions in their dreams which they would shudder at in their waking moments; but we cannot believe that the identity of moral goodness can be so perverted in the dreaming state. We can, however, readily conceive that, when the mind is oppressed, or disturbed by the recollection of some event it dreads to dwell upon, it may be disturbed by the most terrific and ghastly images. A guilty conscience, too, will unquestionably produce restlessness, agitation, and awe-inspiring dreams. Hence Manfred, pacing restlessly his lonely Gothic gallery, at midnight, pictures to himself the terrors of Sleep:—

"The lamp must be replenished; even then
It will not burn so long as I must watch."

My slumbers; if I slumber, and not sleep, I am
 But in the distance of my waking thought, I am
 Which then I can recall not in my bed.
 There is a night; and then eyes, I am
 But close to look within."

Contrition and remorse oppose his rest. If we remember right, it was Bishop Newton, who remarked that the sleep of innocence differed essentially from the sleep of guilt.

The assistance supposed to be sometimes furnished in sleep towards the solution of problems which puzzled the waking sense, opens up a curious subject of investigation. Cases of the kind have been recorded upon undoubted authority. Hence some philosophers, like Sir Thomas Brown and Addison, have been induced to suppose that the soul in this state is partially disengaged from the encumbrance of the body, and therefore more intelligent, which is a mere fancy—a poetical fiction. Surely it is absurd to suppose that the soul, which we invest with such high and perfect attributes, should commit such frivolous and irrational acts as those which take place so constantly in our dreams. "Methinks," observed Locke, "every drowsy nod shakes this doctrine." All we remark, is, that some of the ordinary mental faculties act in such cases with increased energy. But beyond this we cannot go. We are informed by Cabanis, that Franklin on several occasions mentioned to him that he had been assisted in his dreams on the issue of many affairs in which he was engaged. So, also, Condillac, while writing his "Cours d'Etudes" states that he was frequently obliged to leave a chapter incomplete, and retire to bed: and that on waking, he found it, on more than one occasion, finished in his head. Condorcet upon leaving his deep and complicated calculations unfinished, after having retired to rest, often found their results unfolded to him in his dreams. Voltaire assures us that he, like La Fontaine, composed verses frequently in his sleep, which he remembered on awaking. Doctor Johnson states that he once in a dream had a contest of wit with some other person, and that he was very much mortified by imagining that his opponent had the better of him. Coleridge, in a dream, composed the wild and beautiful poem of "Kubla Khan," which was suggested to him by a passage he was reading in "Purchas's Pilgrimage" when he fell asleep. On awaking he had a distinct recollection of the whole, and, taking his pen, ink, and paper, instantly and eagerly wrote down the lines which have been so much admired.

One of the most striking circumstances connected with the human mind is the extreme lightning-like rapidity of its thoughts, even in our waking hours; but the transitions which appear to take place in our dreams are accomplished with still more incalculable rapidity; the relations of space, the duration of time, appear to be alike annihilated; we are transported in an instant to

the most distant regions of the earth, and the events of ages are condensed into the span of a few seconds. The accidental jarring of a door, or any noise, will, at the same moment, it awakens a person, suggest the incidents of an entire dream. Hence some persons—Lord Brougham in particular—have supposed that all our dreams take place in the transition or interval between sleep and waking. A gentle man dreamt that he had enlisted as a soldier, joined his regiment, deserted, was apprehended, carried back, tried, condemned to be shot, and, at last, led out for execution. After all the usual preparations a gun was fired; he awoke with the report, and found that a noise in an adjoining room had, in the same moment, produced the dream and awakened him. The same want of any notion of the duration of time occurs, more or less, in all dreams; hence our ignorance when we awake of the length of the night. A friend of Dr. Abercrombie's dreamt that he crossed the Atlantic and spent a fortnight in America. In embarking, on his return, he fell into the sea, and, awakening with the fright, discovered he had not been ten minutes asleep. "I lately dreamed," says Dr. Macnish, "that I made a voyage—remained some days in Calcutta—returned home—then took ship for Egypt, where I visited the cataracts of the Nile, Grand Cairo, and the Pyramids; and, to crown the whole, had the honour of an interview with Mahomet Ali, Cleopatra, and Alexander the Great." All this was the work of a single hour, or even a few minutes. In one of the dreams which Mr. De Quincey describes—when under the influence of opium—"the sense of Space and in the end of Time were," he states, "both powerfully affected. Buildings, landscapes, &c., were exhibited in proportions so vast as the bodily eye is not fitted to receive. Space swelled, and was amplified to a sense of unutterable infinity. This, however, did not disturb me so much as the vast expansion of Time; I sometimes seemed to have lived for seventy or one hundred years in one night; nay, sometimes had feelings representative of a millenium, passed in that time; or, however, of a duration far beyond the limits of any human experience." One of the miracles of Mahomet appears to be illustrative of the same phenomenon. We read, in the Koran, that the angel Gabriel took Mahomet, one morning, out of his bed to give him a sight of all things in the Seven Heavens and in Paradise; and, after holding ninety thousand spiritual conferences, he was brought back again to his bed; all which was transacted in so small a space of time that Mahomet, upon his return, found his bed still warm.

Are dreams so much varied as is generally supposed? Or, taking into consideration our different mental and physical constitutions, is there not rather a remarkable sameness in them? It is certainly a very unusual circumstance to hear of any dream that does

violence to the common experience of mankind. One class of dreams, which may be termed **RETROSPECTIVE**, is of frequent occurrence. These are characterised by the revival of associations long since forgotten. The faculty of Memory appears to be preternaturally exalted; the veil is withdrawn which obscured the vista of our past life; and the minutest events of childhood pass in vivid review before us. There can be no doubt that something analogous to this occurs in drowning; when, after the alarm and struggle for life has subsided, sensations and visions supervene with indescribable rapidity. The same very remarkable phenomenon takes place also sometimes in hanging; but is by no means uniformly produced. "Of all whom I have seen restored from drowning," observes Dr. Lettsom, "I never found one who had the smallest recollection of any thing that passed under water until the time they were restored." Persons must not, therefore, be deceived by imagining that an Elysium is to be found at the bottom of a garden well, or a canal, or a river.

But to return:—it is not only the very early incidents of childhood which may thus be recalled by our dreams, but recent events, which in our waking hours had escaped the memory, are sometimes suddenly recalled. In his "Notes to Waverley," Sir Walter Scott relates the following anecdote:—"A gentleman connected with a Bank in Glasgow, while employed in the occupation of cashier, was annoyed by a person, out of his turn, demanding the payment of a check for six pounds. Having paid him, but with reluctance, out of his turn, he thought no more of the transaction. At the end of the year, which was eight or nine months after, a difficulty was experienced in making the books balance, in consequence of a deficiency of six pounds. Several days and nights were exhausted in endeavours to discover the source of the error, but without success; and the discomfited and chagrined cashier retired one night to his bed, disappointed and fatigued. He fell asleep and dreamed he was at his Bank, and once again the whole scene of the annoying man and his six pound check arose before him; and, on examination, it was discovered that the sum paid to this person had been neglected to be inserted in the book of interests, and that it exactly accounted for the error in the balance." We read of another gentleman, a solicitor, who, on one occasion, lost a very important document connected with the conveyance of some property; the most anxious search was made for it in vain; and the night preceding the day on which the parties were to meet for the final settlement the son of this gentleman then went to bed, under much anxiety and disappointment, and dreamt that, at the time when the missing paper was delivered to his father, his table was covered with papers connected with the affairs of a particular client and there found the paper

they had been in search of, which had been tied up in a parcel to which it was in no way related.

There is another class of dreams which would appear to be much more extraordinary than these—of a **RETROSPECTIVE CHARACTER**, viz: those in which the dreamer appears to take cognizance of incidents which are occurring at a distance, which may be designated **DREAMS OF COINCIDENCE**. In the "Memoirs of Margaret de Valois" we read, that her mother, Catherine de Medicis, when ill of the plague at Metz, saw her son, the Duc d'Anjou, at the victory of Jarnac thrown from his horse, and the Prince de Condé dead—events which happened exactly at that moment. Dr. Macnish relates, as the most striking example he ever met with of the co-existence between a dream and a passing event, the following melancholy story:—Miss M., a young lady, a native of Ross-shire, was deeply in love with an officer who accompanied Sir John Moore in the Peninsular War. The constant danger to which he was exposed had an evident effect upon her spirits. She became pale and melancholy in perpetually brooding over his fortunes; and, in spite of all that reason could do, felt a certain conviction that, when she last parted from her lover, she had parted with him for ever. In a surprisingly short period her graceful form declined into all the appalling characteristics of a fatal illness, and she seemed rapidly hastening to the grave, when a dream confirmed the horrors she had long anticipated and gave the finishing stroke to her sorrows. One night, after falling asleep, she imagined she saw her lover, pale, bloody, and wounded in the breast, enter her apartment. He drew aside the curtains of the bed, and, with a look of the utmost mildness, informed her that he had been slain in battle, desiring her at the same time to comfort herself, and not take his death too seriously to heart. It is needless to say what influence this vision had upon a mind so replete with woe. It withered it entirely, and the poor girl died a few days afterwards, but, not without desiring her parents to note down the day of the month on which it happened, and see if it would not be confirmed, as she confidently declared it would. Her anticipation was correct, for accounts were shortly afterwards received that the young man was slain at the battle of Corunna, which was fought on the very day of the night of which his betrothed had beheld the vision. It is certainly very natural to suppose that there must be some mysterious connection between such a dream and the event which appears to have simultaneously taken place—but, upon reflecting farther upon the subject, we shall find that the co-existence is purely accidental. If, as Sir Walter Scott observed, any event, such as the death of the person dreamt of, chance to take place, so as to correspond with the nature and time of the appari-

tion, the circumstance is conceived to be supernatural, although the coincidence is one which must frequently occur, since our dreams usually refer to the accomplishment of that which haunts our minds when awake, and often prestage the most probable events. Such a concatenation, therefore, must often take place when it is considered "of what stuff dreams are made," and how naturally they turn upon those who occupy our mind when awake. When a soldier is exposed to death in battle; when a sailor is incurring the dangers of the sea; when a beloved wife or relative is attacked by disease, how readily our sleeping imagination rushes to the very point of alarm which, when waking, it had shuddered to anticipate. Considering the many thousands of dreams which must, night after night, pass through the imagination of individuals, the number of coincidences between the vision and the event are fewer and less remarkable than a fair calculation of chance would warrant us to expect.

In addition to these, we sometimes hear of dreams which appear to reveal the secrets of futurity; and which may be designated Prophetic Dreams—unveiling, as they are supposed to do, the destiny which awaits particular individuals. The prophetic dream of Cromwell, that he should live to be the greatest man in England, has often been referred to as an example of special revelation; but surely there can be nothing very wonderful in the occurrence—for, after all, if we could only penetrate into the thoughts, hopes, and designs which intamed the ambition of such men as Ireton, Lambert, and the like, we should find both their waking and sleeping visions equally suggestive of self-aggrandisement. The Protector himself was not the only usurper, in these troubled times, who dreamed of being "every inch a king;" but we want the data to compute the probabilities which the laws of chance would give in favour of such a prophecy or dream being fulfilled. The prophetic dream refers generally to some event which, in the course of nature, is likely to happen: is it, then, wonderful that it should occur? It would be curious to know how often Napoleon dreamed that he was the Emperor of the civilised world, or confined as a prisoner of war; how many thrones he imagined himself to have ascended or abdicated; how often he accomplished the rebuilding of Jerusalem. A few years ago, some very cruel murders were perpetrated in Edinburgh, by men named Burke and Hare, who sold the bodies of their victims to the Anatomical Schools. We had ourselves an interview with Burke, after his condemnation, when he told us that many months before he was apprehended and convicted, he used to dream that the murders he committed had been discovered; then he imagined himself going to be executed, and his chief anxiety was how he should comport himself on the scaffold before the assembled multitude, whose

faces he beheld gazing up and fixed upon him. His dream was, in every respect, verified; but who, for an instant, would suppose there could have been anything preternatural, or prophetic, in such a vision? For the most part, dreams of this description are supposed to portend the illness, or the time of the death, of particular individuals; and these, too, upon the simple doctrine of chance, turn out, perhaps, to be as often wrong as right. It may be true, that Lord Lyttelton died at the exact hour which he said had been predicted to him in a dream; but Voltaire outlived a similar prophecy for many years. It must, however, be conceded, that persons in ill-health may have their death expedited by believing in such fatal predictions. Tell a timorous man that he will die; and the sentence, if pronounced with sufficient solemnity, and the semblance of its foreknowledge, will, under certain circumstances, execute itself. But, on the other hand, the self-sustaining power of the will, with a corresponding concentration of nervous energy, will sometimes triumph over the presence of disease, and for awhile ward off even the hand of death. The anecdote is told of Muley Moloch, who, being informed that his army was likely to be defeated, sprang from his sick bed in great excitement, led his men on to victory, and, on returning to his tent, lay down and almost instantly expired.

But again it may be asked—what then do dreams portend? Do they admit of any rational interpretation? This branch of the art of divination, which was called formerly by the name of "Oneiromancy," has been practised in all ages; and there is, perhaps, not a village in Great Britain, or on the great continent of Europe, India, or America, in which some fortune-telling old woman will not be found who professes to be an oracle in propounding their mystical signification. The magicians of old were supposed to be skilful interpreters of dreams, which, like the wise-acres of Christendom, they viewed under very contradictory aspects.

From one of the most ancient Arabic manuscripts on the subject, we learn that if you see an angel, it is a good sign; but if you dream that you converse with one, it forebodes evil—to dream you bathe in a clear fountain denotes joy—but if it be muddy, an enemy will bring against you some false accusation. To dream of carrying any weight upon the back denotes servitude, if you are rich—honour if you are poor. There is not an object in nature—not an event that can occur in life—that our modern fortune-tellers have not converted, when seen in a dream, into some sign ominous of good or of evil; and many even well-educated persons are in the habit of fostering their credulity by attaching an undue importance to their dreams. It is a curious circumstance, however, which militates against this mystic art, that the same sign in different countries carries with it a very contrary signification. The peasant girl in England thinks,

if she dream of a rose, that it is a sure sign of happiness; but the *peysanne* in Normandy believes that it portends vexation and disappointment. The Englishman conceives that to dream of an oak-tree is a sign of prosperity; but in Switzerland, the same vision is thought to be a forewarning of some dreadful calamity.

The domestic superstitions which are connected with dreams, are sometimes favoured by, and perhaps dependent upon, a certain morbid condition or irritability of the nervous system, which suggests the dread of some impending calamity, a painful and indefinite sense of apprehension for which no ostensible reason can be assigned. Strange as it might appear, the influence of our dreams upon our waking state is very remarkable; we may awaken refreshed from a dream which has made us, in our sleep, superlatively happy; or we may rise with melancholic feelings after suffering intense affliction in some dream, and the details of both dreams may alike be forgotten. We cannot, after being so much disturbed, at once regain our composure; the billows continue heaving after the tempest has subsided; the troubled nerves continue to vibrate after the causes that disturbed them have ceased to act; the impression still remains, and chequers the happiness of the future day. Even men of strong mind, who do not believe in the interpretation of dreams, may be so affected. When Henry the Fourth of France was once told by an astrologer that he would be assassinated, he smiled at the prediction, and did not believe it, but he confessed that it often haunted him afterwards, and although he placed no faith in it, still it sometimes depressed his spirits, and he often expressed a wish that he had never heard it. In like manner, dreams, which persons do not believe in, will unconsciously affect the tenour of their thoughts and feelings.

There are many persons who appear to have habitually the most extraordinary dreams, and there is scarcely a family circle that assembles round the domestic hearth, in which some one or other of the party is not able to relate some very wonderful story. We have, ourselves, a *répertoire*, from which we could select a host of such narrations; but we have preferred, at the risk of being thought recapitulative, to dwell upon those which have been recorded upon unimpeachable authority. The dreams which men like Locke, Reid, Gregory, Abercrombie, Macnish, &c., have attested, come with a weight of evidence before us which the dreams of persons unknown in the scientific or literary world would not possess. The impressions produced by dreams are so fugitive—so easy is it for persons unintentionally to deceive themselves in recalling their dreams' experience—that Epictetus, long ago, advised young men not to entertain any company by relating their dreams, as they could only, he affirmed, be interesting to themselves, and perhaps would,

after all their pains, be disbelieved by their auditors. Nevertheless, it would be well for all persons to study, whether waking or dreaming, the phenomena of their own minds. The ingenious naturalist, Dr. Fleming, suggests that persons should, in contra-distinction to a "Diary," keep a "Nocturnal," in which they should register their dreams. Doubtless such a journal might turn out to be a very amusing Psychological record.

THE CONGRESS OF NATIONS.

A MIGHTY dome is rear'd in solemn state,
To hold the produce of the World's invention;
The spacious palace of the labouring Great,
Whose bloodless triumphs history loves to mention.

From every land which Man has made his home,
Where arts and science with due culture flourish,
O'er trackless wastes and billows crown'd with foam,
Thy come, the ardent Mind with food to nourish.

The trophies of the Past fade into gloom,
Which conquerors planted on the field of battle;
Where breathing armies sink before their doom,
And shouts of glory drown the low death-rattle.

These things were once, while yet the World was young,

Ere it drank wisdom from the fount of reason:
Now, let a curtain o'er such scenes be hung—
Wars winter fled, we hail a softer season.

The Sunder'd children of the human race,
Crossing their bounds to mingle with each other,
In foreign nations kindred futures trace,
And learn that every mortal is their brother.

The love of Art engenders love to Man,
And thus in turn, the love of his Creator;
Th' Ignorance that mars Heaven's gracious plan,
And rears in blood the murderer and man-hater.

A glorious epoch brightens history's page,
Shedding upon the Future dazzling lustre;
How proud the thought that England is the stage,
Which shall re-echo with the Nations' muster!

CHIPS.

THE SMITHFIELD MODEL OF THE MODEL SMITHFIELD.

"SIR, I will premise by stating that I have not the smallest sympathy with Smithfield, the less so, that one fine morning, in the city, a bullock took such a fancy to pin me to a wall with his horns, that had I not, providentially, happened to have my great coat in my hand, instead of upon my back, (and was thus enabled to throw it over his horns,) I should have been in my grave ere now."

"I visited the free exhibition of the Smithfield Model in Cheapside, City, and beheld a crowd of persons, surrounding the Model; behind which, in addition to a few vendors of penny 'Conclusive Arguments in favour,

and some persons obtaining signatures to a petition, was a red-faced gentleman, who was continually calling upon the spectators to put any questions, or to state any objections, and he would immediately answer them, and he would convince all present, he was sure, before they left the building, that the present market was the only one that could possibly supply London with meat. Well, sir, at length a quiet, respectable looking mechanic, mildly observed, that he thought the present system led to a greater desecration of the Sabbath than an improved system would do. 'Oh!' exclaimed the red-faced man, 'you object upon religious grounds, do you?' 'Principally,' replied the mechanic, 'but upon many other grounds besides.' 'Ah! well,' said the ruddy one, 'if you go upon religion, all I can say is, that I know nothing about that! But I think I can convince you this way: most people have a joint of meat on Sunday, the remains of which are hashed up on Monday. Well; on Tuesday they want a fresh joint, which at present, you can get; but if you remove Smithfield, the butcher will not care to go to market more than once a week, and so, when you go on Tuesday for your usual joint, you will find the butcher with his clean apron on, smoking his pipe, and no meat to be had!'

"I was leaving the building, when I observed two young men signing the petition. I enquired of one, *why* he signed it, and he replied, 'because my friend has done so;' and upon making the same enquiry of his friend, he replied that 'you can't well come inside without signing.'

"I am, O. M."

A PLEA FOR BRITISH REPTILES.

WHAT the flourishing tradesman writes with pride over his shop, we might in most cases write over our storehouse of antipathies,—established in 1720, or 1751. For what good reason we, in 1851, should shudder at the contact of a spider, or loathe toads, it would be hard to say. Our forefathers in their ignorance did certainly traduce the characters of many innocent and interesting animals, and many of us now believe some portions of their scandal. To be a reptile, for example, is perhaps the greatest disgrace that can attach to any animal in our eyes. Reptile passes for about the worst name you can call a man. This is unjust—at any rate, in England. We have no thought of patting crocodiles under the chin, or of embracing boa constrictors; but, for our English reptiles we claim good words and good will. We beg to introduce here, formally, our unappreciated friends to any of our human friends who may not yet have cultivated their acquaintances.

The Common Lizard,—surely you know the Common Lizard, if not by his name of state, *Zootoca vivipara*. He wears a brilliant jacket, and you have made friends with him, as a

nimble, graceful fellow; as a bit of midsummer. His very name reminds you of a warm bank in the country, and a sunny day. Is he a reptile? Certainly; suppose we stop two minutes to remember what a reptile is.

The heart of a reptile has three cavities; that is to say, it is not completely double, like our own. It sends only a small part of the blood which comes into it, for renovation into the air-chambers—the lungs;—while the remainder circulates again unpurified. That change made in the blood by contact with the oxygen of air, is chiefly the cause of heat in animals. Aëration, therefore, being in reptiles very partial, the amount of heat evolved is small; reptiles are therefore called cold-blooded. They are unable to raise their heat above the temperature of the surrounding air. Fishes are cold-blooded, through deficient aëration in another way; in them, all the blood passes from the heart into the place where air shall come in contact with it; but, then there is a limitation to the store of air supplied, which can be no more than the quantity extracted from the water. The temperature of water is maintained below the surface, and we know how that of the air varies, since a certain quantity of heat is necessary to the vital processes; reptiles, depending upon air for heat, hibernate or become torpid when the temperature falls below a certain point. The rapidity of all their vital actions will depend upon the state of the thermometer; they digest faster in the heat of summer than in the milder warmth of spring. Their secretions (as the poison of the adder) are in hot weather more copious, and in winter are not formed at all. The reptiles breathe, in all cases, by lungs; but, we must except, here, those called *Batrachians*, as frogs or newts, which breathe, in the first stage, by gills, and afterwards by gills and lungs, or by lungs only. The *Batrachians*, again, are the only exception to another great characteristic of the reptile class, the hard, dry covering of plates or scales. The reptiles all produce their young from eggs, or are "oviparous"—some hatch their eggs within the body, and produce their young alive, or are "ovo-viviparous." Those are the characters belonging to all members of the reptile class. The class is subdivided into orders, somewhat thus:—
1. The *Testudinate* (tortoises and turtles).
2. *Enaliosaurian* (all fossil, the *Ichthyosaurus* and his like).
3. *Loricata* (crocodiles and alligators).
4. *Saurian* (lizards).
5. *Ophidian* (serpents); and the last order *Batrachian* (frogs, toads, &c.); which is by some, parted from the reptiles, and established as another class.

Now, we have in England no tortoises or turtles, and no crocodiles; and the fossil order is, in all places, extinct; so our reptiles can belong only to the three last-named orders, Lizards, Serpents, and Batrachians.

Thus we come back, then, to our Lizards, of which we have among us but two genera, a

single species of each. These are the Common Lizard, well known to us all, and the Sand Lizard, known only to some of us who happen to live upon the southern coast. The species of lizard so extremely common in this country, has not been found in countries farther south, and is, in fact, peculiar to our latitude. We, therefore, may love him as a sympathetic friend. The sand lizard (*Lacerta agilis*) is found as far north as the country of Linnaeus, and as far south as the northern part of France; in England, however, it seems to be rare, and has been detected only in Dorsetshire—chiefly near Poole, or in some other southern counties. It frequents sandy heaths, and is of a brown sandy colour, marked and dotted; but, there is a green variety, said to be found among the verdure of marshy places. It is larger than our common lizard, averaging seven inches long, is very timid, and when made a prisoner, pines and dies. Its female lays eggs, like a turtle, in the sand, covers them over, and leaves them to be hatched by the summer sun. This kind of lizard, therefore, is oviparous. The eggs of our common lizard are hatched also by the sun; for, reptiles having no heat of their own, cannot provide that which is necessary to the development of an embryo; but, in this case, the sun hatches them within the parent's body. The female of this lizard stretches herself out upon a sunny bank, and lets the bright rays fall upon her body while she lies inactive. At this period, she will not move for anything less than a real cause of alarm. She is not sunning herself lazily, however, but fulfilling an ordinance of God. The eggs break as the young lizards—three to six—are born. This lizard is, therefore, ovo-viviparous. The little ones begin at once to run about, and soon dart after insects, their proper food; but, they accompany the mother with some instinct of affection for a little time. These lizards are very various in size and colour; difference in these respects does not denote difference in kind. The little scales which cover them are arranged in a peculiar manner on the head, under the neck, &c.; and some differences of arrangement, in such respects, are characteristic. The best distinction between the only two species of lizard known in this country has been pointed out by Mr. Bell. In the hind legs, under each thigh, there is a row of openings, each opening upon a single scale. In sand lizards, the opening is obviously smaller than the scale; in our common lizards, the opening is so comparatively large, that the scale seems to be the mere edge of a tube around it.

These are our lizards, then, our Saurian reptiles; and they do not merit any hate. Suffer an introduction now to English Snakes.

The first snake, the Blindworm, is not a snake, nor yet a worm. It is a half-way animal—between a lizard and a snake. The lizard shade off so insensibly into the snake, even the box preserving rudimentary

hind legs, that some naturalists counsel their union into a single class of "aquamate, or scaled reptiles." By a milder process of arrangement, all those animals which dwell upon the frontier ground between Lizards or Saurians, and Ophidians or Snakes, are to be called Saurophidian. The blindworm, then, is Saurophidian; it is quite as much a lizard as a snake. Snakes have the bones of their head all moveable, so that their jaws can be dilated, until, like carpet-bags, they swallow anything. The lizard has its jaws fixed; so has the blindworm. Snakes have a long tongue, split for some distance, and made double-forked; the blindworm's tongue has nothing but a little notch upon the tip. It has a smooth round muzzle, with which it can easily wind its way under dry soil to hybernate; or else it takes a winter nap in any large heap of dead leaves. It comes out early in the spring; for, it can bear more cold than reptiles generally like, and it is found all over Europe, from Sweden to the South of Italy. It feeds upon worms, slugs, and insects. Like the snakes, it gets a new coat as it grows, and takes the old one off, by hooking it to some fixed point, and crawling from it; so that the cast skin is dragged backwards, and turned inside out. The slow-worm is of a dark grey colour, silvery, and about a foot long on the average. It is ovo-viviparous. It is extremely gentle; very rarely thinks of biting those who handle it, and, when it does bite, inflicts no wound with its little teeth. Of course it has no fangs, and is not poisonous. Shrinking with fear when taken, it contracts its body, and so stiffens it, that it will break if we strike or bend it. Therefore it bears the name Linnaeus gave it—*Anguis fragilis*.

We have found nothing yet, to shudder at, among our reptiles. "O! but," you say perhaps, "that was not a real snake." Well, here is our real snake. *Natrix torquata*—our common Ringed Snake; he is very common. He may be three or four feet long, and brownish-grey above, with a green tinge, yellow marks upon the neck, and rows of black spots down the back and sides, alternating, like London lamp-posts, with each other. You will find him anywhere in England, almost anywhere in Europe, below the latitude of Scotland. You will find him most frequently in a moist place, or near water, for he is rather proud of himself as a swimmer. He has a handsome coat, and gets a new one, two, three, four or five times in a season, if his growth require it. When the new coat is quite hard and fit for use under the old, he strips his old one off among the thorn-bushes. He and his lady hybernate. The lady leaves her sixteen or twenty eggs, all glued together, for the sun to vivify. The snake's tongue, as we have said, is forked, the jaws dilatable; he prefers frogs for his dinner, but is satisfied with mice, or little birds, or lizards. He swallows

his prey whole. Catching it first, as Mrs. Glasse would say, between his teeth, which are in double rows upon each jaw, and directed backwards that they may act more effectually, he first brings the victim to a suitable position—head first, he prefers. Then, leaving one set of teeth, say the lower, fixed, he advances the upper jaw, fixes its teeth into the skin, and leaves them there while he moves forward the lower jaw, and so continues till the bird or frog is worked into his throat; it is then swallowed by the agency of other muscles. This power of moving each jaw freely and in independence of the other, is peculiar to Ophidian reptiles. The frog may reach the stomach both alive and active, so that if, afterwards, the snake gapes, as he is apt to do, a frog has been seen to leap out again. The processes of life are so slow in reptiles, that one meal will not be digested by the snake for many days. He is unable to digest vegetable matter. Our snake is very harmless, and if kept and fed, will quickly learn to recognise its patron, will feed out of his hand, and nestle up his sleeve; but he shows a dread of strangers.

We have Adders? Yes, we have a Viper,—*Pelias Berus* is the name he goes by, and his fangs are undeniable. This is the only native reptile that can, in any degree whatever, hurt a man. It is common in England, and, unlike the snake, prefers a dry place to a moist one. "Adder" and "viper" are two words applied to the same thing—adder being derived from the Saxon word for "nether," and viper from viviper; because this reptile, like our common lizard, hatches her eggs within the body, or is viviparous. Our viper is found all over Europe; not in Ireland. As for Ireland, it is an old boast with the Irish that Saint Patrick banned away all reptiles. The paucity of reptiles in Ireland is remarkable, but they are not altogether absent. Our common lizard has a large Irish connexion, and frogs were introduced into Ireland years ago. Their spawn was taken over, put into water, thrive, and thereafter frogs have multiplied. An attempt was also made to introduce our common snake, but the country-people, with great horror, killed the interlopers; a reward even was offered for one that was known to remain uncaptured. Ireland is free from adders.

The most ready distinction between a common snake and an adder, to unfamiliar eyes, is founded on the difference of marking. While the snake has separate alternate spots, the adder has, down its back, a chain of dark spots, irregularly square, and joined to one another. Adders are generally brown, but differ very much in colour. They have on their upper jaw, instead of their lower, a row of teeth, the well-known fangs. These are long, curved teeth, fixed into a moveable piece of bone, and hollow. The hollow is not made out of the substance of the tooth; it is as if a broad flat tooth had been bent round upon

itself to form a tube. The tube is open below and behind, in the curve, by a little slit. Above, it is open, and rests upon a tiny bag connected with a gland that corresponds to a gland in man for the secretion of saliva; but which, in the present case, secretes a poison. The fang, when out of use, is bent and hidden in a fleshy case; in feeding, it is rarely used. The viper catches for himself his birds or mice, after the manner of a harmless serpent. But, when hurt or angered, he throws back his neck, drops his fang ready for service, bites, and withdraws his head immediately. The fang in penetrating, of necessity, was pressed upon the little bag of poison at its root, and forced a drop along the tube into the wound. After a few bites, the bag becomes exhausted, and the adder must wait for a fresh secretion. The poison has no taste or smell, and may be swallowed with impunity, if there be no raw surface in the mouth, or sore upon the throat, or in the stomach. It is only through a wound that it can act like poison. The bite of an adder in this country never yet proved fatal; but, according to the health of the person bitten, and according to the greater or less heat of the weather (for in very hot weather a more active poison is secreted), the wound made will be more or less severe. It is advisable to get out of an adder's way.

All the remaining reptiles in this country are two species of Frog, two species of Toad, and four Newts. They are not only most absolutely harmless, but, the frogs, at any rate, and toads, are ministers to man; and they belong to a class of animals more interesting than any other, perhaps, in the whole range of natural history. We are all well acquainted with the common frog, whose grander name is *Rana temporaria*. We see it—and it is to be feared some of us kill it—in our gardens, among strawberry beds and damp vegetation. But, whereas frogs feed upon those slugs and insects which are in the habit of pasturing upon our plants, and are themselves indebted to us for not a grain of vegetable matter, we ought by all means to be grateful to them. So industrious are frogs in slug-hunting, that it would be quite worth while to introduce them as sub-gardeners upon our flower-beds. In catching insects, the frog suddenly darts out his tongue, which, at the hinder part, is loose, and covered with a gummy matter. The insect is caught, and the tongue returned with wonderful rapidity. The frog, when it is first hatched, has the constitution of a fish: it is purely aquatic; has a fish's heart, a fish's circulation, and a fish's gills. The tadpole swims as a fish does—by the movement, sideways, of its tail. For the unassisted eye, and still more for the microscope, what spectacle can be more marvellous than the gradual process of change by which this tiny fish becomes a reptile? Legs bud; the fish-like gills dwindle by a vital process of absorption; the fish-like air-bladder becomes transmutated,

as by a miracle, into the celled structure of lungs; the tail grows daily shorter, not broken off but absorbed; the heart adapts to its cells; the gills become a reptile as the tadpole changes to a frog. The same process we observe in toads; and it is also the same in our newts, excepting that in newts the tail remains. There is no parallel in nature to this marvellous and instructive metamorphosis.

The perfectly-formed frog does not live of necessity in water, or near it, but requires damp air occasionally. It breathes by lungs, as we have said; but, as it has no ribs, there is no chest to heave mechanically. The frog's air has to be swallowed, to be gulped down into the lungs. That is not possible unless the mouth is shut; and, therefore, as we might suffocate a man by keeping his mouth shut, so we should suffocate a frog by keeping his mouth open. Yet we should not suffocate him instantly; we should disable the lungs; but, in this class of animals the whole skin is a breathing surface. A frog has lived a month after his lungs had been extracted. All respiratory surfaces, like the inside of our own lungs, can act only when they are relaxed and moist. That is the reason why a frog's skin is always moist, and why a frog requires moist air. It does not need this constantly, because, when moisture is abundant, there is a bag in which it stores up superfluity of water, to be used in any day of need. It is this water—pure and clear—which frogs or toads expel when they are alarmed by being handled. Is not enough said, here, to rescue frogs from our contempt? We may add, that they are capable of understanding kindness—can be tamed. Frogs hibernate under the mud of ponds, where they lie close together, in a stratum, till the spring awakens them to a renewal of their lives and loves. They lay a vast number of eggs, at the bottom of the water; and the multitudes of young frogs that swarm upon the shore when their transformation is complete, has given rise to many legends of a shower of frogs. These multitudes provide food for many animals, serpents, as we have seen, birds, fish. And the survivors are our friends.

The other species of frog found in this country is the Edible Frog (*Rana esculenta*). It has for a long time had a colony in Foulmire Park, in Cambridgeshire, although properly belonging to a continental race. It differs from our common frog in wanting a dark mark that runs from eye to shoulder, and in having, instead of it, a light mark—a streak—from head to tail along the centre of the back. The male is a more portentous croaker than our own familiar musicians, by virtue of an air-bladder on each cheek, into which air is forced, and in which it vibrates powerfully during the act of croaking. This kind of frog is always in or near the water, and being very timid, plunges out of sight if any one approaches.

These are our frogs; as for our two Toads,

they are by no means less innocent. They are the Common Toad, by style and title *Bufo vulgaris*, and a variety of the Natter Jack Toad, to be found on Blackheath, and in many places about London, and elsewhere. The toad undergoes transformations like the frog. It is slower in its movements, and less handsome in appearance: similar in structure. There is a somewhat unpleasant secretion from its skin, a product of respiration. There is nothing about it in the faintest degree poisonous. It is remarkably sensible of kindness; more so than the frog. Examples of tame toads are not uncommon. Stories are told of the discovery of toads alive, in blocks of marble, where no air could be; but, there has been difficulty, hitherto, in finding one such example free from the possibility of error. It may be found, however, that toads can remain for a series of years torpid. It has been proved that snails, after apparent death of fifteen years, have become active on applying moisture. A proof equally distinct is at present wanting in the case of toads. The toad, like other reptiles, will occasionally cast its skin. The old skin splits along the back, and gradually parts, until it comes off on each side, with a little muscular exertion on the toad's part. Then, having rolled his jacket up into a ball, he eats it!

No reptiles remain now to be mentioned, but four species of Newt. These little creatures are abundant in our ponds and ditches, and some are most falsely accused of being poisonous. They are utterly harmless. Their transformations, their habits, their changes of skin, their laying of eggs, can easily be watched by any who will keep them in a miniature pond. A large pan of water, with sand and stones at the bottom, decayed vegetable matter for food, and a few living water-plants, extracted from their native place, will keep a dozen newts in comfort. The water-plants are needed, because a newt prefers to lay her egg upon a leaf. She stands upon it, curls it up with her hind legs, and puts an egg between the fold, where it remains glued. These being our reptiles, are they proper objects of abhorrence? At this season they are all finishing their winter nap. In a few weeks they will come among us, and then, when

—“the songs, the stirring air,
The life re-orient out of dust,
Cry through the sense to harken trust
In that which made the world so fair”

may we not permit our hearts to be admonished by the reptiles also?

THE SECOND VOLUME.

Containing from Number 27 to Number 52, both inclusive.

"Familiar in their Mouths as HOUSEHOLD WORDS."—*CHARLES DICKENS.*

HOUSEHOLD WORDS.

A WEEKLY JOURNAL.

CONDUCTED BY CHARLES DICKENS.

No. 51.]

SATURDAY, MARCH 15, 1851.

[Page 24.]

THE FEMALE SCHOOL OF DESIGN IN THE CAPITAL OF THE WORLD.

MR. JOHN MOTLEY is an extensive manufacturer of woollen shawls and table-covers. All British manufacturers of similar articles are not like Mr. John Motley, we are extremely happy to say; but both history and justice compel us to state, that the family of the Motleys is a very large one, comprising many members and branches, all following the same trade, and including the Patchmans and the Stairings, great manufacturers of chintzes and printed cottons; and the Squabtons, who monopolise half the trade in crockery and hardware.

Mr. John Motley has gone on pretty much in the same way all his life, *i. e.*, in the same way as his father before him, who also followed in the steps of his father and grandfather. The necessities of change of some kind, which he called fashion, compelled him to adopt corresponding changes, which he called patterns, and sometimes, by way of irony, *designs*. Very frequently he adopted novelties from the continental manufacturers, but always altered them to his own taste—the regular old family taste of the Motleys; so that, in truth, there was no real adoption of a continental design, but merely a fresh impulse and enlivenment given to the native stock. Mr. John Motley, like all the rest of his family, considered that he thoroughly understood the English taste; that his own taste was the model and criterion of public taste—in fact, that the two things were identical. He had been successful—had raised a fortune, and was still accumulating; and what better proof could anybody have of the correctness of his judgment and method of conducting business. Besides, he used to add, with a knowing wink, they *must* buy our goods, because they can't get any others—the duty on foreign articles giving us a monopoly of the home market. Very proper it should. It protects our property, and the family taste.

Year after year, the successful John Motley sent forth his countless sales of shawls and table-covers, with great vulgar patterns, dabbed, sprawling, or conglomerating, over a gaudy ground—the colours of which were not only insubstantial with those of the

patterns, but a violent outrage to all harmony. If he is ever reproached with a want of novelty, or a want of beauty in his patterns, by some strange and particular fellow among his wholesale customers—a thing that does now and then reach his ears—he merely replies, with dogged indifference, "You see, there's a want of invention in the country—we have no designers; so, we do the best we can. Take 'em or leave 'em."

In a similar course, and with like success, have the various branches of the Motley family proceeded. The Patchmans, and the Stairings have all most rigorously followed in the old system of eschewing all real novelties of any beauty and elegance, and insisting upon their own taste as the taste of the public; till at length the public, by the force of long habit has, in the mass, come to believe them, and adopted most of the new patterns—whether of gaudiness, dulness, heaviness, meanness, vulgarity, or confusion—which they have sent forth to the world. The Squabtons, with all their vast producing power in the shape of hardware articles of domestic use and necessity, have sedulously adhered to the family maxim of "stick to the old models" as long as possible, and by way of novelties "ring the changes" upon them only. Hence our dummy jugs, and mugs, and jars, and candlesticks, and vases, and other articles of the home produce. If you see among them any one shape of an elegance that instantly attracts the eye, you find it is double the price, even when of the same material, and not needing more labour in the workmanship than a dummy article—*provided* there has not been a resistance, or a wilful stupidity in opposition to any real improvement in taste—for this article is from a foreign model. Had it been actually a foreign article for which a duty had been paid, there would be some reason for the double price; but this is simply a copy and adoption, and the high price is therefore of no necessity, but simply in order to hold in check all taste for articles of similar elegance or grace. Mr. Squabton does not approve of them. He only admits them into his show-rooms, because it looks well to have all sorts. But they do not please the habitual Squabton eye. He therefore assumes that they would not meet the public taste; or, if they did, the

public ought not to be encouraged to buy such things—and shall not, as long as we can prevent it.

I have said that all manufacturers were not alike, and that there were honourable exceptions who looked on the existing state of things with very different eyes from those just mentioned. Though comparatively a young man—in fact a junior partner—I trust I may be allowed to include myself among the exceptions. I really do wish to see an improvement in the taste of all designs for the useful arts; and I believe the time is not far distant when manufacturers will more generally perceive the importance of encouraging such designs by all the means in their power. If nothing else will teach them, the results of the forthcoming Great Exposition will do so, as it will make them alive to their own interests by demonstrations of the most effectual kind. The public taste is likely to undergo a rapid revolution in many articles combining beauty of design with domestic utility, that's my opinion; and then where are the producers? and what will become of all the bales, and piles, and stacks of the perverse old stock?

I heard a great Manchester manufacturer lamenting, only a few days ago, the want of new and good designers in our own country. I told him I had been informed that there were two Schools of Design in London—a male school, and a female school—where the students continually produced first-rate designs. He said he had never been there, nor seen any of their designs, that he knew of; and again lamented the want of new patterns. Another, a great ribbon manufacturer of my acquaintance—in fact, he married my aunt—expends at least a thousand a year in getting foreign designs, and he has never once taken a design from any of these Schools. When I told him I had seen good things that came from them, he looked incredulous and vacant, and said that I was young in the business. Not a word about going to see them, or sending up for a few specimens. Another great manufacturer, with whom our firm often has large dealings, dined with us last week. He knew of these Schools, and showed us a beautiful design for a carpet which he had obtained from one of them, in which the colours were all finely harmonised. "It will sell very well," said he, "after I have altered it a little to my own taste." "Why, what will you do to it?" I inquired. "I must *vilgarise* it," said he, touching my elbow; "where they have put grey, I shall put scarlet; and where you see purple here, I shall put green and yellow, or such like." Another manufacturer, whose warehouse I was visiting only the other day, showed me a table cover of a most chaste and handsome design—a broad, rich, gothic border, with a dark centre quite plain, which of course made the deep border look all the richer. "This is very good," said he, "but we always like

something catching in the centre. I shall have a good bunch of peony roses and tulips, or something of that sort, for the middle."

Those rebuffs, however, added to the excellence of several designs I had seen, which had come both from the male and female schools, determined me to go to London forthwith and visit them. It is only justice to say that I did this with the full approval and, indeed, the wish, of my senior partners.

During the journey by rail, I thought very much about these Schools—and especially the Female School, as it seemed to me to include many questions of social interest, which one now so often sees discussed in periodicals, and even in newspapers. Many of these young persons, thought I, are, no doubt, of highly respectable families, well educated, and who once had very different expectations; though now, for the purpose of making designs, they are learning drawing, perhaps, to sell them—perhaps that they may become teachers—but in all cases to help some scanty income at home. Perhaps, also some of them are orphans. But the Government takes charge of them. As the manufacturers have not yet learnt the importance of supporting these Schools, by employing some of the students, or making selections from their designs, a paternal Government has kindly and wisely taken charge of these industrious and praiseworthy young women.

I therefore determined to make my first visit to the Female School, and accordingly betook myself straight to Somerset House. I should premise that I have, myself, a good general knowledge of drawing, and though unfortunately, I have no original genius for designing patterns for my own business, I once had considerable practise in copying both from prints and casts—the "flat," and the "round," as artists call it.

Arrived at Somerset House, I was informed that the Female School of Design was no longer there. "Gone!" said I.

"Aye—removed to over the way."

I was staggered for a moment at this. I feared that a paternal Government had withdrawn the shadow of its fostering wings from those most needing protection.

"But is it not still," said I, "a Government Institution—is it not still under the protection—"

"Yes—yes—all right—over the way;" and the porter closed the door.

I breathed again; my fears for the poor girls were allayed, and I accordingly began to look up and down at the fronts of the houses over the way—that is, opposite to Somerset House. I thought I knew the "Strand" pretty well; but I could not recollect any house over the way of a kind, at all resembling the house of a Government Institution. Nor, strange to say, did looking up and down, at all help me. The more I looked, the less I could discover of any such house—or one likely to be it. In fact, I

speedily came to the conviction that "over the way" meant a considerable way up or down the Strand, on the opposite side; and accordingly I crossed over, and began to walk along, staring up at every house I passed. No external signs assisted me in the least, and I arrived at the crossing leading to Holywell Street. I then turned back, and proceeded, staring up in the same way, till again I found myself at the crossing of Catherine Street. Being now fairly at fault, I went into a shop and inquired. They knew nothing about it. Then into another—and luckily they did seem to know of such a place, and informed me that "it was at one of the soap and sponge-shops" they did not know which.

I was a little surprised at this, but attributed it to the ignorance of the speaker, and was glad at last to have got a clue. Thus directed, I singled out a shop of this kind, and on the left hand side of a door-way leading up a very narrow passage. I saw written up "Female Classes of the Government School of Design," rather small, on a convex board, and half slipping round a corner as if ashamed of itself. No wonder I had not observed it in passing. If I had seen the board, I should have taken it for one of the cheap dentist and cuppers' boards.

Up this narrow passage I walked. It was scarcely four feet wide, and very dark. I admit that the day was extremely bad and foggy. At any rate, it was so dark, and with so little indication of an entrance to a "School,"—unless, indeed, to some poor "Evening School" in the country, or a "Ragged School" in London, that I walked right out at the other end, and found myself in a strange-looking court, which proved to be the entrance to a soap-manufactory. Here I was again obliged to inquire, and was directed back again into the narrow passage; and here I came to a perfectly dark side-door, which I had passed on my way, and now by straining my eyes, I contrived to read the word "School;" for the rest, if anything, I positively could not distinguish; and I will defy you, reader, to see much clearer, even after all the directions I have given, if you go on any day at all foggy or dusky, many of which I believe you Londoners are quite accustomed to. "Queer place enough," thought I, "for a paternal Government to establish a number of young ladies in." The knocker refusing to move, I fumbled out a bell-handle—pulled—and was admitted.

Having made known to Mrs. Mc Ian—the lady superintending the school—that I was a manufacturer, and a partner in an influential firm, I received a polite attention, and was conducted into the largest of the rooms appropriated to the students.

This room was the first-floor front, exactly over the shop below. It could not have been above eleven or twelve feet high. I do not know how many students were there; but the room was full to crowding. They were packed close together on forms, just like children at a

Sunday School, in our manufacturing towns. The elbows, and, in some cases, the shoulders of one student touching those of her next door neighbour, on each side. The drawing desks, or stands, with the forms, were arranged in rows across the room; and so closely that to pass along between was not possible without frequently scraping oneself against the desk behind, or causing the student in front to bend and pack herself forward against her own drawing-board. This was the junior class. They were copying from the "flat" and the "round," (prints or drawings, and bas-reliefs); but, though it was only two o'clock, the light was so bad, owing to the fog, and the dusty, uncleaned windows, that to distinguish anything accurately was out of the question. I asked a student why they did not have drawing-lamps, but was informed that none were allowed. By bending down, with a close scrutiny, to the drawings of two or three of those nearest the windows, I could see that they were very well done; and the copies of several of the casts of scroll-work, flowers, and fruit, in high relief, were excellent. In the imperfect light, the drawings really looked almost as tangible and round as the casts themselves. Some drew in chalk, and some painted in oil, some in water-colour; but the majority painted in what is called *tempera*, or body colour, and of the same kind in which Cartoons are painted. Though the fire was small, the room was very hot and close, and there was no sort of provision for ventilation.

In the back room, on the second floor, which was much smaller, there was similar crowding, and with greater injury, as the higher class of students were here; and these, frequently having large designs, were continually in each other's way. For a young lady to have a blow on the cheek, or the side of her head, from the corner of a wooden-frame—an easel to be upset—a cast knocked down—a freshly-painted design smeared across, or a hole knocked in a canvas, were things of almost every-day occurrence. One of these rents in a design for a carpet, and half finished, I myself saw. The hole was so large I could have crept through it; and on this very day of my visit, a valuable porcelain vase has been knocked down and broken, sheerly from the impossibility of any one being able to move without jostling somebody or something. Here also, the room was very hot and close—nothing in the shape of ventilation.

Impossible as it was, from the state of the atmosphere, added to the extreme dirtiness of the windows, all crusted over, as they were, with London dust and smuts, to judge well of colours, in themselves, I could yet see that the best had been selected, and the best harmonies employed. I here saw designs for table-covers, chintz, ladies' muslin, or other figured dresses, groups of flowers, fruit, carpets, paper-hangings, models in clay and wax, &c.

The designs were handsome, beautiful, elegant, and original, and would do any English manufacturer's heart good to see them. If he only had the good sense to set a fast value on the advantage of finding such things close to hand in his own country.

The two attics above are arranged in the same way as the rooms on the second floor, the senior students being packed in the little back room, while the junior are in the larger room in front. These rooms are only eight feet high. In the front attic there are twenty students. The oppressive atmosphere was scarcely endurable on first entering. No ventilation whatever had been provided. It reminded me of what we read of the "sweating system" among the poor journeymen tailors.

The principal designs in the attics were similar to those below, viz., for carpets, rugs, screens, ladies' dresses, table covers, lace handkerchiefs, ribbons, shawls, &c., and I am quite sure, from the excellence displayed in many of them, that the instructions and assiduity of Mrs. M'lan must be of the highest order. The day being so very dark, I took my leave, proposing to make another visit when the light should be favourable.

This School has now been established eight years, and comprises seventy students. Considering that the majority of them on first entering the School could not draw at all, and had to be instructed in the first rudiments, the progress displayed by so many confers the greatest credit upon their instructor. The merits of this institution ought to be much better known than they are, and the example should be followed in the provinces. It is surprising how few such Schools exist in England, or in any other country. There has been one only in Paris during these many years (I mean, a Female School) but this is not properly a School of Design, and is simply a drawing-school, where they chiefly copy prints, and seldom draw from the "round." A similar school, however, to the present, has been established by a lady in Philadelphia, who wrote to Mrs. M'lan for information as to the methods and general routine adopted. Besides the advantages of such a school to the manufacturer, it is evidently an excellent thing to society to provide such a means for rendering young women able to obtain an honourable independence, and it also supersedes the necessity for engaging male teachers of drawing in ladies' schools, which has often been found very objectionable, if not injurious.

A bright sunny morning happening to favour the Metropolis a day or two after, I renewed my visit to the Government School, over the sponge and soap shop. I made no doubt but I should now see all the drawings and designs to the greatest advantage, at least so far as light was concerned. The fostering shop itself a very good one, and perfectly respectable, though a strange

place for a Government Institute—looked bright and well-to-do, and the wide passage was several shades less dark, though still very gloomy, and exactly like the entrance to a wine merchant's office and cellarage.

In my anticipations I was not deceived. Though there was no room to see any large designs to advantage—the eye being within a foot or two of the specimens, and to step back a pace or two from them being impossible in the room of the senior students—the grade and variety of the designs, and the beauty of the colouring, were on this occasion very apparent. But how was it that the two front rooms—the largest by far—had been appropriated to the beginners and junior classes, while the senior students were thus packed in pens and cribs—back second-floors of only nine-and-a-half feet high, and back attics of only eight feet high by eleven feet in width? The elucidation of this, I regret to say, does not place the wisdom and care of a paternal Government in the highest light, even so far as a knowledge of drawing is concerned.

When there happens to be a bright morning, the very strength of the light in the larger rooms, renders them the more unsuitable for students in drawing—the windows being precisely in the wrong aspect. When the sun shines in these front rooms, the shadow from one student's head darkens fitfully, or in moving shades, the drawing-board of the student next on the other side—and so on, all down the rows across the room. The process of making a copy from a cast, or other model, throwing its own variable shadow, is also rendered most painful and perplexing to a young student,—because a drawing that is correct in light and shade at one period, becomes incorrect in the next quarter of an hour—the cast or model, in the advance of the light, having undergone a corresponding change in its shadows. Hence, all young students who are copying intricate and difficult reliefs, continually find themselves hopelessly thrown out, and reduced to despair.

Now, this is very surprising—inexplicable to any plain man like myself. For are there not two or three Royal Academicians connected with the Board of Trade, and do they never remonstrate with the honourable and learned Board? Moreover, there is a lady, as Directress of the School, who is an accomplished artist. Why does not Mrs. M'lan complain loudly of all this to the Board of Trade, or to somebody high in office? Is Mrs. M'lan afraid a paternal Government will "bite her head off," if she dares to open her mouth?

The fires in the rooms are all kept low, yet to-day being a bright day, the heat and oppressiveness of the atmosphere is scarcely to be endured. In the back pens, where the senior students are packed together, the air is half suffocating—and see! there is poor Miss * * * carried out fainting.

This, the students inform me, is not at all an uncommon occurrence. The chimney, too, is smoking! This, they tell me is also common, and invariable whenever coals are put on; so that they are either obliged to open a window, and risk a bad cold after being in a vapour bath, or else sit in the midst of the cloud to the injury of their eyes, their breathing, and often to the destruction of any delicate tints they are laying in upon their painting. Many of them suffer headache, pains across the eyes, in the throat, sickness and dizziness. One student told me she never was free from headache during the whole six hours she was daily at work. They would account a ventilator as a great blessing, so much do they need a breath of fresh air. Surely a paternal Government might spare (out of a Surplus) two-and-sixpence, to set a whirling ventilator to spin a little vital air through a hole in the wall at the top of each of these rooms, where industrious young women are seeking to acquire the means of assisting their families, and of gaining an honourable and useful independence for themselves in future life.

This Female School of Design which had originally been established in Somerset House, was removed from those quarters by a petition, which set forth the want of adequate room.

"Very well," said the courteous Board of Trade, "Oh, certainly! We'll attend to your wish."

The School was accordingly removed to "over the way!" This looks very like saying inwardly, "I'll give you enough of petitioning for a move."

Without doubt the students are right in saying that the old room in Somerset House was far better. It was large—though not large enough—and they had a proper aspect as to the light. These present rooms are said to be only temporary; but as "temporary" so often means, with the Government, a very long and a very indefinite period, it has been suggested that the School should be moved back to Somerset House meanwhile. But the distressed Board of Trade says there's no room there, now. They can't find four or five spare rooms in all Somerset House—the great building is so full! How very much I should like to see a statement of how all the innumerable rooms in this great quadrangle of great houses are filled. I wonder whether anybody lives there!

Can nobody suggest to the Board of Trade, some place with a proper light, where there is at least one good, large room for these female students? The importance of a large room, besides the advantage of light and air, is very great. A number of students can stand round and see the instructor paint, or give a special lesson to a pupil, from which others may equally benefit. Besides this, there is a great advantage in students seeing each other work; they learn from each

other; and it also excites emulation. Can no such room be found in all this vast metropolis, where so many splendid public and private edifices and buildings exist? If Mr. Leabouchere would but intercede in a high quarter, so that this most praiseworthy School of Design might be located in one of the light, airy, and beautiful stables now building for the Prince of Wales, that would be just the thing, both in itself, and in the quiet refinement of its locality.

But, as for the present rooms, I need not state—as the fact must be obvious to all—that if a paternal Government had studied to select one of the worst possible places for such a school, they could not have more completely succeeded. In points of art, and as a place of study, I have described what it is, without exaggeration; and as to the suitability of its locality for respectable young females, I may also venture to state—with no power to use any exaggeration that can surpass the fact—that it is in the close vicinity of several gin-shops, pawn-shops, old rag and rascality shops, in some of the worst courts and alleys of London, and in a direct line with two narrow streets, which, as disgraces, cannot be surpassed by the worst quarter of any metropolis in the world.

I leave London to-night by the express train, and shall present myself before my partners tomorrow morning in the warehouse, with uplifted hands and eyes; but I'm quite sure our firm will speedily avail itself of some of the designs of those industrious young ladies.

DARLING DOREL

DOROTHEA SIBYLLA, Duchess of Brieg, was born at Cöln, on the River Spree, in Prussia, on the 19th of October, 1590. She was the daughter of Elizabeth of Anhalt, and of John George, Margrave and Elector of Brandenburg, of the old princely Ascanian race. At the death of her husband in 1598, the widowed margravine retired to Crossen to superintend her daughter's education. In due time suitors were not wanting for the hand of young Dorothea Sibylla: among others, the King of Denmark; but he sued in vain. Dorothea at length fixed her affections on John Christian, Duke of Liegnitz and Brieg, who enjoyed a great reputation for virtue, ability, and integrity. To him after a short courtship, Dorothea was married on the 12th of December, 1610, at Crossen; and reached Brieg—the small capital of her future dominions—on the first of January in the following year.

Such is the dry sum of a charming Court biography, which first appeared in a periodical published in 1820, in *Silesia*, and which has been twice republished in a separate form—once (in 1835) at Brieg, under the title of "Passages from the Life of Dorothea Sibylla, Duchess of Liegnitz and Brieg." It purports

to consist of extracts from the journal of a certain tanner and furrier of Brieg, named Valentinus Gierth, an occasional guest at the ducal castle, and ardent admirer of the duchess. As a simple, and—if internal evidence be worth anything—truthful picture of German Court life during the early part of the seventeenth century, it is not to be gained; although suspicions of its authenticity have been cast upon it, similar to those which damaged the charms of the “Diary of Lady Wolloughby,” by eventually proving it to be a fiction.

Dorothea is described as a pattern of goodness, common sense, virtue, and piety. In domestic management, she was pre-eminent. For her own immediate attendance she appointed fourteen maids of honour; and the first families of the land looked upon it as an inestimable privilege to place their daughters at the ducal Court; which was a high school of all noble virtues and accomplishments, “whereof the duchess herself was the chief teacher and most perfect model.”

Nothing could be more primitive than the duchess’s intercourse with the townspeople. Occasionally she walked in the streets of Brieg, accompanied by her maids of honour, and chatted with such of the townspeople as were sitting on the benches outside their doors. The little children looked forward with the greatest delight to these town walks of the duchess; for, the ladies-in-waiting invariably carried about with them in their pockets all sorts of sweetmeats, which the duchess distributed among the little claimants. For this reason, the little children stood peeping round the corners of the streets, when it got wind that the duchess was about to walk out; more especially when it was surmised that the duke would not be with her. So soon, therefore, as Dorothea Sibylla left the castle gate, the little urchins would run through the town like wildfire, crying out, “The darling Dorel is coming! The darling Dorel is coming!”

The manner in which this endearing designation first came to her ears is related with affecting simplicity. “It happened,” says Master Gierth, with true German particularity, “on the 10th of September (old style) in the year of our Lord 1613,” that being the Feast of St. Sibylla—one of the duchess’s name-days—and also the second birthday of her son, George. There was a great feast at the castle; to which the towns-folks and the children of the High and Guild Schools were invited.

“From the terrace,” quoth the chronicler, “the whole procession moved along a wide smooth walk before the orangery; where the quality as well as the children, were richly treated with strong spiced wine, orange water, and confectionary. Her ladyship did likewise lay certain presents before the young lord her son; she did likewise examine the children’s school-books and the master’s report, wherein

the conduct of the children was noted, and did put opposite questions to them touching their Christian belief, and the like; and on receiving right proper answers, her face did shine like an angel’s.

“One little maiden, however, which was weak and ignorant, was not able to answer the questions aright; whereupon her ladyship did ask.

“My child, what is your name?’ Whereunto she did answer, ‘Anna Pöhlin!’

“Well,” asked her ladyship, ‘and what is my name?’

“Straightway the little maiden did answer, ‘Darling Dorel!’

“Hereupon Master Valentinus Gierth was somewhat affrighted, but did quickly recover himself, and stepping up to her ladyship did say:

“Most gracious lady! I trust your ladyship will pardon these words, and not take them amiss; inasmuch, as it is true that the women of this town, as well as of the neighbouring villages, when they do speak of your ladyship, do commonly call your ladyship the Darling Dorel.”

“Then did the duchess fold her hands, and raising them to heaven, did say:

“God be praised for such a precious title; the which, as long as I am in my senses, I would not exchange against ‘Your Majesty!’

“The duke did thereupon embrace her ladyship, saying,

“Away with the title ‘princely consort;’ I will ever henceforth call thee by none other save ‘Darling Dorel!’”

We by no means intend to follow the good Tanner through his minute records; but merely write thus much as necessary preface to a quaint little love story. Premising that the duchess had sent, after her usual fashion, a marriage present to a certain lady, by two of her maids of honour, (by name Agnes and Mary) we shall transfer the narrative to our pages in Master Gierth’s own manner.

After the presentation of the gifts, and when the marriage ceremony was concluded, the two maids of honour were preparing to return to Brieg, when the bride’s father stopped them, saying:

“How? Shall I suffer two such angels of joy to depart, without tasting of my food and my drink? Nay, noble damsels, ye must abide here awhile beyond the marriage festivities, and be of good cheer! I will immediately despatch a trusty messenger on horse to her most gracious ladyship, the duchess, and obtain leave for your sojourn here.”

“The two damsels did therefore abide there the space of three days, and became acquainted with two gallants of the place; with whom they did exchange love-tokens and rings. But when the two damsels returned to Brieg to render an account of their mission, the duchess did note the rings on the fingers

of the two damsels, and questioned them how they came thereby. So soon, therefore, as the two damsels did confess the truth, their mistress, half jestingly, and half in earnest, said unto them :

"How now, ye gad-about! ye have scarce shipped the egg-shell, and have, as yet, no means to make the pot boil, seeing that ye are poor orphans and under age; and ye yet dare to listen to the nonsense of strange gallants, unbeknown to your foster mother! Tell me, foolish young things, ought I not to take the rod to you? Take off the rings from your fingers and give them to me. I will send them back; seeing that the betrothal is null and void, and mere child's play?"

"The young damsels did then obey her ladyship, but wept apace the while. This caused her ladyship to have compassion upon them, and she did minister comfort to them thus.

"Ah! beloved daughters! ye shed bitter, hot tears that ye do not already wear the curch [the German head-dress of married women]. But if ye did but know the heaviness of being wedded wives, even when the cares are lightest, ye would rejoice! Meanwhile the matter hath been carried on against all Christian order. I have always heard that the lover first maketh his suit known to the parents or the guardians, and that then the betrothal taketh place. Your suitors must needs be in great haste. Why stand they in such great necessity of pushing their suit?"

"Hereupon the damsel Agnes plucked up an heart, and said quickly,

"Most gracious lady! the gentlemen did come with us; and have already the consent of their own parents to make their suit if they be but encouraged by a sign of approval."

"Ah! Heaven have mercy!" cried the duchess, joining her hands. "Have ye, scape-graces indeed, brought your gallants hither? I dare not inquire further. May be ye have hidden them in your chamber? Meggy, (the duchess's nurse,) beg his lordship to come hither; I must talk the matter over with him."

"After the duke had come and heard that which had befallen, he straightways asked the names of the gallants; and when the damsels had informed his grace thereof, his lordship did turn unto his consort, saying:

"Listen, Darling Dorel: the parents, on both sides, are most worthy persons, and of unblemished birth. I advise that thou shouldst give thy consent thereunto! Remember, dearest, that we twain were of one mind long before I made known my suit unto thy mother."

"Whereupon her ladyship did strike her lord upon the mouth with her kerchief, and said,

"Well!—well!—but we must first look at these youths, and learn what they are like. Tell us now, young damsels, where are your

lovers hidden, and what is the signal ye have agreed upon?"

"Agnes did immediately tell her ladyship that the gallants were housed at the Golden Pitcher; and, whereas the Lion's Tower, in the palace, could thence be plainly discerned, they had agreed to tie a white kerchief round the neck of one of the lions as a signal that there was hope for them! The gallants had agreed to abide at the hostel the space of eight days. Should the matter, however, turn out ill, the kerchief displayed was to be black.

"Well done," said the duchess to her husband; "they wish to take two fortresses at once; and would have the white flag wave, without firing a shot, and without attempting a storm."

"Hereupon the Duke Christian did take the hand of his beloved wife, and spoke, somewhat in an under tone:

"Darling wife!—was not the green branch so often stuck in your window at Crossen; also a white flag? Moreover, thou knowest little of a siege; preparations for storming a citadel are not made during the daylight; but secretly, in the night season, in order that the garrison perceive them not. Shots may already have been fired. Tell me, young girls, have ye already kissed the gallants? Mary, do you speak; ye have not yet opened your mouth: make a clean breast."

"Ah! most gracious liege," answered Mary, "the gentlemen have, indeed, squeezed our hands in secret, while we sat at table; and during the marriage dance, and at sundry other dances, we kissed each other—seeing that others did the like. But we could not be alone with them at any other time; for the bride's mother was always about us, and we lay in her room. Neither, on the way home, had we much liberty; seeing that the old secretary, whom her ladyship did send with us, did observe us most narrowly. But, when the old man did look out of the window of the carriage, then did the gallants look tenderly upon us, and did kiss their hands to us."

"There now," said his lordship, turning to his wife, "you see that the siege was conducted with vigour. The squeezing of hands was the parley; the kisses the cannon-balls, sent so freely; and the tender looks the shells. Depend upon it the storm cannot long be delayed. Listen, darling wife, my heart melts when I bethink me that we also, in our youth, could not brook a long delay."

"Let the drums beat the chamade [parley], and let us show our colours!" said the duchess; while she threw her arms round her husband's neck, and stopped his mouth with a kiss. The duke did then ask her, jestingly, "But which flag shall it be?"

"Hereupon the two young damsels did cry aloud, as with one voice:

"The white!—most gracious liege!—the white!"

"The duchess could not choose but laugh heartily, and his lordship did immediately order a servant to mount the tower, and to tie a white kerchief round one of the lion's necks. His lordship did then sing an old song the children are wont to sing on May-day :

"A stately house my lord doth keep;
Two maidens from the windows peep;
A kerchief white the one doth wave:
Because they fain would husbands have."

and did then depart to put on better apparel, whereto await the coming of the wooers. He did also command that all the court ladies and the courtiers should be present at the wooing. Meanwhile, 'Darling Dorel' did ask the damsels where they had gotten the rings which they had presented to their gallants in return for theirs? Thereupon Agnes did reply unto her ladyship :

"Most gracious lady! we are but poor orphans, and possess nought save poor little gold rings belonging to our departed mothers, and these we could not bear to part with. We have before promised to buy rings with our money, and deliver them to our gallants on the next opportunity."

"Nay, said her ladyship, 'ye are but poor betrothed, and there is yet time to think twice of the matter;' nevertheless, her ladyship did praise the young damsels, inasmuch as they did not part lightly and rashly with their mothers' trinkets. She advised them, moreover, to tarry; as they or their gallants might change their minds.

"This speech did much alarm the damsels, who did then believe the whole matter to be postponed; and they did forthwith begin to weep, and to beseech her ladyship, not for this account, to cause their lovers to alter their mind, seeing that they, the damsels, were poor and were not likely soon to get other suitors.

"The duchess did then say unto them :— 'The misfortune would not be so great! I would find husbands for you soon enough.' Hereupon, she turned to old Meggy and said,

"Ah! most worthy nurse, what a life does a wretched princess lead! Had I but married an honest burgher, then should I have had nothing but my household duties and my children to attend to; I could have gone quietly to bed, slept without care, and waked with pleasure; but in my position everything is otherwise. Alack, when my other damsels come hither, and learn that these silly girls are already betrothed, they will all run mad, and I shall have to send them to all the marriage feasts throughout the duchy to pick up husbands.

"Hereupon, she sent the nurse Meggy for her jewel box, opened it, and gave to each of the two damsels a handsome ring, the which they might present to their lovers, and thus return their pledge; but under this condition, that they were not to deliver their rings until

the duchess gave them a sign thereunto with her kerchief.

"While all this was going on, the duke on his part had entered the duchess's apartment, accompanied by the chamberlain, all the gentlemen of his court, and the maids of honour. The lovers, meanwhile, were on the look out, and were not aware that matters had gone to such a length, touching their love affairs. They had joyfully obeyed the white signal, and stood near unto the gates of the castle waiting for some opportunity of seeing their betrothed. The duke perceived this, and hereupon opened the window and called unto the soldiers on guard, 'Arrest me those two fellows and conduct them to the guard-house, until further orders!'

"Hereupon the damsels, Agnes and Mary, were exceedingly afraid. The duke, however, did comfort them with the following words :

"This is on your account; hasten and put on proper attire; ye still have got on your old clothes, and must adorn yourselves."

"The damsels ran gleefully and quickly into their rooms; whither the duchess sent after them two other damsels to aid them in plaiting their hair. They soon returned; and each of the damsels about to be betrothed had put on the bridal wreath belonging to her mother.

"The duke now ordered the lovers to be summoned from the guard-house. They were sore abashed when they entered the room; especially when his gracious lordship addressed the following questions to them :

"What are your names? Have you passports? and what is your will?"

"The young men twirled their caps in their hands; stared first at their loves, and then at their gracious lieges; but could not utter a word, and stood looking very sheepish.

"Ah!" said his lordship, 'never in my life did I meet with two such dumb fellows. My dominions will soon touch those of Oppeln, and you serve excellent well as landmarks!—can neither of ye say 'yea or nay'? Answer me straight!—Have ye got the consent of your parents to propose for those two chits; and are ye ready to affirm the same on your word of honour, as gentlemen?"

"Then did the young men recover their speech, and they both answered, 'Yea.'

"Well," said the duke, 'I will now believe ye, and keep you at my court some few days; but as ye may be rogues and vagabonds for all that I know, I will therefore send a messenger on horseback to your parents to get further intelligence, and ye must have patience the while.'

"Hereupon the damsel Mary, turned to the duchess, and said to her with great simplicity,

"Most gracious lady, the gentlemen have spoken truth! Their parents have given them permission to woo us. We have concealed nothing from them, but confessed in the presence of the old lady Wentzlin, that we were poor orphan girls, and have no dower. But the mothers of our two lovers

said that all was well; if only we brought a blessing from Darling Dorel, they should value it more than an earldom! This Agnes and I can affirm on oath.

"On hearing this, the duchess folded her hands in prayer, looked towards heaven with tears in her eyes, and still praying, and gave the signal with her kerchief. Immediately the damsels placed the rings on the fingers of their lovers, knelt down before the duchess, and besought her blessing. The duchess laid her hands upon the heads of the young girls and said,

"God alone, who is in heaven, knows whether this will prove a blessing or a curse; but, if God hear the prayer of a weak woman, it will prove a blessing! Bethink ye of your deceased parents; and may their blessing evermore accompany ye! And therefore, let us most fervently utter the Lord's Prayer."

"Hereupon all present fell upon their knees, and prayed in a low voice; but her most gracious ladyship did say the Lord's Prayer aloud.

"After the prayer was finished, the duchess made a sign to the chief lady about the court, who did thereupon bring, on a silver salver, two half wreaths, which were twined in the hair of the two damsels, Agnes and Mary, after they had taken off their own wreaths; for it was the custom, in Brieg, for betrothed maidens to wear only half wreaths until their wedding-day, when they wore whole ones. The chamberlain did hereupon display from the window a red flag; upon which signal the ducal band did strike up a merry tune with trumpets and kettle-drums from the castle tower; whereupon a crowd gathered in the town to know the cause of such rejoicing at the palace.

"So soon, therefore, as the betrothed couples had duly thanked his grace and the duchess by kissing the hems of their garments, her gracious ladyship did announce to the betrothed damsels, that they should tarry with her for the space of one year, in order more fully to learn their household duties, and to strengthen them in the practice of the Christian virtues; seeing that they were still, as the duchess said, as ignorant as callow geese! Moreover, their clothes and furniture had to be provided, and the like. But to the gentlemen, she said:

"Mind, gentlemen, ye must also make the best of it! Ye are scarce out of leading-strings, and must go through some sort of ordeal. I would advise you to travel, if so be your parents can afford it."

"By all means," added the duke; "my Darling Dorel is perfectly right: you must travel; and, if ye know not whither, go to Jericho, and get ye some beards to your faces."

"As it was yet early in the day, his gracious lordship did order dinner to be prepared; to which, besides the Town Council, and their wives and children, Master Valentinus Giertli and his wife Susanna, were invited.

"His gracious lordship was exceeding merry, and the duchess was most kind in her manner; nevertheless, the guests did not fail to mark that her gracious ladyship did oftentimes look towards the new brides, and that big tears did sometimes roll down her cheek the while."

THE COCOA-NUT PALM.

To a town-bred Englishman, the sight of the *cocos nucifera* growing in its native luxuriance, would suggest little more than untidy orange shops, in which the nut is dealt out to retailers; apple-stalls upon which the kernel is displayed, to tempt amateurs, at a penny a slice; coir-matting woven from the fibre of the shell, and patent candles made from the oil expressed from the nut. He might also, possibly, suppose that to be the same tree he is indebted to for an excellent breakfast beverage: but in that he would be mistaken; for the cocoa, of which chocolate is manufactured, is the seed of the *Theobroma cacao*.

To a native of Ceylon, the cocoa-nut palm calls up a far wider range of ideas; it associates itself with nearly every want and convenience of his life. It might tempt him to assert that if he were placed upon the earth with nothing else whatever to minister to his necessities than the cocoa-nut tree, he could pass his existence in happiness and content.

When the Cingalese villager has felled one of these trees after it has ceased bearing (say in its seventieth year) with its trunk he builds his hut, and his bullock-stall, which he thatches with its leaves. His bolts and bars are slips of the bark; by which he also suspends the small shelf which holds his stock of home-made utensils and vessels. He fences his little plot of chillies, tobacco, and fine grain, with the leaf-stalks. The infant is swung to sleep in a rude net of coir-string made from the husk of the fruit; its meal of rice and scraped cocoa-nut is boiled over a fire of cocoa-nut shells and husks, and is eaten off a dish formed of the plaited green leaves of the tree, with a spoon cut out of the nut-shell. When he goes a-fishing by torch-light his net is of cocoa-nut fibre; the torch, or *chule*, is a bundle of dried cocoa-nut leaves and flower-stalks: the little canoe is a trunk of the cocoa palm-tree, hollowed by his own hands. He carries home his net and his string of fish on a yoke, or *pingo*, formed of a cocoa-nut stalk. When he is thirsty, he drinks of the fresh juice of the young nut; when he is hungry, he eats its soft kernel. If he has a mind to be merry, he sips a glass of arrack, distilled from the fermented juice of the palm, and dances to the music of rude cocoa-nut castanets; if he be weary, he quaffs "toddy," or the unfermented juice, and he flavours his curry with vinegar made from this toddy. Should he be sick, his body will be rubbed with cocoa-nut oil; he sweetens his coffee with *jaggery*, or cocoa-nut sugar, and

suffices it with cocoa-nut milk; it is tipped by the light of a lamp, constructed from a cocoa-nut shell, and fed by cocoa-nut oil. His doors, his windows, his shelves, his chairs, the water-gutter under the eaves, all are made from the wood of the tree. His spoons, his forks, his basins, his mugs, his salt-cellars, his jars, his child's money-box, are all constructed from the shell of the nut. Over his couch when born, and over his grave when buried, a bunch of cocoa-nut blossoms is hung, to charm away evil spirits.

This palm is assiduously cultivated in Ceylon, in *topes*, or gardens; and it was long believed that the rude native system of culture was the best; but experience has shown the fallacy of this opinion. Hence, the Cingalese continue to find the manual labour, but the Englishman provides skill and implements.

There is a good road to within a couple of miles of the plantation I am about to describe; so that the visitor has little difficulty in performing this much of the journey. The remaining two miles lies through a sandy tract of very flat and rather uninteresting country. Here and there, amidst a maze of paddy fields, areca-nut *topes*, and patches of low thorny jungle, are dotted little white-walled huts. They are much cleaner than any such near the towns of Ceylon; attached to each is a small slip of ground, rudely fenced, and half-cultivated, with a few sweet potatoes, some chillies, and a little tobacco and fine grain. It was midday when I started, on foot, to this estate. The sun was blazing above in unclouded glory. Under the shade of a bread-fruit tree the owner of the first hut I got to, was dozing and chewing betel-nut, evidently tasting, in anticipation, the bliss of Buddha's paradise. The wife was pounding up something for curry; the children were by her side—the boys smoking tiny cheroots, the girls twisting mats. It was fortunate for me that the sandy path was overshadowed by jungle-trees, or my progress would have been impossible. Not a breath of air was stirring amidst that dense mass of vegetation; not a twig or a leaf could be persuaded to move; the long paddy (young rice) stalks glittered and sparkled in their watery resting-places, as though they were made of the purest burnished silver. The buffaloes had taken to their noon-day watering-places. The birds were evidently done up, and were nowhere to be seen; the beetles crawled feebly over the cooler shrubs, but they could not get up a single hum, or a buzz amongst them all; even the busy little ants perspired, and dropped their lilliputian loads. Well, the dry ditch and thorny fence that form the boundary and protection of the estate were at last reached, and the little gate and watch-hut were passed. The watcher, or *asacoryn*, was a Malay, mountebanked and fierce; for the natives of the country can rarely be depended on as protectors of property against their fellow-villagers. A narrow belt of jungle,

trees, and shrubs had been left quite round the plantation, to assist in keeping out cattle and wild animals, which are frequently very destructive to a young cocoa-nut estate, in spite of armed watchers, ditches, and fences. Passing through this belt, I found on entering an entirely new scene: before and around me waved, gracefully, the long shining leaves of three hundred acres of cocoa-nut palms, each acre containing, on an average, eighty trees. It was, indeed, a beautiful and interesting sight. Two-thirds of these trees were yielding ample crops, though only in their ninth year; in two years more they will, generally, be in full bearing. Unlike the rudely planted native garden, this estate had been most carefully laid down; the young plants had all been placed out at regular intervals and in perfectly straight lines, so that, looking over the estate in either direction, the long avenues presented one unbroken figure, at once pleasing to the eye, and easy of access. But, if these interminable masses of palms appeared a lovely picture, when regarded at some little distance, how much was their beauty heightened on a nearer inspection! Walking close under the shadow of their long and ribbon-like leaves, I could see how thickly they were studded with golden-green fruit, in every stage of growth. The sight was absolutely marvellous: were such trees, so laden, painted by an artist, his production would, in all probability, be pronounced unnatural. They appeared more like some fairy creations, got up for my especial amusement; resembling nearly those gorgeous trees which, in my youth, I delighted to read about in the "Arabian Nights," growing in subterranean gardens, and yielding precious stones. They hung in grape-like clusters around the crest of the tree; the large golden ripe nuts below, smaller and greener fruit just above them, followed by scores of others in all stages, from the blossom-seed to the half-grown; it was impossible to catch a glimpse of the stem, so thickly did the fruit hang on all sides. I made an attempt to count them:—"thirty—fifty—eighty—one hundred"—I could go no further; those little fellows near the top, peeping up like so many tiny dolls' heads, defied my most careful numerations; but, I feel confident, there must have been quite two hundred nuts on that one palm. Above the clusters of rich fruit were two feather-like flowers, white as snow, and smooth and glossy as polished marble; they had just burst from their sheaths; and a more delicate, lovely picture could scarcely be imagined.

A cocoa-nut tree, in a native Cingalese *tope*, will sometimes yield fifty nuts in twelve months; but the average of them seldom give more than twenty-five in the year. It is, therefore, very evident that European skill may be employed beneficially, on this cultivation, as well as on any other.

I was at first rather startled at perceiving a tall, half-naked Cingalese away in the distance, with a gun at least half as long again as himself, long black hair over his shoulders, and bunches of something hanging at his girdle. He was watching some game amongst the trees; at last he fired, ran, picked up something, and stuck it in his girdle. What could it be? Parrot, pigeon, or jungle-fowl? It was only a poor little squirrel; and there were at least two scores of these pretty creatures hanging at the waist of the mighty hunter! Fortunately I could speak the native language, and was not long in learning the cause of this slaughter. It appeared that in addition to their pretty bushy tails, glossy coats, and playful gambols, the squirrels have very sharp and active teeth, and an uncommon relish for the sweet tender buds of the cocoa-nut flower, which they nip off and destroy by scores, and of course lessen by so much the future crop of fruit. Handsful of the buds, lay half-eaten around each tree, and I no longer felt astonished at this species of sporting.

The ground had evidently been well cleared from jungle plants, not one of which was to be seen in all this tract: a stout and healthy-looking grass was springing up along the avenues; whilst, at certain intervals, patches of Indian corn, sweet potatoes, guinea-grass, and other products—intended for cattle-fodder during dry weather when the wild grasses fail—gave tints of varied luxuriance to the scene.

The ground at this part of the estate sloped a little, and I came to an open space, somewhat marshy in appearance. A number of cattle, young and old, were browsing about on the long grass, or sipping a draught from the clear stream which ran through the low ground. They were confined within a rude but stout fence, and on one side was a range of low sheds for their shelter. The cattle appeared in good condition; they were purchased, when very young, from the drovers who bring them in hundreds from the Malabar Coast; and many were then fit for the cart, the carriage, or the knife. At the end was a manure shed, and outside stood a keeper's hut, with a store attached, in which were piled up dried guinea-grass, maize, &c.

The manure-pit was deep and large, and in it lay the true secret of the magical productiveness of the trees I had just seen. Good seed planted in light free soil, well cleared and drained, will produce a fine healthy tree in a few years; and, if to this be added occasional supplies of manure and a few waterings during the dry season, an abundant yield of fruit will most assuredly reward the toil and outlay of the cocoa-nut cultivator.

Leaving this spot, I strode through the next field, to see what a number of little boys were so busy about. There were a dozen black upsticks, running about from tree to tree; sometimes they stopped, clambered up, and

appeared to have very particular business to transact at the stems of the leaves; but oftener they passed on contented with a mere glance upwards at the fruit. They had a sharp-pointed instrument in the hand: whilst at the wrist of each was hung a cocoa-nut shell. I paused to see what one of these children was searching for, half hid as the little fellow was amongst the gigantic leaves. Intently scrutinising his motions, I observed that he forced the little sharp instrument into the very body of the tree: down it went to the inmost core of the giant stem: all his strength was employed; he strained and struggled amongst the huge leaves, as though he were engaged in deadly strife with some terrible boa or chutah. At last he secured his antagonist, and descended with something alive, small and black, and impaled on the barbed point of his little weapon. A few questions elicited the whole secret. The cocoa-nut tree, it seems, has many enemies besides squirrels: the elephant, the wild hog, the rat, the white ant, the porcupine, the monkey, and a large white worm, either attack it when young, or rob it of its fruit when mature. But the most numerous and persevering enemy which it has to encounter from the age of three years until long after it produces fruit, is the *cooroominga*, or cocoa-nut beetle; a black hard-coated creature, with beautiful wings, and a most powerful little tusk, which it employs with fatal activity to open a way into the trunks of the palms. Its labours commence in the evening, and by early morning it will be buried half-a-dozen inches deep, in the very centre of the tree; where, if not detected, and removed, it feeds on the soft pithy fibres, deposits its eggs, and does not depart in less than two or three days. These holes are always made in the softest and sweetest part of the tree, near the crown; and, in young plants, they prove seriously hurtful; checking the growth, and impairing the health of the future tree. In a morning's walk an active lad will frequently secure as many as a score of these *cooroomingas*; which after being killed, are strung up on filipitian gibbets about the estate, as a warning to their live friends.

Farther on I perceived, gathered in anxious consultation, three of the lads around a tree that was loaded with fruit; they looked up at the leaves; then at the root; then at the trunk. At last, one little fellow started off, swift-footed as a hare, and was soon out of sight. The others began scraping the earth from the root as fast as possible; and all the information they would impart was "*leydie gaka*," or sick tree; so that there was nothing for it but to imagine that the little messenger had been despatched for the doctor. He soon came back, not with the medicine-man, but a *namootie*, or Dutch hoe, and a *cattie*, or sharp bill-hook. And then the busy work went on again. In little more time than I take to tell the story, the soil was removed from

about the root, a hole was discovered in the trunk, and its course upwards ascertained by means of a cane probe. With this cane, one of the boys commenced cutting an opening midway in the trunk of the tree. On looking up, I perceived that this patient gave unmistakable symptoms of ill-health. The long leaves were drooping at the end, and tinged with a sickly yellow; many of the nuts had fallen off, and others had evidently half a mind to follow the example. The flower, which had just burst above, hung down its sickly head weeping away the germs of what had also been nuts. The hole was now completely large enough for the smallest boy to force his hand in; and it soon brought away a basket full of pith and powdered wood from the body of the tree. There, amidst this ruin, was the enemy that had caused so much mischief and labour. It was an unsightly worm, about four inches in length, and as thick as one's small finger, having a dull white body and black head. I then began to wonder what had next to be done, whether the tree would die after all this hacking and maiming. Would the medicine-man now be sent for? No. The interior of the wounded tree, as well as the aperture, was thoroughly freed from dirt and decomposed fibre—which might have aided in hatching any eggs left by the worm—and, finally, the root was covered up, and the opening and inside of the palm tightly filled with clay. I was assured that not more than one of ten trees, thus treated, ever fails to recover its health.

The nocturnal attacks of elephants are checked by means of lighted fires, and an occasional shot or two during the night. Wild hogs and porcupines are caught in traps, and hunted by dogs. The monkeys are shot down like the squirrels, and the white ants are poisoned. In spite of all these measures, however, an estate often suffers very severely, and its productiveness is much interfered with, by these many depredators.

The soil over which I had as yet passed had been of one uniform description—a light sandy earth, containing a little vegetable matter, and but a little. Afterwards, I arrived at a tract of planted land, quite different in its nature and mode of cultivation. It was of a far stiffer character, deeper in colour, and more weedy. This portion of the estate was, in former days a swamp, in which the porcupine, the wild-hog, and the jackal, delighted to dwell, sheltered from the encroachment of man by a dense mass of low jungle, thorns, and reeds. To drive away these destructive creatures from the vicinity of the young palms, the jungle was fired during the dry weather. It was then perceived that the soil of this morass, although wet and rank from its position, was of a most luxuriant character. A few deep drains were opened through the centre, cross drains were cut, and a stream of pure water was sent to the purifying action of the atmosphere and rain, the

whole of it was planted, and it now gives full promise of being, one day, the finest field in the plantation.

From this low ground I strolled through some long avenues of trees on the right; their long leaves protected me from the heat of the afternoon sun, which was still considerable. The trees on this side were evidently older; they had a greater number of ripe fruit; and further away in the distance might be seen a multitude of men and boys busily engaged in bearing away the huge nuts in pairs, to a path or rude cart track, where a *cangany*, or native overseer, was occupied in counting them as they were tossed into the bullock cart. The expertness of the boys in climbing these smooth, broken, and branchless trees, by the aid of a small band formed by twisting a portion of a coco-nut leaf, was truly astonishing. In a moment their small feet grasped the trunk, aided by the twisted leaf, whilst their hands were employed above; they glided upwards, and with a quick eye detected the riper fruit which, rapidly twisted from their stalks, were flung to the ground. Their companions below were busy in removing the nuts; which for young children is no easy task; the nuts frequently weighing fifteen or twenty pounds each nut, with the husk or outer skin on them. The natives have a simple but ingenious method of tying them together in pairs, by which means the boys can carry two of them with ease, when otherwise one would be a task of difficulty. The nuts have little, if any, stalk: the practice, therefore, is to slit up a portion of the husk, (which is the coarse fibre in its natural state), pull out a sufficient length without breaking it, and thus tie two together; in this way the little unbride scampers along with the nuts slung across their shoulders, scarcely feeling the weight.

I followed the loaded carts. They were halted at a large enclosure, inside of which were huge pens formed of jungle stalks, about ten feet in height; into these the nuts were stored and re-counted; a certain number only being kept in each, as the pens are all of the same dimensions. Adjoining, was another and still larger space lying lower, with some deep ditches and pits in the midst. Here the outer husk is stripped off, preparatory to breaking the nut itself, in order to obtain the kernel; which has to be dried before the oil can be expressed. Into the pits or ditches the husk is flung, and left in water for ten or fourteen days; when it is removed and beaten out on stones, to free the woody elastic fibre from dirt and useless vegetable matter. This is a most disagreeable operation, for the stench from the half-putrid husk is very strong. The fibre, after being well dried on the sandy ground, undergoes a rude assortment into three qualities, in reference chiefly to colour, and is then delivered over to the *pond-makers*, who work it up into *yam*, *ropes*, or *junk*, as required. Freed from their outer covering,

the nuts are either sold for making curries, in which they form a prominent feature, or they are kept for drying ready for the oil-mill.

Having learned this much, I strolled through the neat small field, and along a patch of guinea-grass, to see what was going on in that direction. The neat-looking building adjoining was the superintendent's bungalow; and the long sheds and open spaces in their front and rear were for drying the nuts, into what is termed *copperah*, in which state they are ground up for pressure. It was a busy scene, indeed, and the operations require constant vigilance on the part of the manager: yet all the work is carried on in the rudest and simplest implements. Half-a-dozen stout lads were seated, cross-legged, on the ground, each with a heap of nuts by his side. The rapidity with which they seized these, and with one sharp blow of a heavy knife, split them precisely in half, and flung them away into other heaps, was remarkable. It seemed to be done with scarcely an effort; yet on handling the broken nut, one cannot help being struck with its thickness and strength. Smaller boys were busily employed in removing these heaps of split fruit to the large open spaces; where others, assisted by a few women, were occupied in placing them in rows close together with the open part upwards, so that the kernels may be fully exposed to the direct rays of the sun. In this way they remain for two days, when the fruit, partly dried, shrinks from the shell, and is removed. Two more days' exposure to the sun in fine weather will generally complete the drying process. The kernels are then called *copperah*, and are brittle and unctuous in the hand.

To convert this material into oil, the natives employ a very primitive mill, worked by bullocks, and called a *cheekoo*; this process is very slow, and the oil never clean. Europeans have, however, obviated these objections, and manufacture the cocoa-nut oil by means of granite crushers and hydraulic presses, worked by steam-power. This is only done in Colombo, to which place, of course, the *copperah* has to be conveyed. The refuse of the oil-presses—the dry cake or *poenac*—is very useful as food for cattle and poultry, and not less so as a manure for the palm-trees, when moistened, and applied in a partially decomposed state.

Not a particle of this valuable tree is lost. The fresh juice of the blossom which is broken off to allow it to flow freely, is termed, as we have said, toddy; and is drunk, when quite new, as a cool and pleasantly refreshing beverage; when fermented, it is distilled, and yields the less harmless liquor known as arrack.

All these operations are not carried on with ease and regularity. The Cingalese are an idle race; like many better men, their chief pleasure is to perform as little work as pos-

sible. This necessitates a never-ending round of inspection by the European manager; who, mounted on a small pony, paper umbrella in hand, visits every corner of the property at least once in the day, often twice. Neither is it unusual for him to make "a round" during the night. On the whole, therefore, he enjoys no sinecure.

The manufacture of arrack is entirely in the hands of the natives, who employ stills of the rudest construction; the permission to retail arrack and toddy is annually farmed out by the Ceylon Government; the renters are natives, who frequently pay as much as sixty thousand pounds annually for the monopoly; about one-eighth part of the entire revenue of the island.

If we consider the very light and poor nature of the soil in which cocoa-nut cultivation is carried on, it cannot but be matter for wonder that those trees attain so large a size, and yield such bulky and continuous crops during so many years. Not unfrequently they reach a height of sixty feet, and yield fully fifty nuts each tree per annum, gathered in alternate months, and continue in bearing for seventy, and sometimes for ninety years. A calculation, based on these data, shows that one acre of yellow sandy soil will produce, without the aid of manure, a weight of fourteen and a quarter tons in green fruit, and seven tons of leaves annually. To yield this once or twice may not seem deserving of much wonder; but that this production should continue for half a century, without any renovation of soil, and only accidental supplies of manure, cannot but be considered a remarkable instance of the unaided fertilising powers of nature.

THE SMITHFIELD BULL TO HIS COUSIN OF NINEVEH.

COUSIN, the distance of the seas
Destroys no good beast's sympathies;
And whether you be there, or here,
Or on your travels, ancient seer,
Thy veins of royal blood are full—
I feel you are a brother Bull.
Therefore, I now take up my hoof
To write these lines by way of proof;
And if gall-bladders for my ink
I use, it is to make men think.

I reverence your patriarch age,
Your knowledge of the historic page;
And when I learn the mutilations
You've suffered—less from time than nations—
It makes my horns turn cold and pale,
While wrath uplifts my stiffening tail.
Not, do I think, you will refuse
This tribute from the Bovian Muse,
When I confide to your safe ear,
A portion of my sufferings here;
But rather, that your mighty ire
Would spurn the rocks and sands to fire,
And roast your heart, stuff'd high with pride
Until it burst your marble side.

I cannot write in hieroglyphics;
But now, a bright eye o'er the cliff fix,
To watch your coming to our shores,
Saluting you with bellowing roars;
Sounds that comprise the highest greeting,
And tell of wrongs far worse than eating.
To die is natural—to be eaten,
Earth's law; but to be basely benton—
Forming no part of Nature's rules—
Shows that some men are brutes and fools.

Now, Royal Cousin, would'st thou know
Why thus my nostrils sniff and blow;
'Tis wrath, and scorn, and smell of blood—
Smithfield blaspheming in its mud—
Drovers, with tuck'd-up sleeves, and faces
Like devils, who wager at grimaces:
The hail of blows—the torches' glare;
The rushing madness, foulness, flare;
While civic magnates sit and dine
On beef—*our* beef! and o'er their wine,
Declare this murderous market-place
An honour to the human race.

Some sons of Adam—worthy men,—
Have sought to purify this den;
Select a spot beyond the walls,
Where every Bull that bows and falls,
May, with becoming dignity,
Adjust his mantle ere he die.
Well, if 'twere so; and since by fate
And metaphysical aid, his date
Is ever shorten'd; in his end
Remember this—he dies a *friend*.

But men who eat us, boiled and roast,
Too oft forget their Bovian host;
Nay more, forget their fellow-creatures
In praising Smithfield's murderous features,
With all the vices, fevers, groans,
That breed a curse beneath its stones.
Wherefore, before 'tis swept away,
On liveried marrow-bones they pray
That the Most Gracious Queen alive
Would only take a morning drive,
And be convinced at once—small, sec,
The market's rare salubrity;
And grant her sanction to a scheme
Worthy of wisdom's brightest beam,
If any change be on the cards—
To move it just a hundred yards.

But, Royal Cousin, your high mission,
To Fifty One's Great Exhibition,
Is not to show your ancient learning,
But into practice knowledge turning;
And therefore you will see us righted,
Although the "City" be benighted.
I, full of hope, to this great end,
A Cattle-market Model send—
Projected by one Thomas Dunhill—
Where pumps for ever may the tun fill;
Where spaces, and allotments, large,
Shall sink with shame the City barge;
Where screens shall rise up, broad and high,
For safety, care, and decency;
With houses, board-rooms, office, hall—
For governors, sellers, buyers—all;
No longer London's hideous fair,
But built in suburbs, and fresh air.

INDIAN RAILROADS AND BRITISH COMMERCE.

NEARLY two hundred and fifty years have elapsed since a small band of English merchant adventurers went out, urged by a spirit of enterprise almost heroic in those days of dark and difficult navigation, and established themselves under the protection of native princes, at Surat, then one of the principal, now a decayed town and port on the eastern coast of the Indian Peninsula. A few years later Bombay, the germ of our Indian empire, fell to us as part of the marriage portion which Catherine of Braganza brought to our own Charles the Second.

In those days the Portuguese, the Dutch, and the French, had triumphantly established many and rich colonies and dependencies, in seas where the British flag was scarcely known, unless when borne by pirates and buccaniers. Toward the close of the seventeenth century, the humble merchant who then represented the struggling fortunes of the East India Company in Bengal, having negotiated the purchase of a small tract of land for a factory on the banks of the Ganges, selected the site for the future Calcutta, the city of Palaces, round the spot where he was accustomed to smoke his hookah under the shade of a wide-spreading tree.

The rising wealth, power, and influence, of the British Merchant Company excited the suspicions of their neighbours; the native Indian princes, urged by the jealousy and the intrigues of the French and Portuguese, who had preceded us in forming settlements, commenced a series of wars. More than once the fate of our future empire hung upon a thread; the fate of the officers and ladies thrust into the Black Hole of Calcutta, when that city was besieged and taken by Surajah Dowlah, was a favourite tale of horror among our grandmothers.

It happened, however, that among the clerks sent out to keep the accounts of the Company, at seventy pounds a year, was one Robert Clive, the unruly son of a poor Shropshire clergyman. He, finding himself abandoned in a besieged fort, by cowardly incompetent officers, threw down the pen, took up the sword, and commenced a career of conquest, second only in marvellous success to that of Napoleon, during which he laid, broad and deep, the foundations of the empire which now extends from Cape Comorin to the boundaries of the Chinese and Burmese empires.

It was in 1757, at the battle of Plassey, Clive—commanding a little army of English and seapoys, first disciplined by himself—defeated Surajah Dowlah at the head of seventy thousand native troops, and conquered the whole of Bengal at a blow. What Clive commenced, Warren Hastings, and a subsequent succession of men eminent for military and administrative skill, completed. Commercial

and Elphinstone, Wellesley, Wellington, Malcolm and Munro, are a few among a host of great men bred in our Indian school. Thus, from the day of the battle of Plassey, in spite of foreign intrigue and native jealousy, internal insurrections and external wars, often by means most unscrupulous and unjustifiable, oftener by the irresistible force of circumstances, almost always against the will of the Merchant Directory sitting at home, anxious for peace and profit, British power, in constantly widening circles, has extended from the more ancient settlements of Bombay, Calcutta, and Madras, until it has enclosed the whole Indian Peninsula, with the exception of a few kingdoms and principalities, nominally independent, but, in reality, existing only by sufferance; and certain, at no distant time, to be absorbed in British India.

At this moment less than ten thousand European military and civil officers rule and tax seventy millions of Mahomedans and Hindoos; fifty millions more are surrounded by our dominions, open to our commerce, and ready to submit to our rule, whenever we choose to accept their homage.

India is at peace: no longer removed from us by the uncertain length of a sailing voyage, thanks to the enterprise of Waghorn, the steam-engine of Watt, and the locomotive of George Stephenson, we have recovered—shortened to thirty days—the ancient overland route between Europe and Hindostan; at no distant date we may expect to see the Isthmus of Suez give way before the pressure of advancing commerce, capital, and science, and to have cargoes forwarded from the Thames, the Mersey, and the Clyde, by the direct route of the Red Sea without transshipment.

In the midst of the feelings of national pride and self-gratulation, which such a retrospect cannot fail to inspire, conscience, or common sense, or both, ask a plain, practical question, which we shall have some difficulty in answering satisfactorily:—Have we done all we could for the welfare of the native population under our charge?—have we used the best means in our power to discover the wealth, develop the resources, and profitably occupy the industry of the inhabitants of these vast and fertile dominions? It is true that the Indian husbandman can now pursue his occupations without fear of seeing his fields laid waste, his children carried into captivity, by the invasion of hordes of Maharrattas or Pindarries, or by accidents of foreign or domestic warfare. Organised robber bands, which, under the dominion of the most powerful Indian princes, levied black mail, have been put down; and even the secret association of Thugs has been unable to resist our intelligence and power. Life and property are secure; and, in spite of occasional mistakes of the Local Government, there is every reason to believe, from the comparison of the taxes levied, and the prices of corn and

of wages, in the reign of the Emperor Akbar, in the sixteenth century, (the Emperor whose wisdom, justice, and charity are to this day the theme of Hindoo and Arab minstrels,) with those obtaining under the British rule, the condition of the Indian peasant has in no case deteriorated, and in many instances improved.

But this is not enough. We still find large populations, in the midst of vast parts of fertile, uncultivated land, naked and all but starving; we find famine decimating the inhabitants of one district, while in another, distant but two or three hundred miles, grain rots in the field for want of a market. We find the consumption of British manufactures, compared with the population open to us, insignificant and scarcely increasing; the supply of those articles of raw material most needed, and for the growth of which the soil, and the climate, and the habits of the people are well fitted—such as wheat, sugar, hemp, and cotton—so far stationary, and with respect to cotton actually receding. To amend this deplorable state of affairs is not less our interest than our duty.

The great mass of the Indian population are poor; but intelligent, willing to labour, and anxious to purchase British manufactures, if they had the means. Our only hope of extending our exports to India rests upon being able to increase our purchase of their agricultural produce.

When the once great Indian merchant house of Palmer and Co. entered into commercial operations among the Goonds, wild tribes on the banks of the Pranheeta, a branch of the Godavery (in longitude eighty degrees East), their speculations threw a circulation of about ten thousand pounds a year into the country. "The effect upon the condition of the people was seen within the first year, and continued to improve; those that had scarcely a covering for their nakedness were hardly to be recognised in their gay attire. Chintz, handkerchiefs, penknives, and scissors, found a ready sale; the men led the way, but the women soon acquired a taste for dress."

Changes for the purposes of improving the Government and lightening the taxation of the native inhabitants of British India must be slow in their operation and uncertain in their effect. We, in England, in discussing such questions, reason in the dark; for we are not dealing with the destinies of an Anglo-Saxon race, but with one which, as Sir Thomas Munro observed, had scarcely changed in character since India was first visited by Vasco de Gama. But, if we can afford them profitable employment, in cultivating cotton, hemp, sugar, and wheat, we increase the comforts of the peasantry, and the consumption of our manufactures, and add to the gross amount, while diminishing the individual pressure of taxation. This, then, would be a certain good; and our zeal to effect it cannot fail to be quickened when we remember the

urgent necessity, in this country, of finding a supply of cotton which shall render us independent of the blights and frosts of America.

India is the only country in a position, from soil, climate, and population, to supply the quantity and quality we need, within any reasonable period. It is shown, very clearly, in a work laboriously and intelligently compiled by Mr. John Chapman, late Manager of the Great Indian Peninsular Railroad,* that we have it in our power to increase, almost indefinitely, the sale of our manufactures in India, by the simple process of affording a market for the produce of the soil. This market can only be provided by increasing the road accommodation between the interior and the coast.

At present, the consumption of British manufactures in the whole of India amounts to about elevenpence farthing per head. The inhabitants of the valley of the Ganges, who have advantage of water communication, consume about one shilling and three half-pence per head, while, in the Bombay and Madras Presidencies, it varies from sevenpence, in the one case, to sixpence per head in the other. The double consumption in the district in which the inhabitants have cheaper means of sending their produce to market, and obtaining return cargoes, speaks volumes.

On the present occasion, we shall confine our attention to the Bombay district, because that is, as Mr. Chapman very clearly shows, the port from which we ought to derive an ample supply of the cotton we so urgently need; that we do not receive it, is owing to the utter absence of roads throughout the district.

It appears that at a distance of about one hundred and forty miles from Bombay, separated by a lofty range of mountains or Ghauts, there lies a country about four hundred and fifty miles from north to south, with an average breadth of three hundred miles from west to east, the gross surface being, therefore, one hundred and thirty-five thousand square miles; deducting half as occupied by mountains, rivers, barren soil, &c., the other half will contain forty-three millions two hundred thousand acres applicable to the growth of cotton fit for English use; for it is very clearly made out that while scarcely any cotton fit for our manufacturers can be grown in Bengal, from the unsuitability of the climate, and but a limited quantity in the Madras Presidency and other districts—in the area above described, the cotton grown is fit for seventy-five per cent. of our consumption.

That consumption amounts to four hundred and eighty million pounds per annum; seventy-five per cent. would be three hundred and sixty million pounds; now, if one fourth of forty-three million two hundred thousand acres were cropped every year, and produced the average weight of a hundred pounds per acre, the whole crop would be one thousand

and eighty million pounds weight per annum, or three times as much as we could take at the existing rate of consumption by our manufacturers.

We have not space to enter into the details necessary for showing (as Mr. Chapman does most satisfactorily) the existence of this large cotton-growing area, and its capability of growing cotton suited for the British market, because it is necessary to explain how it is that, in the face of a constant demand in the British market for the staple, which so far as soil, climate, and ample supply of skilled husbandmen at moderate wages are concerned, can be raised in unlimited quantities, the export of cotton from Bombay to Liverpool has actually fallen off within the last ten years.

The cotton in question is all brought down to Bombay on the backs of bullocks: for want of roads no other mode of conveyance is practicable. The expense, the loss of time, the damage by accidents of weather, and loss in bad packing, are enormous under the most favourable circumstances; but in some seasons, no sufficient number of bullocks are to be had; those employed are decimated by disease and drought. The merchants frequently find themselves compelled either to break their contracts, or to see their profits consumed in the cost of carriage. If the discouraged merchant discontinues for a year his purchases, the natives in the interior find themselves saddled with crops of cotton which they cannot sell at any price: they cannot even consume it themselves, or feed cattle on it, as if it were grain. Hence, they abandon the growth of a crop which is not sure of a market; and, when a failure of our usual supply from America compels our manufacturers to turn to India, they find that, even for money, the staple is not to be had. Thus, in 1836—twelve years after the pacification of the intervening country had established the trade in cotton between the interior district of Berar and Bombay—the import reached thirty-one millions of pounds. Nine years later, in 1845, it had fallen to twenty-three millions of pounds.

This diminution in supply has not been caused by diminution in the price paid to the cultivator; which has been, for the last sixty years, between one penny farthing and two-pence halfpenny per pound; according to the quality, but simply from the want of certain steady means of conveyance which prevented the purchaser—even if a large quantity of cotton were grown and stacked—from conveying it to the coast. It has been proved that, in 1843, a gentleman, who had contracted to deliver five thousand bullock loads of cotton at Bombay, was prevented from performing his contract by want of cattle; and again, that, in 1846, vessels lay in the harbour waiting in vain, on heavy expenses, for cotton purchased in the interior, which the drought prevented from being sent forward, because it was necessary to limit the number of

* "The Commerce and Cotton of India," by John Chapman.

bullocks by the quantity of water available for their consumption on the road.

We, in England, can scarcely conceive such a state of internal commerce, unassisted, as we have so long been, to, excellent, roads, canals, and railroads. Let us imagine all the railroads, all the canals, and all the turnpike-roads, with the exception of about twenty-miles out of London, destroyed; that between London and the present manufacturing districts, lay a stupendous range of mountains, only to be passed at all at one or two narrow defiles; add a tropical climate, burning droughts at one period of the year, at the other deluges of rain, turning the dry watercourses of the hot season into impassable torrents; and we have a country somewhat resembling that between the port of Bombay and the cotton-growing district. If, then, over such a country, all produce for shipment at the port of London had to be conveyed on the backs of animals, horses or bullocks, it is quite evident that the present enormous traffic would dwindle away to such a minimum, that in a very few years the records of the former enormous influx of goods would become quite incredible. Towns and villages, now carrying on a brisk exchange with London, would be compelled to resign foreign luxuries, to consume their own produce, and be as much as possible self-supporting. To take a simple case, it is quite certain that scarcely any number of horses could be arranged so as to carry the number of passengers who are now daily carried through England by railway, because with animals, as you increase the number, you increase the difficulty of feeding them.

At present it is calculated, by Mr. Chapman, that one million eight hundred thousand bullocks traverse the few routes practicable across the Ghauts, in carrying the traffic between the interior and Bombay, of which one hundred and eighty thousand convey cotton. These animals travel in single file, at the rate of three miles an hour, over tracks worn by the feet of their predecessors, depending for food and water on what can be picked up on the way, sometimes delayed by torrents swelled with the melting of the mountain snow, sometimes struggling through morasses, sometimes driven mad by heat and drought, sometimes struck down in thousands by an epidemic, and left to rot on the roadside, polluting the air and poisoning the water, to the grievous damage of the droves that follow in their track.

Under such opposing circumstances, it is not extraordinary that our commerce with India makes slow progress. Disforms of laws and of rules, improvements of docks and piers on the coast, will do little towards establishing a steady commercial barter of raw material for manufactured goods between England and India, until we have tapped the interior where the great agricultural districts lie.

The Indian village system, which presents

the most ancient municipal system in the world, is especially calculated to encourage isolation, and foster self-supporting communities, after the fashion, although not with the results, communistic writers would desire to see established in Europe. Each village is a sort of republic, ruled by the *Patel* or headman, the *Chougula* his assistant, and the *Koolturnee*, or accountant, with some others. Besides these, the village maintains, as public officers, a band of artisans; these, where the village can afford it, number twenty-four. The carpenter stands at the head, next comes the blacksmith, the goldsmith and assayer of coins, the shoemaker, the potter, the barber, the leather ropemaker, the butcher, the washerman, astrologer, bard, dancing-girl, water-carrier, &c. The remuneration, beside a piece of land, is by a stipend in grain from each cultivator, in return for which, customary services are performed. The carpenter and blacksmith are required to repair and construct implements, wells, and other matters connected with cultivation. This system, as is well expressed by the author, from whom we have abridged these details—*stereotyped the Indus of the day*—to lead the Indian people, bound hand and foot, by custom and precedent, on the path of material improvement. Precept is insufficient, they must be taught by example. They are more ready to copy what they see to be useful, than is usually imagined, but books will not teach them. Let them see how well an improved plough works, and they may be led to try it, and to imitate it.

The grand instrument for effecting a peaceful, profitable, social, commercial and agricultural revolution in India, will be the railroad—that divining rod of the nineteenth century—which not only discovers treasures, but creates them.

In this country we have seen the railroad stimulating conveyance and interchange, opening mines and creating ports, but the effects were not startling, because we already lived in the atmosphere of commercial bustle created by the most perfect system of turnpike roads and canals in the world. In the United States of America, the railroad has performed an additional task: piercing primeval forests, and passing over deserts and morasses, to reach fertile land for agriculture, and favourable sites for ports, carrying with it the population to till the soil, and build the city created by the power of steam. It is as a coloniser that the railroad has played the greatest part in America; receiving and distributing the overflowing emigrant millions of Europe. In India there is, as in America, an ample supply of fertile waste land; there is an even greater degree of isolation than existed in the United States, between the sea-ports and the interior, before the introduction of the steam-horn, and colonists are not needed to execute the works or cultivate the land; because millions of the

native inhabitants would only be too happy to find constant work for little wages.

If these railroads could be constructed between the cotton-producing districts in the interior and the port of Bombay, the present minimum cost of conveying cotton by bullocks, (with all the risk and uncertainty,) of fourpence per ton per mile, would be exchanged for a fixed charge of twopence three farthings per mile, with security, certainty, and capability of delivering any quantity. As the Hindoo peasantry can afford to sell cotton of a quality equal to that which forms seventy-five per cent. of the English consumption, at from one penny farthing, to one penny three farthings per pound; as land and labour are both plentiful in that district; a large increase of cotton cultivation would be certain, thousands would be able to live well and clothe well, who are now half-naked and half-starved. The chief tax in India is the land-tax, the rent, in fact, paid to the Government. Wild land, cultivated, would become subject to tax, and thus, without an increase in the expenses of Government, Indian revenues would increase. But, not only revenues, imports would increase, too; out of every ninepence of British manufactures consumed in India, fourpence consists of cotton goods. Thus then we arrive by railroad at a perpetual circle of prosperity. Commencing with a large growth of cotton, which affords the British manufacturer a constant ample supply of the staple on which the livelihood of some million and a half of our population depends, comes employment for shipping; while, buying what we so much need, we create in the cotton cultivators new customers for the goods, of which they supply the raw materials, as well as for the mixed goods of Yorkshire, and the hardwares of Sheffield and Birmingham. But it is not only cotton cultivators that will benefit from the construction of railroads in India; sugar, rice, indigo and grain, would all find employment for labour and a market; and salt, so much needed by the vegetarian Hindoos, would be distributed in the interior, much to the benefit of the Government revenues.

At present, every ten or fifteen years, some district of India is ruined by famine; grain rises to such a price, that, while many die of hunger, those who survive have transferred all their substance to a few rich grain-merchants and money-lenders, and have to begin the world afresh. Yet the same want of roads, that destroys one district in a failing, ruins another by an abundant harvest, for then grain sinks to so low a price, that the wretched cultivators are obliged to fly to the usurers for assistance to pay their land-tax.

During the last famine at Agra, the Government was obliged to employ and feed sixty thousand persons in the city, and thirty-seven thousand in the district; the demand for grain to feed these paupers, in Agra alone, was about thirty tons per diem. The cattle by which the

grain was to be brought, were incapable of travelling, and dying for want of forage. At this fearful period, at Goodwana, a distance of about four hundred miles from Agra, as much of the finest grain was to be bought for two shillings as would have cost, even if of the coarsest kind, sixteen shillings in the latter city. Thus, from the want of other than hack bullock conveyance, a price affording room for cost of carriage, at the rate of from ninepence to tenpence per mile, was insufficient to procure grain to stay the horrors of famine; as, owing to drought, there was no forage on the road to sustain them, the mere feeding of the bullocks consumed half the grain *en route*.

More evidence might be accumulated, but the corn, salt, and cotton cases are alone sufficient to prove the absolute necessity of improving the means of conveyance in India. To do this, the railroad would be at once the cheapest and most effective.

Two railroads are now in progress on opposite sides of the Peninsula—one from a point near Calcutta, for a distance of about one hundred and twenty miles, to certain coal-mines; the other from Bombay, for about thirty-five miles, toward a place called Callien. Both are being constructed under a guarantee of five per cent. from the East India Company. Neither can be considered of much importance in their present dimensions, except as model lines for the instruction of native labourers and engine-drivers; as instruments for the development of the resources of India, they are quite insignificant. That which should be, if we were wise, an extension of the Liverpool and Manchester Railway, a great cotton line, stops short of the Passes of the Ghauts, at a distance of one hundred and twenty miles from the cotton country. This thirty-five miles will cost half a million sterling; to complete the scheme of two hundred miles, would cost about two millions; to unite Bombay with the Bay of Bengal, traversing the principal intervening cities, would cost seven millions. In the work to which we have so often alluded in the course of this article, a mass of evidence seems to prove that what we call the cotton line from Bombay, constructed according to Mr. Robert Stephenson's estimate at fifteen thousand pounds a mile, would pay private speculators a high rate of interest, if the present goods traffic were merely doubled, without taking the passenger traffic into consideration at all. It is to be hoped that private enterprise, which has done such glorious things on land and sea for England, will not again commence sowing accumulations of capital broadcast in Spanish Bonds, South American Mines, and Mississippi Loans, without first investigating the resources of our vast Indian empire, where millions of peaceful, docile, intelligent husbandmen are willing and able to become our customers, if we will only enable them to carry to market the staples of indigo, sugar, and cotton, of

which we stand in as much need as they do of our raiment and hardware.

The East India Company, powerful as a conqueror and arbitrator, like all other governments, is the worst possible at the retail departments of administration. The ancient deeply-rooted superstitions of Suttee, Thuggee, and human sacrifices, it has suppressed in less time than it took to open the East to steamers. It can annex a quarrelsome kingdom in three months; but it takes three years to consider a crane or jetty; six years to think of a common road; and a generation, if let alone, to consent to a railway. Now, Manchester is celebrated for money-making; great in agitation; not unsuccessful in politics, and holds a deep stake in cotton. Let Manchester, which showed London the way to make railroads, unite profits and patriotism, by risking something to open the unknown oases of Central India to British Commerce.

CHIPS.

THE SPADE.

THE winnings of our "Ace of Spades"* have been doubted by several correspondents in the agricultural districts. They deny it to be the trump card John Sillet made out. We shall best answer their doubts by referring them to John Sillet's own work, which is entitled, "A New Practical System of Fork and Spade Husbandry." It is published in London by Simpkin and Marshall. We may, however, meantime observe, that our correspondents betake themselves, in criticising John's estimate of produce for 1847, to the favourite parliamentary refuge of calling that an "exceptional year," which they appear to regard as destroying the whole value of the facts. On referring to honest John's pamphlet, we find that it was indeed an exceptional year to him, but in the reverse sense to that signified by our correspondents. "I must beg my readers to bear in mind," observes he, "that the past year (1847) though very favourable for grained crops, was a very trying one for roots. In consequence my root crops were very much below the average of other years. I lost nearly the whole of my spring crop of cabbage plants of fifteen thousand." The introduction to the last edition of his work is dated 1850, and so far from making any complaints of altered prices or condition, he continues: "I have for these last seven years been enabled to support myself and family in a comfortable and respectable manner." Even the exceptors to his statements do not agree in their own account of prices—one stating from Birmingham (who, by the way, makes the trifling omission from John Sillet's account of £8 for potatoes) states

the price of onions at tenpence per peck, and allows only eightpence per pound for butter; while he reckons sixpence per pound to be the price of pigs. Another from Harwich states butter at tenpence, and allows only fourpence halfpenny for pigs. Even the former admits (adding the omission for potatoes) that thirty-six pounds six shillings and eightpence may be the net proceeds of two acres after supplying the family; and the latter concedes that a return of forty-eight pounds six shillings and fourpence may be practicable—admissions ample for the purpose of proving the general case of which John Sillet is the practical exponent.

Having disposed of the specific objections of our friends (for whose letters we may take this opportunity of saying we feel much obliged; for it is only by temperate and earnest discussion that truth can be elicited and understood), we shall pass on to the generalities of the spade question, saying a word or two in favour of that primitive implement of husbandry.

"In early ages of society," says Sir John Sinclair, the founder of the Board of Agriculture, "when oxen and horses were cheap, when they were fed at little or no expense, when their stables were little better than miserable hovels, when the wages of ploughmen were low, and when labourers were not sufficiently numerous for carrying on extensive cultivation by manual labour, it is not to be wondered at that the invention of the plough should be accounted a valuable discovery. But now horses are dear, their accommodation and food expensive, the implements of husbandry are costly, while labourers are abundant and their wages low. For porous soils, which have been so highly cultivated by the small farmers of Flanders, manual labour is sufficient for the production of abundant crops, and turns up the manure which falls below the depth of the plough."—"Spade husbandry," observes Dr. Yelloly, "is not a system of expense or risk. Less capital is necessary for it than ordinary husbandry, from the smaller number of horses and implements required, while the advantages are speedily exhibited. Its tendency is to diminish the poor-rates, while it raises the amount of the labourer's remuneration, and makes it dependent on steady habits of industry. By turning up or loosening the ground five or six inches deeper than the plough goes, there is an opportunity afforded for the descent and diffusion of the roots, which are often interrupted in their progress by a hard and impervious subsoil; and with regard to wheat, I have observed that the number and length of the roots are much more considerable in forked than in ploughed land: and the continual addition of decomposed matter afforded by a succession of rooty fibres, must effect a great and permanent improvement in its productive powers."—"By the spade," says another authority, "the

ground is better levelled, the seed more evenly covered, and therefore, more early ripened, and is not disturbed by horses' feet; weeds are better extirpated by being effectually buried or pulled up; and for thorough pulverisation, 'what is equal to a spade with the back of a spade?'"

Experience, however, teaches better than theory; and we learn, from various agricultural reports, and from the parliamentary evidence on the Allotment System, enough to show the value of spade husbandry, and its superiority over the plough, for, of course, small holdings.

Mr. Falla, of Gateshead, obtained, by the plough, thirty-eight bushels of wheat per acre; by the spade, sixty-eight bushels and a half. At Sherborne, in Warwickshire, Frederick Harris, a farm labourer, produced, by the spade, sixteen bushels and a half of wheat, in 1834, on one quarter of an acre, being at the rate of sixty-six bushels per acre. Mr. Gedney, of Redenhall, near Harleston, holder of three hundred acres, beginning with eighteen acres, increased his spade cultivation to fifty acres, encouraged by the luxuriant crops of all kinds of which it is the result; at a cost, for thorough digging, twelve inches deep, and pulverising the subsoil, and ridging it, of only two pounds per acre."

These authorities show that John Silleys are by no means agricultural phenomena. Sir Henry Vavasour instances a cottier tenant of his who rented three acres of land; his stock consisted of two cows and two pigs; he cultivated his land with the assistance of his wife and daughter, twelve years old, at their over hours. They subsisted on their daily wages at other labour; paid their rent by the sale of their butter only; and were in the habit of saving thirty pounds a year out of the produce of the sale of their crops. Mr. Edward, of Melbourne Farm, had a tenant, who, at his over hours, aided by his family, cultivated one acre and a quarter, including the site of his cottage and ippas. The land was at first so poor that it was not considered worth five shillings an acre rent; in a few years, however, care and industry had improved it so much that it yielded a crop worth ten pounds seventeen shillings. This poor man, before he had any land, had the greatest difficulty in maintaining his wife and three children. His family now increased to seven children, and even his health became indifferent; yet with his acre and a quarter, of originally the poorest land, a cow, and a pig—and a spade—he maintained and brought up his increased family in comfort, without requiring parish relief.

The evidence of Mr. John Way of Hasketon, Suffolk, introduces a female farmer—a vigorous spade's woman—"In 1798, a tenant of mine died, leaving a widow and fourteen children, the eldest a girl under thirteen. He had held under me fourteen acres of pasture land at thirteen pounds a year, and had kept two

cows, which, with a very little furniture and clothing, was all the property. The directors of the house of industry immediately agreed to take her seven youngest children into the house. She said she would rather die than working to maintain them; and that if I, her landlord, would continue her in the farm, as she called it, she would undertake to maintain and bring up all her fourteen children without any parochial assistance. She persisted in her resolution; and being a strong woman, about forty-five years old, I told her she should continue tenant, and hold it the first year rent-free. At the same time, though without her knowledge, I directed my receiver not to call upon her at all for her rent, conceiving that it would be a great thing if she could support so large a family, even with that indulgence." Mr. John Way was as wise as good; fifteen of a family, perennially in the workhouse, at three shillings a head, per week, is one hundred and seventeen pounds per annum, and your share would probably come to something over the rent. "The result, however, was, that with the benefit of her two cows, and of the land, she exerted herself so as to bring up all her children, twelve of whom she placed out to service, continuing to pay her rent regularly of her own accord. She carried part of the milk of her two cows, together with the cream and butter, every day to sell at Woodbridge, two miles off, and with her skin and butter-milk, &c., supported her family. The eldest girls took care of the rest; and, by degrees, as they grew up, the children went into the service of the neighbouring farmers."

The moral and social elevation of the poor, to be accomplished by the spade when employed on allotments, has resulted in every instance in which it has been diligently and industriously tried. Mr. Blacker, the Irish agent for the Earl of Gosford, a strong advocate for the spade and for small holdings, draws the following graphic picture:—"I have gone," he says, "to see a poor man, the tenant of less than four acres of land, whose name and residence I can give, if required, who was threatened with an ejectment, being, as well as I recollect, two and a half years in arrears. I found him sitting with his feet in the ashes of a half-extinguished fire, his wife and five children nearly naked; want and misery surrounding him on every side—his house and farm neglected—the fear of expulsion, preying upon his mind and spirits, having destroyed his health, and there he was awaiting the beggary and starvation impending over himself and family, in a kind of listless insensibility—in short, the whole scene was one of actual despair, and the man was evidently in such a state, that he was incapable of any exertion whatever. As I explained to him the plan I had in view for his benefit, it was easy to see the feelings with which he was agitated; with tears in his eyes he promised to do everything I required, and I left

him to send the agriculturist to point out to him what was first to be set about. He faithfully made good his engagement, and did everything as he was directed; and when turnips were ripe, I lent him, out of the sum placed at my disposal for that purpose, some money to buy a cow—the family had previously lived on potatoes and salt, and for even this he was in debt. This was his commencement; and in the short space of about eighteen months afterwards, I found his house clean and comfortable looking, and the place about equally so; in fact, I could not put my foot upon a spot that was not either in crop, or in preparation for one; and he himself, with his health restored, actively employed in wheeling up earth in a wheelbarrow from the bottom to the top of a hill in his land, where the soil was shallow, in which his daughter, a fine stout little girl, was helping him, pulling by a rope in front; and the whole was a picture of activity and successful exertion. He has continued to pay up all his arrears; and although his diet and that of his family is of necessity at present confined almost exclusively to potatoes and milk, they are all healthy, happy, and contented. His rent is four pounds eight shillings and threepence, which the butter from his cow will generally pay, leaving him his pig and his crop, and the produce of his loom to himself. And yet this is the man who, upon the same piece of land, and subject to the same rent, was so lately upon the verge of beggary and starvation.

Those of our readers who desire to pursue this subject, not merely to prove a theory, or to defend a grievance from refutation, will find a mass of information gathered from all available sources in the small work entitled "The Mother Country; or, the Spade, the Waster, and the Eldest Son," by Sidney Smith. The authorities there quoted are not amateur philanthropists, or theoretical political economists, but landowners, land stewards, rural clergymen, bishops, farmers, and peasants, who give chapter and verse for all their facts, and narrate facts which not only match, but go beyond, the achievements of our "Ace of Spades."

At this crisis of agricultural transition, with fifteen millions of acres of waste lands in these islands capable of improvement; during, moreover, the operation of the Encumbered Estates Bill in Ireland, under such a governor as the Earl of Clarendon, the subject cannot be too copiously illustrated, or too generally investigated.

THE SHORT CUT TO CALIFORNIA.

Mon's red tape! It has been an established notion, ever since the days of Cortez, that a communication between the Pacific and Atlantic oceans would be of great benefit to the whole world. Since the discovery of the treasures of California, the necessity for a ship canal (as we pointed out in an early

number of this journal) has increased a hundredfold. The mere engineering of the project has been proved practicable, nay, easy. Cash is ready to leap from the purses of capitalists in both hemispheres; and nothing whatever stands in the way but—red tape.

The construction of the canal, we may remind our readers, is in the hands of the "Atlantic and Pacific Ship Canal Company," of New York. This company, in August, 1849, purchased of the Nicaraguan Government exclusive rights, but is ready to bind itself that the canal, on completion, shall be thrown open, on equal terms, to all the world. The English Government claims, in the name of the King of Mosquito, a part of the river San Juan, claimed by Nicaragua, together with the port of San Juan, at the Atlantic end of the proposed canal. This claim has been a source of chronic irritation. When we last spoke about Central America, there arrived, in the same week, intelligence from that quarter of unusual interest. Of course, according to the local correspondence, "things were fast coming to a crisis." The English were blockading San Salvador to enforce a claim. As retaliation for the blockade, San Salvador and Honduras, under Vasconcelos, President of San Salvador, were preparing to attack Guatemala with an army of seven thousand men, Guatemala being a head quarter for "the English interest." It was thought "that this time Carrera could not escape." A new National Convention was assembling in Chinendega, but "cannot accomplish much, having no faith in America." Mr. Chatfield, the English consul, was recalled, and all were triumphing at that. Lord Palmerston wanted to annex San Juan to Costa Rica. The Ship Canal Company were only playing at surveys; but they were clearing some rapids in the River San Juan, and getting a vessel up into the Lake of Nicaragua. Then, by the last advice before the starting of that mail came positive intelligence, that the engineers of the Canal Company had only seemed to be idle; that under Mr. Oscar W. Child, their chief, who left New York in July last, the corps of engineers had actually completed four surveys; that an entirely new route from Lake Nicaragua to the Pacific had been discovered, and selected as superior even to the route which would have had its terminus at Redlejo; that this route was better, easier, and cheaper than all others; and that the digging would commence directly, if not already begun.

Our eyes and ears were quickened by these tidings, and we looked with interest for the arrival of more special information by another mail. The next mail comes, and tells us that Guatemala was not to be aggressed upon, but was itself a conspirator, with a great deal more of a like incomprehensible nature. Mr. Chatfield, seemingly not recalled at all, had written a long letter about the King of Mosquito's boundary, and a claim on Nicaragua for damage done to somebody, concluding

with a warning to the Nicaraguan Government, that "while the claims of the British remain unsettled, there is no hope of a ship canal." And that is every syllable we find. Not a word more is said of surveys or diggings. The whole of the great undertaking is settled down to negotiation and letter-writing; and is, in short, hopelessly tied up in red tape.

A SPECIMEN OF RUSSIAN JUSTICE.

Amongst the French prisoners taken at the battle of Vitebsk, during Napoleon's disastrous retreat in Russia, was a French general, who was accompanied by his wife and daughter. Being badly wounded, he was removed to the military hospital; but the ladies were received into the private house of Madame Strogno, whose husband held at that time, a subordinate appointment under the Russian Government.

A certain Botwinko was then Procureur at Vitebsk. Without the Procureur's sanction nothing can be done in his department; for he represents the Emperor himself, and is usually called "the eye of His Majesty." His salary is only about twenty-five pounds a year; but he makes, usually, a good income by receiving bribes. Amongst other duties, he had to visit the hospitals daily, and to report upon the condition of the prisoner patients. He paid great attention to the unhappy General, who required every consolation; for, despite his own deplorable condition, it was decreed that he should outlive his wife. That lady caught a contagious fever, which was raging at that time at Vitebsk, and died in a few hours. This event so distressed the General that he soon departed this world, with the only consolation, that Procureur Botwinko, a married but childless man, would adopt his daughter. This promise was actually fulfilled, and the little orphan was taken from Madame Strogno, and established under the Procureur's roof. Her parents' property—consisting of a carriage, horses, jewellery, and no small sum of ready money—was also taken possession of by Botwinko, in quality of guardian to the little orphan.

As the girl—whom they called "Sophie"—grew up, she became very engaging, and was kindly treated by Mr. and Madame Botwinko. She never lost an opportunity, when any visitors were in the Procureur's house, of praising her protectors for their kindness to her; and this, connected with other circumstances, contributed to the promotion of Mr. Botwinko; who obtained the more profitable situation of Procureur-General at Vilna, the capital of Lithuania.

Removal from their old connections, and from those who knew all the circumstances of little Sophie's history, produced a change in the treatment of the new Procureur-General and his wife towards the child. Their kind-

ness rapidly diminished. Sophie was not allowed to appear in the drawing-rooms, in their new residence at Vilna. They incessantly found fault with her; and, ultimately, she was not only sent to the kitchen under the control of the cook; but, on the census of the population being taken, in 1816, her name was inscribed on the books as that of a staff.

As the poor girl grew up she became used to the duties imposed upon her. Associating constantly with the servants, they considered her their equal, and taunted her when—relying on her infantine recollections, she laid claim to noble descent—by calling her in derision "Mademoiselle French General." She knew full well that she was entitled to better treatment; and, that in the absence of paternal authority, she had the right of disposing of herself according to her own will. A strong inducement to alter her condition was presented in the person of a young clerk in a government office, whose duty sometimes brought him with papers to the Procureur for signature. Whilst Botwinko was engaged with his breakfast and the perusal of the papers, this clerk was sometimes kept dangling for hours in the antechamber. After a time, these hours were agreeably spent in the society of Sophie; to whom he eventually made a proposal of marriage. She consented; but, unwilling to leave her guardian like a fugitive, she apprised him of her determination, and humbly requested an account of the property which she had been informed he had taken charge of at her parents' death.

The Procureur-General at first excused himself from giving her an immediate answer. The next day he presented himself at the police office, the whole of whose functionaries were under his control. What he said or did is not known; but the result was that Sophie was taken into custody by the police, and committed to gaol.

Many months elapsed before her fate was known at home. It was stated that she absconded. The clerk, banished the Procureur's house, could not discover the cause of the girl's disappearance; and as all Russian criminal proceedings are conducted with great secrecy, he only ascertained by a mere accident that the girl had been sentenced, by a superior court, to receive a certain number of lashes by the knout, and to be sent to Siberia. The crime of which they accused her was that of attempting to poison her master and mistress.

Alarmed at this information, the young man, without waiting for more particulars, addressed a petition to the war governor of Vilna, the old General Korsakof; whose power in that province was almost omnipotent; and, if not misdirected, was very often beneficial to the inhabitants. The petitioner requested the General's interference and an investigation of the case; assuring him that the girl was innocent, and that the legal authorities who condemned her had been corrupted.

The General was accustomed to decide every case *en militaire*. He had received from the police court an unfavourable opinion of the petitioner's character, which was described as "restless;" and was, moreover, rather offended at his authority having been appealed to by a subordinate. He therefore settled the business summarily, by sending the young petitioner to the military service for life, in virtue of the vagrant act.

Still the young man's petition produced a good effect: the poor girl was not flogged, lest that might have provoked some disturbance in the town. She was merely dressed in convict's apparel and sent off to Siberia.

The transport of Russian convicts costs the government but very little. They go on foot, sleep in *étapes* or barracks; and the daily allowance for their subsistence amounts only to five kopecks, equal to a halfpenny in English money. This they, as well as the poor old soldiers who escort them, have to eke out by charity. For that purpose, the most attractive person amongst each party of exiles is delegated—box in hand, but with an armed soldier behind—to beg alms of the benevolent; and Sophie was appointed to be the suppliant for the rest of her wretched companions.

The road from Vilna to Siberia passes through Vitebsk. The convicts had not been long in the town before Sophie encountered Madame Strogno, who recognised the girl from her very great likeness to her mother, who had died in that lady's house. When she learned that Sophie had been living with the Potwinkos, she had no longer a doubt.

The girl asserted her innocence of the pretended crime for which she was on her way to Siberia, with tearful energy, and the good Madame S. believed her; but her husband, who was at that time the Vice-Governor of Vitebsk, to disabuse his wife's romantic dreams, as he called them, sent for the officer escorting the prisoners; and showed her the list of prisoners, which contained a full record, not only of the crime imputed to the orphan girl, but also of the punishment to which she had been condemned.

In the face of an official document which appeared to be regular, and which detailed the girl's presumed offence with circumstantial consistency, Madame Strogno began to waver in her belief of Sophie's protestations; but the unfortunate girl asserted her innocence so strongly and incessantly, that the Vice-Governor himself was at length induced to look into the facts. The first suspicion that entered his mind was derived from the circumstance of the document stating that the culprit had been punished with the knout; whilst it was evident from her appearance, that that dreadful torture had not been inflicted. He caused a medical man to examine her, who testified that not a scar appeared; yet the knout always leaves insensible traces for life.

In consequence of this discrepancy, Sophie was allowed to remain for some time at Vitebsk under the plea of illness; which, at the request of the Vice-Governor, was readily certified by an official surgeon. After some delay, a memorial was forwarded by the unfortunate sufferer to the late Emperor Alexander, in consequence of which a court-messenger was sent immediately to Vilna. This gentleman brought back to St. Petersburg an enormous volume, containing the so-called depositions taken at the pseudo trial. After careful inspection of them, the Emperor decided that they proved the legality of the proceedings. So artfully were these infamous depositions framed; that, among them, appeared the formula of a chemical analysis of the poison which the girl was accused of administering, and a full confession; to which the culprit's signature was forged.

The answer, therefore, from the throne was not only unfavourable; but the authorities of Vitebsk were reprimanded for allowing the girl to importune his Majesty without sufficient grounds.

Notwithstanding, Madame Strogno was not discouraged; and, to the great alarm of her husband, had another petition drawn up and forwarded with a suitable memorial to the Princess Maria Fedorowna, the Emperor's mother, who was known to all the country as a pious and charitable lady. This petition, presented to his Majesty by his own mother, had so great an influence over him, that he ordered the girl to be brought to St. Petersburg. He felt convinced that some unaccountable mystery was involved in the case.

In due time Sophie arrived at St. Petersburg, and underwent a rigid examination. She asseverated with the most earnest truthfulness, that all the depositions were fictitious; that the chemical analysis was a wicked invention; and that the signature to her fabricated confession was a forgery. She also denied that any trial had taken place, or that she had been examined in any court whatever. Upon this, the Emperor appointed Mr. Getzewicz, the Governor of Minsk—who was known as a most trustworthy man—to go personally to Vilna; to investigate the case; and to report the result. For this purpose the papers and the girl were forwarded back to Vilna.

The mission of Mr. Getzewicz was by no means an easy or a pleasant one: he had to contend with a swarm of official insects; which, like Canadian mosquitoes when disturbed, attack the new comer from every side. However, Mr. Getzewicz stood his ground firmly. He soon discovered that the secretary of the police court who had drawn up the depositions was a convict, sentenced for life to Siberia for having been associated with highway robbers. He had escaped and was retained in his situation by merely changing his christian name, and by being reported

"dead" by Mr. Botwinko. The components of the rest of the court were no less suspicious. In Russia, the police and sheriff's courts, and even the provincial senate itself, are the asylums for military veterans; who, during their long service, had never been trained up to the law. The secretaries draw documents for them, which they sign—very often without reading; that task being tiresome, and often incomprehensible to them.

The court which had promoted and confirmed Sophie's prosecution, consisted of illiterate, worn-out officers, who had no scruple in committing the Procureur-General's victim for trial to the First Criminal Court (Sond Grodoski).

But how was the deception carried on before the higher tribunals? This would puzzle the most ingenious rascality to guess. But Botwinko was a genius in his way:—he actually brought before that court, as well as before the highest criminal tribunal, another young woman; who represented herself to be the girl in question, and confessed her supposed guilt with all the desired particulars. The extraordinary intrigue was the more easily accomplished from the secrecy with which criminal investigations in Russia are conducted. Whenever the culprit acknowledges his crime, the sentence follows without farther inquiry; and, the gaol being under the control of the police office, and the judges of the criminal courts not knowing the prisoners personally, they were obliged to receive in this instance the confessions of any girl whom the police thought proper to send to them.

When the trial was over, the Procureur paid his hireling well, dismissed her, and drew forth his victim from her cell; substituted her for the wretch who had stood at the bar, and sent her to Siberia. Villainy, however, be it ever so cunning, seldom half does its work of deception. If Botwinko had had the whole sentence carried into effect, and poor Sophie knouted, he would not, perhaps, have been discovered by his colleague at Vitebsk; and he might have lived a respected public officer to this day; for of such characters does the Russian system admit the prosperous existence. As it was, however, on the report of Mr. Getzewicz, Botwinko, the secretary of police, and many of his superiors, were thrown into prison.

The end of this dreadful story is melancholy; for in the end guilt triumphed. The Procureur-General, having several partners in his guilty practices, had, if one may so abuse the expression, many friends. At first they tried most ingeniously to bribe Mr. Getzewicz, and to induce him to give up further proceedings; but, finding him inflexible, they put a stop to all that business by administering poison to the unfortunate Sophie. They even threatened the Governor of Minsk himself, in an anonymous letter, to do the same for him.

That threat, it seems, produced the desired effect on the honest but weak-minded man.

Seeing with what desperate people he had to contend—so much so, that his own life was in danger—he sent his final report to the (at that time) Emperor Alexander, with request for further instructions. In the meantime, he retired to his own residence at Minsk, leaving the illustrious Vilna officials in their own prison.

Shortly afterwards, the Emperor died at Taganrog. His second brother, the present Emperor, Nicholas I.—greeted, on his accession to the throne, with a formidable insurrection at St. Petersburg, and with alarming conspiracies and political intrigues in the army—had no time to direct his attention to so trifling an affair as that of our heroine. Political prisoners were to be punished first, in order to spread terror among those who were not discovered as yet. The stability of the throne would not allow him to alarm the administrative servants and other criminals who never thought of subverting Romanoff's dynasty. Hence, with the exception of the political offenders, all others, whose actions were pending in different courts of justice, but not yet adjudicated, were amnestied by the Emperor, on the occasion of his coronation, in 1826, at Moscow.

Thus, the Procureur and his associates were released from prison, losing nothing but their former situations. The Procureur, having scraped together a fortune by his bribes and grasplings, did not care much at becoming an independent gentleman.

What became of Sophie's lover—the unfortunate clerk, who was sent to the army, for his honest but untimely application—could not be learnt. He may now think that his punishment was deserved, and that the girl was really guilty; but it is more than probable that he will never again interfere to restrain the grossest injustice.

And here ends our melancholy tale, which the censorship of the press in Russia prevented from ever before being publicly related. Corroboration can, however, be derived from the inhabitants of Vilna, who lived there from 1816 to 1826; from the archives of criminal courts of that place, where M. Getzewicz's correspondence is preserved; from the list of all the Crown servants of Russia, sent every year to the State Secretary of the Home Department at St. Petersburg; in which, for 1825 and 1826, Procureur Botwinko was reported to be imprisoned at Vilna for the above case, and that the Strapachy of Oszmiana was acting in his stead as Procureur *pro tem*.

"Familiar in their Mouths as HOUSEHOLD WORDS."—SHAKESPEARE.

HOUSEHOLD WORDS.

A WEEKLY JOURNAL

CONDUCTED BY CHARLES DICKENS.

No. 52.]

SATURDAY, MARCH 22, 1851.

[PRICE 2d.]

BILL-STICKING.

If I had an enemy whom I hated—which Heaven forbid!—and if I knew of something that sat heavy on his conscience, I think I would introduce that something into a Posting-Bill, and place a large impression in the hands of an active sticker. I can scarcely imagine a more terrible revenge. I should haunt him, by this means, night and day. I do not mean to say that I would publish his secret, in red letters two feet high, for all the town to read: I would darkly refer to it. It should be between him, and me, and the Posting-Bill. Say, for example, that, at a certain period of his life, my enemy had surreptitiously possessed himself of a key. I would then embark my capital in the lock business, and conduct that business on the advertising principle. In all my placards and advertisements, I would throw up the line **SECRET KEYS**. Thus, if my enemy passed an uninhabited house, he would see his conscience glaring down on him from the parapets, and peeping up at him from the cellars. If he took a dead wall in his walk, it would be alive with reproaches. If he sought refuge in an omnibus, the panels thereof would become Belshazzar's palace to him. If he took boat, in a wild endeavour to escape, he would see the fatal words lurking under the arches of the bridges over the Thames. If he walked the streets with downcast eyes, he would recoil from the very stones of the pavement, made eloquent by lamp-black lithograph. If he drove or rode, his way would be blocked up, by enormous vans, each proclaiming the same words over and over again from its whole extent of surface. Until, having gradually grown thinner and paler, and having at last totally rejected food, he would miserably perish, and I should be revenged. This conclusion I should, no doubt, celebrate by laughing a hoarse laugh in three syllables, and folding my arms tight upon my chest agreeably to most of the examples of glutted animosity that I have had an opportunity of observing in connexion with the Drama—which, by the bye, as involving a good deal of noise, appears to me to be occasionally confounded with the Dreamer.

The foregoing reflections presented themselves to my mind the other day, as I con-

templated (being newly come to London from the East Riding of Yorkshire, on a house-hunting expedition for next May), an old warehouse which rotting paste and rotting paper had brought down to the condition of an old cheese. It would have been impossible to say, on the most conscientious survey, how much of its front was brick and mortar, and how much decaying and decayed plaster. It was so thickly encrusted with fragments of bills, that no ship's keel after a long voyage could be half so foul. All traces of the broken windows were billed out, the doors were billed across, the water-pout was billed over. The building was shored up to prevent its tumbling into the street; and the very beams erected against it, were less wood than paste and paper, they had been so continually posted and reposted. The forlorn dregs of old posters so encumbered this wreck, that there was no hold for new posters, and the stickers had abandoned the place in despair, except one enterprising man who had hoisted the last masquerade to a clear spot near the level of the stack of chimnies where it waved and drooped like a shattered flag. Below the rusty cellar-grating, crumpled remnants of old bills torn down, rotted away in wasting heaps of fallen leaves. Here and there, some of the thick rind of the house had peeled off in strips, and fluttered heavily down, littering the street; but, still, below these rents and gashes, layers of decomposing posters showed themselves, as if they were interminable. I thought the building could never even be pulled down, but in one adhesive heap of rottenness and poster. As to getting in—I don't believe that if the Sleeping Beauty and her Court had been so billed up, the young Prince could have done it.

Knowing all the posters that were yet legible, intimately, and pondering on their ubiquitous nature, I was led into the reflections with which I began this paper, by considering what an awful thing it would be, ever to have wronged—say M. JULLIEN for example—and to have his avenging name in characters of fire incessantly before my eyes. Or to have injured MADAME TUSSEAUD, and undergo a similar retribution. Has any man a self-reproachful thought associated with pills, or ointment? What an avenging spirit to that man is PROFESSOR HOLLOWAY! Have I

sinned in oil? CABBURN pursues me. Have I a dark remembrance associated with any gentlemanly garments, bespoke or ready-made? MOSES and SON are on my track. Did I ever aim a blow at a defenceless fellow-creature's head? That head eternally being measured for a wig, or that worse head which was bald before it used the balsam, and hirsute afterwards—enforcing the benevolent moral, "Better to be bald as a Dutch-cheese than come to this,"—undoes me. Have I no sore places in my mind which MECHU touches—which NICOLL probes—which no registered article whatever lacerates? Does no discordant note within me thrill responsive to mysterious watchwords, as "Revalenta Arabica," or "Number One St. Paul's Church-yard"? Then may I enjoy life, and be happy.

Lifting up my eyes, as I was musing to this effect, I beheld advancing towards me (I was then on Cornhill near to the Royal Exchange), a solemn procession of three advertising vans, of first-class dimensions, each drawn by a very little horse. As the cavalcade approached, I was at a loss to reconcile the careless deportment of the drivers of these vehicles, with the terrific announcements they conducted through the city, which, being a summary of the contents of a Sunday newspaper, were of the most thrilling kind. Robbery, fire, murder, and the ruin of the united kingdom—each discharged in a line by itself, like a separate broadside of red-hot shot—were among the least of the warnings addressed to an unthinking people. Yet, the Ministers of Fate who drove the awful cars, leaned forward with their arms upon their knees in a state of extreme lassitude, for want of any subject of interest. The first man, whose hair I might naturally have expected to see standing on end, scratched his head—one of the smoothest I ever beheld—with profound indifference. The second whistled. The third yawned.

Pausing to dwell upon this apathy, it appeared to me, as the fatal cars came by me, that I descried in the second car, through the portal in which the charioteer was seated, a figure stretched upon the floor. At the same time, I thought I smelt tobacco. The latter impression passed quickly from me; the former remained. Curious to know whether this prostrate figure was the one impressible man of the whole capital who had been stricken insensible by the terrors revealed to him, and whose form had been placed in the car by the charioteer, from motives of humanity, I followed the procession. It turned into Leaden-hall-market, and halted at a public-house. Each driver dismounted. I then distinctly heard, proceeding from the second car, where I had dimly seen the prostrate form, the words:

"And a pipe!"

The driver entering the public-house with his fellows, apparently for purposes of refreshment, I could not refrain from mounting on the shaft of the second vehicle, and looking in

at the portal. I then beheld, reclining on his back upon the floor, on a kind of mattress or divan, a little man in a shooting-coat. The exclamation "Dear me!" which irresistibly escaped my lips, caused him to sit upright, and survey me. I found him to be a good-looking little man of about fifty, with a shining face, a tight head, a bright eye, a moist wink, a quick speech, and a ready air. He had something of a sporting way with him.

He looked at me, and I looked at him, until the driver displaced me by handing in a pint of beer, a pipe, and what I understand is called "a screw" of tobacco—an object which has the appearance of a curl-paper taken off the barmaid's head, with the curl in it.

"I beg your pardon," said I, when the removed person of the driver again admitted of my presenting my face at the portal. "But—excuse my curiosity, which I inherit from my mother—do you live here?"

"That's good, too!" returned the little man, composedly laying aside a pipe he had smoked out, and filling the pipe just brought to him.

"Oh, you *don't* live here then?" said I.

He shook his head, as he calmly lighted his pipe by means of a German tinder-box, and replied, "This is my carriage. When things are flat, I take a ride sometimes, and enjoy myself. I am the inventor of these wans."

His pipe was now alight. He drank his beer all at once, and he smoked and he smiled at me.

"It was a great idea!" said I.

"Not so bad," returned the little man, with the modesty of merit.

"Might I be permitted to inscribe your name upon the tablets of my memory?" I asked.

"There's not much odds in the name," returned the little man,—"no name particular—I am the King of the Bill-Stickers."

"Good gracious!" said I.

The monarch informed me, with a smile, that he had never been crowned or installed with any public ceremonies, but, that he was peaceably acknowledged as King of the Bill-Stickers in right of being the oldest and most respected member of "the old school of bill-sticking." He likewise gave me to understand that there was a Lord Mayor of the Bill-Stickers, whose genius was chiefly exercised within the limits of the city. He made some allusion, also, to an inferior potentate, called "Turkey-legs;" but, I did not understand that this gentleman was invested with much power. I rather inferred that he derived his title from some peculiarity of gait, and that it was of an honorary character.

"My father," pursued the King of the Bill-Stickers, "was Engineer, Beadle, and Bill-Sticker to the parish of St. Andrew's, Holborn, in the year one thousand seven hundred and eighty. My father stuck bills at the time of the riots of London."

"You must be acquainted with the whole

subject of bill-sticking, from that time to the present!" said I.

"Pretty well so," was the answer.

"Excuse me," said I; "but I am a sort of collector—"

"Not Income-tax!" cried His Majesty, hastily removing his pipe from his lips.

"No, no," said I.

"Water-rate?" said His Majesty.

"No, no," I returned.

"Gas? Assessed? Sewers?" said His Majesty.

"You misunderstand me," I replied soothingly. "Not that sort of collector at all: a collector of facts."

"Oh! if it's only facts," cried the King of the Bill-Stickers, recovering his good-humour, and banishing the great mistrust that had suddenly fallen upon him, "come in and welcome! If it had been income, or winders, I think I should have pitched you out of the wau, upon my soul!"

Readily complying with the invitation, I squeezed myself in at the small aperture. His Majesty, graciously handing me a little three-legged stool on which I took my seat in a corner, inquired if I smoked?

"I do;—that is, I can," I answered.

"Pipe and a screw!" said His Majesty to the attendant chariotier. "Do you prefer a dry smoke, or do you moisten it?"

As unmitigated tobacco produces most disturbing effects upon my system (indeed, if I had perfect moral courage, I doubt if I should smoke at all, under any circumstances), I advocated moisture, and begged the Sovereign of the Bill-Stickers to name his usual liquor, and to concede to me the privilege of paying for it. After some delicate reluctance on his part, we were provided, through the instrumentality of the attendant chariotier, with a can of cold rum-and-water, flavoured with sugar and lemon. We were also furnished with a tumbler, and I was provided with a pipe. His Majesty, then, observing that we might combine business with conversation, gave the word for the car to proceed; and, to my great delight, we jogged away at a foot pace.

I say to my great delight, because I am very fond of novelty, and it was a new sensation to be jolting through the tumult of the city in that secluded Temple, partly open to the sky, surrounded by the roar without, and seeing nothing but the clouds. Occasionally, blows from whips fell heavily on the Temple's walls, when by stopping up the road longer than usual, we irritated carters and coachmen to madness; but, they fell harmless upon us within and disturbed not the serenity of our peaceful retreat. As I looked upward, I felt, I should imagine, like the Astronomer Royal. I was enchanted by the contrast between the freezing nature of our external mission on the blood of the populace, and the perfect composure reigning within these sacred precincts: where His Majesty, reclining easily on his left arm,

smoked his pipe and drank his rum-and-water from his own side of the tumbler, which stood impartially between us. As I looked down from the clouds and caught his royal eye, he understood my reflections. "I have an idea," he observed, with an upward glance, "of training scarlet runners across in the season,—making a arbor of it,—and sometimes taking tea in the same, according to the song."

I nodded approval.

"And here you repose and think?" said I.

"And think," said he; "of posters—walls—and hoardings."

We were both silent, contemplating the vastness of the subject. I remembered a surprising fancy of dear THOMAS HOOD's, and wondered whether this monarch ever sighed to repair to the great wall of China, and stick bills all over it.

"And so," said he, rousing himself, "it's facts as you collect?"

"Facts," said I.

"The facts of bill-sticking," pursued His Majesty, in a benignant manner, "as known to myself, air as following. When my father was Engineer, Beadle, and Bill-Sticker to the parish of St. Andrew's, Holborn, he employed women to post bills for him. He employed women to post bills at the time of the riots of London. He died at the age of seventy-five year, and was buried by the murdered Eliza Grimwood, over in the Waterloo-road."

As this was somewhat in the nature of a royal speech, I listened with deference and silently. His Majesty, taking a scroll from his pocket, proceeded, with great distinctness, to pour out the following flood of information:—

"The bills being at that period mostly proclamations and declarations, and which were only a demy size, the manner of posting the bills (as they did not use brushes) was by means of a piece of wood which they called a 'dabber.' Thus things continued till such time as the State Lottery was passed, and then the printers began to print larger bills, and men were employed instead of women, as the State Lottery Commissioners then began to send men all over England to post bills, and would keep them out for six or eight months at a time, and they were called by the London bill-stickers '*trampers*,' their wages at the time being ten shillings per day, besides expenses. They used sometimes to be stationed in large towns for five or six months together, distributing the schemes to all the houses in the town. And then there were more caricature wood-block engravings for posting-bills than there are at the present time, the principal printers, at that time, of posting-bills being Messrs. Evans and Ruffy, of Budget-row; Thoroughgood and Whiting, of the present day; and Messrs. Gye and Balne, Gracechurch Street, City. The largest bills printed at that period were a two-sheet double crown; and when they commenced

printing four-sheet bills, two bill-stickers would work together. They had no settled wages per week, but had a fixed price for their work, and the London bill-stickers, during a lottery week, have been known to earn, each eight or nine pounds per week, till the day of drawing; likewise the men who carried boards in the street used to have one pound per week, and the bill-stickers at that time would not allow any one to wilfully cover or destroy their bills; as they had a society amongst themselves, and very frequently dined together at some public-house where they used to go of an evening to have their work delivered out unto 'em."

All this His Majesty delivered in a gallant manner; posting it, as it were, before me, in a great proclamation. I took advantage of the pause he now made, to inquire what a "two-sheet double crown" might express?

"A two sheet double crown," replied the King, "is a bill thirty-nine inches wide by thirty inches high."

"Is it possible," said I, my mind reverting to the gigantic admonitions we were then displaying to the multitude—which were as infants to some of the posting-bills on the rotten old warehouse—"that some few years ago the largest bill was no larger than that?"

"The fact," returned the King, "is undoubtedly so." Here he instantly rushed again into the scroll.

"Since the abolishing of the State Lottery all that good feeling has gone, and nothing but jealousy exists, through the rivalry of each other. Several bill-sticking companies have started, but have failed. The first party that started a company was twelve year ago; but what was left of the old school and their dependents joined together and opposed them. And for some time we were quiet again, till a printer of Hatton Garden formed a company by hiring the sides of houses; but he was not supported by the public, and he left his wooden frames fixed up for rent. The last company that started, took advantage of the New Police Act, and hired of Messrs. Grisell and Peto the hoarding of Trafalgar Square, and established a bill-sticking office in Cursitor-street, Chancery-lane, and engaged some of the new bill-stickers to do their work, and for a time got the half of all our work, and with such spirit did they carry on their opposition towards us, that they used to give us in charge before the magistrate, and get us fined; but they found it so expensive, that they could not keep it up, for they were always employing a lot of ruffians from the Seven Dials to come and fight us; and on one occasion the old bill-stickers went to Trafalgar Square to attempt to post bills, when they were given in custody by the watchman in their employ, and fined at Queen Square five pounds, as they would not allow any of us to speak in the office; but when they were gone, we had an interview with the magistrate, who mitigated the fine to fifteen shillings. During the time

the men were waiting for the fine, this company started off to a public-house that we were in the habit of using, and waited for us coming back, where a fighting scene took place that beggars description. Shortly after this, the principal one day came and shook hands with us, and acknowledged that he had broken up the company, and that he himself had lost five hundred pound in trying to overthrow us. We then took possession of the hoarding in Trafalgar Square; but Messrs. Grisell and Peto would not allow us to post our bills on the said hoarding without paying them—and from first to last we paid upwards of two hundred pounds for that hoarding, and likewise the hoarding of the Reform Club-house, Pall Mall."

His Majesty, being now completely out of breath, laid down his scroll (which he appeared to have finished), puffed at his pipe, and took some run-and-water. I embraced the opportunity of asking how many divisions the art and mystery of bill-sticking comprised? He replied, three—auctioneers' bill-sticking, theatrical bill-sticking, general bill-sticking.

"The auctioneers' porters," said the King, "who do their bill-sticking, are mostly respectable and intelligent, and generally well paid for their work, whether in town or country. The price paid by the principal auctioneers for country work, is nine shillings per day; that is, seven shillings for day's work, one shilling for lodging, and one for paste. Town work is five shillings a day, including paste."

"Town work must be rather bot-work," said I, "if there be many of those fighting scenes that beggar description, among the bill-stickers?"

"Well," replied the King, "I an't a stranger, I assure you, to black eyes; a bill-sticker ought to know how to handle his fists a bit. As to that row I have mentioned, that grew out of competition, conducted in an uncompromising spirit. Besides a man in a horse-and-shay continually following us about, the company had a watchman on duty, night and day, to prevent us sticking bills upon the hoarding in Trafalgar Square. We went there, early one morning, to stick bills and to black-wash their bills if we were interfered with. We were interfered with, and I gave the word for laying on the wash. It was laid on—pretty brisk—and we were all taken to Queen Square: but they couldn't fine me. I knew that,"—with a bright smile—"I'd only given directions—I was only the General."

Charmed with this monarch's affability, I inquired if he had ever hired a hoarding himself.

"Hired a large one," he replied, "opposite the Lyceum Theatre, when the buildings was there. Paid thirty pound for it; let out places on it, and called it 'The External Paper-Hanging Station.' But it didn't answer. Ah!" said His Majesty thoughtfully, as he filled the glass, "Bill-stickers have a deal to see-

fold with. The bill-sticking clause was got into the Police Act by a member of parliament that employed me at his election. The clause is pretty stiff respecting where bills go; but he didn't mind where his bills went. It was all right enough, so long as they was his bills!"

Fearful that I observed a shadow of misanthropy on the King's cheerful face, I asked whose ingenious invention that was, which I greatly admired, of sticking bills under the arches of the bridges.

"Mine!" said His Majesty, "I was the first that ever stuck a bill under a bridge! Imitators soon rose up, of course.—When don't they? But they stuck 'em at low-water, and the tide came and swept the bills clean away. I knew that!" The King laughed.

"What may be the name of that instrument, like an immense fishing-rod," I inquired, "with which bills are posted on high places?"

"The joints," returned His Majesty. "Now, we use the joints where formerly we used ladders—as they do still in country places. Once, when Madame" (Vestris, understood) "was playing in Liverpool, another bill-sticker and me were at it together on the wall outside the Clarence Dock—me with the joints—him on a ladder. Lord! I had my bill up, right over his head, yards above him, ladder and all, while he was crawling to his work. The people going in and out of the docks, stood and laughed!—It's about thirty years since the joints come in."

"Are there any bill-stickers who can't read?" I took the liberty of inquiring.

"Some," said the King. "But they know which is the right side up'ards of their work. They keep it as it's given out to 'em. I have seen a bill or so stuck wrong side up'ards. But it's very rare."

Our discourse sustained some interruption at this point, by the procession of cars occasioning a stoppage of about three quarters of a mile in length, as nearly as I could judge. His Majesty, however, entreating me not to be discomposed by the contingent uproar, smoked with great placidity, and surveyed the firmament.

When we were again in motion, I begged to be informed what was the largest poster His Majesty had ever seen. The King replied, "A thirty-six sheet poster." I gathered, also, that there were about a hundred and fifty bill-stickers in London, and that His Majesty considered an average hand equal to the posting of one hundred bills (single sheets) in a day. The King was of opinion, that, although posters had much increased in size, they had not increased in number; as the abolition of the State Lotteries had occasioned a great falling off, especially in the country. Over and above which change, I bethought myself that the custom of advertising in newspapers had greatly increased. The completion of many London

improvements, as Trafalgar-square (I particularly observed the singularity of His Majesty's calling that an improvement), the Royal Exchange, &c., had of late years reduced the number of advantageous posting-places. Bill-stickers at present rather confined themselves to districts, than to particular descriptions of work. One man would strike over Whitechapel; another would take round Houndsditch, Shoreditch, and the City Road; one (the King said) would stick to the Surrey side; another would make a beat of the West-end.

His Majesty remarked, with some approach to severity, on the neglect of delicacy and taste, gradually introduced into the trade by the new school: a profligate and inferior race of impostors who took jobs at almost any price, to the detriment of the old school, and the confusion of their own misguided employers. He considered that the trade was overdone with competition, and observed, speaking of his subjects, "There are too many of 'em." He believed, still, that things were a little better than they had been; adducing, as a proof, the fact that particular posting places were now reserved, by common consent, for particular posters; those places, however, must be regularly occupied by those posters, or they lapsed and fell into other hands. It was of no use giving a man a Drury Lane bill this week and not next. Where was it to go? He was of opinion that going to the expense of putting up your own board on which your sticker could display your own bills, was the only complete way of posting yourself at the present time; but, even to effect this, on payment of a shilling a week to the keepers of steamboat piers and other such places, you must be able, besides, to give orders for theatres and public exhibitions, or you would be sure to be cut out by somebody. His Majesty regarded the passion for orders, as one of the most insatiable appetites of human nature. If there were a building; or if there were repairs, going on, anywhere, you could generally stand something and make it right with the foreman of the works; but, orders would be expected from you, and the man who could give the most orders was the man who would come off best. There was this other objectionable point, in orders, that workmen sold them for drink, and often sold them to persons who were likewise troubled with the weakness of thirst: which led (His Majesty said) to the presentation of your orders at Theatre doors, by individuals who were "too shakery" to derive intellectual profit from the entertainments, and who brought a scandal on you. Finally, His Majesty said that you could hardly put too little in a poster; what you wanted, was, two or three good catch-lines for the eye to rest on—then, leave it alone—and there you were!

These are the minutes of my conversation with His Majesty, as I noted them down shortly afterwards. I am not aware that I have been

betrayed into any alteration or suppression. The manner of the King was frank in the extreme; and he seemed to me to avoid, at once that slight tendency to repetition which may have been observed in the conversation of His Majesty King George the Third, and that slight under-current of egotism which the curious observer may perhaps detect in the conversation of Napoleon Buonaparte.

I must do the King the justice to say that it was I, and not he, who closed the dialogue. At this juncture, I became the subject of a remarkable optical delusion; the legs of my stool appeared to me to double up; the car to spin round and round with great violence; and a mist to arise between myself and His Majesty. In addition to these sensations, I felt extremely unwell. I refer these unpleasant effects, either to the paste with which the posters were affixed to the van: which may have contained some small portion of arsenic; or, to the printer's ink, which may have contained some equally deleterious ingredient. Of this, I cannot be sure. I am only sure that I was not affected, either by the smoke, or the rum-and-water. I was assisted out of the vehicle, in a state of mind which I have only experienced in two other places—I allude to the Pier at Dover, and to the corresponding portion of the town of Calais—and sat upon a door-step until I recovered. The procession had then disappeared. I have since looked anxiously for the King in several other cars, but I have not yet had the happiness of seeing His Majesty.

"TO CLERGYMEN IN DIFFICULTIES."

THE family of the Reverend Carmichael Crample, perpetual curate of Crookenden, Hants, is seated at breakfast. Mrs. Crample is blandly declining the request of Master Shirley Crample for more sugar to his milk-and-water; Miss Crample is reading the day-old copy of the "Times," which the vicar is so good as to send regularly; and Miss Emilia Crample is spreading butter over Master Charles James Crample's bread, with fairy-like thinness; the reverend head of the family notices through the glass door leading upon the lawn, the approach of a figure, which gives him sore disquietude.

"It is only poor Mr. Slicer, my dear," says Mrs. Crample. "He is very civil and patient; for his is only a balance since last Christmas—it is a call from Mr. Plumley which I dread most; for he has had no money from us since this time twelvemonth."

Mr. Slicer is shown into the study; to which the reverend gentleman, humbled and abashed, creeps unwillingly from the parlour. The butcher, equally embarrassed, stammers out something about having a large bill to meet on Thursday; and, if quite convenient—well, he hopes, Mr. Crample will oblige him with at least something on ac-

count. The clergyman pleads poverty, and begs a little time. Slicer has not the heart to say more; but, brushing his hat very vigorously with his sleeve, trusts Mr. Crample won't forget him as soon as —

"Mr. Plumley, sir!" says the servant, announcing the grocer; of whose visitation Mrs. Crample had expressed her apprehensions. Meanwhile the butcher, having brought his hat up to a brilliant polish, proceeds to put it to its proper use, and returns towards his shop.

"It's o' no use, sir," exclaims Plumley, after Mr. Crample has swiftly, but noiselessly shut the study door. "It's o' no use a talking any more about it. I owe a duty to my wife and family, and I owe a sum of money to Gampling and Co., my wholesale house. Their traveller worrits my life out. I'm a poor man—I am an uncommon poor man, with a large family."

"So am I," falters Mr. Crample, timidly.

"Well," rejoins Mr. Plumley, "if I had tithes a coming in, sir, besides a stipend, I should say I was *not* a poor man. That's what I should say, and bless myself. Why they tell me the tithes of this parish is worth seven—teen hundred a year."

"The *great* tithes," replies Mr. Crample, with eagerness; "but, they are the dues of my principal, the Reverend Dr. Recumber. Mine are only the small tithes, and I assure you they do not amount to one hundred a year. The additional complement I receive from the vicar is very small."

These mild statements have the effect of diverting Mr. Plumley's wrath from the curate to the vicar; of whom, oddly enough, he, a parochial man (Mr. Plumley is "sidesman" for this year), has scarcely before heard. Presently he breaks out into a strong expression of the "shame" it is that the man who does all the work should have so little of the pay.

"I beg you will not imagine that the doctor is unkind or unkindful of us," says the timid curate: "for instance, he sends us the 'Times' newspaper every day gratis—and that, merely on condition of our forwarding it by every mail to his cousin in India."

"Kind you call it! It don't help you to pay your butcher, or," adds the shopkeeper with emphasis, "or your grocer?"

"Why no," continues the clergyman. "I am indeed most grieved that I am unable to meet your demand; but, Emilia's long illness, and a disappointment Jane has had in getting a situation as governess, have thrown me back; still I"—here the poor curate stops. He is about to add a hope; but, his conscience tells him that he ought not to lead his creditor astray.

The despondent manner in which he drops his voice, touches Plumley's heart. Plumley feels he has been blunt, and repeats. He, too, lowers his voice; he hopes he hasn't said anything hurtful to Mr. C.'s feelings; but Gampling and Co.'s traveller worrits men out o' their lives! "I *know*," he adds a little

louder, "that if you had it you'd pay it; but what I say, is this;—it's a burning shame that you haven't got it!"

Mr. Plumley entered the house with the firm determination that not another ounce of tea should be supplied to the family, on credit, until his bill was paid. But as he passes the kitchen door to go out, he cannot look the servant in the face without saying, "Well, Mary Anne; any orders this morning?"

Before Mary Anne can inquire of her mistress, her master has returned to the parlour. He is the picture of despair. Mrs. Crample has much ado to keep up sufficient spirit to cheer him. The younger children retire, and a consultation begins as to what can be done to obtain some respite from their difficulties, and pay bills off by instalments. "If," says the head of the house, "I could only borrow a sufficient sum from my stipend, it would relieve these poor, patient tradesmen!"

Jane, who has read every advertisement for governesses in the "Times" twice over, here ventures to suggest that nothing could be easier. "Look here, papa," she remarks, pointing to the front page of the Supplement. "A gentleman named N. G., who dates from Cecil Street, Strand, London, addresses himself particularly to clergymen; for the advertisement is headed, 'TO CLERGYMEN (AND OTHERS) IN DIFFICULTIES.' He says he is prepared to advance, by way of loan, any sum of money, from ten, to ten thousand pounds, on personal security."

The curate takes the newspaper from his daughter, and scans the notification carefully, over and over again. He cannot exactly make out the signification of "personal security." Mr. Carmichael Crample is a profound Greek scholar. In mathematics and theology he brought away high honours from college. He can dissect a Pindaric ode, or construe a crabbed passage from any of the Latin Fathers, better than his bishop. But, of the ordinary transactions of life he is as innocent as his own baby. He does not know the meaning of "personal security"; but in order to learn, there will be no harm in inquiring. Mr. Crample is sure, from the very end and purpose of the advertisement, that N. G. must be a benevolent rich man, and will give a prompt and clear answer.

Mr. Crample immediately indited an epistle to Cecil Street, Strand, London, to go by the next post. It gave a candid statement of his wants and wishes (viz., fifty pounds immediately). It also set forth his income, to show that he would be able to repay the loan punctually by the instalments he proposed. He concluded with a request that N. G. would be kind enough to explain the exact nature of the security required.

By the very next return of post there came a letter, which the curate opened with a trembling hand; and, having first glanced it over silently, repeated it aloud to his anxious

wife, in a voice faltering with joy. It ran thus:

"Rev. Sir,

"Yours of yesterday came duly to hand. Though we seldom negotiate with parties for small transactions; yet, under the particular circumstances of your case, are not averse.

"Our system of doing business is always to ascertain the perfect respectability of parties before we undertake commissions, &c., and are happy to state that (as a matter of business), we have made the necessary searches at Somerset House, and find your living to be as you state.

"Time being, no doubt, an object, we enclose a Bill of Exchange for amount required, viz.:—fifty pounds, at two months; renewable, if not quite convenient for you to meet, in whole or part. You have merely to sign your name under the word 'accepted' written across thereof, and remit to us; with post-office order for our charge for searches (as per account below), stamp, &c., and we will forward you the amount, less discount and commission, immediately.

"We are,

"ST. JOHN CLARE, THOMPSON, AND CO.

	£.	s.	d.
"JUL. No. 985423. Stamp,	0	3	6
Drawing Bill.	0	6	8
Searches at Somerset House,	2	2	0
	2	12	2"

For two pounds twelve shillings and two pence, the Crample family, it seemed, could be released from their embarrassments; but, two pounds odd were, just then, as much at their command, as two thousand pounds. There was a family council for some hours as to how the little sum could be raised. Could anything be disposed of? Alas! the inventory of their entire possessions was called up, without much effort of memory, in Mrs. Crample's mind; and object by object was discussed, and truly pronounced indispensable. At last, Jane suggested that her father should write again, to propose that, in addition to "commission and discount," the ready-money charges should be deducted from the sum to be lent. On this advice Mr. Crample immediately acted.

On the second morning, came another letter from Messrs. St. John Clare, Thompson, and Company. "Nothing," said Mr. Crample, with a smile, "could be kinder than these gentlemen; and I really marvel how, being utter strangers, they can be so considerate. They cheerfully agree to my last proposal. All I have to do, is, to put my signature to the document, and return it by post."

The villagers of Crookenden had, of late, seen almost as little of their perpetual curate as of their vicar; and when he did go abroad, he appeared dejected and unhappy. The very day, however, on which he sent off the accepted bill, a change came over him. He went out. He patted all the children on the head; he looked in at the school; he promised a little girl who read the list of hard names in the Genealogical Chapter of Numbers with-

out a mistake, that he would very soon present her with a sixpence. He even called upon Plumley, and had a chat with Mrs. P.; in the course of which, he expressed his regret that "Jane had not been so generous a god-mother to her Jane as he could have wished, but soon, he hoped—"

Mrs. Plumley interrupted him by begging he wouldn't mention that.

"And not only that," Mr. Crample continued, looking pointedly towards the grocer, "but other obligations we are under to our kind neighbours, we hope in a short period to—liquidate."

The butcher was not at home when Mr. Crample called; but, Mr. Crample left an ambiguous message, implying that his next interview with Mr. Slicer should be more agreeable than the last.

Mrs. Crample employed herself in making out a list of the household liabilities, and apportioning the expected cash in various sums to each creditor. In fact, every possible preparation was made; and, on the morning when it was expected, nothing was wanted to the renovated prosperity of the Crample establishment—but the money.

The next morning, alas, the postman passed the window! Shirley was sent after him. Was he *sure* there was no letter for papa?

"None!"

The morning after, and the next, it was the same. "Could the bill have miscarried?"

On the fifth day, Mr. Crample wrote again, inquiring if his last letter had reached Messrs. St. John Clare, Thompson, and Company. With hungry patience, he paused for a reply during another week. Poor Mrs. Crample was, meantime, obliged to turn the screw of economy tighter and tighter, until the pinch reached even the younger branches. Shirley had to drink his milk-and-water without any sugar whatever; and Charles James was reduced to dry bread. Their dress, too, was so shabby they could hardly appear at church.

Innumerable were the excuses for Messrs. St. John Clare, Thompson, and Company, with which Crample amused himself. Perhaps the entire firm had gone out of town, and would send the money when they returned; possibly, their capital had suddenly got "locked up"—(he derived the expression from an indigo broker, to whose son he had been tutor, but had not the remotest idea of its meaning); and somebody had lost the key. Suddenly it struck him that he might not have addressed his letters legibly enough for post-office deciphering—a very common fault of college-bred men. He therefore wrote once more; and, in a clear round text that might have served for a sign, directed his letter to "Messrs. St. John Clare, Thompson, and Company, Cecil Street, Strand, London."

In a few days the letter was returned to the writer, with the following inscription, "Gone away; not known where."

"Ah," said the reverend victim, when he showed this to his wife; "I now feel sure that the whole matter is a hoax. Peradventure, Messrs. Thompson and Co. are a fiction—some young college bloods, perhaps, who just put these advertisements into the papers for fun!"

Two months have passed. Breakfast, such as it is, has been removed. Plumley and Slicer both appear; they know that yesterday their pastor received his quarter's stipend. They have dropped in, to ascertain to what extent he is prepared to liquidate the balances upon their once little, now large accounts. They have scarcely opened the glass door to go away, when the postman appears. The parson seizes a letter eagerly; it is directed in a strange, stiff, business hand. Would his visitors wait till he reads the first line? He breaks the seal, and the words "St. John Clare, Thompson, and Co." gladden his eyes. He turns to his creditors. He hints that Plumley's patience and the butcher's long-sufferance will now be rewarded. He turns the leaf with the greatest care, fearing that the bank note, or cheque on the neighbouring bank, may be blown away. Pleased with a confused and nervously-murmured promise of speedy payment, coupled with the word "remittance," the creditors retire joyfully. Crample has now time and composure to examine the letter carefully.

Not the vestige of a bank note or bank paper of any kind can he discern! He feels that he is not strong enough to peruse the epistle by himself, and desires the presence of his wife and eldest daughter. Thus reinforced, he reads; and the following words grow dim before his eyes:

"The Rev. Carmichael Crample,
"Crookenden Vicarage,
"Hunts."

"Sir, "Clifford's Inn."

"Unless the amount of the dishonoured bill (fifty pounds), drawn by Messrs. St. John Clare, Thompson, and Co., and accepted by you, be paid forthwith (together with interest and costs), I am instructed by the present holder thereof, Oloman l'Evy, Esq., to inform you that legal proceedings will be commenced against you without further notice."

"We are, sir, your obedient servants,
"WRINKLE AND CLIP."

The trio are silent. Each looks at the other for an explanation of the meaning of the extraordinary application. The reverend gentleman, having earnestly applied this dumb catechism first to his wife and then to his daughter, turns his abstracted look upon the backs of his books; and, staring intently at his St. Ignatius, asks it aloud "how he could be expected to pay a debt he has never incurred, while a great many which, alas, he honestly owes, he is unable to liquidate?" St. Ignatius is, of course, not communicative; but, by this time, the full scope and effect of the villany has revealed itself to Jane.

"It is all my doing!" she exclaims, weeping, "All my doing!"
 "Your doing!" repeat Mr. and Mrs. Crample both at once.

"Yes! It was I who suggested that papa should write to those wicked men; and now ruin has come of it!"

The kind old man takes his daughter's hand, and says all he can think of to soothe her. He assures her, in his simplicity, that there is, without any manner of doubt, some mistake. He will write to Mr. Wrinkle, or, better perhaps, to Mr. l'Evy—probably a French gentleman—and explain to him that, from some oversight on the part of Messrs. Thompson and Co., he never was favoured with a shilling of the money; and that, consequently, they will at once perceive he is not their debtor. Mrs. Crample proposes that, to make assurance doubly sure, an additional letter be forwarded to Messrs. Thompson and Co., to their old address in Cecil Street, Strand, London, with a memorandum requesting the postman to inquire whither they have removed; and then to be good enough to take it without delay to their new residence.

Jane, after re-perusing Wrinkle and Clip's letter, and considering awhile, weeps afresh, despite every effort to repress her grief. Without being able to disentangle the affair, she feels a distinct conviction that her father has been caught in meshes, spread in the newspapers, by a gang of swindlers. Her advice is, that her father lose no time in laying the whole case, in person, before his patron.

Poor Mr. Crample recoils at the thought. He will never have sufficient courage. Besides, the Reverend Dr. Recumber, vicar of Crookenden, and rector of No Souls, City, lives in London; and how is the expense of a journey thither to be borne?

"And then the exposure!" hinted Mrs. Crample.

"Exposure, anything, is better than ruin!" urged Jane, turning to her mother; "I feel convinced that the wretches will put papa in prison, unless he gets proper advice how to act. Dr. Recumber will, perhaps, know some solicitor who will tell him how to defend himself from these bad people. Besides, being chaplain to the Duke of Lummersley, he will have great influence in London."

"But who is to do duty in my absence?" asks the curate, rubbing his eyes like a man awakening out of one dream to be drawn into another.

"Doubtless the Doctor will recommend some friend of his!"

The next morning, the Reverend Carmichael Crample was seen in a second-class carriage, duly booked for London; paying the expenses of his journey out of the quarter's scanty stipend, which his careful wife had been, for previous days and weeks, calculating and contriving, to spread over the largest possible surface of debt.

With trembling knees and a palsied knock at the great Belgravian door, Mr. Crample an-

nounced his advent to the portentous pluralist. The Honourable Mrs. Recumber (daughter of the Earl of Pempton) passed him on the stairs on her way to the Opera; and he was ushered into the drawing-room by a powdered footman. The splendour to which Mr. Crample was here suddenly introduced, at first bewildered him. Scarcely an article upon which his wondering eyes fell, but would pay the whole of his Crookenden creditors, and leave a handsome surplus to liquidate the dreadful acceptance. The vicar—a large, pompous man—received his curate with bland surprise. He inquired after each member of his family, seriatim, with an appearance of interest in their welfare, which quite touched the husband and father. When Mr. Crample explained the object of his visit, the Doctor first appeared extremely shocked, and then said he was "deeply grieved." He assured his curate that he was in the hands of swindlers; he advised him by all means to pay the money; and thus save himself endless vexation and certain exposure. It was much better to put up with the first loss. Going to law with such scoundrels was not only unsatisfactory, but, in the end, decidedly expensive.

Poor Mr. Crample felt precisely like the sick pauper, when a fashionable physician prescribed him chicken broth and carriage exercise. He stuttered out something about not having the ability to pay, and expressed—more audibly—a wish that Dr. Recumber would recommend him to a respectable solicitor.

"Well, my dear sir, if you will be rash, nothing," said the Doctor, "would give me greater pleasure."

The bell was rung; another floury footman brought in a silver standish and a mother-of-pearl writing-case: the letter was penned; and the curate, with a profusion of thanks, backed himself out of the apartment.—The next morning at the earliest business hour, he presented it.

Mr. Blindle, of the firm of "Blindle and Bloh," received Dr. Recumber's epistle with reverential awe. (The agency for the Doctor's property was worth five hundred a year to the "office.") Mr. Blindle produced a pair of scissors; and, instead of profanely tearing open the letter, carefully cut away the coat-of-arms, not to disfigure it with the slightest crack. Had he lived in Pekin, and not in Furnival's Inn, he would have burnt incense before the revered document.

The nature of Mr. Crample's business, however, produced a considerable change in Mr. Blindle's mind.

"This," said Mr. Blindle, "is a case rather for the Police than for Common-Law practice. You are at the mercy of a gang of bill-stealers. I presume the transaction began by your answering an advertisement in the 'Times' newspaper, headed, 'To Clergymen (and others) in Difficulties!'"

Mr. Crample breathed forth "Yes!" with

the wonderment of a mystified peasant replying to a conjuror.

"Exactly; and no doubt they have already proceeded against you; for Wrinkle and Clip are what we call in the profession, 'no-quarter men.' However, if you will leave the papers with me, I will send one of our clerks to Clifford's Inn, to see what can be done. Good morning, Mr. Crample."

Mr. Blindle's time was worth about sixty shillings an hour, and he could not afford to waste many minutes on a clergyman in difficulties. Having bowed Mr. Crample out, he thrust half his head into the clerk's office, and exclaimed, "Peggs!—look over this gentleman's papers, and try whether you can do anything with Wrinkle and Clip!" He then shut himself in again.

Mr. Peggs turned over the letters (Mr. Crample had carefully folded and docketed them); and, having without much ado, recapitulated everything that had happened to Mr. Crample, concluded with the query, "Ain't I right, sir?"

"Wonderfully correct!" said Mr. Crample, holding up his hands in amazement. He had made up his mind that the fatal bill transaction was one of a most extraordinary and unheard-of character; the like of which had never happened before. By what divination had the wonderful attorney and his more wonderful clerk come to a knowledge of the minutest circumstances?

The interview in Clifford's Inn is short and decisive. Mr. Peggs went in alone. He pushed open a faded green-baize door, which shut upon him like a rat-trap; and addressed himself to a dirty man, behind a row of rails, who answered to the name of Clip. A dirtier individual, at a side-desk, took a slip of parchment from a pigeon-hole, and began to rub a dirty roll of cloth over it.

Mr. Peggs stated his business:—

"Come to pay?" asked Clip.

"Oh, no; merely to see about an arrangement!" said Peggs.

"Debt and costs in full immediately are the only terms," rejoined Clip.

"It's a clear case of bill-stealing," insinuated Peggs.

"My client is an innocent holder," replied Clip.

"Very!" said Peggs.

"You accept service for defendant?" inquired Clip.

"We do," responded Peggs.

"Now then, Smudge, go it!" said Clip to his clerk; and, before Mr. Peggs was out of the trap, Mr. Smudge had made him the bearer of a parchment command to Carmichael Crample, clerk, to appear before our Lady the Queen, at Westminster, to answer Oloman l'Evy, upon promises, &c.

Meantime, the clergyman had paced the flags of Clifford's Inn Passage, his mind oscillating between anxiety and hope. Despite all that had been told him, he flattered

himself that Messrs. Wrinkle and Clip would rectify the "mistake," when they were fully convinced that he had not received the money they had applied to him for. When Mr. Peggs appeared, he hastily joined him, with the sanguine inquiry,

"Are they convinced of the error? Will they forego?"

"Nothing."

"Peradventure they will wait?"

"Not five minutes," replied Peggs. "They have commenced their action already. Here is a copy of the writ! When they declare, we shall plead—our defence is, no consideration, and fraud, eh?"

Mr. Crample gave a stupefied assent. Peggs walked to the end of Fetter Lane, with the bewildered defendant, and then, wishing him good day, cast him adrift on the ocean of London, without rudder or compass.

The next morning, when Mr. Crample had slept upon his misfortunes, Hope, as was her wont in his case, returned to him with undiminished brightness. All would be right. Messrs. Blindle and Blob would, doubtless, do all that was necessary; and he would return to Crookenden to await the result.

The curate dreams on; and the creditors wait with exemplary patience. Sugar and butter are banned the parsonage; domestic prayers, read by Jane, have been established on Sundays, for the benefit of the younger branches, and for the want of Sunday attire fit for exhibition at church. At length the day of trial approaches; and, when it arrives, the defendant takes another expensive journey to London. He smilingly paces Westminster Hall; for he feels confident of a verdict in the cause of l'Evy v. Crample, clerk. He knows that great efforts have been made by Blindle and Blob to secure that issue; for, on making a modest application to Dr. Recumber to guarantee their costs, the Doctor declined; and, as Oloman l'Evy was reputed to be wealthy, a verdict for the defendant was a matter of moment to "the office." One favourable circumstance had occurred: Messrs. St. John Clare, Thompson, and Company, had been tried at the Central Criminal Court, in the name of Higgs (with an appendix of six aliases) in respect of another bill of exchange; across which, he (Higgs) had—quite accidentally, as he averred—written a wrong name. The finding of the jury implied forgery, and the sentence of the judge was transportation.

The matter of l'Evy v. Crample, clerk, did not occupy her Majesty, sitting by proxy in her Court of Common Pleas, much time.

The plaintiff's counsel, in opening the case, made a playful allusion to the misfortune of Messrs. St. John Clare, Thompson, and Company (*alias* Higgs); but, indignantly repudiated any connexion, on the part of his unimpeachable client, with that atrocious convict. The acceptance had, he asserted, passed through several hands; and plaintiff—who was a highly

respectable wine and cigar merchant at the West-end—had, in an evil hour, discounted it.

The only witness called to support these statements was the plaintiff's clerk. That young gentleman simply swore that he saw the money paid to the "party" whose name appeared as the last of the indorsements. In his cross-examination, he said yes, he was Mr. Oloman l'Evy's nephew. His duties as clerk were very light, for the plaintiff had no regular office nor wine-cellar, and bought his cigars, like any other gentleman—when he wanted to smoke. The "party" for whom the bill was discounted was his (witness's) father, who was Mrs. l'Evy's brother. Knew Higgs (St. John Clare, Thompson, and Company). Was no relation whatever to Higgs—at least would not have been, if plaintiff had not married his (witness's) aunt; and if Higgs had not been Mrs. l'Evy's son by a former husband—which he was. But what had that to do with it?

As the counsel for the defence could not prove the negative that the defendant never had received a farthing of consideration for his bill, he relied upon his eloquence in denouncing the transaction as a wicked fraud, and on the facts elicited in the cross-examination of the plaintiff's witness.—The judge, however, summed up with the simple remark that, although the evidence in support of the plaintiff's case was of an extremely suspicious character; yet, no direct evidence had been adduced on behalf of the defendant to rebut it—and the jury returned a verdict for the plaintiff.

That day week was passed by the Rev. Carmichael Crample in the receiving ward of Whitecross Street prison! The hope which had buoyed him up, even to the last, had now fled. Thoughts of his parish, his home, and the dear ones there lamenting, overcame him. He sat in the darkest corner of the dismal apartment, and wept.

The condition of affairs at Crookenden will be best understood from the following letter, written by the Honourable Kenrick Speckle, B.A. (youngest son of the Earl of Pounton), whom Dr. Recumber had sent down to do duty while Crample was going through the Insolvent Court. The letter was addressed to Sir Richard Rumble, Bart., Balliol College, Oxford.

"Parsonage, Crookenden, Hunts.

"MY DEAR DICK,

"Here's a go!—Old Drizzle, who is keeping the best living in our family warm for me till I can complete my title for orders, is at death's door; and I shall not become due for full orders for another twelvemonth. Even if he hold out three months longer (and I'm game to lay a thousand to twenty he doesn't) I shall be bowled out.

"I was packed off from Town by my antique brother-in-law, Recumber, under the plea that I can read for my title, down here, as well as anywhere else; and do him a service at the same time. The fact is, the regular Crookenden Curate has gone up for a six weeks' whitewash. Our old friend l'Evy is the executioner.

"Instead of a parsonage, this is more like the Valley of the Shadow. The weeping and wailing and gnashing of teeth, are indescribable. The hostess—a limplady, with a faded face—cries all breakfast-time; and, when I ask the second daughter for an egg, she bursts into tears. The two little boys cry over their milk-and-water, and Molly, the servant, never comes into one's presence without similar demonstrations. The very tradesmen are melancholy. I ordered, and paid for—(what d'ye think of that?)—a quarter of a hundredweight of the best almond hard-bake, for distribution amongst the parochial juveniles, yesterday. They sucked every ounce of it; in the dumps.

"I don't think there is a smile to be had, for love or money, in the whole parish; and, if I did not contrive a chat, now and then, with the eldest daughter of the house of Crample, I should abscond. It is martyrdom to be here! She (Jane Crample I mean) has wonderful sense—and only rising nineteen; she sings much better than Miss Huskle, our Oxford *prima donna*. Indeed, all the sense and talent of the family seem centred in her. Five feet five and a half, I should say—splendidly proportioned—and a wonderful complexion. She puts the best face on things, and keeps her spirits up, like a little heroine. I had a gossip with her last night, alone, and she spoke so sensibly of her father's affairs that—but I'm boring you, Dick.

"I will tell you what I wish you would do! Just ride over to the governor, and hint that, if old Drizzle should pop off, a month or two too soon, Jane's father would be a capital warming-pan for me. The living is worth eight hundred a year, and would be a lift for him, and save the dear old boy from the Insolvent Court.

"Yours ever,

"KEN. SPECKLE."

Not only did Sir Richard ride over to the Earl of Pounton and make the suggestion; but, it actually had to be put into force in less than a week; for, as Dr. Drizzle died next day no time was to be lost.

When Mr. Oloman l'Evy saw the appointment of Crample to the new living, in the newspapers, he instantly posted off to Whitecross Street. He expressed intense commiseration for the curate's sufferings, and told Mr. Crample he was willing to release him on his own personal security. Another bill at two months, for nearly double the amount of debt and costs. Peggs nipped the transaction in the bud. He happened to come down at the same time, paid the money by his master's orders (B. and B. took only ten per cent. upon such transactions); and the clergyman, no longer in difficulties, went down by express train to lighten the hearts and dry the eyes, not only of his dearest and nearest, but of the whole parish. Slicer and Plumley had not to wait long for the amounts of their respective bills; and the charity-girl not only got her sixpence, but as many other sixpences for distribution among her schoolfellows, as made capitalists, for one whole evening, of the entire multitude.

At the end of the year, it turned out that

Mr. Crample had not been a mere warming-pan for his new patron's son. A conviction had slowly crept over that young gentleman that the Church was not exactly his calling, and he had gone into the Army—and a very good fellow he proved at heart. Mr. Crample, therefore, got the living.

The latest intelligence of the Crample family reports Miss Crample to be a guest at Pompton Castle. Captain Speckle is in India with his regiment. It is said that he and Jane correspond.

"TO CLERGYMEN (AND OTHERS) IN DIFFICULTIES" still heads an advertisement frequently inserted in various newspapers; and, as Mr. Oloman l'Evy has lately set up his carriage, there is little doubt that "our system of doing business" flourishes, in spite of exposure.

Now, my lords and gentlemen, is there anything wrong about this Mr. Oloman l'Evy and his business; and, if we tried hard, don't you think we might preserve our clergymen and others, as well as our—come!—say as well as our Game!

THE MOTHER'S TEST.

This incident is related of Mary, Countess of Orkney, born deaf and dumb, who, in the year 1753, was married by signs, to her cousin, the Marquis of Thomond.

Our nurse, our dear, old, faithful Joan, what pleasant tales she told,
Adventures that herself had known, or legends quaint and old;
Unceasing marvel each excites; untired, her stores we claim,
Close seated round o' winter nights, beside the fagot's flame.

Once lived she in a moated Hall, an ancient, lone—some place,
Enclosing in its flanking wall a Plaisance and a Chase;
And there she came to tend a dame of high degree and fair,
And her young son, a little one, the first born and the heir.

The Countess look'd into its eyes with bright and searching glance,
Whatever she felt, her fate denies her tongue the utterance;
Hearing and speech to her are lost; in silence, day by day,—
The nurse's time of servitude wore wearily away.

One night the lordling soundly slept within its cradle bed,
A silence perfect and profound throughout the room was spread;
When mark'd the nurse the lady rise, with strange and earnest air,
Back looping from her beaming eyes her long luxuriant hair;
Nurse watch'd her for a little space, as o'er the child she bent,
And strove to read upon her face her thought or her intent.

Alarm'd, she saw her raise on high a missile she had brought,
Ah! what avail'd the warning cry that sudden fears extort.

Far flew the fragments of the vase, when dash'd upon the ground;
The startled child by cries hath shown, he heard the sudden sound.

Ah! who that mother's dread could doubt, who saw the wild career,
The burst of joy sincere, devout, that greeted her success?

With him she sought her couch again, nought then could them divide,
And morning's dawn beheld the twain fast sleeping side by side.

The Earl came at the morning's dawn, but started at the door,
To see the wrecks, not yet withdrawn, lie shatter'd on the floor.

But she with fond and loving signs, kissing her boy, explain'd
How now her heart was set at rest, how she that rest attain'd;
That he her doubt and fear had shared, her happy lord confess'd:

Means to remove it, she, alone, found in her loving breast.

THE SAILORS' HOME.

I WAS thinking occasionally of Gray's "Bard," and then of old Lord Lovat and the heroes of "the forty-five," and of Horace Walpole's account of their execution, and how Lady Townsend was afraid to go anywhere to dinner for fear of "a rebel pie," as I crossed Tower Hill the other morning in my way to visit a peculiar institution in the neighbourhood of the London Docks; I mean the "Sailors' Home" in Well Street. I had learned that such an Institution did exist, some time before, from my young friend and old messmate, Mr. Pipp, late midshipman of H.M.S. "Troubadour." Pipp, who, when I was with him in the "Rattler" (sixteen gun-brig), was one of the idlest men in the profession—who used to smoke cigars out on the bowsprit, when the foresail hid him from the First Lieutenant—who cut down the hammock of the respectable Greek pilot whom we employed in the Archipelago.—Pipp, I say, has now become quite a sensible fellow. He scrutinises our naval expenditure (I wish him joy of the job), talks about "the lines" of the "Inconstant," and bids fair to be the most unpopular member of the next dandy mess he joins. We had often talked over the character of seamen; and had agreed that it was barbarous that these poor fellows should be turned adrift when they landed, at the mercy of the abominable scoundrels who look out for them in sea-ports to plunder them—treating each, as he lands, like a stranded whale, to be cut up for the sake of the blubber, and picked clean as unscrupulously as possible.

Now, the "Sailors' Home," in question, was established in 1835, to give sailors a fair chance of snug quarters when on shore—decent, orderly life—and practical assistance in the management of their business affairs. For, it is to be observed," said Pipp, with

the air of a man, conscious of his power of instructing you, "that when a fellow lives the greater part of his life afloat, all land is to him, more or less, fairy land. You see! A certain halo, you observe, surrounds the meanest land, 'long heath, brown furze, anything,' as what's his name says in the Tempest. He feels when he gets on shore, as a respectable man would, who had been miraculously detained a year or so in a balloon. Hence, he can scarcely be called *compas*, but wanders like an Eastern in an enchanted valley, and requires protection!"

Pipp's period, though a long one, stuck to me; and I found myself a few days afterwards crossing Tower Hill as above mentioned.

Even as certain carved floating pieces of wood informed Columbus that he must be drawing near land, so changing aspects informed me that I was arriving at nautical regions. Marine stores tempted, instead of shawls. The Eastward Jews, happily adapting themselves as ever, sold pea-jackets and straw hats, as those of the West sell flash waistcoats. Some young sailor apprentices were playing at leap-frog. Here and there, a corner shop was presided over by a naval officer with a quadrant, who would infallibly be removed by night as a libel on "the profession," by some friends of Pipp's and mine, if he dared to show himself at Plymouth or Malta. There, you saw extracts from acts of Parliament about merchant seamen, stuck inside the windows, with rope, hour-glasses, Gunter's scales, and dog biscuits. And along the narrowing streets, tumbling round corners with a peculiar jerk—half suggestive of the shooting of the Irishman's gun—and walking along (one foot on the pavement, one on the street) came seamen of every age and clime. A merchant seaman in a red shirt: a sailor boy "done brown" while still "tender;" being, as it were, spitted on top-gallant yards, and cooked before tropical suns: a black negro cook, greasy and grinning, with little ear-rings as ornamental as a ring in a pig's snout. These were the most notable specimens.

I was amused with an ingenious puff of some certain "patent sails" in one window. An engraving represented a tremendous gale of wind, with two frigates on a lee-shore. The prudent frigate, which had supplied itself with "our patent sails," was thrashing away to windward, very prosperously; while the sails of its neighbour were blown from the bolt-ropes!

A fine air of free-and-easiness, indeed, prevails everywhere as you travel eastward, after passing the Tower. The rag-seller, standing under a black ruin of rags, beside his wretched window—where the mouldy fragments look like bits of a disinterred shroud, and the bottles seem only fit to keep vipers in spirits in—looks fiercely at you, through a blood-shot eye. Even the policeman is not the stern composed guardian of the constitution familiar to Regent Street;

he is too often an easy *Nigger* man, with loose belt and wildish air. Nay, I am not sure that a certain division is not highly convivial;—did my eyes deceive me when I saw a pewter pot or two, wearing an aureole of froth round their heads, go into a station-house?

Every now and then the Blackwall Railway seems to cross you, as you turn from street to street, and is highly puzzling. Once it will lie like a huge box, or the side-wind of a caravan, just before you; in a few minutes it seems breaking like a thunder-cloud over your head; and again, perhaps, turns up across a street with a fine airy look, while an engine flies through it like a "resonant steam-eagle," as Mrs. Browning calls it.

The "Sailors' Home" has quite a dignified look as you reach Well Street, with tall columns and steps that lead up to the porch. There is a buzz of sailors generally about the door; you pass through swinging portals, and find yourself in a large airy room, with a fire at each end. Up and down this the inmates are walking two and two, as if they were pacing the deck; or are sitting smoking by the fire. One is, perhaps, a nautical dandy, with wot curls and little ear-rings. These ear-rings always amuse me,—and there is ground, too, for philosophical speculation in considering them. Among the ancients they were badges of servitude. Plutarch gives us a very good joke of Cicero's *apropos* of that; a noisy lawyer, of servile origin, complained petulantly that he "could not hear" something or other. "That is strange," said Cicero; "for you are not without a hole in your ear!" Now-a-days, we see, they are worn in the States—by the freest part of a free people.

Soon after my arrival the sailors went to dinner. Rows of tables in symmetrical order were spread over the floor; and seated at these, I saw my old unmistakable friends, the "blue jackets," discussing their beef; generally, what a naval man would call a good set of men—strong, quiet, self-reliant-looking men. One feels as if one was an intruder, and comforts oneself with thinking of one's good intentions—but don't be alarmed, visitor! That is all your conceit. Jack is nowise disturbed by your presence. He cuts his beef, looks at you casually as you pass in your inspection, and puts you quite at your ease! I really think that a sailor has as good manners as you ever see any body with. There is such a calm good-natured independence about him; a Neptunian politeness, which carries you along like a fine rolling wave. "Manners" being, however, the characteristic of a man "who feels the dignity of man, and is conscious of his own"—as Carlyle has described it, and as Brummell never knew it to be!

The fact is, that a sailor is generally in a true, real position—has certain work to do—certain people to obey. There are no false struggles, no sham pretensions, afloat. Every thing is determined by book and order. Jack will love a ruffian if he is an honest ruffian, and

a barbarian if he is a well-meaning barbarian. It is the continual value set on reality at sea, that gives him independence and self-possession. The ocean knocks him about till he is rounded like a pebble. Salt water keeps character wholesome, as it preserves beef.

I did not enter much into conversation with our friends this time. The Mercantile Marine Act has so frightened them, that they are half-inclined, I really believe, to think that every civilian is in league with the Board of Trade—an imputation to which I, for one, don't desire to expose myself. I went up to one man, and asked him where he'd been cruising lately? Oh, he had been to Buenos Ayres; he'd been to Chili. Chili was a fine place to be ashore at. The man with him informed me very curtly that "he knew a great deal too well to go into the Queen's service."

At one side of the room was a beautiful model of a man-of-war—quite a mammoth in miniature—with fairy tackle, and airy cordage—

"The top-mast halyards, of long spinners' legs;
The royals, like the wings of grasshoppers—"

such a ship as that notable sailor, Captain Lemuel Gulliver, may possibly have dragged from its moorings off Blofascu. In a corner is an elegant bust of the late Captain Robert James Elliot, R.N. This gallant and good gentleman founded the institution, and is held in honourable remembrance by all connected with it.

Above stairs are the "Dormitories," where each resident has his "crib," using that word not in its slang, but in its primary sense. All the little doors are duly numbered in rows, and the whole bears a very snug, cleanly, "ship-shape" appearance. There is a Rhadamanthine law against "smoking in the Dormitories" written up here and there, with Spartan precision—an amusing evidence of the popular love of tobacco on the high seas. There is a lecture-room, where lectures are given to the men, and spacious maps hung up for their use. There is, besides, a lending library at their service; various models, also, of English and foreign ships.

When I descended again to the dining-room, I found that a snug party had assembled round the fire with their pipes—among whom a Malay sailor seemed conspicuous as a conversationalist—and a couple of big swarthy men were criticising the rig of the model man-of-war with a professional look; as they puffed their clouds amongst the rigging. Smoking is not forbidden in the dining-room. To deny a sailor tobacco altogether would be equivalent to damming up water from a duck, or fencing off thistles from a donkey.

The "Home" has its own little bank, with red ledgers all complete; and a "custrier" and "accountant," just like Coutts's! I apprehend many a sailor finds himself a capitalist, and enjoys the luxury of a capitalist in putting in and drawing out his cash at plea-

sure for the first time in his life, when he takes up his residence here. It must be quite a new sensation to Jack to draw a check in payment of a new tobacco-box, or a few pounds' worth of slops. Now that he has got old he finds this banking system far preferable to the plan in vogue in his youth, of eating bank-note sandwiches, and converting Mr. Henry Hasc's promises to pay into pipe-lights.

There is a pretty little Church, "St. Paul's Church, for Seamen," close by, where the Chaplain, the Reverend Mr. Griddle, officiates. This church has eight hundred free seats, and is very well-attended by the seamen; who have bibles and prayer-books supplied to them gratis.

To this enumeration of the comforts and advantages of the institution, I must now add something respecting its business affairs. It was first started, and has always been mainly supported, on moral as well as social grounds. What villainous cruelty, complicated with lamentable sin, sailors just turned adrift from their ships, with their pay in hand, are exposed to—is almost beyond belief. A class of men exists—forming a distinct body—and organised and recognised as such by the name of "Crimps" (a class *per se*, like "Thugs"), who look out for sailors as their destined and natural prey. I should not wonder if they defend their villainies on the same grounds as an Animal-food-man defends his steak when assailed by an argumentative Vegetarian. The "Crimp" swindles the sailor out of his money, and encourages him in vice, while representing himself as his friend—just as you may observe a shark turns when about to bite, and shows the *whitest* part of himself in the act. This "Home" was started mainly to save seamen from these "crimps," and furnish them not only with a place to reside in, in decency and comfort, but with moral improvement and religious instruction. Perhaps, it would interest some readers to see the charge made to the men, which we extract from one of the Institution's documents. The following is a brief summary of what it proposes to do:—

"The seamen will have to pay two shillings a-day, or fourteen shillings a-week, for living at the institution; each man has a sleeping cabin to himself; four meals a-day are provided for the boarders; and a fair allowance of washing is included in the weekly charge.

"Lads, twelve shillings a-week, washing included.

"Apprentices will have to pay one shilling and sixpence a-day, or ten shillings and sixpence a-week, upon the same terms.

"The blessing of religious instruction, the opportunity of living a sober and decent life, a just account of wages entrusted to the care of the institution, security of property, and assistance afforded in getting men shipped again, are the advantages that the Sailors' Home holds out to the seamen.

"Writing, Arithmetic, Navigation, &c., are taught, *without charge*, in the evening, to the

Seamen and Apprentices boarding at the Sailors' Home, by the schoolmaster of the institution."

Seamen find, therefore, in this institution, a lodging-house, club, school, and church in one. That it has already done much direct good in the neighbourhood, we learn on the testimony of Dr. Stephen Ward, a resident in the district, who gives gratuitously his medical assistance to the "Home," and is well qualified to judge on the subject, from a prolonged professional experience of sailors.

Of course there are factions about this matter, as about every other; and I learned in my inquiry that "Sailors' Homes" have their opponents. These, however, consist mainly of sailors' lodging-house keepers, nautical tavern-keepers, and a curious brood of amphibious lawyers who undertake nautical litigation. The lodging-house keepers' opposition is natural;—they seem to consider that the superiority of *their* establishments consists in the absence of religious elements! We must be allowed to deny any superiority in this peculiarity of their houses. Who would judge of the institutions of Lycurgus by the censures of the Helots?

The charge of too great constraint is disproved by examining the regulations; and another charge which I heard made (that a preference is given to "Sailors' Home" men over others at the "Shipping Office" there) is disproved by the statistics of the establishment.

The average number of seamen resident at the "Home," I understood to be one hundred and sixty. From its opening, in 1835, up to April of last year, forty-four thousand seven hundred and eighty-eight boarders were received, of whom twelve thousand six hundred and fifty-six were old boarders. One fact is decisive in proof of the superiority of the sanitary arrangements of this establishment;—during the cholera one fatal case only occurred, the disease having been fatal to many seamen in the neighbourhood, who were less salubriously lodged.

I was told that the great mass of the boarders are generally merchants' seamen, rather than men-of-war's men; which seems attributable to the fact, that men-of-war being paid off at Sheerness, Portsmouth, and Plymouth, their crews do not so naturally drop in, as it were, to such a place, as the crews of ships coming up the river. Then, of course, these seaports have their "Crimps" as well as London; and there is nobody to act wisely towards the sailor; and I have no doubt, from my knowledge of the service, that there are plenty of Old School British officers who pooch-pooch such institutions altogether. These gentlemen have a vague notion that black-guardism and efficiency go together, and that all contrary effort is "cant." You'll curb their spirit, Sir, and take the 'dash' out of 'em; besides, you'll never do it, Sir, believe me! Now, all this is very melancholy and absurd, and must be got rid of before the condition of English seamen can be improved.

There is a "Destitute Sailors' Asylum," another institution in the same street, where shelter and food are given to seamen; who are in distress from any cause." In many cases the distress arises from the recklessness of the seaman himself, which such institutions as the "Home" are intended to strive against.

Mr. Green, the ship-owner, has a special "Home" for his own seamen, which is highly prized for its excellent arrangements. Its rules and regulations were adopted from the Well Street one, of which I have been writing. The average number of men in Mr. Green's, during the year 1849, was four hundred and eighty-seven; that in Well Street, for the same year, four thousand six hundred and thirty-three.

The "Sailors' Home" numbers many naval officers of rank among its directors; and many individuals have, from time to time, supported it with donations and subscriptions, though, perhaps, it has attracted as little aid and attention for an institution with objects altogether so honourable and important, as any we know.

A TIME FOR ALL THINGS.

DIFFERENT periods of the world have been signalised by different struggles of art or science, or other intellectual endeavour, in which the greatest nations, or those possessing most mental energy, were constantly engaged. Thus, we find the early Egyptians devoted themselves to astronomy, architecture, and mythological sculpture,—and produced wonders. War, as an art, was not cultivated; they thought only of vast armies swarming like clouds of locusts, to devastate an enemy's country. The early Greeks brought the art of sculpture to perfection; accomplished master-pieces in philosophy, and in the tragic drama, and greatly advanced the art of war. The early Romans brought the art of war to a higher state, and devoted themselves to it more than to any other study. Long periods of barbarism and feudal battles succeeded, until the revival of letters in Italy; and then we find the greatest intellects devoting themselves sedulously to all the chief branches of learning, science, and the fine arts. Astronomy was greatly advanced; chemistry, also, in many respects, by means of the passion for alchemy that so long prevailed; but painting was only brought to perfection in the time of Michael Angelo, Leonardo da Vinci, Raphael, and Titian. It was the most highly patronised of all things—kings, nobles, and the clergy, leading the way. The history of the world shows no patronage equal to it. Though adverse circumstances, by exciting the will of genius, have often proved advantageous to the ultimate development of greatness, it is yet well worth noticing what great and rapid results may be produced by the most favourable circumstances.

long period has been seen, when voyages of discovery amounted almost to a passion, with some nations. A period has likewise been witnessed, when philosophy and theology have been the leading subjects that occupied the minds of the first intellects in a given country; nor must we forget that a rage for destroying all old systems, both of theology and philosophy, without setting up, or even searching for new systems, was displayed in France to an extraordinary degree, before the first great revolution. In modern Germany, the efforts of the profoundest minds have been devoted to philosophy, literature, science, and the fine arts, pretty generally, in all their numerous branches, and without any special or exclusive devotion.

In America, the great national efforts in commerce, navigation, and the resolution to become a great maritime power, has hitherto nearly absorbed most other considerations, though men of intellectual energy have not been wanting in several departments of literature and learning. With America, however, steam and steam-boats have, for some time, been the predominating science; just as, in modern Italy, the science of music and the art of singing, have received an almost exclusive attention.

In England we have seen many changes of general study and devotion of public interest. We have been great voyagers, travellers, and discoverers; and, without being in any real danger in modern times from the attack of foreign foes, we have been much too fond of meddling in wars of almost incalculable expense, and taking the debt upon ourselves. During fifty or sixty years the British army and navy were the "rage" among all classes, and the arts of war by land and sea were our most popular subjects of admiration. Other studies were, comparatively, of small importance with us. Since then we have absolutely had, though it is very difficult to believe it at the present time, a rage for poetry (originating with Byron), rapidly followed by a rage for novels (originating with Scott), and we have also had something very like a rage for political economy (originating with Malthus), and something nearly approaching a rage for travels and voyages of discovery (dating from Bruce, Belzoni, and Parry), which has almost extended down to the present time, in consequence of the prolonged doubt as to the fate of Sir John Franklin.

But have we not done great things in learning, science, and the fine arts? We have but to point to the works of Bacon, Newton, Shakespeare, and Milton, to answer this question. But to speak of the present time. We have several fine historians, and they are extensively read; we have astronomers, though they are not duly regarded; and we have some great physiologists, but they also, (except from their regular classes) receive little or no public attention. To speak generally, geology and botany are studied at the present day, and natural history is neglected

always excepting the actual exhibition of zoological specimens. In general prose literature much is constantly doing, and with extensive success; while for periodical literature of a cheap kind, yet containing varied knowledge and information for the people, there is at present an unexampled craving. In learning, though we have many learned men, little is done beyond compilation, the age being much too "fast" to admit of a man, who has not an independent fortune, devoting half his life to a single great work of profound research.

In the fine arts, painting has been cultivated very successfully, but it seldom meets with any special patronage from the highest quarters, though sculpture has fared better, on account of its monumental character.

As for poetry, it is a curious, and indeed an almost anomalous fact, that England, whose people are fond of substantialities and realities, and are, apparently, not at all disposed to idealisms, has produced more really fine poets than all the rest of the world put together; and though living poets, with two or three exceptions, are little read at the present time, there are, even now, more real poets in England than all other countries combined can produce.

In music, there is little to be said for us, as composers; but some fine singers, and instrumentalists, we certainly have possessed. Of all native arts, however, those which at present must be pronounced as receiving the greatest amount of attention and encouragement, are the industrial arts; and, with respect to science, all those sciences which can be applied to the immediate efforts, designs, and necessities of the present day. Among these latter, the most prominent are evidently those of engineering and chemistry.

For the study of military engineering, there exist first-rate institutions; but for civil engineering, there is, we believe, only one college or public institution. Chemistry is taught in a great number of public and private institutes, but merely as a branch of knowledge included in a course of general studies. We have, however, only a very few good laboratories, where studies and experiments in chemistry are practically conducted.

Of the extraordinary and highly valuable services rendered to chemistry in Germany, by the indefatigable labours of Müller, Liebig, and others;—as in Stockholm, by Berzelius; in France, by Orfila, Lavoisier, &c. &c.—we need not offer any comment, as they deservedly possess a European fame. And in our own country, since the time of Davy and Priestley, down to our present most eminent chemists—Faraday, Graham, Hare, Ure, Brande, Cooper, &c.—we have not been far behind our friends on the Continent. But eminent as are our men, so few have been our regular chemical schools, and special means of communicating instruction in this department of science, that our manufacturers in various branches of the useful arts have

been beaten, and are beaten, to this day, in many of the most important of these branches, by the French, German, and Belgian manufacturers, as the Great Exhibition of 1861 will, in all probability, most fully demonstrate.

In the sciences of chemistry and engineering, however, we are rich in great names, and in other names of well-deserved eminence. With respect to chemistry, if we except Faraday and Graham, our own country may be somewhat outshone by the extraordinary labours and discoveries of Liebig and Orfila; nevertheless, as we have already shown, we possess many professors of first-rate excellence; and although the metropolis may lay claim to by far the greater number, we must not forget our provincial celebrities, whose energetic efforts have done much to promote the study. Foremost among these we should mention Mr. Herapath of Bristol, Dr. Musprat of Liverpool, and Mr. Daniel Stone of Manchester. In the engineering sciences, we are fully entitled to take the highest place among all nations; and though we are well aware of the great things done in Germany and France, and (in steam science) in America, we may still assert with safety, that the great works of a Brunel, a Babbage, and a Stephenson (we are only mentioning the living) justly place England at the head of all those, of whatever country, who have contributed to the engineering works of this most engineering age.

To sum up the gist of this concise, but comprehensive view, of the top favourites of the present time—for though there is "A time for all things," the world never takes to them all at once, but in succession—we should say that Periodical Literature, Foreign Music, and the sciences of Chemistry and Engineering, were the chief objects of practical study, and extensive patronage by the public at large, in our own country.

Having placed our great civil engineers at the head of all others, in this most extensively employed department of science, a few words should be added concerning the most important works, which the combined powers of the country have been long called upon, both by the people and by parliament, to perform. Need we say that we allude to the Sanitary regulations, affecting the interment of the dead, the removal of fever-breeding nuisances from crowded thoroughfares of the metropolis, the provision of a constant supply of pure water for every house, and a new and efficient system of drainage for London, and its environs.

Why have none of these things been done? A Tunnel under the Thames is called for—and it is accomplished. A stupendous iron Tubular Bridge is called for—and it is accomplished. An enormous Exhibition Palace for the Industry of all Nations is called for—and it is accomplished. But there, ~~he~~ our over-crowded burial-grounds, generating a poisonous atmosphere in the thick of the living and loathing people! There, runs the polluted Thames, of which we are com-

pelled to drink! There, stands Smithfield and other nuisances! And there, sit the Corporation of London, and the Metropolitan Commissioners of Sewers! Why are none of these evils removed? Why do these great, and universally-demanded national works stick fast in the mud of obstinacy and imbecility, and leave us all in the "Slough of Despond." We will answer why, in few words. Dr. Southwood Smith may work early and late, and devise, and exhort; Mr. Chadwick may issue report upon report; the best science may be employed; the best surveys, and the clearest statements, made and proved; the Press may denounce the Board of Health; the country may shout and wonder; Lord Ashley may uplift his hands and smite his forehead;—but so long as men so incapable of all great action as the Metropolitan Commissioners of Sewers (whose deepest anxiety, for a long time past, has been to escape out of office by a quiet back door, without even attempting to commence, or even lay down definitely, any really comprehensive system of drainage) are allowed to twaddle away so much money and time; so long as any nobleman, or gentleman, holds an authority for running wild in "woods and forests" to qualify himself for controlling the Board of Health, precisely because it is known that he will do nothing efficient himself, nor permit anybody else under his authority; so long as the Treasury is allowed to adopt every subterfuge for delay and evasion; and finally, so long as the people of England will endure all this, no one of these most desirable and universally demanded works will ever be accomplished. There is a time for all things; the time for these has absolutely come; but if the country has not strength and perseverance to insist upon them, we shall never obtain them, nor shall we really deserve them.

THE MODERN HAROUN-AL-RASCHID.

In the district of Ferdj' Onah, Algeria, (which signifies *Fine Country*) lives a Scheik named Bou-Akas-ben-Achour. He is also distinguished by the surname of *Bou-Djenoni* (the Man of the Knife), and may be regarded as a type of the eastern Arab. His ancestors conquered Ferdj' Onah, but he has been forced to acknowledge the supremacy of France, by paying a yearly tribute of 80,000 francs. His dominion extends from Milah to Rabouah, and from the southern point of Babour to within two leagues of Gigelli. He is forty-nine years old, and wears the Rahyle costume; that is to say, a woollen *gandoura*, confined by a leathern belt. He carries a pair of pistols in his girdle, by his side the Rahyle *fiar*, and suspended from his neck a small black knife.

Before him walks a negro carrying his gun, and a huge greyhound bounds along by his side. He holds despotic sway over twelve tribes; and should any neighbouring people

venture to make an incursion on his territory, Bou-Akas seldom condescends to march against them in person, but sends his negro into the principal village. This envoy just displays the gun of Bou-Akas, and the injury is instantly repaired.

He keeps in pay two or three hundred Telbas to read the Koran to the people; every pilgrim going to Mecca, and passing through Ferdj Onah, receives three francs, and may remain as long as he pleases to enjoy the hospitality of Bou-Akas. But whenever the Scheik discovers that he has been deceived by a pretended pilgrim, he immediately despatches emissaries after the impostor; who, wherever he is, find him, throw him down, and give him fifty blows on the soles of his feet.

Bou-Akas sometimes entertains three hundred persons at dinner; but instead of sharing their repast, he walks round the tables with a baton in his hand, seeing that the servants attend properly to his guests. Afterwards, if any thing is left, he eats; but not until the others have finished.

When the governor of Constantinople, the only man whose power he recognises, sends him a traveller; according to the rank of the latter, or the nature of the recommendation, Bou-Akas gives him his gun, his dog, or his knife. If the gun, the traveller takes it on his shoulder; if the dog, he leads it in a leash; or if the knife, he hangs it round his neck; and with any one of these potent talismans, of which each bears its own degree of honour, the stranger passes through the region of the twelve tribes, not only unscathed, but, as the guest of Bou-Akas, treated with the utmost hospitality. When the traveller is about to leave Ferdj Onah, he consigns the knife, the dog, or the gun to the care of the first Arab he meets. If the Arab is hunting, he leaves the chase; if labouring in the field, he leaves his plough; and, taking the precious deposit, hastens to restore it to Bou-Akas.

The black-handled knife is so well known, that it has given the surname of "Bou-Djenoni, the man of the knife," to its owner. With this implement he is accustomed to cut off heads, whenever he takes a fancy to perform that agreeable office with his own hand.

When first Bou-Akas assumed the government, the country was infested with robbers, but he speedily found means to extirpate them. He disguised himself as a poor merchant; walked out, and dropped a *douze* (a gold coin) on the ground, taking care not to lose sight of it. If the person who happened to pick up the *douze*, put it into his pocket and passed on, Bou-Akas made a sign to his *chinois* (who followed him, also in disguise, and knew the Scheik's will) rushed forward immediately, and decapitated the offender.

In consequence of this summary method of administering justice, it is a saying amongst the Arabs, that a child might traverse the regions which own Bou-Akas's way, wearing

a golden crown on his head, without a single hand being stretched out to take it.

The Scheik has great respect for women, and has ordered that when the females of Ferdj Onah go out to draw water, every man who meets them shall turn away his head.

Wishing one day to ascertain whether his commands were attended to, he went out in disguise; and, meeting a beautiful Arab maiden on her way to the well, approached and saluted her.

The girl looked at him with amazement, and said,

"Pass on, stranger; thou knowest not the risk thou hast run."

And when Bou-Akas persisted in speaking to her, she added:—

"Foolish man, and reckless of thy life; knowest thou not that we are in the country of Bou-Djenoni, who causes all women to be held in respect?"

Bou-Akas is very strict in his religious observances; he never omits his prayers and ablutions, and has four wives, the number permitted by the Koran. Having heard that the Cadi of one of his twelve tribes administered justice in an admirable manner, and pronounced decisions in a style worthy of King Solomon himself, Bou-Akas, like a second Haroun-Al-Raschid, determined to judge for himself as to the truth of the report.

Accordingly, dressed like a private individual, without arms or attendants, he set out for the Cadi's town, mounted on a docile Arabian steed.

He arrived there, and was just entering the gate, when a cripple seizing the border of his burnous, asked him for alms in the name of the prophet. Bou-Akas gave him money, but the cripple still maintained his hold.

"What dost thou want?" asked the Scheik—"I have already given thee alms."

"Yes," replied the beggar, "but the law says, not only—'Thou shalt give alms to thy brother,' but also, 'Thou shalt do for thy brother whatsoever thou canst.'"

"Well! and what can I do for thee?"

"Thou canst save me,—poor crawling creature that I am!—from being trodden under the feet of men, horses, mules and camels, which would certainly happen to me in passing through the crowded square, in which a fair is now going on."

"And how can I save thee?"

"By letting me ride behind you, and putting me down safely in the market-place, where I have business."

"Be it so," replied Bou-Akas. And stooping down, he helped the cripple to get up behind him; a business which was not accomplished without much difficulty.

The strangely assorted riders attracted many eyes as they passed through the crowded streets; and at length they reached the market-place.

"Is this where you wish to stop?" asked Bou-Akas.

"Yes."

"Then get down."

"Get down yourself."

"What for?"

"To leave me the horse."

"To leave you my horse! What mean you by that?"

"I mean that he belongs to me. Know you not that we are now in the town of the just Cadi, and that if we bring the case before him, he will certainly decide in my favour?"

"Why should he do so, when the animal belongs to me?"

"Don't you think that when he sees us two, — you with your strong straight limbs, which Allah has given you for the purpose of walking, and I with my weak legs and distorted feet, — he will decree that the horse shall belong to him who has most need of him?"

"Should he do so, he would not be the just Cadi," said Bou-Akas.

"Oh! as to that," replied the cripple, laughing, "although he is just, he is not infallible."

"So!" thought the Scheik to himself, "this will be a capital opportunity of judging the judge." He said aloud, "I am content—we will go before the Cadi."

Arrived at the tribunal, where the judge, according to the eastern custom, was publicly administering justice, they found that two trials were about to go on, and would of course take precedence of theirs.

The first was between a *taleb* or learned man, and a peasant. The point in dispute was the *taleb's* wife, whom the peasant had carried off, and whom he asserted to be his own better half, in the face of the philosopher, who demanded her restoration.

The woman, strange circumstance! remained obstinately silent, and would not declare for either; a feature in the case which rendered its decision excessively difficult. The judge heard both sides attentively, reflected for a moment, and then said, "Leave the woman here, and return to-morrow."

The *savant* and the labourer each bowed and retired; and the next cause was called.

This was a difference between a butcher and an oil-seller. The latter appeared covered with oil, and the former was sprinkled with blood.

The butcher spoke first:—

"I went to buy some oil from this man, and in order to pay him for it, I drew a handful of money from my purse. The sight of the money tempted him. He seized me by the wrist, I cried out, but he would not let me go; and here we are, having come before your worship, I holding my money in my hand, and he still grasping my wrist. Now, I swear by the Prophet that this man is a liar, when he says that I stole his money, for the money is truly mine own."

Then spoke the oil-merchant:—

"This man came to purchase oil from me. When his bottle was filled, he said, 'Have

you change for a piece of gold?' I searched my pocket, and drew out my hand full of money, which I laid on a bench in my shop. He seized it, and was walking off with my money and my oil, when I caught him by the wrist, and cried out 'Robber!' In spite of my cries, however, he would not surrender the money, so I brought him here, that your worship might decide the case. Now, I swear by the Prophet that this man is a liar, when he says that I want to steal his money, for it is truly mine own."

The Cadi caused each plaintiff to repeat his story, but neither varied one jot from his original statement. He reflected for a moment, and then said, "Leave the money with me, and return to-morrow."

The butcher placed the coins, which he had never let go, on the edge of the Cadi's mantle. After which he and his opponent bowed to the tribunal, and departed.

It was now the turn of Bou-Akas and the cripple.

"My lord Cadi," said the former, "I came hither from a distant country, with the intention of purchasing merchandise. At the city gate I met this cripple, who first asked for alms, and then prayed me to allow him to ride behind me through the streets, lest he should be trodden down in the crowd. I consented, but when we reached the market-place, he refused to get down, asserting that my horse belonged to him, and that your worship would surely adjudge it to him, who wanted it most. That, my lord Cadi, is precisely the state of the case—I swear it by Mahomet!"

"My lord," said the cripple, "as I was coming on business to the market, and riding this horse, which belongs to me, I saw this man seated by the road-side, apparently half dead from fatigue. I good-naturedly offered to take him on the crupper, and let him ride as far as the market-place, and he eagerly thanked me. But what was my astonishment, when, on our arrival, he refused to get down, and said that my horse was his. I immediately required him to appear before your worship, in order that you might decide between us. That is the true state of the case—I swear it by Mahomet!"

Having made each repeat his deposition, and having reflected for a moment, the Cadi said, "Leave the horse here, and return to-morrow."

It was done, and Bou-Akas and the cripple withdrew in different directions. On the morrow, a number of persons, besides those immediately interested in the trials, assembled to hear the judge's decisions.

The *taleb* and the peasant were called first.

"Take away thy wife," said the Cadi to the former, "and keep her, I advise thee, in good order."

Then turning towards his *chénax*, he added, pointing to the peasant, "Give this man fifty blows."

He was instantly obeyed, and the tale expelled off his wife.

Then came forward the oil-merchant and the butcher.

"Here," said the Cadi to the butcher, "is thy money; it is truly thine, and not his." Then pointing to the oil-merchant, he said to his *chinnax*, "Give this man fifty blows."

It was done, and the butcher went away in triumph with his money.

The third cause was called, and Bou-Akas and the cripple came forward.

"Wouldst thou recognise thy horse amongst twenty others?" said the judge to Bou-Akas.

"Yes, my lord."

"And thou?"

"Certainly, my lord," replied the cripple.

"Follow me," said the Cadi to Bou-Akas.

They entered a large stable, and Bou-Akas pointed out his horse amongst twenty which were standing side by side.

"Tis well," said the judge. "Return now to the tribunal, and send me thine adversary hither."

The disguised Scheik obeyed, delivered his message, and the cripple hastened to the stable, as quickly as his distorted limbs allowed. He possessed quick eyes and a good memory, so that he was able, without the slightest hesitation, to place his hand on the right animal.

"Tis well," said the Cadi; "return to the tribunal."

His worship resumed his place, and when the cripple arrived, judgment was pronounced.

"The horse is thine," said the Cadi to Bou-Akas. "Go to the stable, and take him." Then to the *chinnax*, "Give this cripple fifty blows."

It was done; and Bou-Akas went to take his horse.

When the Cadi, after concluding the business of the day, was retiring to his house, he found Bou-Akas waiting for him.

"Art thou discontented with my award?" asked the judge.

"No, quite the contrary," replied the Scheik. "But I want to ask by what inspiration thou hast rendered justice; for I doubt not that the other two cases were decided as equitably as mine. I am not a merchant; I am Bou-Akas, Scheik of Ferdj Onah, and I wanted to judge for myself of thy reputed wisdom."

The Cadi bowed to the ground, and kissed his master's hand.

"I am anxious," said Bou-Akas, "to know

the reasons which determined your three decisions."

"Nothing, my lord, can be more simple. Your highness saw that I detained for a night the three things in dispute?"

"I did."

"Well, early in the morning I caused the woman to be called, and I said to her suddenly—'Put fresh ink in my inkstand.' Like a person who had done the same thing a hundred times before, she took the bottle, removed the cotton, washed them both, put in the cotton again, and poured in fresh ink, doing it all with the utmost neatness and dexterity. So I said to myself, 'A peasant's wife would know nothing about inkstands—she must belong to the *tailor*.'"

"Good," said Bou-Akas, nodding his head. "And the money?"

"Did your highness remark that the merchant had his clothes and hands covered with oil?"

"Certainly, I did."

"Well; I took the money, and placed it in a vessel filled with water. This morning I looked at it, and not a particle of oil was to be seen on the surface of the water. So I said to myself, 'If this money belonged to the oil-merchant it would be greasy, from the touch of his hands; as it is not so, the butcher's story must be true.'"

Bou-Akas nodded in token of approval.

"Good," said he. "And my horse?"

"Ah! that was a different business; and, until this morning, I was greatly puzzled."

"The cripple, I suppose, did not recognise the animal?"

"On the contrary, he pointed him out immediately."

"How then did you discover that he was not the owner?"

"My object in bringing you separately to the stable, was not to see whether you would know the horse, but whether the horse would acknowledge you. Now, when you approached him, the creature turned towards you, laid back his ears, and neighed with delight; but when the cripple touched him, he kicked. Then I knew that you were truly his master."

Bou-Akas thought for a moment, and then said:—

"Allah has given thee great wisdom. Thou oughtest to be in my place, and I in thine. And yet, I know not; thou art certainly worthy to be Scheik, but I fear that I should but badly fill thy place as Cadi!"

END OF VOLUME THE SECOND.

HOUSEHOLD NARRATIVE

OF CURRENT EVENTS.

1550

FROM THE 28th AUGUST TO THE 25th SEPTEMBER

[PRICE 2d.]

THE THREE KINGDOMS.

HIS Excellency Baron Haynau appeared in London at a season when, to Horace Walpole absolutely nothing abides in London but flabby muck and wooden pines, and which are thought by devout believers in "newspaper dispensations" attributable to nothing so much as that fact, and the newsmagazine prevailing in consequence. Else he would surely have come at the season which extends its welcome to all such visitors and, flouting flattery, and crowned with laurels and gone like any other lion. As it was he stayed but a very short time, and, grateful as he may have reason to be to him, it was difficult for newsmagazines to peruse "without a feeling of subjective pleasure" (as Mr. Macaulay remarks of the mobbing and flight of July 1848) the mobbing and flight of Baron Haynau. In brutality to gentle women and cruel ferocity to noble men the General took a place above the Chief Justice for Jeffries never had an equal chance of glutting his thirst for blood. He had hanged thirteen general officers at Arad, on the same day whose dawn it hath had witness the fatal murder of the chief magnate of an ancient land, is a chance that falls to few and perhaps the only deed by which Haynau will be remembered. His biography will be easily written. When it is first just stated it is added that he flogged women for speaking ill of his emperor and that the emperor had rewarded him with dismissal, he was pulled out of England in disgust by a public law is drawn history will have closed its record on capture but not unsatisfactory, of his Excellency Baron Haynau. It will hardly trouble itself to inquire whether he passed from his estate in the dusk to the repentant arms of his imperial master, and exhumed the dynamite broomstick for a time. His flight from Bukhara will be the culminating point of his career.

Of other home incidents there are not many that call for remark unless we go back to another batch of Popish converts including weak-minded and the relative and the sister of a Protestant bishop two well-endowed vicars a richly benefited rector and if very important at least of Roman Catholic topographies. These Puseyite conversions to Rome are to be regarded with no feeling but of satisfaction by all good Protestants. The danger is not from those who go but from those who stay. The difference is between a fan and a treacherous enemy and as the good Arnold says, we will honour the one and hang the other. To take a notorious instance Mr. Allen the vicar of Launceston has only held his post in the English Church (to the disgrace of those who for the last four years have upheld his continuance there) in the hope and with the purpose of betraying it and there is really nothing in the fact of his now openly joining Rome, but a gratifying confession of the failure of his treachery. The fact that the great body of the English people was in our judgment never sounder in regard to all such matters than it is at present. There would be more danger in the accession of one member of the study thinking middle class population, than in fifty such apostasies as those of the latest batch recorded. Our only desire is that people who still remain in the English Church with the hope of obtaining what they call self-government for it may follow their friends as fast as possible. Self-government means interference of state-control and independence of state control means uncontrolled domination and uncontrolled domination is rejected.

The system of mixed education, says the address just published by the Roman Catholic Association at Thurles with more candour than its writers probably intended may have been devised in a spirit of generosity and impartial policy, but the statesmen who framed it were not acquainted with the miserable nature of its doctrines. That is perfectly true. There is no middle course for the devout adherents of Rome not in there any middle point of compromise for his Protestant laurels. There is no elasticity in a inability to progress in her doctrines or in her institutions. Poor Pio Nono tried it, and found it impossible, and now his Holiness sits in St. Peter's chair with his brain half shattered by the attempt. The big manly voice that at the outset of his pontificate sounded like a new evangel, has dwindled back to the old childish babble about miracles and mothers of mercy. His great acts since he resumed his seat have been three. He has satisfied the doubts of true believers as to the immaculate conception, he has recognised the miracle of the picture that winks its bare faced eyes at Rimini, and he has denounced all education which the Roman Church shall not be suffered to sit supreme.

Very humiliating is it to have to add that the latter decision directly affects the islands. The Synod of Irish priests at Thurles becomingly presided over by a priest who had dreamed the astronomy of Galileo and Copernicus as an insult to the wisdom of Moses and the son of Sancha has implicitly obeyed its infallible Head, and the Queen's College are condemned. It is said that the condemnation passed by a majority of only one, and that one a substitute for an abiding bishop, craftily provided by the Doctor M. Hale, but in the present temper of the Pope this will matter little. The much of it is, and is likely to get all possible help and confirmation from the College of the Propaganda. *Quantum valde* the decision may be taken as settled. The Irish Roman Catholics, then, are to be taught on Roman Catholic principles, or not to be taught at all. Newton is to be filtered through Duns, Herschell through the learned primitive Cullen, the text of Plato through the glosses of M. Hale, and politics and history through the Index Expurgatorius. Then science and astronomy, as well as their history and morality are to be strictly orthodox, and what this kind of orthodoxy means, a dispute now raging in France explains to us. The Archbishop of Paris

advocated for the liberties of the Gallican Church, puts under censure a newspaper famous for its sympathies with the Church Ultra-Montane. The newspaper protests against the censure; appeals to the Pope; and demands judgment whether its doctrines have not been such as are justified by Papal authority. But while the protest is on its way to Rome, a brief of the Holy Father, decisive of one of the questioned doctrines, is already on its way to the Bishop of Rimini. By this brief, Pio Nono gives a crown of gold to the miraculous picture; and so settles that point, which may be said to involve the doctrine of mechanical forces. The others are moral and historical. The newspaper asks the Holy Father if the Inquisition was not a perfectly justifiable mode of protecting the privileges of the Church, and if the Church did not strictly observe the limits of Christian duty in punishing rebellion to her faith by a St. Bartholomew massacre; nor does it seem possible, upon these points, to doubt the Holy Father's reply, when we know that already there has been bestowed upon this humane public instructor and questioner of his Holiness, "in testimony of his satisfaction, a beautiful medal struck in commemoration of his return to Rome." This being the character, then, of the teaching, historical, moral, and scientific, at present in highest favour at Rome, it need hardly excite surprise that the Queen's Colleges have been denounced. It is quite certain that such science, morals, and history, would be scouted there. What then? Of course there must be science, morals, and history, adapted to Roman Catholicism; and a Roman Catholic University is consequently to be founded, self-endowed, and self-supported. In other words, a country reported to be starving is to accomplish, for the obstruction of education, what the same country in its most lavish repeal-rent days was unable even remotely to contribute to, for the promotion of education. "We have within ourselves," says the Synod, again a little over-candid, "and in the persons of our brethren who are scattered, &c., ample resources, zeal, learning, talent, and the pecuniary means, for the accomplishment of such an object." One may imagine a good many people in England somewhat startled at this announcement; and disposed to think it a little hard that, since simple pecuniary means are within reach of Irish Roman Catholics for the perpetration of priestly bigotry, English Protestants should be required to contribute thirty thousand pounds a-year for the rearing of priestly bigots. Thus the Maynooth question, and several others, may happen to be involved in the setting up of this new University! Not two years ago the Vicar-General of Ardagh appointed the *Te Deum* to be sung within his diocese, for the Pope's denunciation of the "Colleges of the Godless;" and Protestant thanksgivings will be not less loud, and much more reasonable, when the Money of the Godless comes to be treated in the same way. It is pleasant meanwhile to note that the authorities of the Colleges gather courage, as their opponents wax in insolence; and that the temporary injustice done to Mr. Vericour has been already promptly redressed.

The same journals which describe the proceedings of the Synod, contain sundry petitions of Irish proprietors to be relieved from the tyranny of the poor law inquisition; nor have the priestly denouncers of the Queen's Colleges been the least vehement opponents of the Queen's poor-law. The moral of this points the difference between money to lift the masses from ignorance, and money to keep them in idleness. The one is contemptuously scouted at our hands, and the other greedily clamoured for. At the same time the opportunity, which might have been turned to noble profit by such an organisation as that of the New Tenant League, bids fair to be lost by obstinate adherence to impracticable schemes. Nothing will content its leaders but to settle by statute the valuation of rent, which is about as reasonable as it would be to settle wages and prices in like manner. Rational men turn from such mischievous proposals to wait patiently the working of the Encumbered Estates Act, to strive for amendments that shall give it greater efficacy, and to found upon it hopeful anticipations against the still continuing miseries of rack-rent, and indiscriminate eviction. Even limited as it now is, it has helped to rid us of not a few of those Irish landlords with the name and nothing else, with the means of the poor and the waste of the rich, with the duties of one condition and the necessities of the other, who have been the bane of the country. Nor does there seem reason to doubt Lord Clarendon's recent statement at his progress in the North, that the promise of a condition of things improving with these changes already begins to show itself in expanding commerce, thriving industry, and restored and rational tranquillity, at least in those portions of the Island most distant from the site of the Synod.

The vice-royal progress in the north of Ireland, the royal progress through Castle Howard and Holyrood to the less sophisticated enjoyments of Balmoral, and the various gatherings and feastings held in consequence, may be passed with this brief mention: pausing only to remark the hearty welcome with which Sir James Graham greeted Lord Carlisle as he passed through Cumberland in returning from attendance on Her Majesty. The key of that nobleman's character throughout life, he said, on the occasion of a public meeting, had been sweetness and kindness of heart. Other men (and particularly he alluded to the Queen most dear to him, who had lately passed to his account) had surrendered their early opinions only to the force of reasoning, and the slow induction of argument, and so exposed themselves to the charge of inconsistency. But Lord Carlisle's kind sympathies and generous feeling towards the great masses of his countrymen had induced him, from his first appearance in public life, to take the very course to which in later days other men had arrived; "and," added Sir James, with a certain glib humour amid his cordial warmth of eulogy, "his kindness of heart and generosity of feeling had stood in the place of reason in the course he had pursued." This was the substance of a speech which we find it very pleasant to record. And it reminds us of another which ought to have mention also. Opportunity was taken at Edinburgh to get Prince Albert to lay the stone of the New National Gallery, when he "improved" the occasion by an extremely graceful and pretty little address. It would seem that an old parliamentary grant for the encouragement of Scotch manufactures and fisheries has fallen into arrear, from the fact of those fisheries and manufactures sufficiently encouraging themselves; whereupon, this arrear being now appropriated to the building of a National Academy of Art, the Prince draws from it the model of a healthy national progress, as exhibited in the ruder arts connected with the necessities of life first gaining strength, then in education and science supervening and directing further exertions, and finally in the arts which only adorn life becoming longed for by a prosperous and educated people. That was doubtless true and ingenious; and the Prince has probably since heard, amid the healthy heathor of Balmoral, that a prosperous and educated people have a strong taste for nature as well as art, and are given to be extremely jealous of encroachment of any kind on their parks and pleasure grounds. For advantage having been taken of the Queen's holiday, to take possession in her name of a part of the holiday ground of her subjects in St. James' Park, very reasonable protests are rising on all sides, such as neither Queen nor ministry will be wise to

disregard. One of the most profligate proposals of last Session for some six and twenty thousand pounds for "the improvement of St. James Park," met with too cold a reception to be pressed upon the house; but the sufficiently scandalous sum of eleven thousand pounds which *was* voted is evidently serving for a commencement; and the improvement of the park, unless a sharp watch be kept upon it, is not unlikely to mean the adornment of the Queen's palace with a garden abstracted from the park, shut out from the public, and devoted to the royal nursery. But the public as well as the ministers are placed upon their guard, and in sufficient time.

So let us hope, are the city merchants to the danger of a continued inadequate water supply in the heart of London; seeing that a hundred thousand pounds were sacrificed at a fire in Mark Lane the other day, when hardly as many sixpences need have been lost if water for the engines could have been obtained. So, let us add with no inconsiderable pleasure, are a class of people that required even severer caution and warning than ministers, merchants, and rate-payers. In Edinburgh, just after the Queen's visit, the responsible officers of the Glasgow and Liverpool steamer *Orion*, wrecked in the summer off Portpatrick with a loss of more than fifty lives, were pronounced guilty of criminal negligence by the High Court of Justiciary, and sentenced, the captain to eighteen months imprisonment, and the mate to seven years' transportation. The case against both admitted of not the least doubt. The defence set up involved the old artifice of an attempt to discredit the compasses, and to prove a sudden inset of the tide; but the jury had not the least hesitation in fixing on the real culprits. If a doubt rest upon the verdict it is that the captain was not entitled to the comparative mercy of his lighter sentence. Assuming the correctness of the nautical testimony, he had for several weeks been steering a course notoriously unsafe, for the sake of a wretched and quite worthless advantage in point of time; and, though the mate bettered his master's recklessness when left in sole charge of the ship, the master continued as responsible for the peril incurred on that familiar coast, in that calm sea, on that lovely summer night, as the man who stood at the wheel when the danger came. What remains in the way of example, after unrelenting enforcement of the punishments awarded, it will become the Board of Trade to look to, after consulting certain recent acts of parliament. Had the boats been found efficient, and the discipline of the ship proved equal to the occasion, the terrible scene of shipwreck might have been deprived of nearly all its horror. It is perhaps hardly disconnected from this subject to add a word on the fate of the wretched man who destroyed himself in a balloon and pony ascent from Bordeaux the other day: and in the death of the poor child who tumbled on his head instead of his heels, in posture-making with his father, à la Risley. There is of course no effectual protection against incidents of this kind but in the refusal of the pleasure-seekers, for whom they are invented, to find pleasure in such unworthy excitements. It is perhaps some set-off, however, for the discredit of the victim in the balloon case having been an Englishman, that the holiday-makers for whom he put his life in peril belonged to another country. Mr. Gale would hardly have crossed the channel with his pony, if *Terminus* had encouraged him to stay here; or if Mr. Green's reception, in his like attempt at Vauxhall, had been a little more brilliant than it happily proved to be.

The results of the harvest generally are up to this period better than had been looked for, and the potato panic has culminated in a not worse supply than that of last year. The country is prospering, notwithstanding that particular classes, manufacturing as well as agricultural, feel the pinch of the transition state through which it is passing to what we hope is the sure promise of a yet solid and more enduring prosperity. Lord Brougham, in the interval of a little illegal amusement with which he has been disporting himself in Westmoreland, dolefully warns the world of the unpromising condition of law in general, and of matters of reform that have lately been taken too much out of his hands; but the world enjoys its summer holidays, does not seem to lose heart, and is doubtless very far from despairing of that good coming time which is to bring even popular education and law reform. It would appear at the same time very certain that Cambridge University will contribute little to either by the member she is about to elect to represent her interests in Parliament. What those interests can be supposed to be, we must infer from the fact that Sir John Herschell declines to represent them; and that the race is to be run between a man of John's and a man set up by the smaller colleges, whose bigotry at least ought to bring them in neck and neck, whatever their college votes may do. The Johnian is for going back to protection, and so is the man of the smaller colleges. The Johnian will have nothing to do with the Jew, neither will the man of the smaller colleges. The Johnian will fight tooth and nail against University Reform and the Educational Privy Council, and so will the small colleges man. Both are high wranglers, both are decent lawyers; yet never were twinedledum and twinedledee committed to more mortal difference than that which rages between Mr. Cowling and Mr. Wigrant. Friends of the University say it has all arisen from the contest starting up in vacation, when only the nobodies are in residence, and when the Master of Trinity is on his travels; but a somebody might surely have been summoned, and waited for, if that were all. Certain is it, we must admit, that London could not have supplied him, unless a police magistrate would have served: for, since Baron Hayman went so suddenly away, those excellent individuals, and the objects of their judicial care, have had the metropolis almost exclusively to themselves. Somewhat fantastic, too, have been their decisions now and then. While a beer-shop-keeper was fined 5*l.* the other day for selling beer on a Sunday morning, the captain of a steamer was fined only 3*l.* for recklessness that had nearly caused a frightful loss of life; and a "fashionably dressed" ruffian who had rioted in a theatre, and flung an enormous cauliflower in the face of one of the actors, was simply asked to put in bail for future decency. Thus fine by degrees, and beautifully less, justice is apt to grow. On the other hand we have to record our gratitude to one of these gentlemen for having pitifully condensed into two lines the philosophy of street-music. It was a case of *Acetab. bagpipes*, which have been lately added to other similar instruments of musical torture; and the defence being that the players got their living by playing on the bagpipes, Mr. Hardwick remarked that "they must not adopt such a mode of getting their own living as would hinder other people from getting theirs." Having touched on legal matters it may be worth while to glance at a Dublin Exchequer Court insurance case, in which the amount of money involved by the verdict turned out to be not greatly more than double the amount that had to be paid to the special jurors in consequence of the trial having been spun out to the enormous length of thirty-one days. A perfect assasment of a trial!

We began with Hayman, and may end with the monster of the deep; adding a word or two on another kind of monster. The assasment appeared on the Irish coast just as Hayman arrived, and as the *Pythia* formerly visited a land more tranquil. The latter was deemed worthy of a god's intervention and

was a brewer's drayman sufficed to lodge Hayman in a dust-bin; and for the third the issue as yet seems doubtful. First, he was first seen scratching himself against a beacon-light off Courtmaskerry; then he was seen while roving about Ballycotton Bay, electrifying small fish and Irish blue-jackets; and when last he was reported to be "very like a (bottle-nose) whale." Clearly he is at least a harmless reptile, and his annual visits promote what Dr. Johnson calls the harmless stock of public pleasure. It would be well if all human specimens of the reptile class were equally so. Mr. Feargus O'Connor's annual visits at Nottingham, for example, are quite another matter; for though there is farce enough in his proffered resignation of his seat to the electors and non-electors of the place, there is a good deal of tragedy in the kind of advice which he has the infamy to proffer along with it. On this last occasion he told the mob who had gathered round him that an English merchant or capitalist was one who traffics on the blood, marrow, and sweat of the people; and that the houses of parliament had no other use or intention than to suck the blood, the meat, and the marrow out of the people. There was no law, he remarked, for the poor. It was safer for a rich man to shoot at a poor man's head, than for a poor man to shoot at a rich man's hare. He singled out some neighbouring manufacturers by name as employing five thousand hands a-day, as being tyrants over that multitude of men, and able to give themselves at once a profit of 250*l.* a-week by reducing wages to the amount of twopence daily. Without an allusion to his own starving victims at Snig's End, he had the effrontery to protest that he had himself spent a hundred thousand pounds in elevating the position of the working-classes; but this piece of impudence was too braggart to meet with other than a cool reception, even from the tools and idiots who hurraled him. He proceeded to describe himself as the special object of government persecution in this country, and declared that for anybody to have had a hand in hunting him down was certain to insure that person's immediate distinction. In this way he accounted for the promotion of Lord Campbell and Sir John Jervis to be Chief Justices, and of Sir Frederick Pollock to be Chief Baron; because the first and second had prosecuted him at York and Liverpool, and the last at Lancaster. And truly what followed next of this choice oration seemed to challenge prosecution number four! The orator avowed, with cool deliberation, that the working-classes of England had been defrauded by the legislature of their fair share in the benefits of the steam engine, of manufacturing machinery, and of extended navigation, during the last half century; asserted that if his principles were carried out, the man who now earned ten shillings-a-week should earn three pounds; and promised that if he had but the power, he would make the taxes to be not more than four millions a-year. He only waited for a war, he added, to carry out these views. They were simply to be patient till France fell out with England, when it should be his care to enable every man to live comfortably, ay, luxuriously, on the sweat of his brow. The old, reckless, wicked story 'Jack (made the clothier is to dress the Commonwealth, and turn it, and set a new nap upon it. It was never merry world in England since gentlemen came up; but it will come right as soon as seven halfpenny leaves are sold for a penny, and the three-hooped pot has ten hoops, and it is felony to drink *small* beer, and the whole realm is in common, and Mr. Feargus O'Connor's mouth is the Parliament of England, and only his palfrey goes to grass in Cheap-side. Happily, however, this sort of trash has very few listeners now, and none among the better kind of working men of England. The braggart who uses it has been thoroughly exposed; and his schemes, except by the victims to whom they have brought loss and despair, are scouted and laughed at. Any one who would contrast the miserable dupes with whom he may still be imagined to have influence, with that noble class of thoughtful and sober men whose intelligence protects them against his arts, should consult and compare the views and wishes of English operatives as detailed before the Parliamentary Committee on the Savings of the Middle and Working Classes.

NARRATIVE OF POLITICS.

LORD CLARENDON left Dublin on the 2nd instant for a *Fortnight's Tour in the North of Ireland*. After visiting the Earl of Erne, and spending several days as the guest of the Marquis of Londonderry, he arrived at Belfast on the 12th. He made a public entry into the town amidst the most impressive demonstrations by the citizens. On the same day, the Lord-Lieutenant commenced his active progress through a round of invitations—to the Hall of the Ulster Flax Society, to the great flax-spinning mill of Messrs. Mulholland, and other notable bodies or establishments. From the Belfast Board of Guardians he received an address, informing him that the condition of the poorer classes in Belfast is gradually improving, and that out-door relief, with its demoralising effects, has been unnecessary. He congratulated them, in reply, on the fact that during a period of unexampled distress, the poor were maintained without assistance by the Government, and without the imposition of undue burdens on the ratepayers; and added—"I agree with you in thinking that the results are attributable to the industrious spirit and orderly habits which have long characterised the people of this city, and to the employment afforded by the prosperous state of trade and manufactures, which I trust may long continue; but they also reflect great credit upon those who are charged with the administration of the Poor-law in Belfast." In the evening a great banquet was given to Lord Clarendon at the Music Hall. He rode to the place of meeting in General Fitzroy's carriage drawn by six horses, a military band preceding him, and the streets crowded by se-

claiming thousands. He was received at the Music Hall by the Corporation in their robes of state; the Mayor preceding him into the dining-room, and as he took his seat the band played "God save the Queen." The guests included men of all creeds and political shades: near to the Mayor were seated the Bishop of Down and O'Connor, the Earl of Erne, the Marquis of Londonderry, Mr. Sharman Crawford, M.P., and Mr. N. Alexander, M.P. The notable speech after dinner was that of Lord Clarendon himself, in acknowledgment of his own health, "which was drunk with hearty and prolonged enthusiasm, the bands playing 'St. Patrick's Day.'" He dwelt in glowing language on the returning tranquillity and dawning prosperity of the country: "Among the most agreeable signs of improvement which have of late taken place in this country, I rank the fact that almost all men in Ireland appear to recognise the folly and uselessness of those political differences which have too long destroyed confidence, scared away capital, and fostered a spirit of animosity among the population. I do not, of course, allude to the legitimate discussion of political questions—the birthright of British subjects—which has utility for its basis and the public good for its object. I allude to that agitation which is carried on, not for the public interest, but for individual purposes; and I am happy in being able to appeal to this enlightened assembly whom I have the honour of addressing, whether, in this respect, a vast improvement has not taken place—whether a period can be recollected less characterised by scheming agitators than that of the two years which have just passed?" He paid a special compliment to Belfast, on her improvement in manufacture and art, and remarked the improved moral and social

character of the people of Ireland in general. One million sterling, he observed, had been already advanced under the Land Improvement Act, and the reports from the Commissioners of public works showed how well the example of improving landlords had been followed by improving tenants, and how important to the labouring classes was regular employment with money wages; "I certainly was grieved at seeing to-day large bales of flax—Russian and Dutch—that might have been replaced by Irish. I regretted the sight; still, it is gratifying to know that attention is being generally turned to the cultivation of flax in this country, and that owners and occupiers of land are beginning to understand how greatly their interests will be promoted by their contributing to advance the national manufactures. I regard the present movements in this direction as hopeful; and I look forward to a time when the advantages will become fully apparent, and when the interests of agriculture and manufactures will be interwoven and brought together into harmonious action." He then pointed out the beneficial working of the poor law throughout Ireland; and concluded with a compliment and an advice to the Irish landlords:—"With respect to the landlords of Ireland, I would take this opportunity of saying that they have been most unjustly condemned as a class. They have no due allowance—I might almost say no allowance at all—for the unavoidable difficulties of their position. I have the pleasure of being personally acquainted with many landlords, who, for kindness and attention towards their tenants, and who, for the zeal and untiring assiduity with which they perform the duties properly devolving upon them, are second to none in the world, and are deserving of the highest commendation. Among a class so numerous, I am well aware that there must be some bad men; but it is the conduct of a good man that will prevail, and I believe such conduct is prevailing. I believe the time is not far distant when the evils of absenteeism will be fully recognised in their true light; and when it will be seen that there is no supervision equal to that of the owner of the soil, and that the landlord will be rewarded more fully in witnessing the welfare and social comfort of his tenantry, than in spending their proceeds in his own pleasures and enjoyments elsewhere."

The statutes which constitute "*The Queen's University in Ireland*" have received her Majesty's sanction, and are now in full operation. The Earl of Clarendon has been appointed Chancellor, and a Senate is constituted, consisting of seventeen eminent individuals of different denominations, who represent generally the various departments of literature and science, medicine, and law. The Chancellor and the Senate appoint examiners, and grant degrees in art, medicine, and law, to the students in the three Queen's Colleges of Belfast, Cork, and Galway.

The Council of the *Tenant League*, now sitting in Dublin, have published the weekly report of their proceedings, with an address organising the movement. They have resolved to take steps for "systematically extending the principles and influence of the Tenant League, by holding sittings of the Council successively and at short intervals in various parts of the country; and, if the friends of tenant right in each district approve it, by holding public county meetings at the same time and place."

The sittings of the *Fraternal Congress at Thurles* terminated on the 10th; but its proceedings, it appears, are not to be promulgated till they have been submitted to, and received the authoritative sanction of, the Holy See. Archbishops M'Hale and Slattery have refused to accept the appointments, conferred on them by the Government, of visitors to the provincial colleges in their respective dioceses.

The "Synodical Address of the Fathers of the National Council of Thurles, to their beloved flock the Catholics of Ireland," has been published in Dublin, in the shape of a pamphlet. The Colleges are violently denounced, and the Roman Catholic priesthood are called upon to abstain from connexion with them. But the authority of this manifesto is doubted; it being said that on certain points respecting the Colleges, the opinions of the bishops were so nearly balanced as to produce a majority of one only.

Mr. Feargus O'Connor went through his annual form of tendering his resignation to his constituents at Nottingham on the 2nd instant. The meeting was far from numerous, and his reception rather cool. He expatiated on his services. During the thirty years of his political life, he had toiled against more antagonism than any man that ever came before him, or than, he trusted, any man that came after him would ever be compelled to encounter. He knew that, Nottingham being an important town, all who had represented it before him had received their reward. Lord Denman was Lord Chief-Justice; and Sir J. C. Hobhouse, who, when member for Westminster, said that he should like to turn the Thames into the House of Commons—Sir John, who was then a revolutionist, was now a Minister of the Crown. But did they suppose that, to be Lord Chancellor, or Prime Minister, or Lord Lieutenant of Ireland, or Governor-General of India, would induce him to give one single vote that was opposed to their interests? As he often told them before, he had never, during his thirty years of agitation, eaten a meal or travelled a mile at their expense, and he had spent over 100,000*l.* of his own money. Did he blame these men for turning round on him? No; he blamed the Chartists themselves. The man who earned 20*s.* looked with scorn on the man who only earned 10*s.*, and the man who earned 10*s.* with scorn upon the pauper. If he had his principle carried into effect, they would be able to earn, not 20*s.* or 10*s.*, but 3*l.* a-week each. He had created the public mind in spite of all antagonism—he had organised it—and when France fell out with England he would direct it in such a direction as would enable every man to live comfortably, ay, luxuriously, on the sweat of his own brow. (Hear, hear.) Nor was he an upstart democrat. His aged uncle had now lived 62 years in banishment, and was now 90, but was as staunch as ever. His father was immured for seven years in damp dungeons and cells, by which he had been hurried to a premature grave—and all for sake of freedom. He had, therefore, a hereditary right to advocate their cause. Mr. O'Connor went on in this strain for sometime longer; and then one of his supporters, Mr. Sweet moved the following resolution—"That we, the electors, and non-electors of Nottingham, beg most respectfully to tender our sincere thanks to our distinguished representative, Feargus O'Connor, Esq., for his unwearied and talented services as a member of Parliament for this town. Notwithstanding the base slanders heaped upon him by a hireling and corrupt press, and the ingratitude of a portion of the working classes; we beg to assure him that our confidence in him remains unshaken; therefore, we most earnestly request him to resume those duties which he has so ably performed, with honour to himself and satisfaction to us." Mr. Sweet then went on:—"If it is your pleasure that Mr. O'Connor should retire, he is quite willing to do so; but if it is your pleasure that he should go back to battle with thieves—they are thieves—they pass acts that rob us, and they are thieves—if it is your pleasure that he should go back to battle with them upon their own platform, he is fully prepared to do so." The resolution was carried almost unanimously; and Mr. O'Connor having briefly returned thanks, called for three cheers for "the Charter, and no Surrender," and also three groans for the Whigs. This was done with considerable spirit, and the meeting broke up.

The *Freshold Land Societies* are continuing their operations. On the 18th the Uxbridge Society took possession, with public celebrations, of eleven acres of fine meadow-land near the town; which will give sixty-four or sixty-six votes for the county of Middlesex to the shareholders. On the same day the Westminster Society took possession of thirty acres of land at East Moulsey; for which they have given 4700*l.*, and by which they will gain about two hundred and sixty votes for West Surrey.

The *Election for Poole* terminated on the 24th, by the return of Mr. Seymour, the Free Trade Candidate, who beat his protectionist competitor, Mr. Savage, by 188 votes to 167.—A keen contest is going on for the representation of *Cambridge University*, in the room of Mr. Law, between Mr. Cowling, and Mr. Wigram. The day of election is not yet fixed.

NARRATIVE OF LAW AND CRIME.

A man named John Ellis, storekeeper to the General Palmer, was murdered in New Zealand on board that vessel while lying in Port Nicholson, in April last. The ship was laid up in that port in consequence of her leaky condition, and the crew had left her. Palmer had charge of all the stores; and was in the practice of coming on shore every morning to transact business with Mr. Bethune, a merchant and agent of the ship residing in Wellington. He became acquainted with four men, named Good, alias Henderson, a deserter from the 60th regiment; Coslin, Jones, and Thompson, and they frequently visited him on board ship. He was missing for a week, and Mr. Bethune, fearing that he had been the victim of foul play, went on board the General Palmer, and saw Thompson, who, on being questioned, said the shipkeeper and Ellis had gone on shore some days before. Mr. Bethune, having reason to know the contrary, gave Thompson into custody, and upon proceeding into the cabin was annoyed by an intolerable odour, and upon uncovering one of the ham-casks, which had contained salt beef, the body of the murdered man was found steeped in brine. The corpse was dreadfully mutilated—the head having been severed from the body. Upon a post mortem examination it was ascertained that he had been disposed of as the Mannings disposed of their victim, O'Connor; he was first shot, and his skull was beaten in by a hammer. Suspicion falling upon the men visiting him, and who were last seen in his company, they were sought; but had absconded. They were subsequently apprehended in different parts of the colony; and, after several examinations, they were all committed for trial at the Supreme Court, which was to hold its sittings in June.

The Irish papers contain many accounts of *Affrays and Disturbances*, caused by the "evictions" which are daily taking place. On the 26th of August an affair of this kind took place near Ballinaloe. It is thus related by the Western Star:—"On Wednesday last, Mr. John Kelly, poor-rate collector, proceeded with three assistants, named Murray, Gavan, and Kenny, to distrain for poor-rates due by a man named Turley—the amount 11. 3s. After going on the lands of Ballymaun, and seizing eleven head of cattle, several people collected and succeeded in rescuing the cattle, with the exception of one cow. Some blows were given on both sides, when Mr. Kelly and his men were attacked with stones. Murray was struck by a stone on the forehead, which forced the blood through his ears and nose; and Mr. Kelly was hit on the back of the head and some other parts of his body. He had a double-barrelled pistol in his hand, and when knocked down two or three of the 'revengers' held him, wrested the pistol from his hand, searched his side-pocket for another pistol, which they got, and when taking it out also took 50l. in notes, either through mistake or design. So Mr. Kelly states. Mr. Kelly and his party, however, got away, and came into town, when Murray, who received such dreadful injuries, was put into hospital. He is the only support of a widowed mother. We understand that the lands on which the seizure was made were waste, and the cattle found there belonged to a number of poor farmers living in the neighbourhood."

There has been another dreadful case of *Murder in Tipperary*. On the morning of the 20th August, as Thomas Batters, of Clashdrumsmith, was going along the road at Broomaha, near Enly, he was fired at from behind a hedge, and was wounded in the wrist and thighs with large shot, making a dozen wounds. The assigned motive was that Batters was employed as caretaker on crops under seizure for rent, and also blamed for entertaining the keepers in his house. The unfortunate man lingered until the following day, when he died of his wounds at eight o'clock in the evening.

Mr. Feargus O'Connor has commenced legal proceedings for the purpose of *Recovering Rents* from the allottees at Snig's End, near Gloucester. On the 28th of August bailiffs proceeded from that city to serve fifty-two writs. The colonists, who had got intelligence of the coming storm, held a meeting on the preceding evening, and concerted their arrangements. On the appearance of the bailiffs they intimated that they would

"saturate the land with their blood before it should be taken from them." The bailiffs, therefore, retired.

The Captain and Mate of the Orion steamer were tried at Edinburgh, before the High Court of Justiciary, on the 26th and 28th of August. The names of the prisoners are Thomas Henderson and John Williams. It was proved that during the watch of the latter as second mate, the vessel approached closer to the shore than is usual by upwards of a mile; and that this unusual course was taken when the weather was hazy, and against the warning exclamations of the experienced seamen who had the look-out watch; the captain came on deck several times during the second mate's watch, and each time observed both the compass and the ship's position off the shore, which could be distinguished during nearly the whole course; thus the mate was shown to have conducted the ship recklessly, and the captain to have left him uncontrolled in his recklessness. The object was to cut off all corners, and to run a straight and swift course. On the part of the captain it was urged, that the usage in the Liverpool and Glasgow service is, that in fine weather he should retire to rest during the four hours of the second mate's watch, that time including an unwholesome part of the voyage; this usage was proved by several experienced captains and pilots; but all these witnesses negatived the propriety of the captain's retirement in hazy weather; yet the log-book of the Orion enters the weather as "hazy and calm." Moreover, the captain was on board, and supervised the course; so it was urged that he must share the responsibility of it. For the mate it was urged, first, that the course he gave was practically correct—but he was contradicted both by Captain Robinson of the Royal Navy, the hydrographical surveyor of the coast, from whose observations the Admiralty charts are prepared, and by commanders and pilots in the service; secondly, that the compasses were wrong generally—but it was proved that they varied only one point; and thirdly, that they were falsified on this particular voyage by eight tons of iron freight stowed near to them—but it was proved that this particular cause could only vary them two points. At the end of a trial of two days, the jury found both prisoners guilty. The court sentenced the captain (Henderson) to be imprisoned for eighteen months, and the mate (Williams) to be transported for seven years.

A case before the Lambeth Police Court on the 31st of August should serve as a *Caution to Railway Travellers*. A gentleman named Aldridge was summoned by the London and South Western Railway Company for riding in a carriage of a class superior to the one he had a ticket for, on Sunday, the 10th day of August. One of the ticket-porters at the Waterloo Road station, stated that on the above evening, on the arrival of the train, he found Mr. Aldridge with a lady and child in a second class carriage. The gentleman handed him three third class carriage tickets, upon which he asked for 3s. more, being the difference between the second and third classes. Mr. Aldridge refused to pay it, asserting that he had been told by the clerk at starting that he might come back in whatever class carriage he pleased. The parties had come from Hampton Court. Mr. Aldridge said he had asked the clerk for two tickets and a half, for self, wife, and child. Was told there were no half tickets. Paid 3s., and asked the clerk were the carriages covered. The answer that he got was, that it was no matter, as he might come back by whatever carriage he pleased. On returning, therefore, as the night was wet, he got into a second class carriage. On arriving at the terminus he was asked for one shilling a head, which he, in common with several others, refused to pay. Mr. Young, superintendent of the London and South Western Railway, said it was quite impossible that the case as stated by Mr. Aldridge could have occurred. The third class carriages were all uncovered on "excursion" days, as the 10th was. The fare to Hampton Court in them was but 1s.; in the second class it was 2s. and in that class they had half-price tickets, but not in the third class, and Mr. Aldridge had admitted that he paid only 3s. for three people. The magistrate fined Mr. Aldridge 5s., 3s. for difference of fare, and 2s. expenses of summons.

William Eli Sandham, a decently dressed young man described as a tailor, was charged at the Thames Police Court on the 3rd instant, with *Stealing a Penny*. A lad named Tighe, the son of a gentleman residing at Stepney, deposed that he was standing the preceding evening, in a crowd, looking at the Bladwell regatta, when the prisoner came close to him, and entering into conversation, picked his pocket of a penny, and then made his way out of the crowd. The lad's evidence was corroborated by his companion. A policeman said that in consequence of a communication from the boys he followed and overtook the prisoner. He asked him if he had taken a penny out of the boy's pocket; and the prisoner said, "No, I have not done so." On the way to the station-house the prisoner said he was a tailor out of work, and that he had but 1s 6d. in his pocket. The prisoner was very much excited at the time. The prisoner: I did not say I was out of work. I said I was not very busy. I am a master tailor, and have work at home. The police constable: I found upon the prisoner 1s. 4d., and an old penny piece; it was an old penny piece. The prisoner: Did not the youth say he did not know what sort of a penny piece it was? Blake: He first said it was an old penny piece; then he said he did not know. The magistrate said the case was so clear he must commit the prisoner for trial. The prisoner: What, for a penny! It will be the death of my mother; I left her at home very ill. Magistrate: I can't help it. You are committed for trial.

At the Thames Police Court on the 4th inst., Captain Alfred Palmer, master of the ship North Star, appeared to answer the claims of four seamen, Philip Neale, John Hannagan, Charles Williams, and John Wadler, for *Wages*, on a voyage from London to Mazatlan and back. The case disclosed irregularities during the voyage, which show the necessity of such a measure as the Mercantile Marine Act, lately passed. The vessel sailed in September last from London to Mazatlan, in South America. The crew was engaged at 2l. a month for able bodied seamen, and 1l. 10s. for ordinary seamen, out and home. It appeared from the statements, complaints, and recriminations before the magistrate, that the vessel, during the whole voyage, had been a scene of dispute between the captain and the men, and of a confusion and want of discipline which must have produced constant peril. The captain met the demands of the claimants for wages with charges against them of idleness, insubordination, and desertion, while they retorted with imputations against him of tyranny and oppression. The circumstances are too numerous to be detailed here; but the captain's charges against the men were so far substantiated, that their claims were materially reduced. Their counter complaints against the captain could not be entertained, as the question at issue was merely the amount of wages due to them; but the case showed how much the merchant service stood in need of regulation.

At the Mansion House, on the 4th, Augustus Styles, a chemist, of Camden Town, was committed for trial on charges of *Forging and Uttering* two bills of exchange for 300l. and 200l., which purported to be accepted by a Mr. Bailey, of Swancombe in Kent, an acquaintance of the prisoner. Styles pretended that he had received the bills from Mr. Bailey in payment for land. Mr. Bailey stated that there was no transaction of the kind, and that his signature had been forged.

At the Marlborough Street Police Court, on the 4th, two respectable young women complained of the conduct of a draper who had a *Tyket-Shop* in Oxford Street. They saw dresses in the window marked "1s.," among the lot was one without a price; a man at the door told them that that also was a shilling. The women entered the shop, bought the dress, and put down a shilling; the shopman threw the coin into the till, and then demanded 1s. 11d. more, snatched back the dress, and refused to return the shilling. The magistrate, remarking that this was the third or fourth case of the kind brought before him within the last day or two, told the young women that their only remedy was a suit in the County Court.

On the evening of the 4th, another attempt was made by the convicts to *Set Fire to Parkhurst Prison*. A warder of the Juvenile Prison, alarmed by a strong

smell of burning linen in one of the wards, entered it, and discovered in one of the cells a mass of fire the flame of which was reaching the ceiling. The fire was happily extinguished without further injury; and it was found on examination that a shovelful of live cinders had been obtained from one of the stoves used for heating irons in the adjoining tailors' shop, placed on the flooring of the ward, and covered with the sheets and bedding of the prisoners.

James Hill, charged with *Forgery* upon the Austrian Bank to the amount of 15,000l., was, on the 5th, committed by the Birmingham magistrates for trial at the next assizes.

At the Richmond Police Court, on the 6th, Francisco Mouhards, a foreigner about thirty years old, was charged with delivering *Begging Letters* to the *Duchess of Orleans*, and with obtaining money fraudulently. He was sentenced to imprisonment for seven days in the Brixton House of Correction. In his pockets were found a number of letters in English, French, and Spanish, signed "Francisco Michods," "François Michods," and "Francis Mouhards." They represented that the writer was a native of Caviaca; and that he has recently come from Paris totally destitute of food or lodging, and not knowing a word of the English language, cannot obtain employment. Among them was this pithy epistle to the Duke of Wellington:—"François Mouhards has had the honour to write to his Grace the Duke of Wellington on the 9th of July last, and has had no answer; and he comes to beg to know if his Grace will answer him. London, 6th August, 1860."

Richard Marsh, a beer-shop keeper, was charged at the Wandsworth Police Court, with *Opening his House on Sunday Morning*. A police-officer stated, that on the previous Sunday he saw the defendant's brother standing outside the door; on recognising the witness he gave a signal to the inmates, and on his reaching the door he heard the bolts drawn. He knocked, calling out, "It is the police; open the door." There was a great scuffling, and he heard the defendant ordering some one to run up-stairs. After a while the witness was admitted. He saw several pots, pints, &c.; some of them full, and the froth fresh. He went up-stairs to a bedroom, where he found fourteen persons, some lying on the floor, others in and behind the bed. Some of them had dogs in their arms, and others had children, and all were striving to keep their "armsful" silent. He knew most of the persons present, some of whom were now in court. The defendant said he did not sell any beer. He was anxious to get in his money, and the men only came to pay him; but it should not happen again. The magistrate said it was a very bad case, and unfair to the trade. He would inflict the full penalty, 5l., or a month's imprisonment. The fine was immediately paid.

Edwin Mogg, captain of the Cardinal Wolsey, Richmond and Hampton Court steamer, was charged before the Richmond bench of magistrates, at the instance of Mr. G. Scott, Portecuse House, with having *Endangered the Lives of Nine Persons*. It appeared that on the 6th of August there was an amateur regatta at Richmond, where several thousand persons were present in pleasure-wherries, skiffs, and other light boats. In the midst of a crowd of these boats the defendant set his engines in motion, without giving the slightest warning. The steamer came in contact with Mr. Scott's boat and upset it, immersing in the water the nine persons who were in the skiff. Among those who were thus in danger of meeting with a watery grave were several ladies, one of whom sunk five times before she was rescued. Three of their number caught hold of the steam-boat, which they were told to cling to, otherwise they would be cut to pieces by the paddle-wheels. These circumstances being proved, the bench fined the defendant in the penalty of 3l.

Edward Bishop, a young man fashionably dressed, was charged at the Southwark Police Court with *Throwing a Cauliflower* on the stage of the Victoria Theatre, and causing a disturbance in the house. Mr. Higgin, one of the actors, said, that on Saturday night, during the farce of the "Mouse," he was concealed under a table in the centre of the stage, while Mr. Korman was on one side, and a lady on the other. He heard an uproar in

the prisoner, and on looking out from his box, he saw the prisoner standing up, throwing a cauliflower on the stage, which struck witness on the head a very heavy blow. Finding that it was a cauliflower, he went forward and appealed to the audience, when nearly everybody pointed out the prisoner as the party who had thrown it. The uproar was so great that it was impossible to proceed with the performance, consequently witness went with his pass-key into the box lobby and demanded an entrance into the box where the prisoner was, but they refused to open the door. Mr. Orger, however, forced it open, and insisted upon the prisoner and his companions quitting the theatre. On their refusing to do so, witness seized hold of the prisoner and pulled him out, and handed him over to the custody of the officer. There was another gentleman in the box with two ladies. This evidence was corroborated by Murray, the constable of the theatre. In defence, the prisoner contended that there was no proof that he had thrown the cauliflower, and denied having done so. He called the two females who were in the box at the time. One of them, Mary Ann Williams, said she saw a cauliflower thrown on the stage, within a few yards of the performers. She did not see who threw it. Immediately afterwards Mr. Higgin came into the box and pulled the defendant out very roughly, and in the scuffle made his nose bleed. After Mr. Higgin left the box, he said that he had given the defendant a sound thrashing. Emily Forrester, the other female, said the cauliflower was certainly thrown from their box, but not by the defendant. Mr. Higgin was the *Moose* at the time, but she did not think the vegetable hit him. The Magistrate said it was quite certain, from the prisoner's own witnesses, that the cauliflower found its way from their box, and he had no doubt the prisoner was the party who threw it. It was a most disgraceful act, and as a caution to others, he should order the defendant to find bail to keep the peace for twelve months. Sureties were put in.

Two boys, named Campbell, dressed as highland pipers, and each provided with a pair of bagpipes, were charged, at Marlborough Street Police Court, with having *Refused to Quit* Suffolk Street, where they were playing, when requested to do so. A clerk to Mr. Garratt, an inhabitant, said, about 11 o'clock the boys put their pipes at work, and kept up such a concert of groaning and screeching with them, that his employer gave him directions to tell them to remove: the witness did so; and the boys refusing to comply with the request, a constable was employed, and they were brought to this court. The boys said they were the sons of a Scotch piper. They got their living by playing on the bagpipes, and they were employed by a lady who liked bagpipe music, to play before the door of the hotel in Suffolk Street, where she was staying. The magistrate told the boys they must not adopt such a mode of getting their own living as would hinder others from getting theirs. It would be impossible for professional men or tradesmen to carry on their daily avocations in the hearing of such a din of discordant sounds as would be caused by a couple of pairs of Scotch bagpipes. To the street-musical abominations of the Italian boys had recently been added that of Scotch bagpipers—a kind of concert sufficient to drive invalids and ordinary people crazy. The street musicians must be told that the law obliged them to go away whenever they were told to do so by any housekeeper in street, where they were playing. For the present offence he would inflict a fine of 1s. only, which should be made 20s. on the next occasion.

A dreadful *Murder and Suicide* were committed at Ballinagh, near Cavan, on the 9th. Dr. Creighton, a gentleman rather more than thirty years old, after practising as a surgeon in Dublin, became the victim of a delusion that his family were in a conspiracy against him. His friends removed him to the country, and settled him in a farm; thinking that the change might tranquillise his mind. Here he lived with an old maiden aunt and a man-servant: recently Miss Faria, a young relative, had been staying on a visit before she proceeded to America to join her friends. Dr. Creighton was now afflicted with a notion that his household wished to poison him; he would refuse food for days, and would catenate on the lawn: on other matters he appeared

rational, and so he was not placed under restraint. On the day above mentioned he went to his aunt's room, said the man was waiting to shave him, and thus got possession of his razor. A little while afterwards, Miss Creighton entered the kitchen, and was horrified by seeing Miss Faria dead on the floor, with her head nearly severed from the body. A train of blood led from the spot to the pantry; and there Dr. Creighton was found just expiring, with a gash in his throat: he seems to have wounded himself while standing by Miss Faria's body, and then walked to the pantry. An inquest on his body found a verdict of insanity.

Lord Brougham was engaged in a *Border Fray* lately near Brougham Hall, Westmoreland. There is some difference between his lordship and the Ramont and Eden Angling Association, as to the right of fishing in the river Eamont, or the right of fishing there at particular seasons. Lord Brougham has lately asserted his right through his keepers, and has furthermore taken parties of visitors to see the sport. He did so on the afternoon of Monday the 18th; the party, in two carriages, comprising Lord Brougham with his lady, the Marquis of Douro, Lady Malet, and Master William Brougham, with his wife and children. The game-keepers threw their nets; on which a party of ten men in ambush rushed forth, sprang into the water, and began a fierce conflict for the nets. A local constable, formally seized the nets under the Solway Act, which confiscates nets of a certain littleness of mesh. At length the Society's men managed to cut off about eighty yards of the net, and made off.

This matter became the subject of a legal investigation before the county magistrates, at Penrith on the 24th. John Robson, a blacksmith, one of Lord Brougham's men, was charged with illegally using a net of a construction prohibited by the act of parliament above mentioned. Mr. W. Brougham, for the defendant, stated that his brother and a party of friends had gone to the river Eamont on the day in question, with the express purpose of trying the construction heretofore put upon the Solway Act, their notion being that they had an undoubted right to fish in the manner they had done. The bench, however, were of opinion that the charge had been fully made out, and fined Robson 5*l.*, which was immediately paid.—John Robson then made a charge of assault against one of the men belonging to the opposite party. After hearing the Marquis of Douro, Mr. W. Brougham, and other witnesses, the Bench gave it as their opinion that a good deal of violence had been used, but as there were cross-charges for assaults, they recommended that all these charges on both sides should be withdrawn. The assault charges were accordingly withdrawn by mutual consent, and so the matter ended. This inquiry excited great curiosity, and the room was crowded with the neighbouring gentry.

Captain Aaron Smith was charged at Bow Street on the 11th, with *Assaulting the toll-keeper of Waterloo Bridge*. It appeared that on the previous day Captain Smith being in a hurry to catch the railway train, and finding the side-gate blocked up by passengers, had endeavoured to pass by the carriage-way. Being stopped by the toll-keeper, he attempted to force his way through, but was repelled and given into custody for an assault. He denied the toll-keeper's assertion that he had struck him, but justified his attempt to pass through the carriage-way. The magistrate fined him 5*l.*, but called the attention of the Waterloo-bridge Company to the inconvenience frequently occasioned to passengers by the narrow accommodation at present afforded to them. This has been attended to, and the tolls are taken from foot-passengers on both sides of the way.

A Coroner's Jury, sitting at Mallow, has returned a verdict of *Manslaughter* against Captain Busho, of the Fifty-ninth Regiment, for killing a little boy by striking him on the head with a whip. The verdict seems extraordinary. From the evidence it was not very clear that Captain Busho struck the child at all, though one witness alleged that he did so because a dog belonging to him had yelped, and he thought the boy had struck it. On the other hand, surgeons declared that the child died of water on the brain, and that there was no mark of violence on the head or face. The verdict, however, was received with expressions of delight by the crowd.

At the Thames Police Office, on the 18th, John Murphy was charged with being in the Hutchinson's Arms public-house, Devonport Street, with *Intent to Commit a Felony*. The curious point in the case was the discovery of the thief by a cat. Murphy was supposed to have left the taproom late at night; the cat was noticed to be uneasy—rushing at the fire-place, mewing, purring, and exhibiting anger. This induced the publican to look up the chimney; whence he succeeded in drawing down Murphy by the heels: a candle and lucifer-matches were found upon him. It would seem that in other cases the prisoner had robbed public-houses by concealing himself in the chimney at night. He was sent to prison for three months for his concealment at the Hutchinson's Arms.

On the 19th, John Gould was tried for the *Manslaughter* of a child named Towers. The evidence showed that it was the result of accident. Gould, an old soldier, decorated with two medals, is toll-man in the Vauxhall Bridge Road; a window of the toll-house overlooks a lane, apparently little frequented; Gould had been washing a basin with boiling water, and he emptied it out of the window, having no reason to believe at that time that any one was passing. Unfortunately two children, had wandered thither; the scalding water fell upon Towers, and eventually caused his death. Gould offered all the reparation in his power to the parents. Officers in the army gave him an excellent character. He was at once acquitted and discharged.

Mr. Alexander Shiver, a draper residing at Cheltenham, was charged at the Marylebone Police Court, on the 24th, by the superintendent of the Great Western Railway Company's police, with *Throwing a Bottle* from a carriage belonging to an excursion train, in which he was a passenger on the previous day, and wounding James Wise, one of the guards, at the Farringdon station. The defendant admitted having thrown the bottle, but without intending to hurt any one, and was liberated on bail till the wounded man's condition was ascertained. On the following day, Mr. Shiver re-appeared, and the guard, who seemed very weak and had his head bound up, stated the way in which he had been injured. The defendant's solicitor said, that as the occurrence was accidental, and as there was no danger to be apprehended, he trusted the magistrate would permit the defendant to make a compensation to the guard for the injury sustained. The magistrate said he could not consent to any compromise in a case in which the public were materially interested, and enlarged the bail in order that the case might be brought before the magistrates in the part of the country where the offence was committed.

At the Southwark Police Court, on the 25th, a young man named Cornelius Burrell was charged with being *A Suspected Person*, and with loitering about the South Eastern Railway Terminus for the purpose of committing felony. A policeman stated, that the prisoner with several others were in the habit of lurking about the railway, and were a source of great annoyance to the public, particularly on the arrival of trains, and that many robberies of females had occurred, who entrusted their property to those fellows, and in many instances never saw it again. On the previous night the prisoner was hanging about the place, and he (policeman) took him into custody, and locked him up. The magistrate said, that the policeman had no right to proceed in that manner. All that the prisoner was proved to have done was to walk about the place leading to the railway, which was open to every body; and it was not even alleged that any offence had been committed by him. The prisoner was therefore discharged.

NARRATIVE OF ACCIDENT AND DISASTER.

This ship *Indian*, *A fine East Indiaman*, was wrecked on the 4th of April, on her outward voyage from England to Bombay, on the Cargados reef of rocks, near the Mauritius. About eight o'clock at night, when running at six knots an hour, through some mistake, it would seem, in the reckoning, she suddenly

struck with a dreadful crash, and almost immediately went to pieces. The loss of life and property was deplorable. A letter from a gentleman on board gives a striking account of the catastrophe, and the sufferings of the survivors:—"We saw in a moment that all hopes of saving the vessel were at an end, as she heeled over to the leeward suddenly, the sea making a clear breach over her every roller. This was the work of a few minutes only. Three parts of the crew were by this time on their knees, crying and making the most frantic appeals to Heaven for aid. All order and discipline were now at an end. The captain and two seamen attempted to cut away the masts; but, owing, I suppose, to the excitement of the moment, they cut away the weather rigging only. The masts, of course, went by the board; but, being still attached to the vessel by the lee rigging and falling over to seaward, they served as a battering-ram, beating the vessel to pieces every successive roller. After the first burst of excitement was over, a simultaneous rush was made for the boats; but we found the only one that was available was the starboard quarter boat; the other two had been staved to pieces by the wreck. The captain was not slow in taking to our only apparent chance of escape, the remaining boat: eight of the seamen speedily following him. They shoved off, but pulled back once or twice near to the vessel, asking for water and bread, which, of course, it was quite out of our power to supply them with. He then pulled away altogether, which was the last we saw of him. The ship by this time was breaking up fast—the stern-frame burst out and was thrown up on the starboard quarter; and in a few minutes afterwards she parted amidships, leaving thirteen persons exposed to the fury of the surf on the forepart of the starboard broadside, where we remained till the morning broke. The tide turned about this time from ebb to flood, when the rollers came in with redoubled violence, and dashed the remainder of the wreck into pieces. All were immediately buffeting with the waves. Sharks innumerable surrounded us on all sides, which very much increased the terrors of our situation. Owing to my being hurled on the rocks by the surf two or three times, I lost my senses, and was perfectly unconscious as to what occurred till I found myself resting on a spar with a sailor. I found the ship had gone to pieces, and that five of our comrades had perished. Water surrounded us in every direction, with nothing in view but one or two small sandbanks, and those a long distance off. By night we had constructed a rude kind of raft, on which we slept; but as the tide ebbed we grounded, and, with the exception of our heads, we were literally sleeping in the water, cold and wretched, but still, comparatively speaking, safe. We remained on the raft in this state two days and nights; the sun scorching us by day, and the wind, owing to our being wet, making us dreadfully cold at night. On Sunday, the third day, having found a small quantity of oatmeal, we determined to start for the nearest sandbank. A sixty-gallon cask of beer, two six-dozen cases of wine, a piece of bad pork, and the oatmeal, were the only things saved from the wreck. We turned the raft, and after a severe day's work reached the bank about sunset, and once more put our feet upon dry land. We had only eaten once, and then but sparingly. Thus we lived fourteen days and nights, subsisting on sharks' flesh and the wine and beer we saved. Not a drop of water was to be had. On the 20th of April we saw a vessel to the leeward of us, and endeavoured to attract her attention by means of a boat-hook and a shirt attached; but she did not or would not see us. The next day, about one hour before sunset, another vessel hove in sight, and about the same spot the ship of the previous evening was seen. We again hoisted our signal, and walked about the bank, to show there were living creatures on it. We thought she did not see us; and after taking our allowance of oatmeal and sharks' flesh, we lay down for the night's rest. In a short time, however, we were alarmed by the barking of our dog; and on getting on our legs discovered to our delight a boat close in upon the sands. She belonged to the vessel we had seen in the evening. The mate and one of the passengers went on board that night, and the rest of the survivors were taken off the next morning; when we were conveyed safely to the Mauritius."

The *Emigrant-ship* was wrecked on the 4th of August, by going upon a rock while off the Banks of Newfoundland. She had on board 300 emigrants from Liverpool to America. The vessel was got off and ran ashore between Cape Ballard and Cape Race. The female emigrants were got into boats, and these having been safely put ashore, the boats returned, and eventually, after considerable exertion, the whole of the remainder were saved, excepting three children, who were lost in the confusion, and were supposed to have perished in the ship, which shortly foundered in five fathoms of water, and was a total loss. The poor emigrants lost everything they possessed; many reached the shore with nothing on their persons but their night-clothes. There were several cabin passengers; among them was an episcopal clergyman, who lost property to the amount of 1,000*l*. Amidst their misfortunes, a gang of desperate wreckers visited the spot, and carried off the little property that was cast up from the wreck and washed ashore; everything, in fact, they laid their hands upon they decamped with. The loss of the ship is ascribed, not only to the dense fog and darkness of the night, but in a great measure to the variability and uncertainty of the currents, together with the force and strength with which they set in towards Cape Race. The vessel was but partially insured.

A *Shocking Death at Hastings Castle* took place on the evening of the 27th of August. A party of young men and women were amusing themselves with the game of "whoop-hide" within the walls. On the south side of the garden, within the old ruins, there is a fence about three feet high, and a hedge growing outside of it, which serves as a protection from the bow of the cliff, which rises perpendicularly above St. Mary's Chapel, in Pelham Crescent, about 200 feet. In the heat of the chase, and to avoid being caught, a young man named Joseph Beck leaped over the fence, believing that there was a footing on the outside, and fell upon the roof of the chapel, where his body was found frightfully mangled. He was a respectable young man, who supported his widowed mother.

Several serious Railway Accidents have occurred this Month. A roadway crosses the line of the Eastern Counties railway through the fields of a farm on each side, near Colchester. On the 31st August, a waggon with three horses and the driver were engaged carting barley, and were in the act of crossing over for another load, when the railway train dashed into them, smashing the waggon to pieces and dreadfully mutilating the horses. Most providentially the driver, who was riding at the time, just before the engine struck the team had the presence of mind to spring to the ground, but in so doing barely escaped with his life, the engine in his perilous descent catching the flaps of his coat and completely tearing them off. One of the horses was found under the engine, and the others lay helpless on the ground. The passengers in the train were alarmed, and rushed shrieking to the windows, but it does not appear that any were injured.

Another accident occurred on the *South Western Railway* on the evening of the 3rd. inst. Between Esher and Weybridge, the engine-driver espied some moving objects on the line; he therefore shut off the steam and signalled to the guards to apply the brakes; but before they had sufficient time to do so, the engine came in contact with the obstruction in front, which was dashed to pieces, and in an instant portions of flesh and blood were scattered over the driver and stoker, as well as over several of the carriages. It was then ascertained that a great number of sheep had strolled upon the line from one of the adjoining meadows; but owing to the train not being impeded in its progress, the driver proceeded on his journey. Next morning it was ascertained that from twenty to twenty-five sheep had been cut to pieces. The animals, it seems, had obtained an entrance upon the line owing to some defect in palings which surround the meadow where they were at pasture.

Mr. Robert Middleton, a commercial traveller from Manchester, was killed on the *East Lancashire Railway* on the 6th, while travelling from Burnley to Colne. The train came into collision with a truck, while the

gate-keeper at a crossing near the station, Hannay, was attempting to move it out of the way. Considerable damage was done to the carriages, and Mr. Middleton was killed on the spot. It appeared, from the evidence at the inquest, that Hannay was an old man, unfit for his duties, whose wages were only 6*s*. a week, and that when the train approached, no signal had been made to warn the engine-driver that there was danger. The Jury found a verdict of "manslaughter" against Hannay; recommended an improvement on the line at the crossing, and stated their opinion that the gate-keeper and porter were not sufficiently paid to secure the protection of the public.

On the morning of the 9th, the *Dead Body* of a respectably-dressed man was found on the Liverpool branch of the London and North-Western Railway, between Eccles and Patricroft. Both his legs had been cut off by a train passing over him; but, whether he was a person who had been crossing the line, or had thrown himself in the way of a train, with a view of suicide, could not be ascertained. There were no papers in his pocket which could lead to a discovery of who he was, nor has he been identified by his friends.

Lieutenant Gale, the Aeronaut, was Killed on the 9th in the neighbourhood of Bordenax. He ascended on horseback in his balloon from that place, and reached the ground safely between Merignac and Cestas. He was engaged in exhausting the balloon of the remaining gas, when the peasantry who assisted him succeeded earlier than he seemed to expect in removing his horse. The balloon, disencumbered of the horse's weight, instantly soared aloft, snapping in two a young fir-tree which held the grapnel. Mr. Gale was not in the car, but was lifted up entangled by the ropes, and was presently too far aloft to let go. He held by the ropes while the balloon floated nearly two miles, and dropped either with it or just before it fell; his body was found in a tree, and the collapsed balloon in an adjacent wood. He has left eight children.

A captain of the National Guard of St. Pierre les Calais, named Millien, now on a visit to this country, has been instrumental in *Saving the Lives* of two children, who would inevitably have been lost but for his timely and humane conduct. On the morning of the 14th, M. Millien was passing over the Kingsland bridge, and hearing cries for help hastened in the direction whence they proceeded. Finding that some one was at the bottom of the canal, he immediately plunged in and brought up the body of a child, and hearing that there was another, he made another plunge, and another was saved, in the presence of a great number of spectators, amongst whom was Dr. L. Burchell, of Kingsland Road, whose exertions soon restored the children. It has been the good fortune of M. Millien to have saved twenty-two persons under similar circumstances, and to have been rewarded with the gold and silver medals of the institutions of his country, as the reward of courage and humanity.

A destructive *Firework Explosion* occurred in Spitalfields on the 16th. Mr. Clithero, of Weaver street, had an extensive factory at the rear of his house; the place was divided into compartments—the mixing-house, the filling-room, and the store-house. Mr. Clithero was employed with a workman in the mixing-house, when, by some means unknown, the combustibles took fire; there was a violent explosion, and the two men were blown out of the building into the yard, terribly burnt. Presently there was a second explosion, the fire having reached the filling-room; and after that the store-house exploded, with a crash and concussion far surpassing the preceding shocks. Houses in every direction were more or less shattered—windows and roofs driven in, and the furniture greatly damaged. The personal casualties were less serious than might have been expected, consisting only of bruises and slight cuts from broken glass. The Fire Brigade report mentions thirty-eight houses specifically, as having suffered; All Saints Church and National School had nearly all the windows smashed; and the greater portion of the large sheets of plate glass in the goods-dépot of the Eastern Counties Railway, a long distance off, were demolished. The firemen prevented the flames from spreading beyond the ruins of the factory. While one of the engines was hastening to

the place, a youth was knocked down opposite the Mansion-house, and the wheels went over his head and neck; he was removed to the hospital, where he died soon after.

A disastrous Fire in Mark Lane broke out on the morning of the 19th, in a house occupied by several firms; thence it spread to Seething-lane, taking firm hold of the extensive premises of Hayter and Howell, army-packers; the roof of the Corn Exchange caught the flames, and half a dozen more buildings were fired. When the Fire Brigade arrived, they devoted their efforts to save the Exchange and those houses on which the flames had not much hold, and in this they succeeded; but the house in Mark Lane and Hayter and Howell's were destroyed. The loss of property has been estimated at 100,000*l*. The premises in which the fire commenced were very extensive, having been formerly used as the town residence of one of the foreign ambassadors. It was erected after designs by Sir Christopher Wren, and presented an example of the magnificence of the early city mansions. Every room was beautifully panelled; the staircase, which was upwards of six feet wide, was formed of carved oak; and splendid specimens of scroll-work adorned the various ceilings. At the rear of the house stood what was formerly the ambassador's private chapel, but of late years it had been converted into a warehouse.

On the morning of the 19th an accident took place on the *Eastern Counties Railway*, whereby nine men lost their lives. Upwards of twenty men were engaged near Brentwood station in ballasting the line; about eight o'clock, they had just emptied a ballast-train: the morning was very foggy; while some of them were on the up-line, an up-train dashed into the midst of them; eight were killed on the instant, and another died a minute after. At the inquest, which terminated on the 23rd, it appeared that the morning was extremely foggy, that the train was not behind its time, and that there had been no negligence on the part of the driver; but sufficient precautions had not been taken to make the driver aware of the obstruction. The jury found that the deaths had been caused by misadventure, and expressed their regret that more caution had not been exercised for the protection of the men employed on the line.

On the night of the 20th, a serious accident happened on the *Great Western Railway*. An excursion train, returning from Bristol, came into collision with a horse-box which had been allowed to remain on the line, near the Wootton Bassett Station. The engine and four carriages were thrown off the line, and overturned, and several of the passengers seriously injured. An investigation took place before the magistrates at Swindon, and William White, the policeman in charge of the station, was convicted of neglect of duty, and sentenced to two months' imprisonment.

There has been *Another Fire at Gravesend*; it broke out about one o'clock on the morning of the 21st, on the premises of Mr. Drusen, a linen-draper in Queen Street, near the market-place, and destroyed these and some adjoining houses. A number of watermen had met together on the previous evening to commemorate a rowing-match for a prize given by the proprietors of the Rosherville Gardens, and these men were assembled, to the number of 160, in an hotel called the Town Arms Tavern, just opposite the house in which the fire took place; and it appears to have been caused by squibs and other fireworks let off by them in the street.

Two steamers have been *Shipwrecked* at the same spot, between the island of Jersey and St. Malo. On the morning of the 16th, the *Superb* was to have started from St. Helier's on an excursion trip, but in consequence of her machinery requiring repair, another vessel, the *Folke*, was substituted. It was soon discovered that she had sprung a leak and was fast foundering, but she was kept afloat till she reached some small rocks called the Minquiers, on the coast of France. The anchor was then dropped, and all the people on board, among whom were several ladies, were conveyed by the boats to the rocks; and after passing the night in that situation, they were picked up by the steamer *South Western*, from Weymouth to St. Malo. On the 24th, the *Superb* was herself wrecked at the same place, and with a much

more melancholy result. She left St. Malo at seven in the morning, and a little after nine, struck on the Minquiers rocks, then under water. A number of the passengers got into one of the boats and put off; but it speedily sank, though in smooth water, and they all perished. Fortunately the tide was falling, and soon left the ship high and dry on the rocks. Signals of distress were made, and after two hours, the survivors were saved by the *Jupiter* cutter and the *Courier* steamer. Besides those who perished in the boat, two children were thrown overboard by the shock when the vessel struck. The persons lost were Mr. Gossett, a merchant of Jersey, and his wife; Mr. Jackson, his son and daughter; Mr. Rottenbury, Miss Price, Mr. Sedgwick, and three of the crew. The survivors, about 40 in number, were landed at St. Helier's. An inquiry into this disaster must necessarily take place.

Two infants, of three years and fifteen months old, children of Robert Wardell, a labourer at Wetwang, were *Drowned* on the 23rd. At the inquest on their bodies, their mother gave an affecting account of their death:—"I went to glean in a field of Mr. Hill's, and took my two children with me. I left them under a hedge with some other children, and went off to glean. About 1 o'clock they both came over to the side of the field where I was. I gave them some cake, set them under a hedge, and told them to wait until I got another glean, and then I would take them home. A pond was near where I left them, but it was fenced off. About a quarter of an hour after I went to the place where I had left them, and I said, 'Have I two little bairns here?' as I usually did. I was surprised at not receiving an answer. I then began to look about, and on going to the pond I discovered the legs of one of the children projecting out of the water." A surgeon was immediately sent for, but he was unable to restore them to animation.

The Lille correspondent of the *Boulogne Interpreter*, states that the child of an English tumbler, named Elliott, was *Killed* while performing three feats with his father. The little fellow upon being thrown into the air from his father's foot, instead of falling upon his feet, by some unlucky movement, fell upon his head, which caused a dislocation of the neck, and, as a matter of course, instant death.

SOCIAL, SANITARY, AND MUNICIPAL PROGRESS.

THE *Board of Trade Returns* for the month ending the 5th August, show a decrease of exportations on comparison with those of August 1849, to the amount of 334,854*l*.; but the exports of the month ending August 1849 were unprecedented, and exceeded those of August 1848 by 2,012,600*l*. The decrease in the present return of exports is chiefly on cotton manufactures and yarn, together about 200,000*l*.; on woollen manufactures, 142,665*l*.; silk manufactures, 18,864*l*.; and on metals, 130,842*l*. On the other hand, there is an increase on linen and woollen yarns, and on raw wool: on machinery, coals, and culm; and on alkali: in the aggregate about 200,000*l*. The total exports during the first seven months of the year were 37,868,072*l*. against 32,879,865*l*. during the same time in last year. Among the imports, those of grain show an advance compared with the same month in 1849, of 500,000 quarters. After a considerable time of stagnation, the consumption of coffee shows a forward movement; that of tea and sugar, continues in its steady line of advance.

The total amount of income-tax paid by the several *Railway Companies* in England and Scotland for the year 1849 was, according to a recent return, 237,909*l*. 13*s*. 10*d*.; the amount for England being 218,899*l*. 18*s*. 10*d*.; and that for Scotland, 19,009*l*. 16*s*. The London and North-Western paid 50,684*l*.; the Great Western, 24,631*l*.; the Midland, 19,438*l*.; the London and Brighton, 17,056*l*.; and the Eastern Counties, South-Eastern, and South-Western, upwards of 16,000*l*.

A notice to the public has been issued from the General Post Office relative to *Sunday Postal Arrangements*. It declares that the regulations which have been

in force since the 23rd of June last are cancelled, and that the regulations previously in force are reverted to. The regulations are as follow:—"All post offices in England and Wales will be closed to the public on Sunday from ten A.M. for the remainder of the day; except in those cases where the delivery commences between nine and ten A.M., when the office must continue open for one hour after the letter-carriers are despatched; and except also in those cases where the delivery commences later than ten A.M., when the office, having been closed at ten A.M., must be re-opened for one hour after the despatch of the letter-carriers. No inland letters will be received on the Sunday, except such as are prepaid by stamps or are unpaid; for the deposit of which the letter-box will be open as usual throughout the day. Until the closing of the office at ten A.M., or during the subsequent hour after the despatch of the letter-carriers, foreign letters may be prepaid, postage stamps may be obtained, and letters may be registered on payment of the usual registration-fee: strangers, renters of private boxes, and those who reside beyond the limits of the letter-carriers' deliveries, may also, while the office is open, obtain their letters at the office window. Except at the times above-mentioned, no letters or newspapers can be delivered from the office on the Sunday." In consequence of the excellent arrangements to carry into effect the new regulation which came into operation on the 1st instant, for a delivery of letters and newspapers on Sunday mornings before church-time, it appears that this was accomplished to the greatest satisfaction of the inhabitants in every district. According to the accounts from the chief commercial cities, the deliveries were generally completed by about nine o'clock, or ten at the latest, without any trouble, thus affording the letter-carriers the remainder of the day to attend any place of worship they might think proper.

The new *Friendly Societies' Act* contains an important clause, suggested by the shocking murders committed to obtain sums of money insured in burial-clubs. It is as follows:—"That in all societies established under the provisions of this act, or of any act relating to friendly societies, it shall not be lawful for the trustees or other officers of such societies to assure a sum of money to be paid on the death of a child, whether a member of such society or not, under the age of ten years, excepting the actual expenses, not exceeding 3*l.* in case of each child, to be paid to the undertaker or person by whom the burial is conducted, and whose receipt alone shall be sufficient discharge to the society; nor to pay any sum of money which may have been insured and become payable on the death of any member thereof, or of the husband, wife, or child, of any member, unless the party applying for the same shall produce and deliver to the officer a certificate, signed by a physician, surgeon, apothecary, or coroner, in the form annexed in the schedule of this act." The form is to the effect, that death was not occasioned by criminal conduct, and that the party had not been deprived of life by means of any person beneficially interested in obtaining burial money from any society. Such certificate, where it is possible to obtain one, must be delivered, or the officer paying the money will be liable to a penalty of 10*l.* on conviction before a magistrate, one-half of which is to go to the informer.

Cheap pleasure *Excursions by Railway* are becoming more and more common. On Sunday, the 15th, three thousand persons went by the Great Western from Paddington to Bath and Bristol. On the preceding Sunday there was an excursion train from Bristol and other places to Windsor—about a thousand persons were conveyed. This novel Sunday excursion system for the Great Western Railway has roused a great opposition from the clergy of Bath and Bristol; who, headed by the bishop in the Bristol case, have sent remonstrances to the company against the "profanation of the Lord's Day." A deputation from the clergy of Bath, who waited on the mayor upon the subject, spoke of the demoralising effect produced by these excursions, and of scenes of riot and disorderly conduct in the streets by an influx of persons having no regard for the sacredness of the Sabbath, with the temptation held out to townsmen to join in those misdoings.

The *Westmoreland and Cumberland Agricultural Society* had its annual *Exhibition of Stock* at Carlisle on the 16th inst. After the ploughing matches and other proceedings the members of the Society dined together, the Earl of Carlisle occupying the chair. Among the company were the Bishop of Carlisle, Sir James Graham, M.P., Colonel Lowther, M.P., the Dean of Carlisle, Mr. P. H. Howard, M.P., the Hon. C. Howard, M.P., the Hon. Mr. Gage, Mr. Marshall, M.P., Captain Graham, the High Sheriff of the county, the Rev. Canons Gipps, Percy, Goodenough, &c. The noble chairman in giving "Success to the Cumberland and Westmoreland Agricultural Society," prefaced the toast by an able and pleasant address. He contrasted the old border days with the times in which we live. The time, he said, was not so many hundred years back when the gates of Naworth Castle, as of many other similar strongholds in the country, were only open for men clad in mail or doublets of proof, who perhaps did not wholly abstain from plunder, and who went abroad with a resolution to share what they could take in addition to the produce of the soil. It was not so much that they were intent on careful husbandry or the best manuring, but their thoughts were rather turned to those fat bees which he would not presume to say they "robbed," but which they "recovered" from their neighbours across the border. Well, they had changed their system since then. There were some who fancied that they still admired those days of yore. He certainly loved their pictorial associations, but he thought upon the whole that we had a much better time of it in the present day. We tilled our lands in safety; we had no "warder on the wall," or "beacon on the hill" to give us assurance that our flocks were not to be carried off wholesale, and that our shepherds might go to sleep in safety. Nay more, we could cross the Scottish border, and make our recognisances across the Solway; we might stretch our videttes as far as Eskdale and Liddesdale, not to burn the beeves or to harry the stackyards, but to examine, it might be sometimes to imitate, those processes of agriculture for which our Scottish brethren had obtained such just celebrity. This seemed to him to be the especial advantage of societies and meetings like the present—that our knowledge might not be confined to what this man might earn in our own parish, or what took place in the next parish, or the next ward, or the next county, but what occurred in the kingdom at large; what invention had been tried and tested elsewhere; what improvements had been put to the actual test of successful operation; what implements had obtained the prize in other districts; what are the best modes of rearing and fattening stock; what pedigrees had been most successful in introducing symmetry of limb and plenty of meat; to show you, in short, how far you ought to rest contented with your present practice, and what you ought to strain at imitating elsewhere. The noble Earl proceeded to say that the great lesson inculcated by the times in which we live was, the necessity of exertion, and of applying judgment and industry to all the processes of agriculture; and that the effects of this lesson was apparent in the improved farming of Cumberland. Independently of having some drawbacks and some difficulties peculiar to their climate and their soil with which they had to struggle, and which he was sure told advantageously for the pith and nerve of their stout northern character, there were other circumstances in their condition which ought to inspire them with good confidence in themselves, for it appeared, in one of the most recent accounts put forth by the Poor Law Commissioners in Cumberland (and he believed that Westmoreland was in nearly the same position), that the poor rates were of a lower proportionate amount than those of any other county in England. They made also an advantageous appearance in all the sanitary statements that had been put forth, and exhibited a very low comparative amount of mortality. Would they not, then, buoyed up by the just reputation of their united counties for the beauties of their natural scenery, for the crystal expanse of their lakes—and for the majestic crenelated of their mountains and the sturdy strength of their yeomen, consent to wrestle with the difficulties of their soil as well as they wrestled with one another; and for their bright lasses, whom it was superfluous in him

to praise—for the more important moral and mental qualities which distinguished them—for that sturdy independence which other country men would do well to imitate? In addition to these just titles to praise, those powerful incentives to renown and to virtue, they would also prove by the agency of such a society as that, by the hearty and enlightened co-operation of landlord and tenant, and, above all, by the energies of the labouring population, that the counties of Cumberland and Westmoreland would attain a proficiency in agriculture, which would enable them to take the foremost rank in that as well in so many other respects amongst the counties of their native land.—Sir James Graham, in giving the health of Lord Carlisle, said it was not the Cumberland fashion to flatter ministers of the Crown, and therefore he should speak the simple language of the heart. The family of the Howards (to which the noble president belonged) had been for many generations intimately connected with the county of Cumberland. In its various branches, in many generations, the family of the noble president had been distinguished for spotless honour, for social virtue, for public honesty, and for firm attachment to the cause of liberty and popular rights. Neither the favours nor the frowns of the court had been able to seduce or overawe that family. Those were great claims, and the noble chairman was worthy of his descent. He had, by his conduct and demeanour, gained friends everywhere; and though it might be said that one who so succeeded was "all things to all men," yet, in his case, there could be no such unjust conclusion. There had been no man more firm in his conclusions, no man more consistent in his friendships and attachments, no man more sincere and bold in the expression of them. And what was the key of his character? It was sweetness and kindness of heart. And though political allusions were forbidden, they must pardon him for one thing, it struck him so forcibly. Other men, by the force of reasoning and the slow induction of argument, had changed their opinions—amongst them, one dear to him, now gone to his last account. Of them it might be said, that they had yielded at last to reason and had exposed themselves to the charge of inconsistency. Let it be what it might, his noble friend, by his kind sympathy, by his generous feeling towards the great masses of his countrymen, had from his first appearance in public life taken the very course to which in later days other men had arrived, and his kindness of heart and generosity of feeling had stood in the place of reason in the course he had pursued. In conclusion, Sir J. Graham observed, that the present was the first public appearance of the Earl of Carlisle in the County of Cumberland, and called on the company to give him a greeting which he would never forget. The toast was drunk with three times three and loud acclamations.—The health of the landed proprietors of the county, coupled with the name of Sir James Graham, called him forth a second time. He bestowed the highest praise on the agricultural classes of the county. He said, that both the large and small proprietors of the county had shown confidence in agriculture. For every shilling they had expended in improving their property, he believed that during the last thirty years the tenantry had spent at least an equal sum—their industry, skill, and constancy amidst difficulties could not be too highly praised. On the part of the yeomanry he had seen an outlay so judicious, extensive, and productive, as to put to shame the great proprietors themselves. Nor was it confined to them; the great winners at that day's show had been neither landed proprietors nor yeomen, but tenant farmers. He thought, however, the fault of their agriculture was that they ploughed too much. His advice would be to plough less and to graze more. [This remark was received with cheers mingled with some marks of dissent.] Why, if high farming and good grazing did not pay, scourge crops and bad farming never could pay? It might be said that dairy produce did not answer, and that butter and cheese also, against the introduction of which from abroad there was a considerable protective duty, had fallen in price. If that were so, another article was steadily advancing in price which was closely connected with good farming. He referred to sheep and the value of wool. In the last seven months there had been no less than 41,000,000 lb.

imported from foreign countries, as compared with 31,000,000 lb. in the same period of the preceding year. At the same time the declared value of exports from this country of woollen manufactures had been 6,000,000 l. worth in the last seven months, as compared with only 4,000,000 l. worth in the seven months of the previous year, showing that there was for wool and woollen manufactures an increase of demand and price. He rejoiced to find, therefore, that there had been established within the last three months a factory for the produce of woollen goods in Carlisle. He concluded by giving "The Tenantry of the County." The toast was acknowledged by Mr. Hodgson, who gave "The Labouring Classes;" and the toast of "The Bonny Lassies of Cumberland," given by the chairman, concluded the evening.

PERSONAL NARRATIVE.

THE Queen, Prince Albert, and Royal Family, *Left London* on the 27th of August, and arrived the same afternoon at Castle Howard the seat of the Earl of Carlisle, by whom the royal party were splendidly entertained. Next day they proceeded to Newcastle, where they were received at the railway station with cheers, by an immense assemblage; from thence to Berwick where Her Majesty stopped to view the magnificent new viaduct; and arrived in the evening at Holyrood. There was no parade of a public demonstration; no triumphal arches or firing of salute; but the air was rent with the shouts of countless thousands, assembled on the neighbouring heights as the Queen entered the palace of her ancestors.—On the 30th, at an early hour in the morning, Her Majesty and Prince Albert ascended to the summit of Arthur's seat. The prince afterwards laid the foundation stone of the National Gallery, and the ceremony, which attracted an immense concourse of spectators, was very imposing. In the afternoon, Her Majesty visited the splendid new Hospital founded by the late Mr. Donaldson in the suburbs of the city, for the education of three hundred destitute children. She was most enthusiastically received on her route.—On the following morning the royal party left Edinburgh for Balmoral. At every halting-place and point of view during the journey, the people of all ranks crowded to gratify their curiosity or manifest their respect.—Her Majesty has since remained at her Highland home, enjoying with great zest the pleasures of the country. One day the Queen ascended to the summit of Ben-ne-bord, and another day was present at the "Braemar Gathering" a great assemblage of Highlanders, which takes place annually for athletic sports and other pastimes. Prince Albert has amused himself with shooting; his companions in the sport being the Earl of Carlisle and Sir Edwin Landseer. The Duchess of Kent has several times driven from Aberdeen to Balmoral, to join the family circle.

The remains of Louis Philippe were buried on the 2nd inst. Having been removed from Claremont to Weybridge, they were deposited in the vaults of a Roman Catholic chapel attached to the residence of Miss Taylor. The obsequies of the ex-monarch were conducted with the utmost simplicity, and there was an entire absence of that state which might have been expected to mark the funeral procession of an individual of such distinguished rank. At nine o'clock in the morning, mass was celebrated in the chapel by the late King's chaplain, Dr. Whitty, the Vicar-General of the London district, and several other ecclesiastics. After the conclusion of mass, the coffin was borne from the chapel to the vault, when it was placed in the tomb which had been erected in the centre of the vault, and immediately under the dome of the chapel. When the coffin had been deposited in the tomb, the Count de Paris, the Dukes de Nemours and d'Aumale, and the Prince de Joinville, entered the vault, and the Rev. Dr. Whitty read the prayers for the dead, the other clergymen giving the responses. The tomb was afterwards sprinkled with holy water by the officiating priests, the royal princes, and the other persons present. The sons and grandson of the late King then knelt down and fervently kissed the coffin;

they were deeply affected, and it was not without some difficulty that they were induced to quit the vault. On the lid covering the tomb in which the coffin was deposited, was placed the subjoined inscription, surmounted by the arms of the Orleans family and the royal crown of France:—

Deposite Jacent
Sub hoc lapide,
Dumce in patriam
Avitos inter cineres,
Deo adjuvante, transferantur
Reliquie
LUDOVICI PHILIPPI PRINCEPS,
Francorum Regis,
Die Augusti xxvi.
Anno Domini mdccl.
Ætatis 76.
Requiescat in pace.

The following inscription was engraved upon a silver plate on the lid of the coffin:—

LOUIS PHILIPPE PREMIER
Roi des Français,
Né à Paris
Le 6 Octobre, 1773;
Mort à Claremont
(Comté de Surrey, Angleterre),
Le 26 Août, 1830.

The *Will of the late Sir Robert Peel* contains a codicil, dated the 24th of March 1849, bequeathing to Lord Mahon and Mr. Cardwell, as trustees, all the unpublished letters, papers, and documents, either of a private or public nature, in his possession at the time of his decease. The following extract explains the testator's views, and is strongly characteristic of the lamented statesman:—"Considering that the collection of letters and papers referred to in this codicil includes the whole of my confidential correspondence for a period extending from the year 1812 to the time of my decease, that during a considerable portion of that period I was employed in the service of the crown, and that when not so employed I took an active part in Parliamentary business, it is highly probable that much of that correspondence will be interesting, and calculated to throw light upon the conduct and character of public men and upon the political events of the time—I give to my trustees full discretion with respect to the selection for publication of any portion of that correspondence; I leave it to them to decide on the period and on the mode of publication, in the full assurance that they will so exercise the discretion given to them, that no honourable confidence shall be betrayed, no private feelings be unnecessarily wounded, and no public interest injuriously affected, in consequence of premature or indiscreet publication. I am especially anxious that no portion of my correspondence with Her Majesty Queen Victoria, or with His Royal Highness Prince Albert, should be made public use of during the life of either, without previous communication with parties who may be enabled to ascertain that there is no objection whatever on the part of either to the use proposed to be made of such correspondence. I authorise my trustees to sell or dispose of the copyright of any of the said documents, if the case in which publication should be determined on by the trustees should be one in which pecuniary compensation for such copyright could be fairly and equitably made, not meaning, however, in any way to fetter their discretion in respect of the giving of gratuitous access to the document whenever they think such access advisable. In the case that any moneys should arise from the publication of any of the said letters, papers, and documents, I authorise the said trustees to apply the said moneys in paying the costs and charges of such publication as far as the trustees may be justly liable for such costs and charges, or other the expenses attending the execution of the trusts hereby reposed in them, and to apply the residue to the assistance or relief of deserving persons being in need of such assistance or relief, engaged, or who have been engaged in pursuits of art, literature, or science; or to apply such residue, or any part of it, in aid of institutions established for the relief or benefit of artists, or literary and scientific persons, and my said trustees shall not be accountable to any persons whatsoever for the application of any

such moneys. With these views, it is my desire that the trustees shall, with all convenient speed after my decease collect together all the said letters, papers, and documents, and subject the same to such examination as they in their uncontrolled discretion shall think fit. I give them the fullest power to destroy such parts thereof as they shall think proper, and to provide for the immediate care and custody and ultimate disposition of all or any part of the said letters, papers, and documents."

On the 4th instant, three foreigners, one of whom wore long moustachios, presented themselves at the brewery of Messrs. Barclay and Co. for the purpose of inspecting the establishment. According to the regular practice of visitors, they were requested to sign their names in a book in the office, after which they crossed the yard with one of the clerks. On inspecting the visitors' book, the clerks discovered that one of the visitors was no other than *General Haynau*, the late Commander of the Austrian forces during the Hungarian war. It became known all over the brewery in less than two minutes, and before the General and his companions had crossed the yard, nearly all the labourers and draymen were out, with brooms and dirt, shouting out "Down with the Austrian butcher," and other epithets of rather an alarming nature to the General. He was soon covered with dirt, and perceiving some of the men about to attack him, ran into the street to Bankside, followed by a large mob, consisting of the brewers' men, coal-heavers, and others armed with all sorts of weapons, with which they belaboured the General. He ran along Bankside until he came to the George public-house, when, forcing the doors open, he rushed in and proceeded upstairs into one of the bedrooms, to the astonishment of the landlady, who soon discovered his name and the reason of his entering her house. The furious mob rushed in after him, threatening to do for the "Austrian butcher," but fortunately for him the house was very old fashioned, and contained a vast number of doors, which were all forced open except that of the room in which the General was concealed. The mob increased at that time to several hundreds, and the landlady became alarmed about her own property as well as the General's life. She accordingly despatched a messenger to the Southwark police-station, and in a short time a party arrived, and with great difficulty dispersed the mob and got the General out of the house. A police galley was at the wharf at the time, into which he was taken and rowed towards Somerset House amidst the shouts and execrations of the mob. At Waterloo Bridge a cab was procured, and he was conveyed to Morley's Hotel. On the evening of the 6th, he left London for the Continent.

The Council of the Queen's College, Cork, has formally rescinded their former act, *Suspending M. de Vericour* in consequence of the work published by him; M. de Vericour having announced that he had already given directions for the alteration of the titlepage of his work, so as to convey that it was written by him as "Professor of Modern Languages," and not in his capacity as Professor to the Queen's College. The council also resolved that any professor should be at liberty to publish any work so that he did not in any way connect its publication with his collegiate duties and position.

Lord Viscount Falkland, who took a leading part in the proceedings of the recent Gorham meeting in St. Martin's Hall in July last, has gone over to the Church of Rome. The Rev. Eyre Stewart Bathurst, Rector of Kibworth in Leicestershire, and formerly Fellow of Merton College, Oxford, and the Rev. Mr. Alice, Vicar of Launton, have taken the same step.

Some of the Irish papers have been telling astounding stories of apparitions of the *Great Sea Serpent*. A Mr. T. Buckley, writing from Kinsale on the 11th instant, informs the Cork Reporter that he was induced by some friends to go to sea, in the hope of filling in with the interesting stranger, and that he was not long kept in suspense, for "a little to the west of the Old Head the monster appeared." Its size, he truly avers, is beyond all description, and the head, he adds, very like a (bottle nose) whale. One of the party fired the usual number of shots, but, of course, without effect.

Obituary of Notable Persons.

JOSEPH BAILEY, Esq., M.P. for the county of Hereford, died on the 31st August, in Belgrave Square. The hon. gentleman was a Conservative in politics, and identified with the Protectionists. Mr. Bailey seldom spoke in the House of Commons, but on all great political struggles he invariably attended and recorded his votes against the present Government.

The Right Hon. C. W. W. WYNN, M.P. for Montgomeryshire, died on the 2nd inst. in his 75th year, at his residence in Grafton Street. He was the oldest member of the House of Commons, having sat for Montgomeryshire since 1797, and for about a year previously for Old Sarum.

Srs. GEORGE HAMILTON, Minister Plenipotentiary of England at Florence, died in that city on the 3rd.

Mrs. EOBERT, the actress, a lady not surpassed by any upon the stage in a particular line of parts—witness her *My Mother* and others—died at Brompton on the 3rd, at the age of 67.

LORD WILLIAM CLINTON, fourth son of the Duke of Newcastle, attached to the British mission at Athens, died there on the 3rd in his 35th year.

COLONEL WILLIAM ELPHINSTONE HOLLOWAY, C.B., commanding officer of Royal Engineers at Plymouth, died on the

4th, after a protracted illness, the severity of which was much increased by the wounds he had received in the service of his country. Colonel Holloway was in the Peninsular campaigns of 1810, 1811, and 1812; he was wounded in the trenches before Badajoz, and shot through the body on the 26th of the same month whilst storming the same works.

BARONESS ROTHESCHILD died at Gunnersbury Park on the 5th in her 89th year. She was the widow of Baron Rothschild, the celebrated capitalist, who died in 1836; by whom she leaves four sons and two daughters, Baron Lionel, Sir Anthony, Baron Nathaniel, Baron Mayer, Baroness Anselm, and Mrs. Fitzroy.

The Rev. Dr. INGRAM, President of Trinity College, Oxford, and Rector of Garsington, died at Trinity College on the 5th. Dr. Ingram is the author of "Memorials of Oxford," a work of great antiquarian research.

The Right Hon. JONAS DOHERTY, Chief-Justice of the Court of Common Pleas in Ireland, died on the 8th at Beaumaris, a short time after his lordship had retired to rest: his death was the result of a disease of the heart.

The Right Rev. Dr. STORMON, Bishop of Meath, died at the Palace, Ardbraccan, on the 17th. His lordship was a member of the Privy Council in Ireland.

VISCOUNT NEWARK, the eldest son of Earl Manvers, died on the 23rd, at Torquay, in his 45th year.

COLONIES AND DEPENDENCIES.

SIR CHARLES NAPIER'S formal resignation of the command in India, and the official appointment of his successor, leave us still in the dark as to the cause of dispute. Some light has been thrown by the last arrival, however, and not of the pleasantest kind, on the state and discipline of some portions of the Indian army. The whole question will doubtless be opened up on the arrival in England of the late Commander in Chief. It may, meanwhile, not be inconsistent with a high admiration for the great qualities of all the Napiers, to express a wish that this remarkable family were better provided with what the world commonly agrees to call discretion and prudence; and that they could bring themselves, when out of office, to be something less of the democrat, and, when in office, something less of the tyrant.

Of positive news from any other of our dependencies or colonies the month has furnished none. But we have thriving accounts from Jamaica of a proposed vigorous effort at cotton cultivation in that island; and from other quarters we hear generally not unfavourable accounts of material prosperity. The agitators are the men that don't thrive, though very possibly for reasons making their agitation not unjustifiable. When we received our last news of Doctor Lang, who has been moving heaven and earth for the establishment into an independent republic of all the Australian Colonies, on the plan of the United States, he had been hung into prison for debt. But he is out again by this time; and his political energies, however unwisely directed for the present, need not in their issue be unproductive of good. Such irritants are not ill medicine for the present malady of the Colonial Office.

The *Overland Mail* has brought dates from Bombay to the 6th, Calcutta the 7th, and Madras the 13th of August.

Colonel King, Committed suicide at Wuzerabad, near Lahore, on the 6th of July. He commanded the 14th Light Dragoons, at the battle of Chillianwalla, where the corps retreated from before the enemy, got into momentary confusion, and overset a couple of our own guns, thereby causing them to be captured by the Sikhs. The affair was passed over at the time, and in a short time probably all would have been forgotten, had not Sir C. Napier, in a speech to the corps some months back, alluded to the matter by saying that such a corps as the 14th would go anywhere, or do anything, if properly commanded. This taunt acted powerfully on the over-sensitive mind of Colonel King, and he became the prey of a settled melancholy, which he never seems to have been able to throw off. In June, some of his men were taunted at the theatre by the artillerymen with being cowards, which was of course resented, and a row ensued. Shortly before this, a man of the corps, named McLean, was taken before Colonel King for some crime, and on being sentenced to punishment, called him a coward. For this he was tried by a court-martial, and sentenced to corporal punishment, which he underwent on the 20th March; and the man, on being taken down from the halberts, walked towards Colonel King, and again called him a coward, using, at the same time, grossly abusive language. McLean had managed before coming out for punishment to get enough liquor to make him shortly after tipsy, hoping thereby to deaden his feelings to the cat-o'-nine tails; and it was while under the influence of the liquor, and the pain caused by the flogging, that he again com-

mitted himself as above. He was now ordered to be tried by a general court-martial, which took place on the 3rd of June last. He was found guilty of outrageous and insubordinate conduct, and sentenced to transportation for seven years. This sentence, having been transmitted to the Commander-in-Chief, was returned by him with the following remarks:—

"Revised.—In revising the proceedings of the court, I am obliged to call its attention to some facts which demand the most serious notice.—1st. The prisoner was allowed to get drunk in the guard-room of Her Majesty's 14th Light Dragoons, when under sentence of a court-martial.—2nd. The prisoner was brought drunk to the parade.—3rd. Assistant-Surgeon Fessenden, whose business it was closely to have examined the state of the prisoner who was about to suffer corporal punishment, did not examine him, and did not perceive that he was intoxicated, till drink and the pain of punishment had made him so furious, that the assistant-surgeon's own words are "I thought he was either mad or drunk."—4th. Adjutant Lieutenant Apthorpe, equally unobscuring with the assistant-surgeon, did not find out that the prisoner was drunk till after he had received punishment.—5th. The consequence was that this soldier was flogged when in a state of intoxication, and all this took place in the presence of Lieutenant-Colonel King, the commanding officer of the regiment.—6th. When freed from the trappings, the prisoner, infuriated by having drunk nearly two bottles of arrack and some beer in the guard room, as proved before the court, became outrageous and abusive, as might have been foreseen.—7th. I ask the court, therefore, to reconsider and to mitigate its sentence, for however disgraceful and insubordinate the conduct of the culprit may have been, it was certainly as much produced by the neglect of duty in others, as by the drunkard himself. The sentence appears to me to be severe beyond all proportion to the crime, in the peculiar circumstances above stated.

(Signed) C. J. NAPIER,
"Commander-in-Chief, East Indies."

The court-martial accordingly reconsidered their sentence, and re-transmitted it to the Commander-in-Chief,

they respectfully begged to adhere to it. Charles Napier returned the sentence with the following note subjoined:—

"Head Quarters, 1st July, 1850.

"I am sorry that the conflict itself called upon to adhere to a sentence which I have no power to commute, and cannot, in the extraordinary circumstances of the case, execute. I have, therefore, no alternative but to pardon the prisoner, not excused by his drunkenness, but in facts stated in my remarks to the court on its proceedings being revised. I assure the court that great severity, without a due consideration being given to circumstances, is not justice, nor conducive to discipline.

The prisoner is to return to his troop.

"(Signed)

C. J. NAPIER.

"General, Commander-in-Chief, East Indies."

These remarks seem to have caused the cup of Colonel King's bitterness to overflow; for their promulgation was immediately followed by his act of suicide.

The *Affreedees* have again closed the pass to Kohat, and seem inclined to be as troublesome as ever. A man of the Horse Artillery has been shot by one of them close to his quarter guard.

The *Sikh Prisoners* at Allahabad keep the authorities there in a state of disquiet. They have been detected in a communication with the ex-Ranee (now in Nepal). On the 26th of June a Cawnpore Brahmin, named Seetaram, was found inside the quarters inhabited by the prisoners, ten in number, notwithstanding all the precautions and vigilance used to prevent every species of intercourse. Nothing was found on the man, though he acknowledged being in Sikh pay. The next day a court of inquiry was assembled, and sufficient was elicited to prove that a deep-laid plot had been organised. Several letters were found addressed to the friends of the prisoners, and one document containing the names of the different officers in command of corps and the stations where their regiments were located. Information was likewise obtained of two Sikhs, who were concealed in a Ghossein's house in the city, having in their possession a sum of 20,000 rupees, dedicated to purposes of bribery. Upon the person of one of the prisoners a file was found. The Jemadar and sentries in charge of the guard have been placed in arrest, on a suspicion of collusion.

A tragical event has occurred on board the Hon. Company's cargo boat Kalcogunga, in tow of the steamer Burhampootee, at Patna. She left Allahabad with thirty-nine Sikh convicts with a very weak guard. The arms of the guard were piled between them and the convicts; when at Patna, the latter having seized the fire arms, which were loaded, rose upon the guard, and a desperate conflict ensued. Two of the guard and two of the convicts were killed, and the convicts succeeded in running the boat ashore and escaping. It appeared that the affair took place in the day time, which renders it still more extraordinary.

Another *Explosion of an Ordnance Flotilla* occurred on the Ganges, near Chuprah, on the 10th of July. The fleet consisted of about thirty boats, of which upwards of half were loaded with gunpowder. Twelve boats were lost—seven, with 1800 barrels of powder on board, exploded, and five sunk. The crews discovered the fire in time, and escaped. Suspicion attaches to the boatmen, from the circumstances of their having received their pay in advance at Dinapore, and having escaped injury. A committee of inquiry has been instituted to investigate the matter.

The Bengal papers are filled with disgraceful *exposés* of the extent to which gambling is carried on amongst the young officers of the Queen's and Company's services

on leave at Simla and other hill stations. Some of these have been openly charged with cheating at play. This shows the propriety of Sir C. Napier's unpopular general order restricting the leave of officers to the hills during the hot season.

The discussion on Mr. Bright's motion has excited much interest in India, and the local press generally advocate the appointment of a cotton commission.

The accounts from *Hong-Kong* are to the 24th of July. Sickness among the European troops has been on the increase; as many as 160 men have been in the hospital at one time, and about thirty-five have died of fever. This happens when there is no unusual sickness either among the community or the government police force. This mortality is ascribed to the unhealthy position of the barracks, occasioned chiefly by the nature of the ground in the rear, and to the crowded state of the rooms occupied by the men.

The Governor of Macao, Commodore Da Cunha, who had recently arrived, died on the 6th of July. He had been for some time in bad health. His death is said to be most unfortunate for the settlement of Macao, matters with the Chinese government not being yet arranged.

Papers from *Ceylon* have been received to the 15th of August. They announce Lord Torrington's resignation of his office of Governor, and his intention of taking his departure for Bombay.

The intelligence from the *West Indies* is not important. Several articles on the culture of cotton appear in the journals of Kingston, and on the 27th ult. a large meeting was held in the directors' room of the Bank of Jamaica to establish a small company, with a limited number of shares, to test the practicability of rendering the cotton plant a staple production of the island. Resolutions in accordance with this view were passed, and every symptom of vigour manifested.

The *Montreal* papers contain an account of a most destructive fire in that town on the night of the 23rd of August, which destroyed property to the amount of half-a-million of dollars. Above a hundred houses were utterly destroyed, besides great damage done to many others. The rapid extension of the fire is attributed in a great measure to the use of shingles in roofing houses, which seems to be a practice very generally adopted in the town to save expense.

Advices from *Melbourne* have been received to the 16th of May. The Reverend Dr. Lang, who some years ago attracted attention by a letter to Earl Grey impugning the administration of the Australian Colonies, had created much excitement by originating a movement for the independence of these Colonies. He had delivered a lecture on the subject at Melbourne, in a tone of respect for the queen and good will to England, but openly advocating complete separation and independence, which, he believed, Great Britain would concede on a proper representation of the case. He recommended the formation of an "Australian League" or federal republic, embracing all the Colonies, constructed on the model of the United States of America, and denominated "the United Provinces of Australia." Dr. Lang entered minutely into the details of his scheme, and was loudly applauded. After the delivery of his lecture he was thrown into prison for some matter of debt, to the great displeasure, it is stated, of the Melbourne public, who were raising a subscription for his release.

NARRATIVE OF FOREIGN EVENTS.

SOLEMN ceremonials have been celebrated over *Napoleon* for him who now sleeps in the quiet vault at Weybridge, Changarnier ordering and Louis Napoleon not resisting. It is called hypocrisy, but not without much reason. Hypocrisy is the homage which vice pays to virtue; and if Louis Philippe must stand for virtue in the case, Changarnier and Louis Napoleon are free from vice. They have for some time faithfully governed on the principles of the citizen-king, simply using their greater power to better his instruction. Nevertheless the Orleans adherents, who are strong in the departments through which the president lately

passed to Cherbourg, have not shown symptoms of greater favour to the candidate for empire. At Cherbourg itself he had a reception of marked coldness; and the folk who went to enjoy the holiday and increase the noise, had to exhaust their stock of enthusiasm on the ships and the fortifications. The enormous six-deckers and eighty-four-pounders carried off, accordingly, an amount of loose admiration which has quite startled good people on the opposite coast. The effect has been but transient, however. France makes only a holiday show in these matters after all. The statistics of maritime development and progress are against her; and it is but to contrast any one of our naval ports with what has been going on at Cherbourg since the days of Louis Quatorze, to see that nature is more than a match for art in this respect. It is not ships and fortifications that make a maritime country, nor even the advantages of natural ports and harbours. When France can send to Portsmouth or Plymouth such a fleet of pleasure yachts as were sporting the other day round her war-leviathans at Cherbourg, it will be time for England to look about her. Not till she begins to take to the sea as the duck to the water, need her maritime supremacy be feared. Never yet, with all her big equipment and endless braggadocio, has she really shown the natural taste for it.

A new element of discord, which seems to promise new and important combinations, has been flung into the endless German dispute. The entire population of the State of Hesse Cassel, including parliament, army, and state functionaries, as well as common people, have risen against their Elector and his minister, and incontinently bundled them out. This revolution differs from those which have been general in that neighbourhood of late, in the circumstance that it is strictly a vindication of order. The Hessians had been perfectly quiet in '48, content with the constitution they obtained in '30; and it has been simply the gross violation of the latter by their prince which they have thus summarily punished. The incident, though not unimportant in itself, derives a still greater importance from its probable influence on the dispute between North and South Germany, and the aid it is likely to give Prussia in her present attitude of resistance. The activity of the Holsteiners, and their still resolute and indomitable front, is another turn in events which falls out opportunely; and it is not by any means impossible, if the right courage and a proper understanding of the constitutional cause be now steadfastly shown, that Prussia may redeem her mistakes, obtain a triumph over Austrian imbecility and intrigue, and finally assert her own position at the head of public opinion in Germany.

In our *Narrative* of May we said that the pinch of the Slavery Compromise in America, would be felt when the law compelling the surrender of fugitive slaves came to be discussed. The bill has passed the senate amid extraordinary excitement, and is now under debate in the lower house, the excitement by no means diminishing. The provisions of this bill, already passed through a house where the democrats have a majority, is scarcely credible even of a country debased as America is by her "domestic institutions." Commissioners are appointed to determine claims, with a direct pecuniary interest if they determine for the master, with none if they pronounce for the slave! Heavy fines and penalties are imposed on refusals to take part in arrests, on whatever groundless suspicions; and on attempts at rescue, on whatever ground of justice! The arrests may be made with or without warrant, and neither the declaration nor the oath of the fugitive is admissible in his own defence! All the processes are summary, all the powers irresponsible, and the entire forces of the state are lent for the oppression of the poor hapless coloured wretch, whom any reckless trafficker in human flesh may, with or without a claim, resolve to drag to slavery! The proposal of such a measure is a scandal to civilisation, and its enactment will be another item in the heavy claim which is silently mounting up for sure and not tardy retribution.

"There is a strong blind Samson in that land!"

President Louis Napoleon's *Journey in the French Provinces* was partly noticed in our last Number. He returned by Strasbourg, Metz, and Rheims, to Paris, where he arrived on the 28th of August. We extract from the French papers a few characteristic traits of his reception. At *Mulhausen*, where he stopped before he arrived at Strasbourg, the zeal of a functionary in endeavouring to force the National Guard to cry "Vive le Président!" is said to have so irritated them that they assembled in masses, and shouted "Vive la République" under the President's window. Offended at this, he left the place instantly, refusing to visit the factories. When he came to *Colmar*, the authorities were unprepared to receive him with due honours, and he expressed his discontent by refusing to go to a ball offered to him. In the capital of *Alsace*, however, his reception was splendid. His cavalcade, as he entered the town amid the shouts of the assembled thousands, had a truly imperial aspect: "His guard was composed of the Cavalry of the national Guards of Strasbourg and the Gendarmerie; after whom came about a dozen Lancers; and then between the Minister of War and the Minister of Foreign Affairs rode the President, as usual wearing the uniform of a general officer of the National Guard, with the grand cordon of the Legion of Honour. He rode a most beautiful horse, which had been presented by the authorities. It was most brilliantly caparisoned: the housings wanted only the crown to complete the imperial effect. As the President came opposite to the Hôtel de Paris, he looked up to the balcony of the first floor, and taking off his plumed hat, bowed to the very saddle-bow to the Grand Duchess of Baden, who had arrived in order to witness

her nephew's entry into Strasbourg. A lively description is given of the presentation of addresses by the corporations of the small towns and villages in the neighbourhood. "The most interesting sight of all was that of the rural mayors in their old quaint costume; simple peasants, who had probably never heard of the Republic, but came to see 'Luig Bompar,' the nephew of the Emperor. The peasantry are much attached to Louis Napoleon, and the present journey proves it. These village functionaries, each wearing his scarf of office, were in number nearly two hundred, and they were from those places the President had been unable to visit. They felt rather awkward in finding themselves in these splendid saloons; but they were soon placed quite at their ease by the good-natured and familiar manners of the President, who had a kind word, a ready smile, and a grasp of the hand for each. Before a quarter of an hour had elapsed, there they were in a group, with the President in the midst of them, and chatting away in German or *Alsacian patois*, which he spoke with them very fluently. They looked quite pleased at finding that 'Luig' spoke in their native tongue as well as themselves. This interview lasted some time, for all parties seemed to like the conversation. In the mean time, crowds of visitors were thronging the court of the Prefecture, and an immense crowd blocked up the streets. The cries of 'Vive Napoleon!' 'Vive le Président!' and 'Vive la République!' scarcely ceased the whole of the morning." At Metz there was a grand review of 15,000 regular troops and National Guards. The President's reception at the Arsenal was most enthusiastic. He has, it seems, made artillery a subject of special study. He conversed

and surprised the military men by the extent of his professional information. In the evening a grand ball was given in his honour. The managers conceived the idea of not allowing any ladies to enter the ball-room before his arrival. When he entered the room, at a little after nine, he found himself surrounded by all the pretty women of Caen. The gentlemen were then admitted, and dancing immediately commenced. The President opened the ball, and remained there until eleven o'clock. His progress from Metz to Paris was highly satisfactory. At Verdun, the streets were transformed into a garden, and the enthusiasm of the people seemed greater and more sincere than in any other town. At Rheims, he replied to a flattering address with effective brevity:—"Our country wishes for nothing but order, religion, and liberty. Everywhere the number of the agitators is infinitely small, but the number of the good citizens infinitely great." "Entering this ancient city of Rheims, where the kings, who also represented the interests of the nation, came to be crowned, I wished that we could, in the same place, crown not a man, but an idea of union and conciliation, of which the triumph would restore repose in our country."

On the 3rd, the President set out upon another provincial excursion. He arrived that evening at Evreux, where he entertained a large party to dinner. The Socialists had summoned from Rouen a number of their friends to get up a hostile demonstration, but it proved a failure.

The President arrived at Caen on the evening of the 4th. He reviewed the troops and National Guards on the morning of the 5th. He was received by the troops, and by the immense population which crowded on his way, with cries of "Vive Napoleon!" The cries of "Vive la République!" were few at Caen. Among the addresses delivered to the President at Caen, was one from the President of the Council General of the Department, in which it was remarked that Louis Napoleon was addressed by the title of "Your Highness." He left Caen immediately after the review, and arrived the same evening at Cherbourg.

On the morning of Friday the 6th, the President received the mayors and authorities of the neighbouring arrondissements, and many Englishmen of distinction, who had arrived at Cherbourg in yachts, paid their respects to him. He then reviewed the National Guard and the troops of the garrison, in the midst of a vast concourse of people. Democratic cries were uttered by some groups, and a midshipman who distinguished himself by the violence of his gestures and his insulting language, was taken into custody. A banquet was given to him by the city of Cherbourg, at which seven hundred persons were present. Many Englishmen were among the guests; particularly Admirals Sir C. Napier, Sir Thomas Cochrane, and Sir Edmund Lyons; Captains Pelham, Mundy, Cresswell, Seymour, Mackintosh, Jones, and Hall; the Earl of Wiltshire, Commodore of the Royal Yacht Club, the Earl of Cathcart, Marquis of Ormonde, Earl of Orkney, Viscount Castlerbury, Mr. Talbot the Vice-Commodore of the Royal Yacht Club, and Captain Smith of the Royal Engineers. After dinner the Mayor of Cherbourg gave as a toast "The memory of the Emperor Napoleon, and the health of the President of the Republic." The President, in acknowledging the compliment, made several noticeable remarks. "How did it happen," he said, "that the Emperor, in spite of war, was able to cover all France with imperishable works that are found at every step, and are nowhere found so remarkable and so great as here? It is that, independently of his genius, he lived at a period when the nation, exhausted by revolution, gave him the necessary power to crush anarchy, repress faction, and secure the triumph by glory abroad, at home by a vigorous impetus of the general interests of the country." He proceeded to give as a toast, "The City of Cherbourg," adding, "Yes! I propose this toast in the very sight of the fleet that carried so nobly the French flag to the East, and is still ready to carry it with equal glory wherever the honour of our nation calls it. I propose this toast in the presence of these distinguished strangers now our guests. They are conscious themselves of the fact that if we desire peace it is not because we are weak. It is not because we are weak,

but rather from that community of interests and those sentiments of mutual esteem which bind together the two most civilised nations of the globe. I drink to the city and port of Cherbourg!" These words were followed by repeated shouts of "Vive l'Empereur! Vive Napoleon!" After the banquet the President visited the Fort de Roules, which commands the harbour, but which is not now occupied. At night a splendid ball was given in his honour, at which several thousand persons were present. All the ships in the harbour were illuminated, as also many of the private houses in the town. On Saturday morning, the 7th, the President visited the arsenal. He was cordially received by the artisans in all the *ateliers*. At mid-day he proceeded to the squadron, and visited the admiral's ship, the Friedland, commanded by Vice-Admiral Parseval Deschênes. He visited in turn each vessel of the fleet. In the course of this day was repeated a beautiful display by the yachts which the President's late arrival on Thursday prevented him from witnessing. A squadron of thirty of the largest yachts was formed into two lines under the Commander of the Royal Yacht squadron, the Earl of Wiltshire, and its Vice-Commodore, Mr. Talbot, M.P.; and it sailed out of the roads for a cruise round the *digue*. The vessels swept along, each with bated or hastened speed so as exactly to preserve its place with relation to all the rest; the whole body tacking, reaching, and swelling along, with the simultaneous movements of a flight of birds in the air. Their manœuvres beyond all others engrossed the attention of the French. The citizens and peasants marvelled agape at the exhibition of such professional skill by the land-men owners of the craft; the sailors openly expressed their admiration—the captain of the *Jemappes* exclaiming aloud, that the manœuvres were "superbe et très-délicieuse!" The day terminated with a banquet, which took place at 7 o'clock. A hall was given the same night in the great hall of the Esplanade. A brilliant and numerous assemblage was present, and it is stated that 7000 applications had been made for tickets. The President dined with the lady of one of the representatives of the department. On Sunday, the 8th, after hearing mass on board the Friedland, the President proceeded to complete the inspection of the vessels which he had not time to examine in all their details the day previous. At two o'clock the manœuvres commenced. The ships were cleared as if for action; and not less than 4000 shots were fired, after which fifty boats completely armed, and forming in line, proceeded to exercise and sham fights, during which a feigned attack was made on the steam-frigate *Descartes*. The President then proceeded to the gun-room of the Friedland, where a banquet had been prepared. The table was in the form of a horse-shoe, and the small arms of the ship, arranged in stars, &c., formed the ornaments of the banqueting-hall: 112 persons sat down to dinner. This number included the commanders of the squadron, as well as the officers of every rank. The English Admirals, Cochrane, Napier, &c.; Captains Chads, Seymour, and Stopford, &c., were amongst the number. When the dessert was placed on the table, Admiral Parseval Deschênes rose, and in a firm tone of voice proposed the President's health in the following terms:—"To the health of the President of the Republic! His presence in the squadron is the guarantee for the future of the efficacious protection of the government. 'Vive le Président!'" This cry was taken up and repeated by the Admiral and all the guests. The President rose and returned thanks thus:—"I am happy to have it in my power to propose, in turn, a toast to the French Navy, on board the ship of which the Admiral near me is the worthy chief,—to that French Navy whose devotedness to the country has ever been proved in its brightest days as in its gloomy,—to that Navy whose valour is so heroic, that even when fortune turns against it, we may still apply to it the words of the poet—'Her cyresses have been as glorious as her laurels'—(the *cyprès ont été aussi beaux que ses lauriers*).—I drink to the French Navy." This speech and toast were, as will easily be supposed, followed by loud and repeated applause. The President entered the hotel of the Maritime Prefect at ten o'clock, after having spent the whole day on board the fleet. On Monday morning the President left Cherbourg,

the National Guards and an immense crowd of people saluting him with loud cries of "Vive Napoleon! Vive le Président!" He arrived that evening at Saint-Lô, where the manifestation in his favour is described as "enthusiastic and universal." He then skirted the whole Eastern coast of the Bay of St. Malo, staying at Couteances and Avranches; and finally returned to Paris by way of Argentan; the authorities and people everywhere hailing him cordially.

The Councils-General of France have terminated their Annual Session. The chief question agitated by them has been the revision of the constitution. The result has been thus summed up:—Twenty-one councils separated without taking the subject into consideration; ten rejected propositions for revision; two declared that the constitution ought to be respected; thirty-three departments therefore refused, more or less formally, to aid the revision. On the other hand, forty-nine councils came to decisions which the revisionist party claim for themselves. But a very great diversity is to be perceived in these decisions. Thirty-two pronounced in favour of revision only "so far as it should take place under legal conditions," or "so far as legality should be observed;" two of those called attention to the forty-fifth article of the constitution, which makes Louis Napoleon incapable of being immediately rechosen; but another demanded that his powers should be prolonged. One council voted for revision, and also desired to prolong the President's power; ten simply voted for revision; five pronounced for immediate revision, but by very small majorities; one went further, and proposed to give the present Assembly—which is legislative and not constituent—authority to effect the revision. Three councils express merely a desire for a remedy to the present situation. Thirty-three departments have not pronounced for the revision, or have pronounced against it; thirty-three are in favour of a legal revision; thirteen demand the revision without explaining on what conditions they desire to see it effected; and six demand it immediately; making the total of eighty-five.

The Commission for Surveillance met on the 19th in the National Assembly. M. Dupin presided. The Minister of the Interior was summoned, as usual, to attend and give an account of the state of the country. M. Buroche read a document on the subject, from which it would appear that at no previous period was there greater prosperity in most branches of trade and manufactures, and not for many years was public order better maintained than at this moment.

It appears that there are in France regularly licensed *Marriage Agents*, whose transactions are sanctioned by the law courts. The civil tribunal of Le Mans has just condemned a person named Désigné and his son, of Parigné l'Évêque, department of the Sarthe, to pay 10,000 francs to M. Foy, for having negotiated the marriage of the son with a Mlle. de Bruc, niece of the Marquis de Malestroit. M. Foy was applied to by the father and the son to find a wife for the latter. Foy introduced them to Mlle. le Bruc, who was possessed of a certain fortune, and the son eventually married her. By an agreement duly drawn up before the marriage, the father and son bound themselves to pay M. Foy 12,500 francs for his services. This, however, they on different pretexts subsequently refused to do, and so Foy brought his action; but reduced his demand to 10,000 francs, he having consented, after some negotiation, to accept that sum. After hearing counsel at great length on both sides, the tribunal gave judgment in Foy's favour for the full amount claimed.

A Split has taken place among the Legitimists. On the termination of the Congress at Wiesbaden, a circular was addressed to the party, under the authority of the Count de Chambord, in which it declared that he "has formally and absolutely condemned the system of an appeal to the people, as implying the negation of the great national principle of hereditary monarchy." This was met with a reply from the Marquis de la Roche-Jaquelin, who had previously proposed an appeal to the people of France, to know whether they would have a Republic or a Monarchy. In a letter to the Paris Journal *le Evénement*, he negotiates with energy his former sentiments, and says: "I accept completely my

excommunication; it is evident that we have no longer the same principles."

The accounts from *Piedmont* describe the public mind as greatly excited against Austria. On the 15th, there was a disturbance, from this cause, in the theatre of Turin; during the performance of a piece called *Lega Lombarda*, when a number of soldiers wearing the Austrian colours of "black and yellow," and headed by an Austrian eagle, came on the stage, they were saluted by a hurricane of hisses, and a tumult of groans, which lasted for nearly a quarter of an hour. The attack did not come from any isolated box or bench, but it was participated in by all present, and it is said that there were not ten ladies or gentlemen who did not take an active share. The people regard the presence of the Austrians in Italy as the sole bar to the establishment of Italian nationality.

The King of Prussia, on receiving a deputation from the Conservative Constitutional Union of Berlin on the 13th, thus expressed his sentiments on the question of *German Unity*:—"My sentiments on the German question have often been misunderstood. Some have done me great injustice in respect to those sentiments [alluding to the speech of the King of Wurtemberg on the opening of the Chambers]. This will not turn me from the path of duty. It is to be regretted that in more than one place it is not understood that it is possible to be honest in politics. In striving for Germany I follow the impulses of my own heart. I maintain the German idea, and will pursue the path on which I have entered, as far as God gives me light; but I hope no further. As King of Prussia, I shall strive for Germany; as a friend and ally, I will carry conciliation as far as the honour of this country will permit. For the maintenance of this honour, I can appeal to the five hundred years which the history of my house embraces."

The ratifications of the Treaty of Peace between *Germany and Denmark* were exchanged on the 6th instant at the residence of the British Minister at Berlin, and a protocol of the transaction was signed by the Ministers of the parties, and by Mr. Howard the British *chargé d'affaires* on behalf of the mediating power. The German states, parties to the treaty thus ratified, are, the King of Prussia, the Grand Dukes of Baden, Saxe-Weimar, and Mecklenburg-Schwerin; the Dukes of Saxe-Meiningen, Saxe-Altenburg, Anhalt-Dessau and Bemburg; the Princes of Schwartzburg-Rudolstadt and Sonderhausen, the Princes of Waldeck, the Princes of Lippe-Detmold, of Reuss, Elder and Younger, and the senates of the Free Towns of Lubeck, Bremen, and Hamburg. The Danish Minister declared, in the name of his government, that in lending itself to the partial exchange at the recommendation of the mediating power, it retained the hope that as the present act does not yet contain all the states belonging to the Germanic Confederation, no delay will occur in his reception of the complement necessary to verify the ratifications of this treaty for the whole of the states forming this Confederation.

A Movement of momentous import has taken place in Hesse Cassel, in consequence of an act of the Elector's government, administered by his Prime Minister Hasenpflug. By an article of the constitution, the Hessian Chamber has the exclusive right of voting taxes. Hasenpflug, however, declined or delayed to call them together, until the time generally destined for the close of the session. The Ministers immediately put before them a demand for money, and for the liberty to raise the taxes for 1866. The Parliament replied, by an unanimous vote, that however little the ministers possessed the confidence of Parliament, they would not go the length of refusing the supplies, but requested to have a regular budget laid before them, which they promised to examine, discuss, and vote. To so fair and constitutional a resolution the minister replied by dissolving the Parliament, and proceeding to levy the taxes in spite of the Parliament and the constitution. The cabinet went to the extremity of proclaiming the whole Electorate in a state of siege, and investing the commander-in-chief with dictatorial powers against the press, personal liberty, and property. The town council unanimously protested against these

and such a spirit of resistance was evinced by the Elector and his minister were constrained to flee in flight. The Elector left Cassel on the 13th, and arrived the same evening at Hanover, where he was afterwards joined by Hassensprung. Some of the accounts state that M. Hassensprung was motivated by terror in his flight. He arrived at Rheda, in Westphalia, on the 13th instant, and on the following morning he took the train to Cologne. He was pale, and his features were distorted with fear and the fatigues of his journey. He informed his fellow-travellers that he was proceeding to Coblenz; but it was generally supposed that he intended to escape into Belgium. His presence in the train having become known, it was soon whispered at all the stations that the "Hessen fluch" (Hesse's curse) was a passenger in a certain carriage; and everywhere public opinion vented itself in groans and execrations. On the arrival of the train in Düsseldorf, the gendarmes on duty were informed of the presence of Hassensprung, the convicted forger of Greifswald. One of the passengers, who had paid a particular and by no means welcome attention to M. Hassensprung's bearing and features, was canvassing the subject with one of the gendarmes, when the ex-minister, unable to retain his pent-up emotion, addressed him with, "I say, sir, why do you persecute me?" "Sir," replied the passenger, "I do not persecute you. I'm just telling this man of the villainies of that scoundrel Hassensprung." The gendarmes asked him for his passport; and when the minister produced that document, a voice was heard to cry, "Look sharp, man, whether it is a good passport! You know he's a forger!" Upon this Mr. Hassensprung was arrested, and taken to the police-station; but he was subsequently allowed to proceed by post to Langensfeld, where he intended to wait for the Elector's arrival. At Hanover it is said that the Elector made application for military aid to carry out the policy in which he had been checked; but the reply was unfavourable. Thence he turned to the South-west, in order to regain the South of his own dominions by a detour through Minden and Düsseldorf. He and his ministers were at Frankfurt on the 16th. From thence he went to Williamstadt, where, on the 19th, he issued a decree making that place the seat of government.

On the 13th, the day on which the Elector took his secret departure, a courier arrived at Cassel from General Heintze, the Minister of War, to General Bauer, the Commander in Chief, instructing him that the government had been removed from Cassel; and that the Elector had revoked all the decree establishing the state of siege, except the second section of it, which placed the Civil Guard under the Commander in Chief. The municipal authorities met, and immediately issued an address, stating that the harmony between the military and civil powers would obviate all the evils threatened by the unexpected departure of the Sovereign and his Ministers, and exhorting the people to persevere in their strictly legal and orderly behaviour. On the 14th, the Permanent Committee of the Assembly resolved to bring old General Bauer, a staunch disciplinarian soldier, but a most honest and respected citizen, to account for his share in executing the late measures. He was prosecuted for abuse of office, violation of the constitution, and high treason. On the first point, a military one, the Garrison Court acquitted him; on the other two, the "General Auditorial" Court found that "the facts adduced were not sufficiently strong to warrant further proceedings." The old soldier has expressed his desire to resign, and confines himself at home as "sick."

The accounts from Madrid announce the capture and death of the Centralista chief, Ballarín, who for more than three months past had kept in continual movement the whole of the troops of that province. He was concealed in his mother's house in the village of St. Andrea de Palomar, where the volunteers of Catalonia, who had been for many days in pursuit of him, overtook him. They attacked resolutely the place of his refuge, where his brother and some of his partisans also were, and after an obstinate defence, during which two of the volunteers

were killed, succeeded in entering the house, when they immediately put him and his companions to death, and severely wounded his brother, who however had the good fortune to make his escape. At this moment there is not a single insurgent in arms in Catalonia.

The Elections for the Cortes, both in Madrid and in the provinces, have terminated in no signal defeat of the Progressista party, that the government will find itself almost without an opposition in the assembly. Even the moderate or conservative opposition has obtained so few votes, that it has no longer any pretension to the name of a party. An idea of the general result may be obtained from the state of the ballot in Madrid; the Moderates had 2185 votes, the Progressistas 609, the Conservative opposition 15, and the pure Democrats only 6.

Hostilities have been renewed between the troops of Denmark and the Duchies. Offensive operations were commenced by the Schleswig-Holsteiners on the 12th, and continued without any definite result to the 13th inst. On the 12th inst. the entire Holstein army advanced, and made an attack on the whole Danish line. The fighting, as at Idstedt, was very fierce, especially at Eckernförde, which was taken and retaken twice during the day; and then remaining in the hands of the Holsteiners, who established their head-quarters there in the afternoon. The town suffered severely; the Danish ships of war stationed in the harbour fired broadsides, until the Holsteiners, having brought up some heavy guns to the coast, compelled them to leave. The wounded were sent to Kiel, and filled fourteen carriages. The Danish camp, strongly entrenched before Eckernförde, was taken, after three assaults, by the Holsteiners, and afterwards destroyed by fire. The strong Danish trenches were carried by the bayonet, and the carnage seems to have been frightful. At day-break on the morning of the 13th, the battle was renewed with redoubled fury. General Willisen marched on Missunde to force the Schlei. He was attacked by the Danes in the forest of Cosel, and driven back. He withdrew behind Eckernförde. The Holstein army surrendered Eckernförde on the 13th, and resumed its position of the 12th. On the 14th, General Willisen's head-quarters were at Wittensee.

The accounts from Copenhagen give some particulars respecting the Morganatic marriage (mentioned in last month's Narrative) between the King of Denmark and the Countess Danner, formerly the court milliner. The ceremony was performed in the Palace Chapel, and two Countesses were commanded to attend—the Countess Von Ahlefeld (the lady of the Chief Clerk of the Closet) and the Countess Knuth. The youthful bride was led to the altar by Baron Lewetzau, Marshal of the Royal Household. The ceremony was performed in the presence of the whole court, who were attired in court dresses. After the marriage there was a grand dinner at the palace. The Hereditary Prince Ferdinand led the Countess Danner to table, and the King the Countess Von Ahlefeld. A few days after the King and the Countess Von Danner paid an unexpected visit to his stepmother, the Queen Carolina Amelia. The Queen Dowager, the widow of Frederick VI., forbade the visit that the king and the countess intended to pay to her. The ladies who attend court, and who were highly indignant at this marriage, were under great apprehensions lest they should receive commands to wait upon the Countess Von Danner; it being known that she had declared that nothing would give her more satisfaction than to see the ladies upon whom she waited as their dressmaker now come and pay their court to her.

The Peace Congress assembled at Frankfurt, commenced its proceedings on the 22nd August in the Church of St. Paul. Dr. Jaup of Darmstadt was elected President of the Congress. The principal speakers at the meetings were Mr. Cobden, the Rev. Mr. Burnes of Camberwell, M. Emile Girardin, M. Bonnet, the pastor of the French Protestant church, Mr. Garnet a negro, Blifu Burritt, Mr. Hindsley of Oldham, M. Gaudier one of the Secretaries, Dr. Baller from America, the Rev.

M. Copray a native chief of the Chippeway tribe, Mr. Miall, Mr. Chipple of New York, and several others. They delivered their speeches in their respective languages, but when an oration was considered unusually important, the substance of it was given in two other languages by competent interpreters. The last meeting was held on the 24th; on this occasion thanks were voted to the municipal authorities of Frankfurt for their kind reception of the members of the Congress; and Mr. Cobden caused infinite delight and astonishment by acting as fagman to an English "Hip, hip, hurrah!" demonstration of gratitude. A resolution to publish the proceedings at three kreutzers (about twopence), terminated the meeting. Next year the Congress is to be held in London.

The accounts from New York are to the 14th inst. A bill has been passed by both houses of Congress to establish a territorial government in New Mexico. The senate have passed the Fugitive Slave Bill, the object of which is to provide for the settlement of questions respecting fugitive slaves. These make all the bills which were incorporated in that of the Compromise. The bills passed are the Utah Bill, the Texas Boundary Bill, the Admission of California Bill, the Territorial government for New Mexico Bill, and the Fugitive Slaves Bill. The following are the principal provisions of this last-mentioned important measure:—

The judges of the United States' District Courts, or their commissioners, in every county within their district, shall hear and summarily determine all cases of claim made by the owner for his *Fugitive Slave*. The deposition or affidavit of owner, or other satisfactory testimony, sworn to before a magistrate, according to the law of the state whence the slave escaped, shall be held sufficient to establish the right of property and to authorise the arrest and reconveyance of the fugitive to the state whence he or she may have fled; but in no trial or hearing under this act shall the testimony of the alleged fugitive be admitted in evidence. Any person aiding or abetting the escape, or interposing to prevent the arrest and reconveyance, will be subject to a fine not exceeding 1000 dollars, and to imprisonment not exceeding six months, besides forfeiting 1000 dollars by way of civil damages to the party injured. In case of affidavit being made by the claimant of a fugitive that he has reason to apprehend a rescue before he can reconvey such fugitive beyond the border of the state in which the arrest may have been made, it shall be the duty of the officer making the arrest to retain the fugitive in his custody, to personally remove him to the state whence he fled, and then to deliver him to said claimant or his attorney. To this end the officer is authorised and required to summon such assistance as may enable him efficiently to perform this duty. Finally, should such fugitive, subsequently to his arrest, be rescued by force from those having him or her in custody, and the rescue be proven to have been without collusion on the part of the owner, then the said owner shall be paid from the public treasury the value of said fugitive, and the amount paid (which is to be limited) shall be recovered by the general government from the state or territory in which the rescue was effected.

The present state of *Slavery in the United States* is illustrated by several recent circumstances mentioned in the American newspapers. An insurrection, in which 400 slaves were to be engaged, was discovered at Lowndes County, Alabama, some weeks since. The rendezvous of the negroes was fired upon by the whites, killing one slave and wounding twenty others. The slaves then fled. It is said that the slaves were incited to the insurrection by an abolitionist, for whose apprehension a reward of 6000 dollars has been offered. A general massacre is supposed to have been intended.—The runaway slaves have been so numerous of late, that the owners have become very much alarmed, and hence are disposed to remove them to safer parts of the United States, or to sell them to slave traders. The family of William Williams, the coachman of Presidents Polk, Taylor, and Fillmore, were suddenly, on Friday morning, seized by a slave trader and taken from their homes in Washington, to be sent to New Orleans. His wife, over fifty years of age, three daughters, and three grand-

children, were thus snatched from him in an hour to a fate worse to him than death, to be sold in the South to the highest bidder, and separated from him and each other. The poor man was nearly crazed by the dreadful parting. After many years' toil he very recently purchased his own freedom, but his family were owned by some one in New Orleans. The President, feeling deeply for his distress, gave him money, and let him go to see them again. Williams found the trader would take the sum of 3200 dollars for them, and he returned with the hope of raising that amount here to redeem them. The President, Mr. Webster, General Scott, and a number of Senators, members, and citizens, have contributed sums from five to fifty dollars. Mr. Corcoran gave 200 dollars, which was the price asked for the aged wife, and he made her "free" at once. Besides doing this, Mr. Corcoran has purchased one of the women, who has lived in his family for some years, Mrs. Commander Paterson another, and Mrs. General Towson a third, who lived with her some years past. So the children, for whom 1500 dollars were asked, only remained to be purchased by their grandfather, who is said to be in a fair way of raising the money.

Professor Webster, convicted of the *Murder of Dr. Parkman*, was executed at Boston on the 30th. According to the American practice the execution took place within the prison walls, in the presence of certain citizens chosen as witnesses. This, however, did not prevent the display of the curiosity always exhibited on such occasions by the public. A local paper says:—"The rear of the houses in Lowell Street looked into the gaol-yard, and both the windows and roofs of some of them were packed with persons of both sexes, and of all ages. It grieved me to see ladies and young girls manifest their morbid curiosity in this way. I am happy in being able to say, however, that three of those houses were shut by the occupants, who went out of town rather than witness the execution, or be in the vicinity of the place when the solemn preparations were being made, and where a fellow-being was to expiate his crimes by a violent death. If I had had time I would have procured the numbers of those houses, and the names of their occupants, and inserted both in this report. On the door of one of these houses a bill was posted to this effect: 'Not at home: opposed to capital punishment.' " It seems untrue that Webster made a second confession, admitting the commission of a premeditated murder. It is stated, on the contrary, that immediately before his death, he expressed his adhesion to his statement that the deed was not premeditated. It appears, however, that the general opinion in the United States is, that the murder of Dr. Parkman was premeditated, and that the verdict of the jury was in accordance with the facts of the case.

Jenny Lind arrived at New York on the 1st inst., and was received with the most extravagant demonstrations of enthusiasm. On the following day, it is stated, 800 American ladies paid their respects to her. The day for commencing her concerts had not been fixed.

There are accounts from *San Francisco* to the 1st of August. Emigration to California is still on the increase; hundreds were daily flocking to the diggings by way of Panama and across the plains from the southern states of America. The rivers during the winter months being so high have prevented many adventurers from working to any advantage. At the beginning of the dry season, in May, dams were commenced across the different rivers, with the intention to turn them completely from their course, but the dams as soon as formed were washed away. It is in the beds and on the banks of rivers that most gold has hitherto been found. The mode of appropriating land is a curious one, each person being allowed on arrival to stake off ten acres of ground till the whole river or ravine is taken up. At Dew Creek, emptying into the Yuba river, gold has been found in the highest mountains to an enormous extent; after digging some 80 or 100 feet, a vein of gold was struck yielding from six to eight ounces per man per day, and with every prospect of its continuing. One man sold his claim (ten acres) for 20,000 dollars. The mountains near the Sierra Nevada also proved very rich, two men having averaged 7 lb. a day for several days.

The intended road across the Isthmus of Panama from

Navy Bay had been commenced by the American Company; hundreds of labourers having arrived there from Cartagena and the surrounding country.

There are accounts from San José, the capital of the North American State of Costa Rica, of the 11th of June. General Don J. M. Castro, the founder of this republic, had resigned his presidency and embarked for Europe, in order to study the institutions of the Old World, and to promote the welfare of his country by laying open its resources to commercial and agricultural enterprise. The President's administration appears to have been wise and liberal. He has introduced ample religious toleration; the right to all foreigners of being naturalised; and the total abolition of slavery and the slave-trade. Under his administration treaties of amity and commerce have been concluded with Great Britain and other powers. The state of Costa Rica is situate west of Panama, on the great barrier dividing the Atlantic and Pacific Oceans. It contains from 2500 to 3000 square leagues. It is bounded on the N.E. by the Atlantic, on the S.E. by the Pacific. The population is above 100,000. The commerce of this country is chiefly carried on with Great Britain in British bottoms. During the years 1848-9 the arrivals at Punta Arenas amounted to seventy ships, with a total of 7188 tons of merchandise. The development of commerce is at present paralysed by the

long and expensive voyage round Cape Horn, as many of the productions of Costa Rica, fitting for the markets of Europe, cannot bear the heavy charges on exportation by that route. The exportation in 1848 amounted to 150,000 quintals of coffee, 10,000 hides, a considerable quantity of mother-o'-pearl, sarsaparilla and dye-wood, and a small lot of pearls from Golfo Dulce and Nicoya. The state of Nicaragua is wholly supplied with tobacco from Costa Rica; tortoise-shell is also exported in considerable quantities. The annual value of importations amounts to 1,000,000 of dollars, including 200,000 dollars from Nicaragua. Some gold mines are now being worked, and there are many others of copper exceedingly rich, of coal, nickel, zinc, iron, and lead mixed with silver, but they are neglected for want of capital. Traffic is at present carried on by the Port of Punta Arenas, on the Pacific Ocean, to which port a good carriage-road has been completed from the capital, a distance of seventy-two miles. Obstacles which would have deterred a less patriotic administration from the undertaking were surmounted by President Castro in the construction of this road. Forests, and mountains attaining an elevation of 4500 feet, were cut through; deep ravines and impetuous torrents were overcome; and five excellent stone bridges thrown across the route, at an expense of 150,000 dollars.

NARRATIVE OF LITERATURE, SCIENCE, AND ART.

THE names of the Commissioners for inquiring into the state, discipline, studies, and revenues, of the Universities and Colleges of Oxford and Cambridge, have proved a guarantee for the earnestness and good faith of the promoters of the inquiry. No friend to the real interests of either University need have any fear of committing them to the decision of such men as Sir John Herschell and Doctor Peacock; or as Doctor Jeune, Mr. Liddell, and Mr. Sacheverell Johnson; or as Professors Powell and Sedgwick. The effect is already felt, and the howl of resistance sensibly diminished. Sedatives of a satisfactory kind have also been applied to another as bitterly agitated question, and the reading-room of the British Museum is now enriched with a manuscript catalogue bringing up the arrears of books to the latest practicable date, in a hundred and fifty-three manuscript volumes. This, to which a duplicate copy is added, is in addition to other catalogues, printed and in manuscript, already existing; and is further re-inforced by a catalogue of the munificent bequest of the Grenville library, hitherto closed to the public by the absence of that accommodation. Thus has been wisely substituted for a matter of very just complaint what must be termed even a source of national pride, for it may be doubted if facilities of access equal to these exist in any other great library in Europe. A third subject connected with literature of considerable present interest is that of the possibility of securing any English copyright in a book written by a citizen of America, or any other alien. The question is again to be brought before a court of law: but if the issue be taken largely on the construction of the Act of Anne, and not on any such incidental point as the claim of a particular author to the rights of English citizenship, there can hardly be a doubt but that the latest and most authoritative decision, pronounced two years ago in the Court of Exchequer, will be finally affirmed. There can be no assignment of a thing that has no existence; copyright has now no existence in England, except under the Act of Anne; and no one who has carefully read that statute can have failed to arrive at the conclusion that its operation is strictly and exclusively limited to English authors.

The month just passed has maintained its reputation as the dullest of the literary year. Hardly a book worth naming has been published in it. A second series of Mr. Jesse's gossiping anecdotes of London and its Celebrities; two re-publications from America, one a book called *Barber* (a romance of which a parcel of Barbary corsairs are the heroes, not at all worthy of the happy extravagance of the author of *Kaloolah*), and the other a diary of *Rural Hours*, by the daughter of Mr. Fenimore Cooper, in which the scenery and social characteristics of a village in a New York county are rather nicely hit off; a translation from the German of somewhat similar *Pictures of Rural Life in Austria and Hungary*, with a mixture of high scenery and romantic incident that reminds one now and then of Mrs. Radcliffe; a capital tract on the *Mosaic Sabbath*, in which the good sense as well as learning of the subject is expatiated; and some few volumes on subjects of medical treatment, interesting only to practitioners in medicine; are the sole publications of the month of which any mention falls strictly within the purpose or intention of this record. Already, however, notes of preparation promise a busy autumn, both east and west of Temple Bar; and the present

dearth will doubtless make next month's harvest all the more abundant.

The Gazette of Tuesday the 3rd inst. contains the lists of the separate commissions appointed by Her Majesty to inquire into the state, discipline, studies, and revenues, of the two Universities of Oxford and Cambridge. For the Oxford Commission—The Right Rev. Lord Bishop of Norwich; the Very Rev. Archibald Campbell Tait, D.C.L., Dean of Carlisle; the Rev. Francis Jeune, D.C.L., Master of Pembroke College, in the University of Oxford; the Rev. Henry George Liddell, M.A., Head Master of St. Peter's College, Westminster; John Lucius Dempster, Esq., M.A., Vice-Warden of the Stannaries of Cornwall; the Rev. Baden Powell, M.A., Savilian Professor of Geometry in the University of Oxford; and the Rev. George Henry Sacheverell Johnson, M.A., of Queen's College, in the University of Oxford. For the Cambridge Commission—The Right Rev. the Lord Bishop of Chester; the Very Rev. George Peacock, D.D., Dean of Ely; the Right Frederick William Herschell, Esq., the John Russell, Knight, her Majesty's Attorney-General; and the Rev.

Adam Sedgwick, M.A., Woodwardian Professor of Geology in the University of Cambridge.

The Society of Arts has issued a notice, intimating that, as the Exhibition of the Works of Industry of all Nations in 1851 has rendered it superfluous for the Society to pursue its ordinary course by the offer of its usual prizes, the Council are of opinion that it will be most useful for them to encourage the production of philosophical treatises on the various departments of the Exhibition, which shall set forth the peculiar advantages to be derived from each to the arts, manufactures, and commerce of the country. They, therefore, offer the Society's large medal and 25*l.* for the best, and the small medal and 10*l.* for the second best, several treatises on the objects exhibited in the section of raw materials and produce, the section of machinery, the section of manufactures, and the section of the fine arts. Each treatise must occupy, and not exceed, 80 pages of the size of the Bridgewater Treatises, and must be delivered on or before the 30th of June, 1851. The Society will also award its large medal and 25 guineas for the best general treatise upon the Exhibition, treated commercially, politically, and statistically; and small medals for the best treatises on any special objects or class of objects exhibited. The treatises for which rewards are given are to be the property of the Society; and if deemed suitable for publication, should the council see fit, they will cause the same to be printed and published, and will award to the author the net amount of any profits which may arise from the publication after the payment of the expenses.

The Gloucester Musical Festival was held on the 10th, 11th, 12th, and 13th instant. The performances were on a great scale, but destitute of any novel feature. The collections for the charity amounted to 86*l.* 6*s.* 6*d.*, being 100*l.* more than was received at the last Gloucester Festival.

The Eisteddfod, or congress of Welsh bards and minstrels, was held at Rhuddlan on the 24th, 25th, 26th, and 27th. It was got up with great splendour, and attended by a large assemblage of the nobility and gentry of the principality.

The Submarine Electric Telegraph between the English and French coasts, was successfully laid down on the 28th of August. The points chosen were Shakespeare's Cliff at Dover and the opposite chalk headland of Cape Griseux on the French coast midway between Calais and Boulogne. The operations were conducted from the Goliah steamboat. Between the paddle-wheels in the centre of the vessel, was a gigantic drum or wheel, nearly fifteen feet long and seven feet in diameter, weighing seven tons, and fixed on a strong framework. Upon it was coiled up in close convolutions about thirty miles of telegraphic wire, encased in a covering of gutta percha. The connexion of the thirty miles of wire enclosed in gutta percha was made good to three hundred yards of the same wire enclosed in a leaden tube, to protect it from being chafed by the shingle on the beach and in the shallow water. The Goliah then steamed forward at the rate of about three or four miles an hour, in a direct line to Cape Griseux. The great drum was put in corresponding motion, and from it the wire was paid off over a roller at the stern of the vessel. At every two-hundred-and-twentieth yard (one-sixteenth of a mile), the square leaden clumps, weighing some twenty pounds, were rivetted to the wire to sink it well to the bottom, and to assist in embedding it in the submarine soil. The depth of the water varies between one hundred and one hundred and eighty feet; but at certain points there are ridges and valleys which made the sinking of the wire one of careful management. Between two of these ridges, well known to sailors, and called by the French the Colbart and the Varne, is a steep valley surrounded by shifting sands, many miles in length, parallel to the shores; and in these sands, as with the voracious Goodwins, ships encounter danger from losing their anchors,

and fishermen lose their nets. The wire was successfully plunged to the bottom, however, safe equally from ships' anchors, sailors' legs, or monsters of the deep. The remainder of the route was safely and slowly traversed, and the Goliah reached the French coast about eight o'clock in the evening. In half-an-hour the wire had been carried ashore and run up the face of the cliff, and messages had been carried from end to end of the wire. A few days afterwards it was discovered that the wire had been cut asunder among the rocks at Cape Griseux, the leaden tube in which it was enclosed having been too soft to protect it from injury. The communication between the coasts has been consequently suspended till means of greater security are adopted.

The operation of Throwing down a portion of the Cliff near Scaford by an explosion of gunpowder, was successfully performed on the 19th. Its object was to project a part of the cliff above 200 feet high, upon the beach, so as to constitute a groin for the protection of vessels. Several immense charges, containing many thousand pounds of powder, were deposited under the cliffs, and ignited by voltaic batteries. There was no very loud report; the rumbling noise was probably not heard a mile off, and was perhaps caused by the splitting of the cliff and fall of the fragments. There seemed to be no smoke, but there was a tremendous shower of dust. Those who were in boats a little way out felt a slight shock. It was much stronger on the top of the cliff. Persons standing there felt staggered by the shaking of the ground, and one of the batteries was thrown down by it. In Scaford, too, three quarters of a mile off, glasses upon the table were shaken, and one chimney fell. At New haven, a distance of three miles, the shock was sensibly felt. The effect of the explosion was stupendous. The chalky cliff cracked along a frontage of more than a hundred feet; and then the whole mass of the precipice seemed to crumble into pieces and fall into the sea. The dislodged mass formed a bank about three hundred feet broad and nearly three hundred long towards the sea, and about a hundred feet high.

The government have completed the purchase of all the ground and property requisite for the construction of the New Harbour of Holyhead; and the whole of the works will now be pushed forward with the utmost expedition, nearly 1500 men being constantly engaged in the various operations. The engineers are proceeding rapidly with the extension of the sea-walls at the Northern breakwater, and are also proceeding with the erection of the stages. Many thousands of cubic feet of stone are now ready for the commencement and erection of the immense sea-wall, and fresh supplies are daily obtained from the lofty heights that overhang the harbour, where extensive quarrying operations are carried on. The material thus obtained is thrown down into the breakwater, in masses from ten to fifty feet in thickness. The estimated cost of this new harbour, which will give 316 acres of sea-room, is 700,000*l.*

Canal Locks have been superseded by the introduction of an inclined plane, on which the boats can be drawn up to the proper level by means of a stationary steam-engine. This new process was put to the test on the 24th of August, at the Blackhill Locks, on the Forth and Clyde Canal. The result was most satisfactory; three boats having been drawn up in less than five minutes, while to have made them pass through the locks would have taken half an hour.

Mr. Hind, the astronomer, has given an account of the discovery of a New Planet, made by him on the evening of the 13th. It is in the constellation Pegasus, and appears like a star of the ninth magnitude, with a pale bluish light. At 11 h. 29 m. 36 sec., Greenwich time, on the 13th, its right ascension was 23 h. 44 m. 45.06 sec., and its North declination 14° 6' 42.7"; at 3 h. 28 m. 24 sec., on the 14th, its right ascension was 23 h. 44 m. 54.55 sec., and its North declination 13° 50' 20.3". Mr. Hind says, "This new member of the solar system forms the twelfth of the group of ultra-astrical planets, the third of which I have been fortunate enough to discover in the course of a rigorous examination of the heavens." He proposes to name it "Victoria," and to symbolize it by "a star surmounted by a laurel branch."

COMMERCIAL RECORD.

BANKRUPTCY.

From the Gazette of August 30. ROBERT BARKER and HENRY BAYLY, Bicester, Oxfordshire, drapers.—WILLIAM JEFFERSON, Hull, painter.—ROBERT M'DOWALL, Worthing, Sussex, draper.—WILLIAM MILLER and ALEXANDER MILLER, Liverpool, and Bootle, Lancashire, wine merchants.—CHARLES PORTER, Bocking, Essex, grocer.—VIRGIL JAMES POWELL, King's Place, Commercial Road East, tobacco manufacturer.—ROBERT SMITH, Liverpool, tavern keeper.—JOHN SNOWBALL, Gateshead, Durham, builder.—SAMUEL WILSON, Wolverhampton, grocer.

September 8. ALFRED CRANSTON, Wimborne Minster Dorsetshire, cabinet maker.—STEPHEN CHARLES LAKEMAN, St. Mildred's Court, City, commission agent.—(GEORGE NORTON, Cadford Saint Mary, Wiltshire, plumber.—JAMES PRIESTLEY, Radcliffe, Lancashire, cotton spinner.

September 8. THOMAS BRADLEY, Ranelagh Road, Pimlico, lard refiner.—GEORGE FRERED, Kidderminster, bookseller.—JOHN STONE, Hull, wine and spirit merchant.—WILLIAM THOMAS, Southrop, Gloucestershire, baker.—WILLIAM WARD, Liverpool, victualler.

September 10. JOSEPH BROWN, Gravesend, grocer.—JOSEPH CHARLES BERNIE, Pall Mall East, and Sun Court, Cornhill, emigration agent.—JOHN DAWSON, Northfleet, Kent; Mitre Court Chambers, Temple; and Clement's-lane, Lombard-street City, shipowner.—RICHARD GARDNER, Boughton Mill, Northamptonshire, miller.—JOHN HALL, Brighton, victualler.—ISAAC JESSUP, Kingsdown, Kent, farmer.—DANIEL RAIFORD and GAD SOUTHALL, Gracechurch-street, City, coal merchants.—SUMNERLAND STANFORD, Plymouth, innkeeper.

September 13. THOMAS BOOKER, sen. and THOMAS BOOKER, jun. Mark-lane, City, merchants.—CHARLES CUTBERT, Kennington-cross, coal-dealer.—JAMES HUSKEY, Poole, linen-draper.—WILLIAM JEFFERSON, Hull, painter.—GEORGE KETCHER, Asheldham, Essex, innkeeper.—JAMES TOWSE, Watford, Hertfordshire, innkeeper.—ROBERT WESTLEY, Greenwich, boot-maker.

September 17. JAMES BENSLY LARKE, Norwich, draper.—ELIAS MARCUS, Vincent-street, Limehouse and Stepney, builder.—JOHN SAVILL, St. Neot's, Huntingdonshire, draper.—EDWARD PALFREY SIMMONS, Highgate, Warwickshire, commercial traveller.—ABRAHAM SOLOMONS, Basinghall-street, City, merchant.—JOSEPH TURNER, Eastbourne, Sussex, grocer.

September 20. JAMES ATKINSON, Newcastle-upon-Tyne, victualler.—JAMES BENNETT, Hayhill, Berkeley-square, builder.—HENRY WARD FARRER, Old Fish-street, City, wine-merchant.—SAMUEL FAIRBIE, Bradford, Yorkshire, grocer.—BENJAMIN HOPKINSON BATES, Liverpool, merchant.—WILLIAM HUNTLEY, Hart-street, Covent-garden, licensed victualler.—RICHARD WILSON JEWELL and EDWARD ATKINSON, Charlotte terrace, New Cut, Lambeth, linen-draper.—WILLIAM PIER, Reading, Berkshire, tobaccoist.—FREDERIC VINER and THOMAS KITELES, Greenwich, millers.—GEORGE WALKER, Philipot-lane, City, merchant.

September 24. MARY BAKEWELL, Manchester, size manufacturer.—RICHARD BATTERSBY and JAMES TILFORD, Liverpool, linen-merchants.—JOHN JOWETT and THOMAS JOWETT, Coventry, grocers.—WILLIAM LUTON LOWE, Salford, Lancashire, victualler.—CHARLES RICHMOND FORGUES, Hardwick-place, Commercial-road east, wine and spirit merchant.—WILLIAM RICHMOND, Devonport, printer.—JOSEPH ESKELL, Froesehol-street, Hoxleydown, rectifier.—JAMES TAYLOR, Rochdale, cotton spinner.

BANKRUPTCIES ANNULLED.

Sept. 10.—HENRY ASHBEY, Kingscote, Gloucestershire, innkeeper.

Sept. 20.—WILLIAM ASH, Henry-street, Hampstead-road, plumber.

THE STOCK AND SHARE MARKETS.

City, Sept. 27.

During the early part of the month the business in the English Stock Market was moderately active, but for the last fortnight very little has been done either for speculation or investment, and prices have remained almost stationary. Our last review left Consols at 96½ to 1, from which price there was little variation till the 8th inst., when they became rather weaker, and declined to 96. Since then the market has been steadier, and the price is quoted this day 96½ to 1. The transfer books of the Reduced 3 per Cents, and the 3½ per Cents, and two or three other stocks, are shut for the dividend: they will re-open on the 16th Oct.

As the Railway Share Market this has been a month of great excitement and fluctuation. Extensive purchases have been made, and the prices of nearly all the chief stocks have experienced a very considerable rise, which, notwithstanding a temporary reaction, is well maintained; and the tone of the market is decidedly firm, and prices still looking up.

STOCKS.

	Prices during the Month.		
	Highest.	Lowest.	Latest.
Three per Cent. Consols	96½	96	96½
Three per Cent. Reduced	97½	96½	shut

CORN MARKET.

Mark Lane, Sept. 28.

The corn market has not been characterized by any important movement during the present month. The prices of wheat have been very firm, and the rates for home growth rule at present a shade above those of August. The London weekly averages last announced are as follow:—

Wheat, per quarter, 46s. 11d.	Peas, 32s. 1d.
Oats, 19s. 8d.	Flour, Town made, delivered,
Rye, 24s. 1d.	per 280 lb., 36s. to 38s.
Barley, 27s. 8d.	" American, per barrel, of
Beans, 28s. 8d.	166 lb., 40s. to 42s.

PROVISIONS—LATEST WHOLESALE PRICES.

Bacon, per cwt.—Waterford, 46s. to 50s.; Belfast, 48s. to 50s.	Eggs, English, 6s. 6d. to 7s. 6d. per 100.
Beef, per 8 lbs., mid. to prime, 2s. to 2s. 10d.	Hams, per cwt.—Limerick, 64s. to 70s.; Belfast, 58s. to 64s.; American, dried, 34s.; York, 60s. to 70s.
Butter, per cwt., Cork, 1st, 80s. to 81s.; Carlisle, 1st, 78s. to 80s.; Limerick, 1st, 72s. to 76s.; prime Dorset, 78s. to 82s.; Dutch Friesland, 78s. to 80s.; Fresh, 8s. to 10s. per 12 lbs.	Mutton, per 8 lbs., mid. to prime, 2s. 4d. to 2s. 4d.
Chosen, per cwt., new Cheshire, 42s. to 67s.; new Wiltshire double, 44s. to 54s.; Dutch, old Gouda, 32s. to 36s.	Potatoes, per ton.—Kent and Essex Regents, 30s. to 70s.; Shaws, 50s. to 60s.; Chats, 30s.
	Pork, per 8 lbs., 2s. 8d. to 4s. 4d.
	Veal, per 8 lbs., 2s. 6d. to 3s.

GROCERY—LATEST WHOLESALE PRICES.

Cocoa, per cwt.—Trinidad, 42s. to 50s.; Brazil, 28s. to 29s.	Sugar, per cwt.—Loaves, 50s. to 51s. 6d.; brown to good brown Jamaica, 36s. to 36s. 6d.; ditto fine, 40s. to 41s. 6d.; Mauritius, yellow, 35s. 6d. to 40s.; Brazil, brown, 32s. to 36s.
Coffee, per cwt.—Native Ceylon, 52s.; mid. to good plantation, 57s. 6d. to 75s.; good ord. West India, 42s. to 47s.; Mocha, 70s. to 75s.; Brazil, 88s. to 47s.	Tea, per lb. (duty 2s. 1d.)—Ord. Congon, 11½d.; Souehong, com. to fine, 11d. to 2s. 8d.; ord. to fine Hyson, 1s. 2d. to 3s. 6d.; Imperial, 1s. 3d. to 2s. 8d.
Rice, per cwt.—Bengal white, 9s. 6d. to 12s. 6d.; Madras, 8s. 6d. to 9s. 6d.; Carolina, 18s.	
Sago, per cwt.—Pearl, 19s. to 24s.	
Candles, per 12 lbs., 4s. 6d. to 5s.; Coals, per ton, Wallsend, 18s. 6d. to 18s. 8d.	

OILS.

Pale Sperm, per ton, 88s. 6d.	Oil, Gallopoll, 43s.
Sperm, 83s. to 84s.	Pale rape, 37s. to 38s. 10s.
Cod 83s.	Lined, 32s. 10s. to 33s.

THE HOUSEHOLD NARRATIVE OF CURRENT EVENTS.

1850.]

FROM THE 29TH SEPTEMBER TO THE 28TH OCTOBER.

[PRICE 2d.]

THE THREE KINGDOMS.

THE incidents of the past month are fraught with warning to writers of history. There has been so alarming a succession of events at once strange and humiliating, and the recurrence of crime and disaster has been so revolting and incessant, that, to a statistic who should merely aim at effect in the portraiture of a period, and think it fair to seize any fact, however extreme or exceptional, wherewith to form general conclusions, we might seem to have suddenly retrograded from Queen Victoria, Lord John Russell, and Doctor Sumner, to Dick Turpin, Jerry Abershaw, and the Pope. Were it possible to imagine M. Ledru Rollin, for example, inspired for the occasion by a regard to the rights of conscience and property, one might fancy him describing, for a second edition of his *Décalogue de l'Angleterre*, the condition of English society, and its results during October 1850, somewhat in the following strain.

"It became at this period perfectly evident that the restraints of order and law, as well as the obligations of conscience, had lost their power over the ill-disposed. With irrepressible and insolent defiance Robbery and Murder stalked through the land. Houses were entered in the metropolis at mid-day, their inmates left half-strangled, and property of singular value carried off without hindrance. Men were waylaid in the public thoroughfares, struck into insensibility, and plundered of all they possessed. Jewellers' shops were stripped in the Strand. In broad day, in Adam Street, Adelphi, a government messenger was stopped and rifled. Highway robbery was committed in St. Paul's churchyard. Infernal machines were delivered by hand in Brompton. Houses were entered in the Regent's Park, and only saved from plunder by the timely and gallant resistance of the men and women servants. The counties in closest vicinity with the metropolis were over-run with thieves of the most daring kind. County magistrates went to bed with six-barrelled revolving pistols under their pillows. Bag-shot was once more a solitude; and grass grew again on the old Bath road, as in the days when it made smooth trotting for the hoofs of highwaymen's horses.

"All the incidents just mentioned, and all those to be now narrated, occurred within the brief space of three weeks of the distressing period referred to. In the parsonage house of Frimley, a small village within half an hour's ride of the metropolis, a venerable clergyman was murdered in his bed by burglars detected at their midnight practices. In the same county eighteen houses had been similarly entered and robbed, and their inmates treated with violence, in less than the same number of preceding weeks; and in the neighbouring county of West Kent, ten parsonages had been plundered in less than the same number of preceding months. But the fate of the rector of Frimley seemed suddenly to let loose, simultaneously, over all the counties of England, a spirit of outrage without parallel for concentration and intensity. The *Times* devoted column after column to burglaries in the provinces. Durham and Devonshire, Lancashire and Bedford, Bucks and Staffordshire, figured in a single list served up at a morning's breakfast-table. The objects of ruffianly attack embraced prizes as various as the government mail-carts and the meanest huckster's shops; and so flushed were the rogues with their daring success, that they even broke into the Governor's house in the gaol at Worcester, and carried off the plate under the very noses of warders and turnkeys. Nothing was too high, and nothing too low, for the designs of this desperate banditti; nor could their cruelty, when unresisted, be equalled but by their cowardice when resolutely met. A girl of fourteen, armed with a brace of pistols, put some half dozen thieves to flight at Abbotkerswell, in Devon; 'O don't! for God's sake, don't shoot me!' was the supplication of a cringing thief to the butler in the Regent's Park, to which that gallant domestic responded by 'firing at his head'; a youth at Northampton sprang from bed in his shirt upon a burglar armed to the teeth, and pinned him to the earth till assistance came; and one spirited old maid proved too much for a couple of tall ruffians at Swindon in Gloucestershire. But these cases were unhappily rare; for the destruction of life at this lamentable period seemed to have been sought quite as eagerly as the abstraction of property.

"In Birmingham a gold and silver beater was struck and maimed with murderous weapons until supposed to be dead. At Bath the landlord of a tavern, and his wife, were murderously mutilated with a razor. At another hotel in Kendal, an aged dissenting minister was horribly wounded and half suffocated in his bed. A labouring man in Oxfordshire savagely murdered his wife. At a farmer's house in Laugharne two murders were committed within a few days of each other. In another part of South Wales an elderly lady was poisoned for the chance of an inheritance. At a small town in Lincolnshire a ferocious old drunkard, of seventy-three, stabbed to death a youth who would have prevented his murdering his aged partner. At Haverfordwest an old woman was found murdered in a ditch. A murdered infant was picked up in one of the most populous of the London squares; and, in Essex, a poor reduced girl and her unborn infant were mercilessly strangled. 'He has fair hair,' said the reporter of the leading journal of England, describing the seducer and supposed murderer, in the last-mentioned case, 'a brilliant florid complexion, small delicate features, regular in their contour, and a general cast of countenance very expressive of mildness and rustic innocence!' Such was the fashion at this deplorable juncture of speaking of persons charged with the most detestable crimes.

"It cannot of course be thought surprising that the whereabouts of the Police should have become matter

of anarchy, while unchecked and uninhibited violence thus raged throughout the kingdom. The cost of guardianship being not less than 17,000*l.* a year in the county of all others the least effectually guarded, such a question became extremely natural; but, alas! the discovery was soon made, that the paid conservators of order and decency, at this distressing period, had not been able to escape its general demoralisation. Consistently with this acts just recorded, a series of acts of criminal outrage upon the public peace were proved against its very custodians themselves. While the unhappy goldbeater of Birmingham was under the furious bludgeons of his assailants, two 'experienced officers,' a sub-inspector and a sergeant, were proved to have stood within sight and hearing of the outrage, and, in reply to entreaties from the daughter of the victim, to have refused interference with what might be merely, for what they knew, an act of highly proper chastisement! In the same week, in the centre of English civilisation, three very gross and wicked offences were proved against members of the metropolitan force; and one of its superior officers was charged with manslaughter by a coroner's jury, for having beaten and maltreated to death an industrious inoffensive artisan. But the general disorganisation of society exhibited appearances even more alarming. It was not simply to the lower servants of the law, but to its highest administrators, even to its makers and judges, that the scandal of this unhappy time extended. An Ex-Lord-High-Chancellor of England was fined for unlawful practices with fishing-nets; and a Nobleman in the most exalted rank of the peerage assaulted, without provocation, two wayfaring young collegians whom he encountered by chance (and without his trousers) in what the law of the land had declared to be a public pathway, but which he insanely imagined to be as much right to shut up, as to lock up his own nether garments.

Nay, not even here did the marks of universal degradation cease. What had heretofore been considered the most stubborn bulwark of English independence was now discovered to have been equally undermined. A hope prevailed that the daring spirit of burglary would have found some check in the difficulty of disposing of the property and plate which were its spoils; but a man of the highest respectability in the City, a bullion broker of forty years' standing in Barbican, a man who had amassed enormous wealth without forfeiting the respect of his fellow citizens, was suddenly discovered in close correspondence with gangs of provincial burglars, who had thus found safe and unsuspected market for their villainous trade. Nor were encouragements to misdoing in any degree less wanting, either from those who administered what was called justice, or from those in whose behalf it was administered. While magistrates failed properly to discriminate the grades of guilt in criminals, society as little perceived the danger of misplaced sympathy with crime itself. Charitable people with money to bestow, lavished it on those who had yielded to temptation and made poverty the excuse for theft; while the patient and long suffering class whom temptation had found firm, were left to perish on all sides around them. In Staffordshire a labouring man was as heavily punished for setting snares, and beating with a dog, as one of the highway tramps for an act of thieving, as well as beating of a very different order; and, by a bench of Squire Westerns in Westmoreland, the value of a dissenting minister's life seemed to be judged pretty nearly on a par with the worth of a brass pan.

"In short, but for the unquestionable authenticity of the records preserved of this extraordinary crisis in the British history, the relation of it would be utterly incredible. Whether the scene be the heart of the metropolitan city, or the wilds of an Irish county, the inquirer is shocked and disgusted alike by the same absence of all the signs or fruits of civilisation. Children and grown men were dying of absolute starvation in the public roads of the County of Clare, at the very time when crossing-sweepers of Baker Street were leaving large fortunes behind them. St. Luke's in England was filled with people capable of the most rational enjoyments, whose innocent and pleasant recreations the journals duly chronicled; while a parcel of hot-headed Presbyterians and hair-brained Roman Catholics were left free to agitate Ireland for the restoration of her prosperous days, by hawling for the annihilation of every holder of property. The art of Mutualism, or the Means of Trading Without Capital, was at the same time regularly taught in both countries by societies invented for the express purpose of plunder; and four City of London firms with very sounding titles appear to have carried on the invention with moderate success in 'a single apartment in a sort of public house' in St. Martin's Court. All over the counties of England, concurrently with these events, arose the flames of incendiary fires; and even claims the most monstrous were set up to a sort of vested interest in the profits of calamity. A band of fishermen on the Norfolk coast asserted their right to a beneficial share of every wreck upon their shore, by going off in their boats like so many savages of the Pacific, and committing despoilment upon a steamer hired by the owners of the wreck for its rescue. Other as intemperate wretches drank themselves to death from the spoils of a shipwreck washed on the coast of Liverpool; and of the same wreck, on that same full-frequented hospitable coast, even the gallantest, best paid, and till then most unflinching service of humanity was abandoned, and hapless creatures clinging to the sinking shrouds saw their last hope perish within sight of its fulfilment, by the cowardly retreat of the Liverpool life-boats before an ordinarily-tempestuous sea. Even to seamen of the higher rank the panic of the time extended; and the commander of a steamer in the English channel, after running his ship on its most formidable reef of rocks with a sacrifice of eleven lives, in a calm sunny day, was the first to desert the ship he had impudently for the supposed shelter of a boat, which he swamped by suddenly leaping into it in search of despicable safety.

"Do these read like the records of a civilised land? Yet not even here are we permitted to close our remembrance of barbarous events in the same single month of the eighteen hundred and fiftieth year of the Christian dispensation. In this so-called Christian period, a man in a fair way of trade had to answer the indictment of his parish for refusing to support his aged mother; and a lodging-house keeper in Kent Street did not hesitate to dispossess himself of a half-dying tenant, in arrears of rent, by dragging him naked out of his sick bed, bastinadoing him down the stairs with a heavy bludgeon, and thrusting him without covering into the public streets, bleeding and insensible. 'Gruel indeed! what next?' asked the wife of a master-tailor in Whitechapel who was working and starving his apprentice to death, when the lad drooped at length under his labour of near eighteen hours a day, and required other nourishment than 'tea and dripping.' Then, of course, very speedily, the *What next!* came, and the poor creature welcomed it with the exclaiming cry of 'Oh! God has heard my prayer!' Then children from six to ten years had caught the infection of hardness and guilt, and were as resolute and insolent in the docks of the police courts as the most veteran offenders. Nor this alone with children bred to neglect and shame. Thirty-three boys, well born and carefully nurtured, had to be suddenly removed from one of the most important schools of discipline in the kingdom, with

their characters indelibly blackened. The most appalling stories were also told in the police offices, of public lodging-houses crammed with both sexes in streets behind one of the greatest London thoroughfares, where wretched creatures were wont to pass the night in a house without proper accommodation for nine, and where the rooms overflowed with night-soil. Nor, as if to prove even such horrors capable of aggravation, was there wanting the contrast of scandalous waste beside these pictures of destitute misery. Two or three days after refusing to let a vote be passed for occasional loan of a book from the city library to a studiously-inclined member of corporation, the common councillors of the city of London voted five hundred and twenty-seven thousand pounds for the continued support of the abominations of a cattle market in the heart of their crowded streets!

"What, meanwhile, was the spiritual condition of the country thus overburdened with folly and crime? We may obtain, perhaps, some approximative notion of it by taking the prison commitments of an important county for the twelve months immediately preceding. They exhibit eight hundred and thirty souls made amenable during that time to such laws as prevailed. One-third of those had never attended a place of any kind in which a form of divine worship of any description prevailed. Nearly one-half had never learned to read. Seven hundred and fifty forlorn wretches among the number were found able to repeat the Lord's Prayer, but nearly four hundred of them possessed not the slightest notion of its meaning. Six hundred and twenty-two could repeat the Apostles' Creed, but of these more than one-sixth had no knowledge of the nature, the works, or even the name of Christ. No one, at the same time, could feel the least surprise at this, who knew how the spiritual teachers of the day passed their time, and the subjects in which alone they took interest. They had long abandoned every effort to enlighten the rational beliefs or inculcate the practical duties, for eager discussion of such questions as whether sermons should be delivered in a surplice, or candles lighted at the communion-table; and at what period of the rite of baptism the babe was saved from sin's eternal penalties; and whether Church could act independently of State, and if State had power to sit in judgment on Church? And while the garrison thus quarrelled and disputed, lo! the enemy were thundering at the gates.

"The state of England in the nineteenth century had retrograded, in a word, to that of Britain at the close of the sixth century. Of the latter period the chroniclers record that the clergy seldom troubled themselves much with preaching the faith either to the ignorant Britons or the heathen Saxons, whereupon Pope Gregory the Great was moved by divine inspiration to undertake the conversion of the island by sending over more worthy preachers; and over there came accordingly a monk, subsequently bishop and archbishop, and invested with plenary power over twelve other bishoprics, into which this kingdom was then and there divided by order of his Holiness. After a lapse of twelve centuries and a half, exactly the same thing now occurred; but, unhappily for this offending and miserable people, what in its origin was an effort of retrieval, in its renewal was but the penalty of sin. The intervening centuries counted backward, to depth after depth of degradation; and in more than equal proportion to the blessings of Christianity which Gregory the Great diffused by a movement of divine inspiration, were the scandals of Popery which Pius the Little inflicted by means of Doctor Nicolas Wiseman. No sooner had the new Cardinal Archbishop arrived within the precincts of his Archiepiscopal diocese, than a compact band of infuriated Westminster doctors of the faith about to be displaced, including one archdeacon, five canons, and an infinite number of rectors, vicars, subdeacons, precentors, minor canons, professors of divinity, incumbents, and curates, rose en masse under the leadership of the Reverend William Sewell, and ———"

Cetera desunt.

So might the history of our time be written, with not a word of falsehood in the facts, and with not a word of truth in the inferences. For let the reader take breath, and continue of good heart. The final sentence against Old England still waits to be pronounced. We have not yet become the serfs of an Italian priest, nor yet are we obliged to beg our daily bread from the barbarous Russian. The cheerful arithmetic of our *Household Words* Lord Granby rejects as distasteful; but to deplore and bemoan a system which is fast ruining the country solely by relieving its pressure of taxation, is an innocent comfort which no one need grudge to that extremely self-sufficient young nobleman. Even Lord Stanley begins to have hopes of us; and to admit that "the agricultural interest" and "the good of the community" may be separable things. It is true that certain elderly authorities which warn us of a plague as the first fruit of next year's Exhibition, also tell us that Free-Trade is responsible for all the murders and burglaries. But, on the other hand, the worthy Mr. Recorder Hill discovers an origin for them less far a-field, and has set a number of intelligent writers on an eager discussion of their remedy.

Thus already evil turns to good; and it will be safe to predict that, of the crime whose alarming frequency during the past month struck every one with so much terror, what remains a few months hence will be but the wholesome example of its detection and punishment. For it is not that such depravity in far greater excess has not heretofore existed, but that it has never been seen in such startling contrast to the amendment and better progress of all things else—never tracked with so much vigour, never laid bare with such terrible distinctness. Not to leave undone but to keep unknown, has been of burglars in past days, as of the Venetian ladies in Iago's time, the best virtue; but it is a virtue which cannot co-exist with true and honest civilisation. Her office is the painful but essential one of compromising no unpleasant reality in favour of a less unpleasant seeming. It is the necessary purification of the Woolwich Academy, which makes its present shape be seen; as it is from the vigilant watchfulness of men no longer tolerant of the least abuse of authority, that the exceptional defects of our system of Police are no longer able to conceal themselves. And infinitely greater and more beneficent are the duties and labours of civilisation which still wait to be discharged. She has to attend to the neglected and remember the forgotten. She has to direct misplaced sympathy into better channels. She has to connect the enjoyments of wealth and success with the higher sources of content and virtue. In one sense it may be no extravagant charge to attribute to the more rapid means of accumulating wealth increased temptations and facilities for crime. Upon intellectual cultivation depends the worth of material prosperity; and this before every other is the consideration which should occupy the thoughts of all men at present. Religion must be made a practical and intelligible truth; the poor must be taught as well as fed; and a sound system of Universal Education we must look for our only effective antidote to crime and tiquety. We require no other weapon against the Pope and his Cardinal Archbishop, but most assuredly this weapon will be needed.

NARRATIVE OF POLITICS.

A DEPUTATION from the *Ulster Tenant Right Provincial Committee* waited on Lord Clarendon during his late visit to Belfast, for the purpose of presenting an address. His Lordship declined to receive the deputation, on the ground of his engagements, but a copy of the address was transmitted to him; and the following reply, dated the 18th of September, was sent by his private secretary:—"Gentlemen,—I am directed by the Lord-Lieutenant to thank you for your address, congratulating him upon his visit to the north, and expressing your dutiful attachment to Her Majesty. His Excellency observed with extreme satisfaction the agricultural and manufacturing prosperity that prevailed throughout the district to which you more particularly called his attention; but he forbore to enter into any analysis of the causes which have contributed to this happy state of things, respecting which a variety of opinions must necessarily exist. His Excellency considers, also, that it would be improper, on his part, in replying to your address, to discuss the relations that should subsist between landlord and tenant, as the question will be brought under the consideration of parliament next session; and you may rest assured that it is the earnest desire of Her Majesty's Government to promote such an arrangement as may be satisfactory to all parties concerned. The Lord-Lieutenant is much gratified at learning that you do not assume the attitude of complainants against any class of our fellow subjects, as he cannot doubt that temperate discussion and a careful abstinence on all sides from offence and irritation, will greatly facilitate the adjustment of this important question. The agricultural body you represent must be well aware that landlords and tenants are mutually dependent on each other; that their interests are identified, and can never be separated without reciprocal injury; but his Excellency is convinced that in Ireland, as elsewhere, respect for the rights of property will be found perfectly compatible with that security and confidence upon which the profitable investment of capital must depend."

Mr. Nicholas Maher, one of the members for Tipperary, and a large landed proprietor in that county, and the Hon. Cecil Lawless, member for Clonmel, and son of Lord Cloncurry, have given in their unconditional allegiance to the principles of the Tenant League.

The *Durham Agricultural Society* held its annual meeting on the 3rd inst. The most remarkable feature of the proceedings was the speech of the Duke of Cleveland, a conservative and protectionist, who, on this occasion, putting aside the usual views of his party, indicated the necessity of every sort of exertion on the part of the farmers; telling them that, by discarding their antiquated modes of cultivation, they may make the land bear double the produce now generally raised from it.

At a meeting of the *Eury Agricultural Association* on the 4th, Lord Stanley, the chairman, made a speech which was remarkable as containing a retraction of the opinion he had expressed in the House of Peers, that the recent free trade legislation had altogether swapped the energies of the farmer, and brought both him and the landlord to ruin. He now congratulated his audience on the spirit of agricultural improvement and expenditure which he saw around him, and expressed his confident belief that that spirit, and that expenditure, would be equally beneficial to landlord and tenant. He entreated them not to relax in their efforts. "Let the seal," he said, "which you have manifested in the first instance be continued, as I am sure it will. Let the landlord and the tenant, let the merchant and the agriculturist, pull together in a joint endeavour after our common prosperity; and believe me, that we shall insure, in spite of all discouragement and difficulty, great and gratifying success."

A great gathering of the *Essex Protectionists* took place on the 9th, the occasion being the annual dinner of the *Saffron Walden Agricultural Association*. The principal speakers were Major Beresford, one of the county members, and the Rev. Mordaunt Bernard, rector of Little Bardfield. The rev. gentleman, in acknowledging the "health of the bishop and clergy," said that at a meeting which had been recently held in

a neighbouring county, the clergy had been compared to rooks. The clergy were certainly birds which once or twice in the year eat some of the corn—he did not mean to say they eat one-tenth part—and he was quite sure the farmers did not grudge them their share. At all events, he trusted they would not attempt to cut down those tall and ancestral trees in which the clergy had built their nests. Both speakers ridiculed the idea of "high farming," and contended that no kind of high farming, at the present prices, could save farmers from ruinous loss, doctrines which seemed to receive the unanimous assent of the meeting.

The *Tenant League* held a monster meeting at Navan, the capital of Meath county, on the 10th. Some fifteen thousand are said to have been present, chiefly tenant-farmers. Mr. Columbus Drake, J. P., presided; Mr. Sharman Crawford, M. P., was the most notable speaker. Mr. Crawford claimed the League's principle of adjusting the relations of landlord and tenant by valuation, as his own; founding its justice on the fact that in Ireland the relation of landlord and tenant is such as to render necessary a protection against extortionable bargains about the land, which is not necessary in bargains about other matters. Contemning, at his time of life, the charge of popularity-hunting, he pledged himself to do everything he could, in Parliament or out of it, to obtain for the tenants their rights. A letter from Mr. Henry Grattan, M. P., refused a "pledge to any particular body of men, or any set of principles they may adopt," and one from Mr. Corbally, M. P., expressed a belief that "the proceedings of the Tenant-Right Conference have materially injured a good and just cause."

The annual aggregate meeting of the *Parliamentary and Financial Reform Association* was held on the 14th in the London Tavern. The meeting was crowded. Sir Joshua Walsley was in the chair, and the principal speakers (besides the chairman) were Mr. Scarie, Mr. W. J. Fox, Mr. Hume, Colonel Thompson, and Mr. Feargus O'Connor. The leading resolution (which, with the others, was passed unanimously) was—"That, on a deliberate review of the proceedings of the last session of Parliament, this meeting feels called upon to express its strong dissatisfaction with many of the votes of public money—votes altogether unwarranted by the reasons assigned for them, or by the financial condition of the country; that, connecting these votes with the neglect of numbers of petitions from the people for Parliamentary and other reforms at home; the disregard of general and just complaints from our fellow-subjects in the colonies abroad; the continuance of heavy and oppressive taxation, and the maintenance of overgrown and unnecessary establishments; this meeting is deeply impressed with the necessity for a radical reform in the Commons' House of Parliament, for the purpose of giving to the people a constitutional control over the proceedings of that assembly, and, consequently, over the taxation and expenditure of the country."

At the *Waltham Agricultural Society's* Annual Meeting, on the 19th, there was an excellent *Show of Stock*, followed, as usual, by a dinner, at which the Marquis of Granby presided, supported by a number of the neighbouring landlords and clergy. Unlike the speakers at some of the previous meetings this season, the noble Marquis stoutly maintained the old protectionist doctrines, which, he affirmed, were still held to their full extent by Lord Stanley. Among the other topics of his speech, was the present cry for financial reform, which, he held, is a consequence of the distress caused by free trade. "What is the meaning (he said) of this crying out from one side of England to the other for diminishing the expenditure? What is it but that the people are now feeling the pressure of taxation much heavier than they have ever done before? Dickens, in a late work, said that in 1815 the taxes of the country were at the rate of 5*l.* 4*s.* 10*d.* for each man, but that now it is 2*l.* 14*s.* 11*d.*, about one-half. If that be the case—if taxes are only one-half of what they were then, how is it that there is this outcry for a reduction of taxation? The system which is now being carried on is ruining the country and destroying her vitality together with her best interests." He concluded by advising the farmers to cultivate their land as well as possible, and by referring to the next general election as the period

when they might secure representatives of sound principles.

From the *Revenue Returns* to the 15th of October, it appears that the net produce of the revenue for the year preceding that date, was 48,743,043*l.*; and that for the year preceding 10th of October 1840, it was 48,272,335*l.*; the increase on the year being 470,708*l.* For the quarter ending 10th October 1850, the revenue was 12,192,458*l.*; for the corresponding quarter of 1849, 13,610,661*l.*; decrease 418,103*l.* This decrease is accounted for chiefly by the repeal of the duty on bricks, which, in the corresponding quarter of 1849, amounted to 240,000*l.*; and by the diminution of 179,719*l.* on the Stamp duties, owing to two causes. Last year the discount previously given on receipt and certain other stamps was reduced, the reduction taking place on October 10, 1849. This created a great demand immediately before that date. On the other hand, the new Stamps act, reducing the duties, has come into operation this month, and the public have very generally put off to the new quarter the purchase of stamps for legal documents.

A return to Parliament just issued contains a list of *Sinecure Benefices* in England and Wales, with the name of the patron and incumbent, and the annual value and population of each. It appears that there are fifty-seven sinecure benefices, of which eighteen are in the diocese of Norwich. The annual value of these benefices ranges from 10*l.* to 1123*l.* In some of the places there are no churches, and in others the churches are in a dilapidated state. The population in some of the sinecure benefices exceeds one thousand souls.

The *Sales of Encumbered Estates* were resumed at Dublin on the 22nd; on which day seven estates were sold, of the aggregate value of 50,000*l.*

The Committee of Prelates appointed by the Synod of Thurles to carry into execution the project of establishing a *Catholic University in Ireland*, on the model of the Catholic University at Louvain, have resolved that regular monthly collections, on the plan of that for the propagation of the faith, be made throughout the kingdom by local committees, of which the parochial clergy are to be ex-officio members. They have published a long address to the Catholics of Ireland, insisting on the grave evils to faith and morals of separating religion from secular education, and calling loudly for support to their projected establishment.

Mr. Herbert Watkin Williams Wynn has been elected member for Montgomeryshire, in the room of his uncle, the late Mr. Charles Watkin Williams Wynn.

On the 4th, Mr. Loftus Wigram was elected member for the University of Cambridge without opposition, Mr. Cowling having previously withdrawn from the contest.

Mr. Booker, a protectionist, has been elected member for the County of Hereford, in the room of the late Mr. Badley.

NARRATIVE OF LAW AND CRIME.

MR. CURETON, of the British Museum, was *Robbed and nearly Murdered* in an extraordinary manner on the 20th ult. Mr. Cureton lodges on the second floor of a house in Aldersgate Street. In the afternoon three men, fashionably dressed, inquired for him in the lower part of the house, and were directed to go up-stairs; they did so, and in about a quarter of an hour descended, and left the place. A few minutes later, a Mrs. Wilson took some milk for Mr. Cureton's tea, and on entering his room she found him extended on the floor, insensible, his face quite black, and blood flowing from a wound in his forehead. Seven hours elapsed before Mr. Cureton was restored to consciousness. He then intimated that he had been robbed. It seems that the three men pretended that they wished to purchase a crown-piece of William and Mary. Mr. Cureton showed them one. While two of the gang were inspecting it, the third stood by the door—probably watching if any one ascended the stairs. Mr. Cureton turned to ask him to be seated; at that instant an instrument was pressed round his throat, depriving him of all power; and he was struck a violent blow over the right eye which made him fall senseless. Then, it appears, the villains ransacked the place; ear-

rying off a watch, a diamond pin, a box of cigars, and old coins worth from 300*l.* to 400*l.* as antiques, but not so many shillings if melted down for silver. It is supposed that the vice in which Mr. Cureton's neck was grasped was formed of two "life-preservers" tied together at one end. Fortunately the villains missed the most valuable articles; having overlooked a number of gold coins while sweeping away the silver ones. Two rewards were offered for their conviction—50*l.* by Government and 50*l.* by Mr. Cureton.—On the 2nd instant the police produced Henry Denham, a rough-looking young man, at the Mansion House, and charged him with having been concerned in the robbery and outrage. It seems that this person is a thief, and has been convicted; and the police had received information that he was one of the robbers. Mrs. Wilson, who lives in the house where Mr. Cureton lodges, and who admitted the three men on the 20th of September, stated that she could not swear to the prisoner, but she believed that he was the last of the three who entered the house. The noise of the violence and robbery had attracted the attention of Mrs. Edwards, who lives in the first floor; and as Mr. Cureton was usually very quiet, she went to speak to Mrs. Wilson about the noise, but could not find her. Mrs. Edwards saw the three ruffians descend the stairs; but, unfortunately, did not particularly notice them. Denham protested his innocence, and said he was an out-patient at St. Thomas's Hospital at the time of the robbery. He was remanded and brought up for further examination on the 9th, when he was again remanded for the production of additional evidence; and the magistrate directed him to be placed in the infirmary as he complained of illness. While he was being removed, the magistrate was informed that a gentleman was in court who had recognised him as one of a gang who made an attack on him similar to that which had been made on Mr. Cureton. The prisoner was again placed at the bar, and a gentleman presented himself in a state of great agitation. He stated that his name was Thomas Miller, a colourman in Longacre; that about a month ago an attempt was made to rob him as he was returning home about midnight; he was seized by three or four men, who caught him round the throat with an instrument like a walking-stick, made of gut or some pliable substance; he felt suffocated, and was thrown with violence on the kerb-stone, one of his teeth being broken and his chin severely hurt. Alderman Gibbs: Look at the prisoner at the bar, and say whether you know anything about him? Witness. I have no hesitation in saying that the prisoner is one of those who attacked me. I have a recollection of his face from the strong reflection from the gas-lamp upon it. My recollection was so strong that the moment I looked at him at the bar I was almost ready to sink. The Prisoner. Oh, Lord! Oh, Lord! how wicked! Alderman Gibbs: Do you apprehend that he was the man who put the instrument round your neck? Witness. I do. Alderman Gibbs: Did you lose any property? Witness. No; my pockets were tightly buttoned up. I struggled, and struck one of my assailants, and I think I must have marked his face with my knuckles. Alderman Gibbs: How many were at you, to the best of your belief? Witness. I believe there were three at me, and that one was on the look out. When I was assaulted, it was a quarter past twelve o'clock to a moment. The Prisoner. Oh, it's a cruel thing—a most cruel thing. No sooner does one charge fail than another wicked charge is brought on. Oh, I was not out of my bed at the time he speaks of. I was seriously ill at the time, and I can prove it. Witness: I wish to see the prisoner with his hat on his head. The prisoner put on his hat. Witness (having looked steadfastly at the prisoner). I cannot alter my opinion as to his identity. The Prisoner: It was only a few moments ago I had my solicitors here. Why was not this charge brought forward for his presence? Oh, you may as well hang a dog as give him a bad name. I know nothing at all about these wicked charges. The prisoner was then removed from the bar. On the 16th Denham was re-examined, and committed on the charge of assaulting Mr. Miller.

A coroner's inquest, held on the 24th of September on the body of a young man named Stendon, who was found dead on board the *Lady Sale*, a merchant brig, when

she arrived at the West India Docks, produced some striking disclosures as to the *Sanitary Condition of the Vessel*. It appeared from the evidence that the deceased was a sailor, in the service of a gentleman at Gambia, and that in July last he engaged with the master of the *Little Sale*, to allow him to work his passage to England. When the vessel left the River Gambia the crew consisted of eleven men, including the master and mate. The day after her departure it was found impossible to go below deck, in consequence of the steam and heat arising from ground cocoa-nuts, and the stench from undried mahogany. The crew were, therefore, obliged to remain on deck day and night, and get their berths where they could. The effect was, that the whole were more or less attacked with fever. Six of them, among whom was the deceased, were unable to work the ship. The cured beef was also so bad as to be unfit for human food. The crew remained thus exposed three parts of the passage. There was no surgeon on board, but every assistance was afforded by the mate and steward, who gave the invalids sage, arrowroot, gruel, and jalap. There were only twenty-four bottles of wine in the ship's stores, of which but ten were appropriated to the sick. One seaman died on the passage from exhaustion. When the vessel reached Cork, five sailors were put ashore, and placed in the hospital. In ten days they were thought to be sufficiently recovered to be able to continue the voyage. In two days after the ship left Cork they were again taken ill. The deceased soon became delirious, and frequently got on deck nearly naked. He was attacked with dysentery, and the fore-castle, where his berth was, emitted such an effluvia, that no one would enter it. When the ship had gone into the West India Dock Basin, he was found dead in the fore-castle. Had the ship been detained by contrary winds in the Channel, the mate stated that he had no doubt but that all the men who were in the hospital at Cork would have died. The verdict was—"That the deceased died of an attack of dysentery, and the jury regret that better accommodation and attention were not ordered for the deceased on board the ship."

An inquest was held on the 25th and 26th of September, on two of the persons who perished by *The Wreck of the Superb*. Joseph Johnson, the engineer, stated that that the vessel had never passed so near the rocks before; he did not know why they took that course on the present occasion. When the steamer struck, the cutter *Jupiter* was six or seven miles distant, and she bore down to the aid of the *Superb*. The passengers and their luggage were taken on board in a boat, a portion at a time; and at a later period the crew also quitted the wreck, after saving what they could. Thirty feet of the stern of the *Superb* went under water when she struck. Amy, a sailor, stated that Fleming, the mate, was at the wheel at the time of the disaster. He told Amy he was going to pass through the rocks, as he had done several times in the *Camilla*. Prieulx, the master, cried out twice, "Port!" but Fleming took no heed; Prieulx again shouted "Port!" Fleming then obeyed, but the vessel struck directly after. Mollet, a sailor, said he let down the small boat and jumped into it; numbers followed; the plugs were out and it filled. It was imprudent to attempt the passage through the rocks. "We were in the habit of taking three boats out with us, but we had then only two. Our long-boat was about nine or ten feet long, and would hold ten or twelve persons; the other, four or five." Gaudin, the second mate, stated that he was one of the persons who got into the other boat; that, too, had no plug, but Gaudin kept the water out with his foot. When there were fifteen or eighteen people in the boat, the master, Prieulx, leapt into it, and begged it to capsize; but for that, the mate thought all the people in the boat would have been saved. Thomas Hamon, a fisherman, detailed how he saved some persons who were struggling in the water. He has known the rocks for thirty years, and they are not the least practicable for a steamer. Prieulx told him he took that unusual course to show his passengers the wrecked *Polka*. Several passengers gave evidence, principally narrating their own adventures. The jury returned a verdict, assigning the wreck to culpable imprudence on the part of Captain Prieulx, and also charging Fleming the mate with imprudence. In

consequence of this verdict the master and mate were arrested, and found bail of 100*l.* each for their appearance when called on to answer the charges to be preferred against them in the royal court of Jersey.

A boy of about eleven years old, called Joseph Bean, was brought before the sitting magistrate at the Mansion House on the 27th of September, upon a charge of *Robbery*. The wretched child had been frequently committed to prison for theft, and been twice whipped by the direction of the magistrate, and the sentence had been regularly recorded. The case was the first heard in the court under the new Juvenile Prisoners Act. The magistrate said, it was his duty, under the new act, to ask the prisoner or the person who answered for him, whether it was wished that a summary sentence should be passed, or that the case should be sent for trial to the Central Criminal Court. The father of the boy said his child was, in his opinion, quite incorrigible, and it would, therefore, be advisable to send him to be disposed of at the Old Bailey. The magistrate regretted the obligation upon him to commit the boy for trial, as summary conviction presented in such a case much greater chances of reformation. The prisoner's father said he had been completely beggared by the boy, and persevered in his desire to see the case before a jury. The boy was accordingly committed for trial.

The Rev. Mr. Hollest, Perpetual Curate of Frimley Grove, was *Murdered* on the 27th of September, by robbers, who broke into his house in the dead of night. Frimley Grove is a small village, about a mile and a half from the Farnborough Station of the South-Western Railway. Mr. Hollest was in his fifty-fourth year; he had held the curacy for seventeen years, and was universally respected. He lived in an old-fashioned brick-house standing in its own grounds, and distant about a hundred yards from any other house. On the night in question, there were in the house Mr. and Mrs. Hollest, their two sons, youths of fourteen and fifteen, who were at home from school, a man-servant and two maid-servants. Mr. and Mrs. Hollest slept on the first-floor. About three o'clock in the morning, they were awakened by a noise in the room; and saw two masked figures standing at the foot of the bed, with lights. Mr. Hollest thought it a trick of his sons, and good-naturedly chided them for the unreasonable hour they had chosen. Mrs. Hollest was not so deceived, and screamed in terror. The men instantly seized them both, and, with pistols pointed at their heads, declared that if they made the slightest noise they would blow their brains out. Mrs. Hollest struggled hard, and at length succeeded in slipping out of bed and seizing a bell-rope; upon which her assailant rushed round to the side of the bed, threw himself upon her with such force as to snap the bell-rope asunder, and continued to stand over her with his pistol pointed to her face. Mr. Hollest, who was a strong and active man, struggled with the villain who stood over him, and getting out of bed, was in the act of stooping down to reach the poker from the fireplace, when his assailant fired, and wounded him in the abdomen. Mr. Hollest was not aware at first that he had been struck, and continued to grapple with the robber, endeavouring to prevent his escape. The report of the pistol alarmed the miscreant who was standing over Mrs. Hollest, and he left her for a moment and joined his companion. Finding herself released, she rushed to the fireplace, and, seizing a large hand-bell, swung it to and fro several times. The villains almost immediately left the apartment; and, descending the staircase, hastened out of the house by the front-door. Mr. Hollest seized a loaded gun, ran down stairs, and fired at three men who were running across a lawn; but, it appears, without effect. On returning up-stairs, Mr. Hollest first discovered that he was wounded. He got into bed, and sent the man-servant for constables and a doctor. Examination of the premises showed that the robbers had entered by a scullery-window, and then forced an entrance into the kitchen. They had set all the doors open, and fastened them back, so that they might easily retreat. They carried off much plunder. When Mr. Davies, the family-surgeon, examined Mr. Hollest, he at once pronounced a fatal issue. The patient's sufferings were intense; and at noon on Sunday, the 29th, it was announced to him that death was approaching. He

received the intelligence with Christian resignation; took an affectionate leave of his family and servants; expressed a desire to partake of the sacrament, which was administered to him by a clerical friend and neighbour; and he expired, in a state of almost unconscious exhaustion, between eight and nine o'clock on Sunday evening. An officer of the Detective Force was sent from London to aid the local police; and on Sunday evening three men, calling themselves Smith, Jones, and Harwood were apprehended at Guildford. They were known as daring thieves who had been several times in custody before. Government offered 100*l.*, and the family of Mr. Hollest 50*l.* for the conviction of the criminals. An inquest was begun on the 30th. The facts above stated were proved; and Mary Goldstone, a servant of Mr. Mayberry, a surgeon at Frimley Grove, identified Smith and Jones as two of three men whom she saw talking on a grass-plot before her master's house at half-past twelve on Friday night. Smith and Jones denied this; saying they could bring witnesses to prove they were not at Frimley. The inquest was adjourned for a week. — Samuel Harwood, a brother of the man already in custody, was arrested subsequently. A keeper found in a plantation the masks worn by the men, made of green baize; and a piece of corresponding baize was found in Samuel Harwood's house. The inquest was resumed on the 8th, and again adjourned to the 22nd. — On the 12th the prisoners were examined before the magistrates of the county. The reporters for a number of newspapers attended, but were refused admission. The principal witness was M. S. Hollest, who had been likewise examined before the inquest. Her deposition, it is stated, contained a remarkable fact relative to a copper token found in the pocket of one of the prisoners, which she positively identified as a coin that had been paid to her a few days previously to the murder, by a Miss Bulpin, the village school-mistress, and which was stolen, with other copper moneys, by the thieves. This token formed the weekly payment of one of the little school-girls to a provident fund for purchasing clothes, set on foot in Frimley by Mrs. Hollest. It was paid to Miss Bulpin, the schoolmistress, by the little girl, and handed over a few hours afterwards by her to Mrs. Hollest, with the remark that it was a very odd looking penny. Miss Bulpin added, that she did not think it would pass; but Mrs. Hollest expressing her belief that it would, showed it to Mr. Hollest, remarking to him, that "they had not paid much respect to poor King George's nose" (the nose on the profile of King George is much scratched and battered). Mrs. Hollest then put the token with other moneys into a bag, where she was in the habit of keeping the "clothes fund," and there it remained up to the night of the murder.

The investigation was resumed on the 18th. In the meantime Hiram Smith had volunteered a confession of his own guilt, involving also his associates; and his statement had been taken down by Mr. Keene, the governor of the goal, and police-sergeant Hollington. The other prisoners were kept in total ignorance of this circumstance. When brought for further examination, the four prisoners were placed in a semicircle before the magistrates, separated from each other by turnkeys, that all possibility of their communicating with each other might be cut off. The magistrates went through all the steps of the evidence against the prisoners, independently of the confession, as if that had not been made; and Hiram Smith put questions to the witnesses as if he had made no confession. The evidence concerning the confession began with the statement of Sergeant Hollington, that "on Monday last the 14th inst." in consequence of what had passed on the previous day between Smith and the governor, Mr. Keene, "Smith was brought into the room where they were then assembled." Levi Harwood here glanced rapidly and suspiciously at Smith, whose eyes were fixed on the ground. Jones looked doggedly forward, turning his eyes neither to the right nor to the left; while Samuel Harwood, whose face became suddenly pale with apprehension, gazed with an alarmed expression at the chairman. The chairman—"What passed?" The witness—"Mr. Keene said to the prisoner, 'Here is Mr. Hollington.' Smith then wanted to see one of the handbills, but Mr. Keene had no copy, and he therefore

produced the *Hus and Ory*. I afterwards sent for a bill, which the prisoner read himself. He then wanted to know the meaning of the word 'accomplice'; and we told him that he must use his own judgment. He also wished to know whether the promise of pardon in the bill would be acted up to if he were to 'poach.' We told him that he had the bill before him, and must use his own judgment. Neither of us held out any hope to him founded thereon; but he said that he saw it was plain, and he would therefore make a statement." [Levi Harwood again directed a rapid but furious look at the prisoner Smith.] He had been cautioned several times, and told that his words would be taken down and used against him; but he answered, "Every man is bound to take care of himself;" and made the statement which Sergeant Hollington took down, and which was now read to the court. It was to the effect that the robbery was planned by Smith himself and the three other prisoners, and gave a minute detail of the outrage, corresponding to the circumstances which had already transpired. It declared that Levi Harwood was the person who fired the fatal shot at Mr. Hollest. It added, that, after the robbery and murder, they went to Kingston, and that Levi Harwood then went to London to dispose of the booty. While this document was read by the clerk to the magistrates, Smith remained with his eyes fixed on the ground. Levi Harwood swung himself to and fro occasionally, and shot looks full of the most savage anger at his approver-accomplice; his hands all the time being deeply buried in his breeches-pockets, as if to restrain himself from some act of violence. Jones scowled fiercely forward; and Samuel Harwood looked more and more alarmed. When the reading of the confession had terminated, Levi Harwood exclaimed, though in a subdued tone of voice—"It is all false what he says, gentlemen, all of it." The chairman observed, that the confession was important evidence against Smith himself; whether it affected any one else would be matter for future consideration. Smith—"It's all true, every word of it." Mr. Keene's written account of the confession was then handed in and read: it agreed exactly with that of Sergeant Hollington. Smith repeated—"It's the truth, and ne'er a one of them can deny it." Levi Harwood—"I can deny it, for I don't know anything about it." Smith, with an air of astonishment on seeing the preparations making for the removal of himself as well as his associates, here asked the chairman whether he was to be locked up as he used to be? The chairman—"Certainly. What you have said is strong evidence against yourself." Jones then, for the first time since the announcement of the confession, turned towards Smith, and in a voice rendered hoarse by the vehemence of his passions, said, "I hope you will get shot yourself some day for what you have said." The prisoners were remanded, and removed; Levi Harwood vehemently protesting that Smith was a liar. The adjourned coroner's inquest was resumed on the 22nd. Among the other evidence brought forward was the confession of Hiram Smith. The inquiry was again adjourned to the 29th.

In July last a daring Robbery was committed in Northgate, one of the principal streets of Halifax, by a party of very expert thieves, who entered the premises of Mr. Lewis Balerna, watchmaker and jeweller, during the night, and cleared the premises of upwards of 50 silver watches, 11 gold watches, 320 fancy gold rings, 30 diamond rings and a great quantity of articles of jewellery. A reward of 50*l.* was at the time offered for the conviction of any of the thieves, but no trace of them, or of the property stolen, was gained until Sunday the 20th of September. On that day Mr. Bewick, the chief superintendent of the Manchester detective force, received some information which led him to visit a house in Ashley Lane, Manchester, where he found a large box, which had been left there by a woman who called herself Ellen Mout, and which contained forty-four gold and silver watches, a large number of gold pins, and other articles, many of which he recognised as the produce of the Halifax robbery. Next day he went to Liverpool, and discovered that Ellen Mout had been living there as the wife of a man named Hawkins. She had been arrested on suspicion of felony by the Liver-

pool, police, but no charge being made out against her she was set at liberty. He at once recognised her as one of the most notorious thieves in the district, whose real name was Amelia Wade, but who had found it convenient on many occasions to adopt an *alias*. She was of course taken into custody, and it is believed that three men, in custody on another charge at Liverpool, were concerned in the robbery.

At the Mansion House on the 30th of September, William Lefevre, a child of ten years old, was charged with having attempted to *pick Pockets*. His impudence was remarkable; he had been observed by a labouring man together with two other boys, endeavouring to pick pockets, and he appeared to be the most active of the little gang. The witness followed them for some time, and at last saw the prisoner dextrously slip his hand into a woman's pocket, but as he pulled it out empty, the man merely gave him a slap on the side of the head, and told him to be off. "Off!" said the boy, squaring up to him, "do you cut away with you, or I'll knock in the whole front of your head; blast if I don't." The witness was not much astonished at the language, for he had seen the prisoner and his companions before, but having thought proper to pursue them further, and prevent them from going into a halfpenny steamer, the young fellow said, "Well, I see there's no use in talking, and I certainly will pitch into your breadbasket, old fellow." And he threw himself into position, and said he was all right in pluck. Alderman Gibbs: What have you to say, prisoner? The prisoner: I was only playing about with other boys, when this man, who isn't a policeman, came up and threatened us. I told him I was able to fight him, and he wouldn't have me; that's all. He was remanded.

Alexander Minginoria, a Pole in the uniform of a French soldier, was charged at Marlborough Street on the 30th September, with *Begging in Shops*. He gave an account of himself, from which it appeared that he had fought against Russia in 1834, and for this he had been exiled. He went to France, entered their service, and was sent to Algeria. In that colony he had spent the best years of his life; and when he returned to France the revolution had occurred and a republic had been established. The French government had come to the resolution to expel foreigners from that country. Accordingly he was peremptorily required to quit the country of his adoption, and for which he had fought for so many years. A free pass and a free passage were provided for him, and he was landed on the shores of England without a shilling. The secretary of the Polish Society, who was in attendance, said he could corroborate one portion of the defendant's story, as far as the extradition of Poles from France was concerned. Within a very few months he could prove that 200 destitute Poles had been driven from France by the French Republic, and had been landed penniless on the shores of England. It was monstrous such a system should be permitted. He believed the fact had been communicated to Lord Palmerston, but he was not aware whether any steps had been taken to check the evil. The magistrate concurred in condemning a proceeding that had the effect of driving these poor foreigners from a country on which they had some claim, to a country on which they had no claim whatever. The secretary said, the public grant for the relief of the distressed Poles had ceased, the English nation having naturally become tired of giving alms to the refugees. There was, however, 1200*l.* subscribed privately for the relief of the Poles, and out of this fund a passage to America would be furnished to the defendant. The magistrate gave the poor man 5*s.* for temporary relief.

At Bow Street on the 1st of October, Theodore Staines, who was described as editor of a weekly paper, and said he was a novel-writer for certain periodicals, was charged with two *Savage Assaults in Long Acre*, while in a state of intoxication. He had been walking in Long Acre after midnight with a gigantic walking-stick, which he flung indiscriminately over the heads of unoffending by-passers. A carpenter named George received a smart blow on the head, and the constable who apprehended him was kicked, struck, and bitten by him on the way to the station. He expressed his regret at what had happened. He had now no recollection of it. Owing

to a long absence on the continent, he was unused to English liquors, and a very little had effect. The stick produced was a curiosity, which he had brought from abroad. He hoped his "brethren of the press," as he called the reporters, would not expose him. The magistrate advised him to keep his "curiosity" at home for the future, and fined him 30*s.*, or a fortnight's imprisonment, for the assault on George. For the assault on the constable he was sentenced to eight days' imprisonment without the option of paying a fine.

A *Lunacy Case*, curious for the technical objection which was the subject of preliminary discussion, was decided at Dumfries on the 3rd. The subject of investigation was the state of mind of Mr. Pulteney William Mein, eldest son of Pulteney Mein, Esq., of Canobie. The pleadings, or "*brieves*," as they are termed, described the party as *maximus filius*. This description was objected to on the part of the defendant, as being mis-descriptive. It was contended that *maximus filius* would have been a good description of the *largest* son, but, to describe the eldest, the words should have been *maximus natus*. The objection was overruled, and the case proceeded on the merits, when, after an inquiry of three days, the jury found a verdict *cognoscens* Mr. Mein, in other words finding him insane.

On the 3rd, an inquest was held at Milntown, in the county of Clare, on the body of Dennis Kearin, a pauper boy of eleven years old, who had *Died on the Road* between the Milntown auxiliary workhouse and the Ennistymon workhouse. The board of guardians had ordered the paupers in the auxiliary workhouse to be inspected. At six o'clock in the morning, on a very bad day, 85 boys, 14 men, and 3 women, set out and walked to Ennistymon, a distance of fourteen Irish miles; were inspected, and set out again on their return, without having tasted food since their departure in the morning. They were exhausted with cold and hunger, and the boy Kearin fell down and expired on the spot. One of the witnesses, a resident in Milntown, who met the party of paupers as they were straggling along in the evening, gave the following description of their condition: I was on my way home to Milntown, from Ennistymon Fair. I observed a man up against the wall on the side of the road; I asked him what he wanted there, and he told me he was weak and not able to walk. I came on then, and met another man on the road, who walked a few steps with me and said his sight was darkening, he was so weak from hunger. I met a number of the boys further on; I asked them were they able to walk home; some were, and some were weak. I met another boy further on, and he having a sheaf of beans under his arm, he and I came to the road as far as Mr. Kearin's bridge. We met with more of the boys, and he stopped along with them. I came on, when I met three other boys; and one of them was trying to bring another boy who was not able to walk; it was then dark, I took the little boy that was weak by the arm, and led him along with the other boy. I did not go far when the other boy told me he was falling dead with weakness. I took him in like manner by the hand, and had both the boys then by the arms. I led them both on until we came to Clonbonny Bridge. I took off their hands there, and had to turn aside from them, when I heard a cry, and I took the chaps by the hands and went on. I saw a little boy staggering before I could come up to him. He was dashed against the wall. I asked one of the little boys that was with me to take up the boy that fell. He said he could not—that he was dead. I came on, and did not look after the boy that fell. I heard the sound of his skull against the wall. I saw no person with him. The boys I had, told me several times they were hungry. All the boys I spoke to were pauper boys. They were sent from Milntown Auxiliary Workhouse to Ennistymon Workhouse. I asked them, did they get anything to eat at Ennistymon house? They said, No. They told me they ate a few spoons of stibout that morning for breakfast at six o'clock. The jury returned the following verdict:—We find that Dennis Kearin, aged eleven years, came by his death on Monday night, September 30th, on his way from the Ennistymon Workhouse to the Auxiliary House at Milntown from exhaustion, for want of food, and exposure to cold, and from the neglect of the officers

connected with the parent house and auxiliary house at Milntown, together with the neglect of the Ballyvoughan guardians. The Government have ordered a magisterial investigation into this affair, the result of which is not yet known.

A thrice adjourned *Inquest* on the body of James Geary, a young Irish labourer, was terminated on the 4th. It appeared from the evidence that Geary had died on the previous Sunday. About one o'clock on Sunday morning, the 19th of August, he was attacked by the police near the court where he lived, adjoining Burial-ground Lane. The police beat him about the head and shoulders with their staves, and as he lay on the pathway with his head hanging over the kerbstone, one policeman held him by the collar and another knelt on his chest; after which they pulled him up and dashed him against the railing, when Sergeant Bushell struck him across the arms and legs with his staff, and while they dragged him to the station-house, Sergeant Bushell again struck him with his staff. The people cried out "Don't kill the man." Geary, who was perfectly sober and orderly, was charged with drunkenness and disorderly conduct; but the magistrate dismissed the charge. The day after he got the beating he took to his bed, declaring he would never recover it, and gradually sunk until he died. One of the witnesses swore to Sergeant Bushell being the man who struck Geary with the truncheon, but could not swear to the identity of the other policeman. The jury returned a verdict of "Manslaughter against Sergeant Bushell," who was committed to Newgate. He has been since tried at the Central Criminal Court and acquitted.

Mr. Thomas Charles Sirrell, gold and silver refiner of the Barbican, a tradesman doing a large and profitable business of an apparently respectable character, was, on the 4th, arrested by the police on a charge of *Receiving a Quantity of Stolen Plate*, with a guilty knowledge of the mode in which it was obtained. A large quantity of plate was stolen from the residence of the Rev. Mr. Fisher, a Catholic clergyman, near Liverpool. The officers visited Mr. Sirrell's, and seized the goods. They telegraphed the seizure to Liverpool, and received instructions to arrest Mr. Sirrell; this was also done, and he was conveyed to Liverpool, and brought before the magistrates, by whom he was remanded. Two persons, named M'Aulay and M'Guire, were apprehended at Liverpool, charged with stealing the goods received by Sirrell. On the 8th the prisoners were again examined and remanded. When the police arrested Sirrell, they examined his general stock, and saw enough to induce them to seize the whole, on suspicion that it was the produce of robberies. It was removed to the Scotland Yard station, and part of it was recognised; Mr. Argent, of the Rainbow Tavern, Fleet Street, identified some plate which he had lost, though his marks had been nearly obliterated; and Mr. Lovegrove, of the London Coffeehouse, claimed a number of spoons and forks. It was ascertained that a pair of salt-cellars, part of the packets sent from Liverpool, were stolen from the house of Mrs. Tinley, a lady living in that town. On the 18th, Sirrell and M'Aulay were committed for trial; but M'Guire was discharged. Mr. Sirrell has since been liberated on bail.

An inquest was held on the 5th on the body of Ann Francis, a young girl, servant in a family in Newman Street, who had committed *Suicide*. She had formed an affection for a young man named Kelly, whose master resided in the same house, where she had been a servant five years. She received a letter from Kelly, in which he said that he intended sailing for New York, in consequence of her having said that she was pregnant by him. Next morning she was found by a fellow-servant in the kitchen, hanging by a rope from a clothes peg, and dead. The following letter, addressed to her mother, was found close to where she was hanging:—"Dear mother, Kelly has ruined me, and says that I am the cause of his going away. It's more than I am able to bear. Good-bye, dear parents. Ann Francis."—A verdict of insanity was given.

John Lambourn, a labourer, residing at Watlington, in Oxfordshire, has been apprehended on the charge of having *Murdered his Wife*. They had long lived unhappily, and violent altercations were often heard

between them. The wife was seen in good health on the 5th, and at eleven o'clock that night she was found dead in the garden, near her cottage door. She was then quite cold, her bonnet and cap were saturated with blood, and a quantity of congealed blood was beneath her head. The coroner's jury found a verdict against the husband, who was committed for trial.

John Kelly, a boy of twelve years old, was charged at the Mansion House on the 7th with *Stealing* in the clothes market in Cutler Street. He had been seen walking along with two "blinds," a black-and-white dog and a girl, both of which he was in the habit of using in his trade of theft, in which although so young he had been very expert and successful. He carried a whistle, which he blew upon the approach of danger, and the call was immediately answered by a rush from a crowd of Petticoat Lane thieves, and generally a rescue. The girl had been the immediate recipient of the "swag," and the dog was stated to be the bitter enemy of the police and others who are interested in the preservation of peace and the diminution of robbery. Upon the present occasion the prisoner was disappointed, and his whistle having been secured, he was unable to summon his friends to the rescue. Alderman Gibbs: Let him be taken down stairs and soundly flogged, so that he may remember the day. The prisoner. Oh dear, don't whop me, and I'll promise to cut away from you altogether. Alderman Gibbs: No; you must go away taking with you a wholesome whipping.

A *Daring Robbery* was attempted in the house of Mr. Marston, a gold and silver beater in Birmingham, on the 7th. About four o'clock in the morning he was roused from sleep by a noise in the house, and on getting out of bed he found that his room door, which he left ajar on retiring to rest, had been in the meantime closed. He went down stairs, and glanced into the sitting-room, saw three men emptying his sideboard of the plate which it contained, and a large heap of the spoil was lying on the floor. He attempted to run back to his bed-room, with the intention of getting his firearms, but the robbers attacked him with their bludgeons. He turned upon them and tore a wooden rail out of the banister, maintaining his position on the stairs for several minutes. At length, one of the villains brought a poker from the sitting-room, and with this he struck Mr. Marston numerous blows across the head and legs. Unable to hold out any longer he dropped at their feet, but even then they kicked and struck him, so as to prevent the possibility of his pursuing them, and as at this moment a fainting fit deprived him of his senses, they no doubt thought they had killed him. They then quitted the house, making their exit from the premises by the same way as they had entered, namely, through the ceiling of Mr. Marston's warehouse, from which a door communicated with the house. During this struggle, which lasted a quarter of an hour, and while Mr. Marston's daughter and servant were at a window crying loudly for help, two or three policemen were standing inactive before the door; and they afterwards alleged that the noise was caused by a man chastising his wife (or son, as one of them said) as if such a thing was likely to happen in a highly respectable house, and at such an hour in the morning. At last the door was opened from the inside, and Mr. Marston was found covered with blood, and insensible. No property was carried off. Five young fellows belonging to a London gang of thieves have been arrested. The policemen were brought before the watch committee, when Miss Marston attended and stated the facts; but the men were simply reprimanded by the Mayor. Five men were apprehended on suspicion, but, in consequence of the precarious state of Mr. Marston, they were not brought up for examination till the 23rd. Against two of them, Elijah Wareham and John Smith, no evidence was adduced; the others, Christopher Healy, Joseph Marshall, and William Wallace, after a long examination were remanded.

Cornelius Bowan, a respectable looking man of middle age, was charged on the 7th, at the Southwark police-court, with *Assaulting* police constable Gingle while in execution of his duty. The policeman said that the defendant with several women were standing by a coffee stall at one o'clock in the morning, talking and making a noise; that he desired the defendant to move on,

which, he refused, and seizing the policeman by the collar, tore his coat, but was at length taken to the station-house. The defendant brought two respectable witnesses to disprove the complainant's statement. The defendant was taking a cup of coffee at the stall and making no noise or disturbance, when he was attacked and violently struck by the policeman. The magistrate said that it was necessary that policemen should be protected in the execution of their duty. In this particular case, however, it appeared that there were no just grounds for the policeman's interference with the defendant while drinking his coffee, and that instead of the latter committing the first assault, it was proved by two competent witnesses, the policeman was the aggressor; that the public must also be protected from such conduct as that described, and, therefore, he should discharge the defendant.

A number of *Incendiary Fires* have taken place in different parts of the country.—On the evening of Sunday the 6th, about nine o'clock, a large stack of barley adjoining the homestead of Mr. Boldero of Battleden in Suffolk, was discovered to be on fire. A gentleman and lady passing in a gig saw two men running away from the stacks, and immediately afterwards the flames burst out. The fire extended to a neighbouring wheat-stack, and both were consumed; but the arrival of fire-engines prevented further damage. The two men were apprehended next day in a beer-house in the vicinity.—On the 7th, about two in the morning, the stack-yard of Mr. Meredith, a farmer at Frodsham in Shropshire, was discovered to be on fire. Engines were brought from Shrewsbury, eight miles off, but notwithstanding the exertions of the firemen, zealously aided by the villagers, the whole stack-yard and farm buildings (except the dwelling-house) were destroyed.—On the morning of the 8th, a fire broke out on a farm belonging to the Duke of Wellington near Strathfieldsaye, occupied by Mr. Luke Goddard. The whole of the farm produce, consisting of several new ricks and other corn in store, homestead, buildings, and implements of husbandry, were consumed. A cart and a boy about to leave the farm, have been arrested on suspicion.—At Rainham in Kent, on the night of the 9th, two stacks of wheat were fired simultaneously after dark, and entirely destroyed.—On the following morning, a large wheat-stack, the property of the Earl of Gainsford, was discovered to be in flames. Fire-engines were useless, as no water could be obtained. A labourer suspected of causing these fires was taken into custody.

At the Southwark Police Court on the 8th, Thomas Claggett, a grocer in Bermondsey Street, was summoned at the instance of the parochial authorities of St. George's, for refusing to contribute to the *Maintenance of one of his Parents*. The relieving officer said, that the defendant's mother, an aged widow, had applied and obtained relief of the parish, and that her son had refused to contribute to her support although a brother of his, who was only a shopman, and at very low wages, allowed her a trifle a week out of them, but not sufficient to defray her expenses. The defendant, a well-dressed man, when asked why he refused to maintain his mother, said, It is not in my power. Appearance is deceitful; my expenses are considerable, and the profits on my business are very small; there is so much competition in the grocery line especially, that the people in that trade, vulgarly speaking, are "eating each other's heads off." The Magistrate: What rent do you pay? Defendant: I pay 45l. and taxes, and that is as much as I can do. Mother knows it's not in my power to give her anything. The poor mother, who was present, held her head down and said nothing. The magistrate told the defendant that by law as well as by nature he was bound to contribute to his mother's support, and that he rendered himself liable to pay 1l. a month for every month he neglected it. The magistrate then directed that the summons should stand over for a fortnight, in order to give the defendant an opportunity of coming to some arrangement with the parochial authorities.

On the 9th a *Commission of Lunacy* was held at Exbridge to inquire into the state of mind of Mr. Arthur Hugh Manners Tollenmache, son of the late Hon. Charles Tollenmache, nephew of the Earl of Dysart, and, on the maternal side, of the Marquis of Tweeddale. The com-

mission had issued at the instance of Mr. Wiltbraham Francis Tollenmache, a brother of the unfortunate gentleman. It was shown by the testimony of several witnesses that Mr. Tollenmache, who was fifty-one years of age, had been of weak intellect from his infancy; that he never made any progress at school, not having learned even writing; and that he had been under the care of Mr. Norton, of Rose Cottage, for the last ten years. The commission had been issued in consequence of his father's death (which occurred three months ago), upon which event he became entitled to a considerable fortune—about 45,000l. The jury returned an unanimous verdict, that Mr. Tollenmache had been of unsound mind since the 1st of March, 1836.

Grace Gardiner, a gaudily-dressed girl, was charged at the Southwark police-court on the 10th with *Stealing a quantity of Silk and other articles* from Mr. Belcher, a hatter in Great Suffolk-street. She had been only three days in his house as a servant when she disappeared after ransacking the drawers in Mrs. Belcher's bedroom, and she had been taken into custody the preceding night on Blackfriars Bridge. The girl's father, a respectable-looking man, stepped forward, and, with tears in his eyes, said that when he was informed of the circumstances he immediately came up from the country to seek for his daughter; that she had been reared with tenderness by her parents, and was always a good and virtuous girl until she had recently, without their knowledge, formed an acquaintance with some persons of bad character in London. The moment he was apprised of the robbery he lost no time in endeavouring to trace where she had taken up her abode, and by accident met her on Blackfriars Bridge the preceding night, and dressed out in the gaudy manner she now presented. When she caught sight of him she attempted to make her escape, but he prevented it by calling a policeman and giving her into custody. When he effected her capture he immediately communicated the fact to her late master, as, although she was his daughter, he would not screen her from the consequences of her conduct; and he added with emphasis, that he should prefer witnessing the transportation of his child, rather than she should lead the life of an abandoned woman, as he feared would be the case if she were not stopped in her reckless career. Mr. Belcher confirmed the father's statement, and on his account, expressed a wish not to prosecute; but the magistrate said he felt it his duty to commit the prisoner for trial. In the course of the examination it was stated that since she absconded, she had been living in a house of ill-fame in White Horse-street, and that she was proceeding thence to a theatre when she was met by her father.

Rosina Herbert, a young woman with a delicate infant in her arms, was charged on the 11th, at the Thames Police Court, with *Pressing Eight Shirts*, which she had received to make up for a woman named Elizabeth Miller. The magistrate asked the prosecutrix what she got per dozen for making the shirts, to which she replied 2s. 6d., and she gave them out at 2s., having but a halfpenny profit on each. The prisoner, who wept very bitterly, said she got but seven farthings for each, and she had to work early and late to make three in a day. The magistrate said that it was a distressing case, and he was embarrassed to know how he should act. Understanding that the woman's husband was in attendance, he ordered him to be called in, and at the same time asked the prosecutrix within what period the shirts ought to have been returned? She replied that they ought to have been sent home that morning. The husband was asked if he could pay for the redemption of the shirts, and he said that he could not, indeed. He was unable to save his poor wife from disgrace and a prison. The magistrate said the prisoner had no right to pawn the shirts; her distress was no justification for making away with other people's property. He was unwilling to send the woman to prison if the husband could pay the money lent upon the shirts. The husband: It's a large sum for a poor man. I'll endeavour to make it up in a week. The magistrate said he would adjourn the case for a week, and held the prisoner to bail on her own recognizance to appear on Friday next. As for the pawnbrokers, there was no pity at all for them. They had no right to take in such things, which

they must know did not belong to the party who raised money upon them, and if the husband could not raise the money, they would have to restore the shirts to the woman Miller without payment. The statement of this woman's case in the newspapers, induced several benevolent persons to contribute to her relief. On the 16th, the magistrate at the Thames office, on the occasion of one of these contributions, observed that more than 20*l.* had been already forwarded for the relief of Rosina Herbert and her children, and that there was really no occasion for any more contributions, while so much distress existed among persons who had withstood temptation and committed no crime. On the 18th, the woman was again brought before the magistrate, when it was proved that the prisoner had last year been convicted of pawnning articles the property of her employers. The magistrate said that this previous conviction had much altered his view of her case, and sentenced her to pay 8*s.* 6*d.*, the value of the goods pawned, together with a fine of 10*s.* He also declared that, in future, no money transmitted for specific purposes should ever be so applied; that if money was sent to be used at discretion, it would be received, but not otherwise. Some person subsequently sent the woman herself money to pay the fine, and she was discharged.

A Young Woman was Murdered on Saturday, the 12th, near the village of Dodinghurst in Essex, under circumstances of peculiar atrocity. At this village, a farm is occupied by Mr. Thomas Drory, a highly respectable yeoman living at Great Burstead. The farm was managed by Mr. Drory's son, a quiet, well-looking young man of three and twenty. Under young Drory was placed as a farm-bailiff, Thomas Last, a labourer; whose family consisted of his wife, and her daughter by a former marriage, Jael Denny, a young woman of twenty, of commanding stature, handsome figure and face, and agreeable manners—the acknowledged beauty of the village. Young Drory and the Lasts, with their daughter, lived in the same house till a recent period. Drory used his position to establish a close intimacy with the daughter; and it was the discovery of this relation, by Mr. Drory, senior, that had lately caused the removal of the Lasts from his farm, and their retirement into a cottage at some little distance from the farm-house. The young farmer, however, persisted in his intimacy; and at length Jael found herself pregnant by him. At the inquest, after the girl's murder, her mother stated that she had not long since taken poison, which she said young Drory had given her to kill her infant; and that the effect of the poison was plain in her swollen lips and flesh: Jael herself had said she did not take all the poison, or it would have killed her. Drory lately paid his addresses to a young lady, and it appears that he had given instructions to have the banns published for his marriage. One day when Mrs. Last returned home, she noticed that her daughter was taken by surprise, and looked painfully agitated: going up stairs she found young Drory under her bed; and on her discovery of him, he tried to get her to sign a paper to which he had already got the daughter's signature, exculpating him from any connexion with her cause of trouble. Mrs. Last refused to sign this paper. On the evening of the murder, the girl had been walking with Drory, and returned home in better spirits than usual. She told her mother that Drory had put her in good spirits, and that she was going to meet him again at half-past six. She then put on her bonnet and cloak, went out, and did not return. Her stepfather, anxious on account of her absence all night, went out early on Sunday morning in search of her. About eight o'clock he found her lying dead a short way from the stile where she had said she was going to meet Drory. He ran back to his house, and Mr. Hammond, the landlord, returned with him to the place where the body lay. She was lying on her face, and a fur tippet lay about three yards off. A cord was round the neck; it was twisted round three times, and one end was in her hand. The face was swollen and black; there was a stream of blood on the ground, and blood was oozing from the mouth, nose, and ears. There was an injury on the chest, as if some one had knelt upon it; and there were marks of teeth, and scratches on the hands and arms. She was in the ninth month of pregnancy. Suspicion fell on young Drory, who was imme-

diately arrested by the Superintendent of the Essex Police. This gentleman, at the inquest, gave the following account of the arrest:—"I asked Drory when he saw the deceased last. He said, 'At half-past five o'clock last (Saturday) evening,' and that he had not heard of her this morning." I took him to the spot, and saw the deceased lying on her face. The left side of her nose where she lay was flattened. I removed the cord from her neck. It was almost imbedded in it. The noose of the cord had cut the skin of the neck. It was turned thrice round the neck very tight—so much so that the neck was swollen above it. I then took the prisoner into custody. He did not speak. I took him to the deceased's house, and searched him. He said he had a letter in his box which would prove the child was not his. We then went to the house where the prisoner lived, and on searching his box, found the letter which has been produced, as well as two pieces of cord. One end of one piece had been recently cut. The prisoner said that the deceased and he had been acquainted, but that he had broken it off more than nine months." A labourer named Harris, resident in the neighbourhood, said that he saw the deceased and Drory together about half past five on Saturday, going across the meadow from Mr. Drory's farm; they were together about twenty minutes, when they parted and went severally homewards. This witness added that, two or three months before, he had heard Drory say that "he should like to shove her off, as he was carrying things on too far and was apprehensive of getting into trouble." A labourer named Hubbard, employed on Drory's farm, said that his master went out at half past six or seven on Saturday night, when he said he was going to Brentwood with some eggs, and two inhabitants of Brentwood saw Drory there about eight or a little later. Professor Taylor, of Guy's Hospital, gave evidence respecting marks of blood found on the trousers worn by Drory on the night of the murder. The coroner, in charging the jury, remarked that Drory's having been at Brentwood at eight o'clock was not inconsistent with his having committed the murder at half-past six. The result of the investigation was a verdict of Wilful Murder against Thomas Drory, and he was committed for trial at the Assizes.

A Desperate attempt at Robbery was made during the night of Sunday the 13th, in the house of Mr. Holford, in the Regent's Park. Several men broke into the house; the servants were alarmed, rose, armed themselves and attacked the robbers, one of whom they wounded and captured. On the following day the prisoner was brought before the Marylebone Police Court, and a number of witnesses were examined. The prisoner called himself William Dyson. Mr. Holford, it appears, is in America. James Paul, the butler, had secured the house on the night in question. About two o'clock in the morning he heard a noise; he got up, and saw the shadow of a man on the lawn; Paul dressed and armed himself, roused the groom and footman and armed them, and then awoke two coachmen in the stables, giving one a loaded gun and the other a pitchfork. These forces were stationed about the house. Three men were seen to leave the banquetting-room, and one of these was Dyson; he was knocked down by a coachman, with a pitchfork, and two men grappled him till the police came. Another of the robbers was seen running away; the butler snapped one lock of a double-barrelled pistol, but it missed fire, and as the robber ran behind a bush, Paul fired the other barrel. The under-coachman had fired his gun as soon as he saw the three men descend from a window; one exclaimed, "O God!" as if he had been struck. Dyson only was caught, the others having disappeared for a time. When search was made, blood was found near the bush at which the butler had fired; and there were traces of blood over some fences, for a considerable distance. Nothing of note was found on Dyson. But at the house the officers picked up some pieces of candle, a crowbar, part of an ornamental ornament broken from a figure in the banquetting-room, a sling formed of a large stone tied in a handkerchief, and a hat; there were shot-holes in the hat, and marks of blood on the inside. The robbers had entered by a window, which they had forced open with a crowbar. The prisoner was remanded.

On the evening of the 14th a *Robbery* was committed at Mellow Cottage, near Abbotkerswell, in Devonshire. The proprietor was absent, and had left the care of the house to his three daughters; who had just retired to bed when they heard a noise below, as of some persons breaking into the house. The eldest of them, about fourteen years of age, jumped out of bed, struck a light, which she gave to her sisters, and, arming herself with two pistols, walked down over the stairs, followed by her sisters. On entering the parlour, they found everything in confusion, papers lying about, and the desk rifled. The burglars fled on the entrance of the girl; and the young lady with the pistols jumped from the parlour-window on to the lawn, and fired both after them. The thieves had stolen some money, papers, and plate; but being eager to get off, they dropped some plate on the lawn, which was recovered in the morning.

Numerous *Burglaries* have been committed this month in various parts of the country. They are all very similar in their circumstances. The thieves generally effected an entrance through a window insufficiently secured. On one occasion a house-dog, which had been relied on, entirely failed to do his duty. In most cases the criminals were detected, and a number of them have been committed for trial at different assizes.

Mr. and Mrs. Coplestone, the landlord and landlady of the Queen Square Tavern, at Bath, were *Assaulted and dreadfully wounded with a razor*, on the 17th, by a person named Ogle Wallis, who lodged in their house. He was leaving the house, with his portmanteau, when, his rent being in arrear, the landlord insisted that he should pay it before carrying off his goods. Wallis flew on the landlord, and attacked him with a razor; and Mrs. Coplestone, coming to his assistance, was attacked in the same manner. Both were cut in the hands and face, and the husband so much injured that for some time his life was in danger. Wallis then tried to escape from the house, but was seized in the vicinity. He was brought before the magistrates, and Mrs. Coplestone and others were examined; but, as Mr. Coplestone was unable to attend, the prisoner was remanded.

On the 19th, the master and crew of the *Lowestoft steamer*, were *Assaulted by a body of Wreckers*, while giving assistance to a vessel stranded in the vicinity of Lowestoft harbour. The owners of the stranded vessel had contracted with the Harbour Company, who had undertaken to bring the vessel into port by means of their steamer; but a number of the beachmen, resolving to secure the salvage to themselves, proceeded to the wreck in boats loaded with stones, and commenced a violent attack on the crew of the steamer with stones and boat-hooks, wounding several of them severely, and driving them from their employment. Two of the ringleaders were brought before the chairman of the quarter sessions, one was fined 4*l*, which was immediately paid by his comrades; and the other was discharged unpunished, the magistrate at the same time addressing the men upon the illegality and disgraceful nature of their proceedings.

At the Central Criminal Court on the 23rd, Elizabeth Gilday, a decent, careworn looking woman, with an infant in her arms, surrendered to take her trial for *Bigamy*. The evidence proved that in June, 1835, the prisoner was married to her first husband, who turned out to be an habitual felon, and she suffered brutal ill-treatment at his hands. Subsequently he was transported for seven years, leaving her with one child quite destitute, whom it appeared she had honestly brought up by hard labour, and her conduct had been most exemplary. Once during her husband's period of transportation he had written to her, and hearing no more of him she married again in August, 1847, John Fletcher, with whom she still lived, and had two children. Her second husband was a most respectable man and much attached to her, and they lived comfortably until the return of the first husband from transportation about three months ago. The jury found her guilty, but recommended her to mercy, and she was sentenced to one month's imprisonment.

At the last Surrey quarter sessions, the subject of *Enormous Increase of Crime* in the county, and the deficiency in the police arrangements, was introduced

by Mr. Austan, who moved for a committee to report upon the means of adopting a rural police. The motion was agreed to without opposition; but Colonel Chalmers remarked, that though the neighbouring county of Essex was paying 18,000*l*. a year for their constabulary, this did not prevent the recent commission of a most dreadful murder. Captain Mangles in supporting the motion said, that the utmost terror prevailed in the county, and a general feeling of insecurity existed in the minds of the inhabitants, which was very much increased by the dreadful occurrence that had recently taken place. For his own part, his own house had been armed for a long time, and he never went to bed without having a six-barrelled revolving pistol under his pillow.

An inquest has been held at Guy's Hospital on the body of a lad named Robert Minton, an apprentice to a tailor in the city, who, it was alleged, had *Died from Neglect*. It appeared that he worked from six o'clock in the morning till ten and eleven at night, and on Saturdays still later; that his bed was dirty, his sheets not having been washed for three years. His mother stated that his master's wife treated him unkindly. He had come home some days before, and said he was very bad; he was crying, and said, "Oh, God has heard my prayer." He begged of witness to take him away from his place. The mother went to the mistress, and asked her to let the deceased have a basin of gruel, as he was very ill. The reply was, "Gruel indeed; what next?" The jury found that the lad had died of typhus fever, and gave their opinion that he had been very unkindly treated.

Several men have died from *Drinking Spirits to Excess*. A large body were employed at Liverpool in repairing an embankment, when a puncheon of rum was washed ashore from a wrecked vessel. They immediately seized the prize, disputing and fighting for its contents. In every direction the men were to be seen prostrate from the effects of their immoderate draughts, and it is matter of astonishment that many did not perish in endeavouring to reach their homes through an adjoining marsh. Two or three were taken up dead, and several others in a dangerous state. One of the dead was a strong young man of twenty-five, who has left a widow and family.

A Number of cases of *Crime* have occurred during this month, the details of which it has been found impossible to give; but they have been briefly noticed in the Summary.

NARRATIVE OF ACCIDENT AND DISASTER.

ACCOUNTS have been received of the *Shipwreck* of the *Mary Florence*, a vessel which left England in February last with a supply of coals for the Peninsular and Oriental Steam Navigation Company at Aden. This disaster was attended with most melancholy circumstances. The master, Captain Christopher Short, had a small share in the vessel. He was accompanied by his wife, and the crew, consisting of first and second officers, carpenter, steward, and twelve seamen. The ship, as he states, came in sight of the Comoro Islands in the Mozambique Channel on the 25th of May, and Cape Guardafui, on the 3rd of June. The latter is a headland, forming the extreme eastern portion of the African coast, a few hundred miles S.E. of the port of Aden and the entrance of the Red Sea. It was about four o'clock in the afternoon when the Cape, as the master supposed it to be, was sighted—though, from what has since transpired, it is evident he was mistaken, and that he had taken the tops of high mountains inland for the headland of the point. This mistake proved fatal, for in the course of the night the ship ran ashore. An unsuccessful attempt was made next day to get her off with the assistance of the natives, who affected to be friendly, and it was determined to land the ship's stores and other valuables on the beach. On the afternoon of the second day, as the weather was becoming boisterous, it was determined to effect a passage for Mrs. Short, but this was no sooner done than the natives seized her, and drove the sailors who accompanied her into the sea. Captain Short believing, it would seem, that any

attempt to rescue his wife and comrades would be unavailing, left the place next day in the long-boat with the remaining portion of his crew. They took a course along the coast, and after enduring great privation and barbarous treatment from the natives wherever they landed, they succeeded in reaching Muscat.

As soon as Captain Short had partially recovered from the exposure and privation he had endured during the fifteen days and nights at sea in the long boat, he sought a passage in the first vessel for Bombay. On his arrival there he communicated the circumstances to the authorities, and prevailed on them to despatch a steamer to attempt the rescue of his wife and the portion of his crew who were left behind. Before she sailed, however, intelligence arrived from Aden that a portion of the crew had been taken off the coast by Captain Ramsay, of the *Columbia*, on the 12th of August; but that the remainder, and also Mrs. Short, had perished in an attempt to escape from the natives. It is now ascertained that poor Mrs. Short, with the other sufferers, met their fate on the evening of the same day that they landed from the wreck. She contrived to free herself from the clutches of the natives, and rushed down to the beach where the boat's crew were assembled. They managed to get the boat which broke away from the wreck when Captain Short was about coming off with assistance; and at the earnest entreaties of Mrs. Short it was determined to make an attempt to regain the ship. Amidst so great a surf it appeared hopeless, but the fear of remaining in the hands of the natives during the night induced them to risk it. The boat was got off, but was soon swamped, and all of them perished.

The *Overland Mail* has brought news of the *Wreck of Three Fine Indiamen*. The *Ariadne* of Greenock sailed from Calcutta for England in July; and about three weeks afterwards a wreck was discovered near Palmyras' Point, on the coast of India, which proved to be the *Ariadne*, without a living soul on board. The chief mate was picked up by a steamer, twelve days after the vessel was wrecked; he had retained the land on a spur, and was nearly dead from exhaustion. It appeared from what he said that the master and crew had been carried out to sea by a gale of wind, and it was apprehended that all had perished. The *Manchester*, of London, sailed off the same ship's on the 6th.

Three new days sail from Calcutta. The people on board were saved by the boats before saw went to pieces. The *Mermaid*, also of London, sailed on the morning of the 9th of July, but the crew were saved. The cargo of the three ships exceeded 100,000l. sterling.

A tract *Met his Death* by a dreadful accident on the 20th of September, at the Derby Railway Station. A middle-aged man, of rather shabby exterior, had been observed in the station-yard in the course of the evening. The London mail-train arrived as usual at half past ten, and the stoker imagined he could detect a slight collision when near a luggage-train that had arrived shortly before. Upon mentioning this circumstance, an examination took place, when the body of the man who had been observed in the yard in the former part of the evening, was discovered in a shockingly mutilated condition. The whole of the carriages had passed over it. Near to the body were three parcels which he had succeeded in extracting from the luggage-carriages, and it appeared evident that he was engaged in robbing the carriages when the London train came up.

On the 28th of September an *Explosion of Fire-damp* took place at Cood Poth colliery, near Wrexham, whereby three men were killed and two others desperately injured. At the inquest on their bodies a verdict was returned of *Accidental Death*. The jury recorded their opinion that no blame could be attached to the proprietor or to the manager of the pit, it being found, on examination, ventilated in the usual way. During the examination of one of the witnesses, it transpired that the pit was much more subject to sulphur than any other pit in that part. The coroner drew the attention of all present to the importance of using the safety-lamp. The men, in reply, said that it gave so imperfect a light they could not get near as much coal with the safety-lamp as they could do with a candle. The coroner contended that was a trifling consideration compared with the misery entailed by these dreadful accidents.

On the evening of the 29th ult., as the down-train was proceeding between Walcot and Upton Magna stations, a man named Daniel Burgess, a groom in the employ of Mr. Nightingale and Captain Muckleston of Shrewsbury, was riding in the guard's or break van with several others, among whom was his wife, standing up (there being no room for them in the carriages); he was leaning against the side-doors, when they flew open, and he was precipitated out. The train was going at great speed at the time. Immediate search was made for Burgess, who was discovered near the opposite rails with his skull dreadfully fractured, and quite dead. It is supposed that in falling his head must have pitched against the rail on the other line, the concussion of which, from the great velocity of the train, must have caused instant death. He has left a wife and ten children.

The extensive premises of Messrs. Brooke, tallow melters and chandlers, in the Southwark Bridge Road, were *Burnt Down* on the night of the 3rd. While the workmen were melting tallow in a large pan, the mass caught fire: the men attempted to smother it, but were obliged to retreat, and in a few moments the flames spread in every direction. An engine-station was placed immediately opposite the spot, and in five minutes the engine was at work; but from the combustible nature of the stock, the firemen could do nothing to save the factory; however, they prevented the fire from getting a firm hold on the contiguous buildings.

Mr. Hatchwell the station-master at Bury St. Edmunds, and Mr. Walton, the station-master at Thurston, on the Eastern Union Railway, were *Accidentally Killed* on the morning of the 4th. Having some business which required speedy conveyance, they seat themselves on the top of one of the carriages; and in passing under a bridge, their heads struck the arch with a force which caused the instant death of both. At the inquest, the engineer of the line stated that their riding on the roof of the carriage, was a breach of discipline, and that they had subjected themselves to dismissal for leaving their stations without order. They had been ten years in the service of the company.

Mr. McNeil, sheriff substitute of Wigtonshire, was *Killed* on the 6th, by a fall from his dog-cart. The horse took fright, and the boy who drove being unable to hold him, Mr. McNeil, in seizing the reins, was thrown upon the road and almost immediately expired.

A *Fatal Accident* took place on the 6th, in the Bristol Channel. A party of gentlemen hired a boat at Bristol to take a trip down the Channel. It blew a stiff gale when they set out; and the boat, through the mismanagement of an amateur steersman, was capsized on the return homewards. Seven of the party were saved by some boats which happened to be near; but four—Mr. Evan J. J. J., Mr. Thomas Rich, Mr. George Packer, and Mr. William Lodge (who was the steersman), were unfortunately drowned.

There was a *Storm* of extraordinary extent and violence on Sunday and Monday, the 6th and 7th. The wind, from the South and West-south-west, drove the water out of the Thames to such an extent, that at low tide on Monday the river was almost unnavigable. In the Pool, tiers of vessels were aground; and even the small steamers could not ply above bridge.—At Nottingham, much damage was done to buildings. A tall and insecurely-built stack of chimneys, with portions of the roof, fell into a street at a place where a number of persons had assembled round Wombwell's show; a boy was killed on the spot, and a woman was so maimed that her life is in danger, and a good many other persons were seriously hurt.—Disasters to shipping are reported from the coasts at all points, but in most cases without loss of life. The *Juffrow Jantje*, a Dutch galliot, was wrecked in the East Bay of Dungeness, and only one man of the crew was saved.—The storm was very violent at Dover. The sea rose to a great height, flooding the quays and promenades. The works which were being carried on for the construction of the harbour of refuge were completely destroyed. Enormous piles, eighteen inches square, were snapped asunder, and everything upon them overthrown. Three large diving-bells, which were used in the construction of the works, were carried away into the sea. The works have been

entirely suspended; the damage done amounts to many thousand pounds.—At Liverpool, great damage was done to the shipping, even in the docks. A fine ship, the *Providence*, which left the port on Wednesday for the coast of Africa, struck on the Barbo Bank, at the mouth of the Mersey. As soon as the accident was known, the Magazine life-boat was taken by a steam-tug to the locality, and managed to rescue thirteen persons; but the first and second mate, and twenty-one of the crew perished. The *Arcturus*, from Abail, struck on Crosby Point, and became a total wreck; the pilot and first mate were drowned. The *Aurora*, from Cardiff, was also lost, near Holyhead; but her people escaped.—Two vessels were lost on the sands off Yarmouth, within sight of a fishing-lugger, which could render no assistance. One ship was dashed to pieces; the other struck the sands, got off again, and then foundered: every soul perished. From the size of the vessels, it is calculated that twenty men must have been drowned.—Many wrecks and minor casualties are reported from Wales, but without loss of life.

On the 8th, about noon, a *Boat was Lost* belonging to the Dolphin, revenue-cutter, containing five men, one a custom-house officer, and four rowers. When leaving a brig they had boarded opposite Woolwich Dockyard, they cast off at the moment the Syph, Woolwich Company's steam-packet, was approaching; and before the boat could get out of the way and the steamer eased, it was cut in two, and the whole of the men went under the wheel of the steamer. Four of the men were saved; but one, named Manning, was drowned, and another severely hurt. There was no blame attached to the Syph, as her captain and crew did all in their power to avert the accident.

On the 8th, an *Explosion* occurred at the powder-mills of Messrs. Hall, near Faversham. Providentially the workmen were not in the mill at the time; and the damage was confined to the destruction of the building in which the explosion took place.

A little boy of seven years old was literally *Cut to Pieces* at Newton, near Malgate, in Yorkshire, on the 9th. He was the son of Smith Deuce, a brick-maker, and had gone into the brick-shed where his father worked. The clay in this yard is worked by machinery, being put into an aperture filled with clay-knives, and the whole set in motion by steam-power. The engine on this occasion was at work, and the poor child accidentally fell in amongst the knives, and was instantly killed.

A *Destructive Fire* broke out on the evening of the 19th, on the premises of Mr. Bennington, a painter and glazier, in Grange Road, Bermondsey, in consequence of Mr. Bennington having let a lighted candle fall into some liquid varnish which he was preparing. Several engines were speedily on the spot, but owing to the want of water they were comparatively useless, and Mr. Bennington's premises, his furniture, stock in trade, were totally consumed. He was not insured, and his family, who a few hours previously were in comparatively affluent circumstances, have been reduced to a state of utter destitution.

On the 19th, Mr. Longfield, a druggist in Leeds, was nearly killed by the *Imprudent use of Naphtha*; while pouring this substance from a large into a smaller vessel, it ignited at a lamp which he had placed on the floor near the vessel. In a moment he was enveloped in flames, and was so dreadfully burned that for some time it was doubted whether he would recover.

On the evening of the 23rd a young man was *Killed* at the terminus of the London and South-Western Railway, Waterloo Road. A number of men were engaged at the usual hour making ready the train for Southampton, when Thomas Martin, one of the company's porters, made an attempt to cross through a vacancy between a number of carriages. Unfortunately at that instant six or seven men, who did not perceive that Martin was crossing the rails, pushed a number of carriages forward with such violence as to force the poor fellow against the buffers of the carriages. He was speedily extricated, and removed to St. Thomas's Hospital, where he died soon after his admission.

On the night of the 23rd, a bailiff named Andy was *Beaten* at Newtown, in Tipperary. He went to serve in order from the Tipperary Bank on Luby, a farmer,

who, on seeing him enter, deliberately laid hold of his gun, and attempting to within two or three yards of him fired, and literally tore open the belly and side of the unfortunate man. It is needless to say he died instantaneously. The poor man had sent his wife to America last summer, and expected to join her as soon as she would be able to send him a remittance.

SOCIAL, SANITARY, AND MUNICIPAL PROGRESS.

(ONE of the letters on "Labour and the Poor," recently published in the *Morning Chronicle*, contains some *Remarkable Omnibus Statistics*. The total number of omnibuses traversing the streets of London is about 3000, paying duty (including mileage), averaging 9l. per month each, or 324,000l. per annum. The number of conductors and drivers is about 700, paying annually 6s. each for their licenses, or 1750l. collectively. The receipts of each vehicle vary from 2l. to 11l. per day; estimating the whole 3000 at 3l., it follows that the entire sum expended annually in omnibus hire by the people of London amounts to no less than 3,285,000l. The average journey, as regards length, of each omnibus is six miles, and that distance is, in some cases, travelled twelve times a day by each omnibus. Taking the average as between forty-five and fifty miles a day travelled by each omnibus, and computing the omnibuses running daily at 30.0, we find "a travel" of upwards of 140,000 miles daily, or a yearly "travel" of more than fifty millions of miles. On each of its journeys, an omnibus carries on the average fifteen persons. Nearly all are licensed to carry twenty-two (thirteen inside and nine out), and that number perhaps is sometimes exceeded, while fifteen is a fair computation; for as every omnibus has now the fares of 3d. and 6d., there are two sets of passengers, and the number of fifteen through the whole distance on each journey of the omnibus, is (as has been said,) a fair computation, for sometimes the vehicle is almost empty, as a set-off to its being crammed at other times. This computation shows the daily "travel," reckoning ten journeys a day, of 450,000 passengers. Thus we might be led to believe that about one-fourth of the entire population of the metropolis and its suburbs—men, women, and children; the inmates of hospitals, gaols, and workhouses; paupers, peers, and their families all included—were daily travelling in omnibuses. But it must be borne in mind that as most omnibus travellers use that convenient mode of conveyance at least twice a day, we may compute the number of individuals at 225,000, or, allowing three journeys as an average daily travel, at 150,000. The extent of individual travel performed by some of the omnibus drivers is enormous. One man stated that he had driven "his bus" 72 miles (12 stages of six miles) every day for six years, with the exception of twelve miles less every second Sunday, so that this man had driven in six years, 179,668 miles.

An *Experimental School for Juvenile Delinquents* has been formed at Aberdeen by Mr. Watson, the sheriff. A preliminary meeting was held on the evening of the 7th, in the soup-kitchen in Loeh Street, which has been appropriated for the school. About thirty young thieves were present. A plentiful supply of coffee and rolls was provided; and they appeared greatly delighted with their treat. The sheriff urged the boys to come back next morning at eight, to be fed, taught, and amused all day, and get home in the evening at seven. They would have (he said) a little work to do, they would get abundance of food, useful instruction, and plenty of play. The school would be open for two months, and by that time, he hoped employment would be got for the big boys, and the younger might be transferred to one of the Juvenile Industrial Schools. On his appealing to them whether they wished to live honestly or not, vehement responses of "Yes, yes," were returned. In answer to their previous statement, that their parents required them to do something to help them, the sheriff said that nothing was more necessary than that their parents should get food, but if they came to the school and gave sufficient evidence of their need, they would get it, or the boys might take it home to them at night. This promise drew forth joyous expressions. The boys

all agreed to come to the school, expressing their willingness to work. The ages of the boys were thirteen and under—none being admitted above thirteen years of age. On the opening of the school, twenty-two boys presented themselves and were next day admitted. Since then, the attendance has continued the same, and the attention to work and study has been, with the aid of a little corporal castigation, very satisfactory.

An act of *Municipal Charity* has been done by Miss Howard, of York Place. She has assigned over to trustees £5,000, for the erection of twenty-one houses on her property at Pinner, near Harrow, in the form of a crescent; the centre house for the trustees, the other twenty houses for the use of twenty widows, who are to occupy them free of rent and taxes, and also to receive 60*l.* a-year clear of all deductions. The widows of naval men to have the preference, then those of military men, and, lastly, those of clergymen; none but persons of good character to be selected, to be chosen or dismissed for misconduct by the trustees. The deed is now enrolled in Chancery, and approved of by the Lord Chancellor. The trustees are the Earl of Fingal, and W. A. Mackinnon, Esq., M.P.

The *Free Grammar School at Richmond*, erected as a testimonial to the memory of the late Canon Tate, who was one of the most successful teachers in England, was opened with much ceremony on the 3rd. The Archbishop of York, the Bishop of Ripon, the Earl of Zetland, the Earl of Lovelace, the Mayor and Corporation of Richmond, with many other persons of distinction, took part in the proceedings.

A general meeting of the *Society for Promoting Christian Knowledge*, was held on the 1st of October; Archdeacon Sinclair in the chair. It appeared by a letter from the Bishop of Montreal (Dr. Fulford), that he had arrived in his diocese, and met with a gratifying reception both from clergy and laity. Various letters were read from several colonial prelates, including the Bishops of Toronto, Quebec, Fredericton, Adelaide, Newfoundland, Antigua, and Cape Town, and grants were voted towards the erection of churches and other objects in their several sees. On the application of Dr. Gubet, Bishop of the English Church in Jerusalem, a large supply of the Society's version of psalms in Arabic was granted for distribution in the East. An interesting letter from the Rev. William Armstrong, chaplain at Valparaiso, respecting the exemplary community forming the population of Pitcairn's Island, was listened to with much interest. The sum of 1,000*l.* was voted towards the new bishopric in the settlement of Canterbury, New Zealand; and 3,000*l.* was placed at the disposal of the Bishop of Toronto, towards the endowment of a college in connection with the Church of England in his diocese. Many schools and lending libraries in England and Wales were aided with grants of books, as were also poor emigrants quitting the English shore.

His Royal Highness Prince Albert has *Presented a Donation of 50*l.** in aid of the Association for the Establishment of Evening Classes for young men.

On the 10th, the Common Council of London *Voted a Grant* of one hundred guineas in aid of the Jews' Free School, where 1100 children are well and morally taught. A similar sum was granted to the Church of England Sunday School Institute.

The *New Stamp Act* came into operation on the 10th inst. The following are some of its most important articles. An agreement, or memorandum of an agreement, where the matter shall be of the value of 20*l.* or upwards, will be liable to a duty of only 2*s.* 6*d.* where the same does not exceed 1080 words, and according to its length, a progressive duty of 2*s.* 6*d.* On bonds not exceeding 50*l.* the duty will be only 1*s.* 6*d.*; and so on. The *ad valorem* duty will be charged to 7*s.* 6*d.* on 300*l.*, and when the same shall exceed 300*l.*, then for every 100*l.*, and also for any fractional part of 100*l.*, the charge will be 2*s.* 6*d.* The several kinds of bonds known in the law are set forth, and the duties prescribed according to the amount. With respect to conveyances of property, where the purchase or consideration therein or thereupon expressed shall not exceed 25*l.*, a duty of 2*s.* 6*d.*, and so on progressively to 500*l.*, when the duty will be 3*l.*, and 10*s.* for every additional 100*l.* As to leases of lands,

tenements, &c., at a yearly rent without premium, the duty will be according to the yearly rent, from 6*d.* to 1*l.*, which last mentioned duty will be when the rent does not exceed 100*l.* The *ad valorem* is charged on the premium paid. On mortgages the duty will be 1*s.* 3*d.*, where the sum does not exceed 30*l.*, up to 7*s.* 6*d.*, for 300*l.*; and beyond that sum, 2*s.* 6*d.* for every additional 100*l.* Settlements are liable to a higher rate of duty; when the value of the property settled upon any good or valuable consideration, other than a *bona fide* pecuniary consideration, does not exceed 100*l.*, the duty will be 6*s.*, and an additional 5*s.* on every 100*l.* Sellers of receipt stamps are now allowed 7*l.* 10*s.* in the 100*l.*, in lieu of one half per cent.

The *New County Courts Act* contains a provision under which actions can be tried in the County Court for more than 50*l.* It is enacted by the 17th section, that if the parties shall agree, by a memorandum signed by them or their attorneys, the County Court may try actions beyond the amount limited, or any action in which the title to land, whether of freehold, copyhold, leasehold, or other tenure, or to any tithe, toll, market, or other franchise, shall be in question. It also contains a provision respecting professional remuneration, whereby an attorney shall be entitled to a sum not exceeding 1*l.* 10*s.* for his fees and costs, where the debt or demand claimed shall not exceed 35*l.*, or 2*l.* in any other cause within the jurisdiction given by the act; and in no case shall any fee exceeding 2*l.* 4*s.* 6*d.* be allowed for employing a barrister as counsel in the cause, and the expense of employing a barrister or any attorney either by plaintiff or defendant shall not be allowed on taxation of costs unless by order of the judge.

A *Temperance Festival* was held on the 14th, at the London Tavern. The company, between five and six hundred, were entertained with tea, speeches, and "temperance melodies." The principal speaker was Mr. George Cruickshank, the celebrated artist, who was vehemently applauded. He was there, he said, to declare his adhesion to that great and glorious cause. He had been a teetotaler three years and a half; he was sorry he had not been so all his life; but he would keep the pledge now as long as he existed. He had twice had wine prescribed as a medicine, but he had refused it at the risk of his life. In the room in which they were assembled, all the great national interests had been from time to time advocated; he had himself acted as steward on occasions when the late lamented Duke of Cambridge presided—great and glorious occasions, but none of them surpassing in importance that on which they were assembled. It was gratifying to behold a meeting of teetotalers in one of the first rooms in the City of London, where wine had flowed in torrents, not to mention oceans of brandy and whiskey-punch. He recently attended a eastermongers' supper and ball, both which passed off very pleasantly; two drunken men forced themselves into the assembly with a view to create a disturbance, but the good sense and sobriety of the company completely defeated their object. He regretted that he had not the means of rendering pecuniary assistance to this cause, but he hoped to be able to aid it with his pencil or pen. From his previous efforts in this way he had not derived the least profit; but if they had promoted the temperance cause in the slightest degree, he was satisfied. It appeared by a statement read by one of the secretaries, that it is intended to make some characteristic demonstration at the time of the great Industrial Exhibition of 1851.

A new mode of *Appropriation of the Prisons of the Metropolis* to distinct classes of offenders came into operation at the beginning of this month. All the female prisoners, and all male prisoners under seventeen years of age, were removed from the House of Correction at Coldbathfields to the House of Correction at Westminster; and all male prisoners above seventeen were removed from the latter place to Coldbathfields. Prisoners committed under the Hackney Carriage Act, and for want of sureties, were removed from both those prisons to the House of Detention. Nearly 900 persons were thus transposed.

Negotiations have been entered into with the Lords of the Admiralty and Government authorities for the establishment of a *Submarine Telegraph* across St.

George's Channel, upon a similar though much more extensive scale to that now being undertaken between England and France. From the extreme western coast of Ireland to Halifax, the nearest telegraphic station in America, the distance is 2155 miles; and as this might be accomplished by the steamers in five or six days, it is apprehended that England, by means of telegraphic communication, may be put in possession of intelligence from America in six days, instead of as now in twelve or fourteen.

All operations connected with the *Submarine Telegraph* between England and France are now suspended till next spring. The interval will be employed in manufacturing the wire cables and other apparatus, so that the electric line may be completed by May. Messrs. Fox & Henderson, the contractors for the completing of the Cork and Bandon Railway, have been declared contractors for making the wire cables.

An inquiry of a very serious character, which has been going on for some time into the character of some of the *Cadets at the Royal Military Academy, Woolwich*, has been brought to a close. In consequence of some practices too gross to be particularised, by some of the students who had recently joined from the new training school at Carshalton, the Master-General of the Ordnance ordered a committee of inquiry to assemble and investigate the circumstances. The first result was the dismissal of three students from the Academy, who had been convicted of these practices. The result of the labours of the committee has been the expulsion of six more out of the ten students who had joined the Academy, making nine in all, and the peremptory dismissal of twenty-three scholars from the Carshalton School.

The recent act "to amend the Law relating to *Benefices in Pluralities*," provides that no person appointed to the deanery of any cathedral church shall be allowed to hold the office of head ruler of any college or hall within either the Universities of Oxford or Cambridge, or the office of provost of Eton College, or of warden of Winchester College, or of master of the Charter-house, together with his deanery. This enactment is not to apply to the dean of the Cathedral Church of Christ in Oxford, as chief ruler of the college there maintained. Heads of colleges in the universities are not to hold cathedral preferment except in cases where benefices or cathedral preferments may be permanently attached to or form part of the endowment of the office.

A Ball was given to the *Inmates of St. Luke's Hospital*, upon St. Luke's day, the 18th. It was the first occasion of this kind which has taken place at St. Luke's, and from the successful issue of the undertaking it may be expected to be repeated. Between sixty and seventy of the patients, men and women, were assembled at six o'clock in the evening in the great hall, and music being provided, they were quickly arranged in their places for the old English country dance. This, with appropriate changes, was kept up with great spirit until nine o'clock, when all retired peaceably and cheerfully to their respective apartments. The officers of the establishment, with each nurses and attendants as could be spared from the galleries, joined merrily in the dance. By this means the confidence of the patients was secured, and they showed themselves grateful for the enjoyment afforded them, by entering into the amusement without levity or boisterous conduct of any kind. There are at present 196 patients in the hospital—91 men and 105 women. The average of cure during the last year was 60 per cent., being a considerable improvement upon former years.

The Board of Directors of the *Asylum for Idiots* have just issued an appeal to the public. They have under their care, at Park House, Highgate, and Essex Hall, Colchester, no less than 129 patients, and the total number of persons the institution has dependent upon it is 163. There are now 170 eligible patients seeking admission at the ensuing election, and the board can only venture to admit fifteen of the number. They are anxious to erect a building properly adapted to the care and education of the idiot, which, they say, ought to contain not less than three hundred beds, and which will be arranged so as to serve in all respects as a model institution. Her Majesty has set an example of patronage by a contribution of 250 guineas, so as to secure a

perpetual presentation to a bed, the right to be exercised by the Prince of Wales.

On Friday, the 26th a *Grand Banquet* was given at York by the Lord Mayor and municipality of that city, in return for the banquet given in March last by the Lord Mayor of London to the municipal towns of the United Kingdom. The entertainment, given in the Guildhall of York, was of the most splendid description. It was honoured by the presence of Prince Albert, ninety-four mayors of boroughs, representing all the different portions of the United Kingdom; and the numerous company included Lord John Russell, several members of the Government, and the Commissioners for the Exhibition of 1851. Among the addresses after dinner the greatest interest was excited by that of Prince Albert, after his health had been proposed by the Lord Mayor of York and drank with the utmost enthusiasm. His Royal Highness dwelt upon the preparations for and prospects of the approaching great Exhibition. "I see," he said, "in your anxiety to meet us, her Majesty's Commissioners, again, a proof of your earnest and continued zeal in the cause of the approaching Exhibition. It could not be by the impetus of a momentary enthusiasm, but only by a steady perseverance and sustained efforts, that you could hope to carry out your great undertaking, and ensure for yourselves and the nation an honourable position in the comparison which you have invited. If to cheer you on your labours, by no means terminated, you should require an assurance that that spirit of activity and perseverance is abroad in the country, I can give you that assurance on the ground of the information which reaches us from all quarters; and I can add to it our personal conviction, that the works in preparation will be such as to dispel any apprehension for the position which British industry will maintain. From abroad, also, all accounts which we receive lead us to expect that the works to be sent will be numerous and of a superior character. Although we perceive in some countries an apprehension that the advantages to be derived from the Exhibition will be mainly reaped by England, and a consequent distrust in the effects of our scheme upon their own interests, we must, at the same time, freely and gratefully acknowledge that our invitation has been received by all nations with whom communication was possible, in that spirit of liberality and friendship in which it was tendered, and that they are making great exertions, and incurring great expenses, in order to meet our plans." His Royal Highness paid a graceful tribute to the memory of Sir Robert Peel; observing that, only at their last meeting they were admiring his eloquence, and the earnestness with which he appealed to them to uphold by their exertions and personal sacrifices what was to him the highest object, the honour of his country. He concluded by saying that, viewing the practical nature of the English character, he was pleased when he saw the plan of the Exhibition of 1851 undergo its ordeal of doubt, discussion, and even opposition; and that he hoped he might now gather, from the energy with which its execution was pursued, that the nation was convinced that it accorded with the interests of England, and the position which she held in the world. Lord John Russell, the Archbishop of York, the Earl of Carlisle, the Lord Mayor of London, and other distinguished persons, also addressed the meeting.

A great *Diminution of Crime* in the counties of Gloucester and Somerset is apparent from the reports made to the Quarter Sessions for those counties, just concluded. The tables from the House of Correction in Gloucestershire detailed a decrease in the number of prisoners, and the disposition of those in charge was much improved. There has been likewise a decrease in the cost of maintaining these houses, of 25 per cent., owing partly to an abundance of labour and partly to the cheapness of provisions. In Somersetshire for the year ending Michaelmas, 1849, there were 740 persons committed for trial; but in the year just ended, viz., at Michaelmas, the committals were only 689, being a diminution of 152, and the character of the various offences on the whole has been much lighter. This satisfactory condition of the country is to be attributed to the improved condition of the working-classes, and the general prosperity of labour in the country.

PERSONAL NARRATIVE.

THE Queen and Prince Albert continued to enjoy the tranquil residence at Balmoral till the 10th., on the morning of which day they departed for the South. They arrived at Edinburgh about seven in the evening. Preparations had been made to give a loyal welcome; and among the features of the demonstration, was a bonfire piled to the height of forty feet on the summit of Arthur's Seat. The blazing mass consisted of thirty tons of coal, a vast quantity of wood saturated with oil and turpentine, and a thousand tar-barrels. It was kindled at five o'clock, and the flames are said to have been seen by the Queen for many miles of her route on both sides of the Forth.—Her Majesty was received at the decorated platform of the railway by Sheriff Gordon and other dignitaries; and a military escort lined the way to Holyrood Palace.—The Royal party left Edinburgh next morning, and arrived in the evening at Buckingham Palace; and on Saturday, the 12th, they went to Osborne.

The Duchess of Kent arrived in town on the 10th, from Dalmahoy, the seat of the Earl of Morton, near Edinburgh.

Intelligence has been received from the *Arctic Expedition in Search of Sir John Franklin*. The *North Star*, which went out as a tender-ship to the expedition of Sir James Clark Ross a year and a half ago, returned unexpectedly to Spithead on the 28th of September, bringing dispatches from the ships of the four expeditions which went out early this year. The *Prince Albert*, a ship dispatched in July last, under Captain Forsyth, to make a special search beyond Brentford Bay, returned to Aberdeen on the 29th ult. Dispatches from Captain Ommaney, Captain Penny, Sir John Ross, and Captain Forsyth, have been published by the Admiralty; but they throw little or no light on the fate of the missing voyagers. It appears that some Esquimaux were fallen in with near Cape York, who told a story which was interpreted to be "that in the winter of 1846, when the snow was falling, two ships were broken by the ice a good way off in the direction of Cape Dudley Diggs, and afterwards burned by a fierce and numerous tribe of natives. The ships were not whalers—cruisers—were worn by some of the white men. A part of the crews were drowned; the remainder were some time in huts or tents, apart from the natives; they had guns, but no balls, were in a weak and exhausted condition, and were subsequently killed by the natives with darts or arrows." This was the version given by one Adam Beck, Captain Ross's Esquimaux interpreter; but Captain Penny's interpreter was totally at variance with the other, whom he called a liar; and the commanders of the expedition were incredulous as to the story. From the information brought by the *Prince Albert*, it appears that what seemed to be traces of the missing expedition had been found in the direction of the Wellington Channel, a situation that was considered likely. These were, the vestiges of five tents, and the remains of provisions, probably left by a party who had lost their ship or ships, but how long ago there were no means of judging. There was a piece of rope, which was sent home for examination, and appears to have been probably a part of the Arctic stores sent from Chatham to Woolwich for the *Erebus* and *Terror*, in 1845. The search was going on, by all the parties engaged in it, with undiminished zeal and activity.

On the 28th of September, Mr. Alderman Musgrove was elected Lord Mayor of London. The Sheriffs for the ensuing year are Alderman Robert Watson Gordon, cutter, and Mr. G. Edm. Hodgkinson, spectacle-maker.

The Right Hon. J. H. Monahan, late Attorney-Gen-

eral in Ireland, has been appointed Chief Justice of the Common Pleas, subject to any reduction in the salary and income of the office which Parliament may make, in accordance with the report of the committee of the House of Commons upon official, diplomatic, and judicial salaries. Mr. Hatchell, the Solicitor-General (M.P. for Windsor), becomes Attorney-General, and the Solicitor-Generalship is conferred upon Mr. Henry George Hughes, Q.C., an eminent member of the Chancery bar.

The Rev. Dr. Townsend, recently made Dean of Waterford, is raised to the vacant Bishopric of Meath. The see of Meath yields an annual income of 4000*l.*, with extensive patronage.

Lord Gough has received the freedom of the burgh of Inverness. His first triumph in the field was as a lieutenant of light infantry in the 78th Highlanders, raised in the immediate vicinity of Inverness. The name of Lord Gough immediately succeeds that of Prince Albert on the Burgess roll of Inverness.

The late Vice-Chancellor Sir James Wigram has retired upon an annuity of 3500*l.*

Obituary of Notable Persons.

THE BARONESS DE NEWMAN, *née* Lady Augustus Somerset, eldest daughter of the Duke and Duchess of Beaufort, and wife of Baron Neumann, formerly Austrian Minister at the Court of St. James's, died in childbirth at Vienna, on the 20th ult.

Mrs. MacLEAN, the wife of D. Maclean, Esq., M.P. for Oxford, was killed in the prime of life, at Castellamare, near Naples, on the 20th ult. She was taking a drive in her carriage, when the horses took fright and ran away, and she sustained such severe injuries that she expired a few hours afterwards.

LORD LEIGH died at Bonn on the 27th of September, in his 69th year. He had left England some weeks before, for the benefit of his health.

THOMAS AMYOT, Esq., F.R.S., and F.S.A., for many years Treasurer to the Society of Antiquaries, died on the 28th ult. at his residence, 13, James Street, Buckingham Gate, in the 76th year of his age.

REAR-ADMIRAL SIR J. MARSHALL died on the 30th ult. at Pen-y-fryn, near Conway, the residence of General Sir C. Smith, in consequence of a fall from a zig. He was in the 65th year of his age, had been in the navy half a century, and was a distinguished officer.

Mrs. JAMES INGRAM, proprietor and landlord of the Fox Inn at Woodford, in Gloucestershire, died on the 2nd, in his 93rd year. He was the last survivor of the crew of the *Royal George*, which sank at Spithead on the 19th of August, 1782, having escaped almost miraculously the fate of his companions. Mr. Ingram had seen a great deal of service, having been at the siege of Gibraltar, and in many naval actions. His sight and health were remarkably good up to within a short time of his death. He was well known on the old coach-road from Gloucester to Bristol, as the coachmen used frequently to pull up to allow their passengers to see a veteran whose life had been marked by so singular an incident.

Mrs. SARAH HIFFIN, the celebrated miniature-painter, who was born without hands or arms, died at Liverpool on the 2nd, at the age of 66. For many years she supported herself by her art; but as age came on she fell into distressed circumstances, till a small annuity was purchased for her by subscription, through the benevolent exertions of Mr. Richard Hathbone of Liverpool.

MAJOR-GENERAL WINGROVE, of the Royal Marines, died on the 7th, aged 70.

The Rev. Dr. THURCKERAY, Provost of King's College, Cambridge, died at his residence in Wimpole Street, on the 21st, at the age of 73.

SIR WILLIAM WRIXON BECHER, Bart., died a few days ago at Ballygiblen, his seat in Ireland. He formerly represented Mallow in the House of Commons, and in 1831 he assumed the name of "Becher," in lieu of his patronymic, in accordance with the will of his mother's brother, and was that year created a baronet. He was born in 1780, and married in 1820 Miss O'Neill, the celebrated tragic actress, who survives him, by whom he leaves issue three sons and two daughters, his eldest son Henry, born in Sept., 1827, succeeding to the baronetcy.

THE DUKE OF PALMERSTON died at Lisbon, on the 12th. He was buried with great pomp and royal honours.

COLONIES AND DEPENDENCIES.

THE apparently settled tranquillity of India continues to be matter of congratulation, but whispers of a coming storm against the Directors grow more and more distinct and ominous as the time approaches for Sir Charles Napier's return. He had selected the 5th of November as the day on which to begin his homeward journey; and this may possibly prefigure both the extent of the meditated "blow-up," and its interception by some wary Montecagle.

From the Colonies there is no worse or better tidings than the election of Dr. Lang to the Legislative

Council of New South Wales as Member for the City of Sydney. The contest was a narrow one, and its result may prove not unimportant. It exhibits the present strength of the democratic party in New South Wales in a somewhat grave light, and ought to receive proper attention from the authorities in Downing Street.

The accounts by the last *Overland Mail* are from Bombay to the 17th September, Calcutta to the 7th September, and Hong Kong to the 24th August.

The whole of *British India* was tranquil, but the petty civil war on the Nizam's borders still continued.

The native state of *Oude* seems inclined to rival the Nizam's territories in anarchy and misgovernment. It will be remembered that some months since an English officer was killed and two guns lost in an attack on the fort of a refractory vassal of the King of *Oude*. A second event of the same nature has occurred. The Rajah of *Essauggur* had shown himself for some time unwilling to pay the portion of revenue due from him to the *Oude* government, and it became the duty of Lieutenant F. Orr to obtain these dues from him; but before resorting to more stringent measures he imprudently determined on an interview with the Rajah, who came attended by 200 armed followers. Lieutenant Orr had with him only a *Jemadar's* party of *Sepoys*. A discussion ensued, which terminated with blows. Lieutenant Orr received eleven wounds (seven were severe), and was with great difficulty carried off by his party, who behaved very well, and sustained considerable loss. The Rajah lost on his part his brother-in-law and three followers, and was himself wounded. As soon as the Rajah's followers had seen their master safe into his fort (which immediately opened a fire of grape on Lieutenant Orr's party), they commenced a pursuit, from which Lieutenant Orr with difficulty escaped into the districts of a rival Rajah.

The present aspect of the *Punjab* is most encouraging; the population, now disarmed, have settled down into their former habits of industry. The breadth of land under cultivation this season is said to be unprecedented, and the crops are everywhere most promising.

Sir Charles Napier was to begin his homeward journey from Simla on the 5th of November, and the Governor-general was expected to return from Konawar to Simla at the end of September. It was then expected that his Lordship would visit the *Punjab*.

Sir Charles Napier has issued a general order condemnatory of the conduct of those commanding officers who neglected to read and explain to their regiments the orders issued in October, 1849, by the Governor-General and Commander-in-Chief, with a view to preparing the minds of the *Sepoys* for the withdrawal of *Scinde* allowances. To this neglect on the part of Major Troup, of the 66th Native Infantry, it will be remembered that the mutiny and consequent disbandment of that regiment were attributed by Sir Charles. In this order the Commander-in-Chief very clearly defines the duties of officers commanding regiments, brigades, and divisions; and states that his own period of service with the "noble Indian army" will very soon close.

The most important piece of intelligence from *Hong-Kong* is the continuation of the fearful mortality among the troops, which we noticed in last month's "Narrative." This mortality was chiefly in the 59th regiment, which had lost ninety men in about two months; while, among the Europeans belonging to the Engineers and the Artillery no unusual sickness had prevailed, and the community generally was healthy. This sickness, therefore, is ascribed to the unhealthiness of the barracks and the want of sufficient sanitary precautions. The mortality, however, had begun to abate.

A formidable insurrection against the Chinese government had broken out in the province of *Kwang-si*. The leader, who is named *Li-ting-pang*, is said to be at the head of 50,000 men. He has assumed the title borne by the highest *Tatar* generals, and threatens to exterminate the present and restore the old Chinese dynasty.

The last *West India Mail* has brought advices from the principal colonies to the end of last month.

In *Jamaica* the cultivation of cotton is the great point of interest. An association has been formed in Jamaica in order to test the capabilities of the island

for "the remunerative production of this plant; and Pembroke Hall, an estate adjacent to Kingston, has been leased for that purpose.

A coloured woman, named *Moss*, died in Kingston on the 1st of September, at the extraordinary *Age of 160 Years*. She was until within a short time of her dissolution in the enjoyment of all her faculties, and had not known a day's sickness during the last forty years of her existence.

The *Rains* which had fallen in *Hamover*, *Westmoreland*, *Trelawny*, and *St. Anne's*, were expected to assist very materially the planters with their next crops.

In *Barbadoes* the weather had been extremely sultry, with heavy showers of rain. The country looked beautifully green, and an immense crop of sugar was calculated upon by the most experienced planters. A fire took place on the 19th ult. at *Pashfield* estate, which destroyed property to the value of 1500*l*.

In *Trinidad*, commercial affairs were in a very unsatisfactory condition, and a scarcity of capital was complained of. A large number of properties had been advertised for public sale in December next on account of arrears due for the ward-rate. There was no sensible alteration in the wages of labourers. A few small proprietors were planting cotton, but more as essays than for speculation. Great dissatisfaction was expressed by the middle classes, and the owners of small properties, at the heavy taxation imposed, and a great many people would probably be driven from the island in consequence thereof. The crop shipped in 1850 amounted to 23,412 hogsheads, and it was estimated that the whole crop would amount to 24,000 hogsheads, showing a deficiency of 4000 hogsheads when compared with the yield of 1849. The prospect of next year's crop, however, was very favourable.

In *British Guiana*, the court of policy had held two sittings, at one of which, two despatches from Earl Grey were read, acknowledging certain communications from *British Guiana*, calling for changes in its legislative institutes, in which the noble earl expressed himself not unwilling to sanction certain alterations in the court of electors, the effect of which would be to increase the number of members and limit their tenure of office, provided such should be the wish of the court of policy. Governor Barkly also announced his readiness to carry these views into operation by increasing the financial representatives from six to ten.

There are advices from the *Cape of Good Hope* to the 5th of August. The most important article of intelligence is the annexation to the colony of a tract of land about 150 square miles in extent, lying east of *Albert* division and west of the *Wilge* river. The whole tract is designed and appropriated as a "National Reserve," for the use of the aborigines or persons of African descent; and no farms or lands within it will, unless otherwise directed, be granted to persons of European race. The tract is now occupied by the aborigines attached to the *Wesleyan* missionary station at the *Wittebergen*. The *Wilge* River, now the eastern boundary of the colony, is henceforth to be known as the *Tees*.

Papers from *Sydney* have been received to the 3rd of August. Dr. Lang had been elected representative of the city of *Sydney* in the legislative council, by a majority of 25, the votes for him having been 970 and for his opponent, Mr. Holden, 945. On being declared duly elected, he addressed the multitude, and was then drawn home in his carriage by his partisans.

From *South Australia* there are favourable accounts of the progress of the *Australian Mining Company*. Fresh applications are constantly coming in for grants of land, of from one to five acres each, and the

township of Tungkillo (the seat of the company's works) is increasing in extent. Schools have been established, and nothing can be more gratifying than the rapid progress which the children are making—both in the ordinary branches of education and in religious instruction. The lord bishop has arranged for a monthly visit to Tungkillo, by a clergyman, and a Wesleyan minister also attends once a month regularly. By subscriptions among the people, a useful Sunday-school library has been established. The miners' library, liberally provided by the directors, has proved very acceptable, and is calculated to have very beneficial results; the subscribers voluntarily pay one shilling a month towards the expenses of the institution, and one shilling entrance.

PROGRESS OF EMIGRATION AND COLONISATION.

Several letters, addressed to the Right Hon. Sidney Herbert, have been recently received at the office of the *Female Emigrant Fund*, in reply to communications made to the colonies soon after the institution had commenced its operations. The accounts from the Cape colony are particularly encouraging; and the committee have decided on the immediate selection of fifty young women for emigration thither; and it is intended that they shall be despatched on or about the 15th of next month. Governor Sir Harry Smith and Dr. Gray, the Bishop of Cape Town, have manifested extreme interest in the operations of the committee. The Bishop writes as follows, under date April 25th:—"The class of persons in whom you are interested is one which is much needed in this colony. I have no hesitation in saying that a very large number of females of good character, who would take the situations of household servants, at wages at least equal to what you give in England, would in a few weeks be absorbed. We shall be quite prepared to employ as many as you are likely to be able to send us, and I am sure that if they come as you propose, not more than thirty at a time, with characters (which should be sent with them, and addressed to me), they will all be engaged within a day or two of their arrival.

The communications from *New South Wales* are of an equally cheering character, as will be seen by the subjoined extract. Dr. Broughton, the Bishop of Sidney, writes, on the 6th of May:—"The following observations are founded on data supplied by an analytical view of the census of New South Wales for 1846, the last which has been taken under legislative sanction. The total population of New South Wales, including Port Phillip and the crews of colonial vessels, was then shown to be (in round numbers) 139,000; viz., males 114,000,

females 75,000. The proportion of females born in the colony was 14 per cent. beyond that of males. The arrival of female emigrants during the year 1849 has exceeded that of males by nearly 18 per cent. Supposing such causes to have been in operation during 1847, 8, 9, (since the census was made up), the ratio of the sexes at the present time may be as females 6, males 7, instead of 5—8, as in 1846. Still, therefore, there is an alarming disproportion; and it must be the prayer of every friend of virtue and morality, that this inroad upon the appointment of the Almighty may not be continued. I see every probability that within the limits of the settled counties, several hundreds of women acquainted with household work, if they were of unblemished characters, would readily find engagement in respectable places, where they would be well maintained and attended to until they should dispose of themselves more to their advantage.

Information has also been received of the arrival at *Toronto*, under the care of Mr. A'Court, of those emigrants who were sent out to Canada in the *Elspeth*, and, further, that they had all obtained places within a week:—and intelligence has arrived from Port Phillip, stating that the *Culloden*, the first ship despatched to that quarter, was hourly expected, and that the colonists were ready and anxious to receive her emigrants.

The *Slanes Castle*, the first ship sent out by the *Family Colonisation Society*, founded by Mrs. Chisholm, sailed on the 30th of September, from Gravesend for Australia.

The *Emigration* from the Western and Southern parts of Ireland, goes on without abatement. This month two vessels have sailed from Galway for New York, each carrying nearly 250 passengers, many of them belonging to the better class of farmers. The *Tipperary Free Press* thus speaks of the flight from the southern district:—"The tide of emigration from this unfortunate land to the colonies and the United States is swelling beyond measure. No conception can be formed of it by the vast number of families which pass through both town and country *en route* to Waterford, &c., day after day, as the great emigration movements principally take place by night! On Wednesday night the watchman on duty in this town counted no less than 54 horses and carts laden with living souls and baggage, all destined for a foreign land; and when so many have passed through Clonmel in one night only, what estimation can be made of those who have travelled for the same purpose through the various highways leading to the ports which branch off at some distance from this town."

NARRATIVE OF FOREIGN EVENTS.

THE position of parties in France is unchanged. The month has been filled with the intrigues and counter-intrigues of the minister-at-war and the commander-in-chief, and with Louis Napoleon's attempts upon the army by means of chickens and champagne. But the end of the month leaves matters much as they were at its beginning; except that at least the poor President is fain to announce, officially, his intention to remain perfectly quiet and attempt no *coup d'état*, but to wait in patience for such fortune as the Assembly may choose to provide for him.

Of German affairs in their present state it is hardly possible to speak, so as to render what is said in the remotest degree intelligible. But the still lingering Schleswig-Holstein dispute has furnished excuse for an insolent threat on the part of Russia and France which may yet unite Germany and strengthen Prussia, in spite of her poor imbecile king; and the gallant people of the little Electorate of Hesse Cassel maintain still their attitude of calm resistance, in spite of the open bullying of declared foes and the timid hesitation of cowardly friends. Time must bring forth the rest.

California is added to the American Union, and the opponents of slavery exult in another free state. But their richer harvest of triumph is arrived, as we predicted that it would, in the agitation against the Fugitive Slave Act. North and South, East and West, the abolitionists are now more active, resolute, and powerful than ever. Even the advocates of the law do not fail to perceive this, and already coolly declare themselves prepared for "an agitation of a most fearful, revolutionary, and bloodthirsty character." Sooner or later we believe that it will be all this. But have the more prudent class of American Statesmen considered it in that light, or prepared themselves sufficiently for the very possible, and perhaps not very distant result?

News from China comes over so high a wall, that it never comes but imperfectly. There is a pretty well substantiated rumour, however, of rebellious doings in the south; and that the insurgents, led on by a new aspirant to the Empire, have worsted the regular troops in more than one engagement. An usurper generally makes so excellent a prince that it may possibly be for the interest of us all to wish success to the rebel.

The President of the French Republic has lately been busy with great *Reviews and other Military Pageants*, entertaining the officers with handsome collations and abundance of champagne, and the soldiers with liberal distributions of rations. One of these took place on the 2nd, when the President reviewed a great body of troops on the Plaine de Satory near Versailles. He was accompanied by the Minister of War, and by General Roguet, his aide-de-camp. General Changarnier left Paris an hour before the President. Though entitled to take the command he did not do so, General Neumayer acting in his room. After the review the President gave a collation to the officers and non-commissioned officers, and ordered 18,000 rations to be distributed to the soldiers. The President joined the collation given to the general officers, but General Changarnier declined being present, and returned to Paris, when the other general officers adjourned to the *déjeuner*. The frequency of these reviews, the manner in which the troops were *fêted* by the President, the manifestations made by the soldiers, and the rumour that a difference of opinion existed between the President and General Changarnier on the subject, led to an extraordinary meeting of the Commission of Permanence. The Minister of War, General Hautpoul, having been called on to explain the circumstances with reference to the late reviews, replied that he wished to inform the commission that he held no command from the Assembly, and that consequently, he could deny the right of the commission to put any questions to him. He, however, waved these objections; and in reply to the question, said that the accounts published in the papers respecting the reviews were grossly exaggerated; and that nothing whatever had occurred there of an unconstitutional or an unmilitary character. The commission heard the General's explanation in perfect silence; nor did any discussion whatever take place. The Minister further observed that it would be impossible to publish an order of the day preventing the soldiers from expressing their feelings of attachment and respect to the chief of the State, and if it were possible he would not do so. With respect to the review that was to take place on the following Thursday, he pledged himself for the maintenance of the most complete tranquillity on that occasion. When the commission was about to separate, the president again addressed the Minister of War, and said, "General Hautpoul, I am desired by the committee to apprise you that in case General Changarnier be removed from his command, or that any other steps be taken against him, we are determined to convoke, forthwith, the Legislative Assembly." To this the Minister made no reply, and the commission adjourned. On Thursday the 10th, the review referred to by the Minister of War, took place on the Plaine de Satory. There were 25,000 troops, chiefly cavalry. The President was accompanied by General Hautpoul, the Minister of War, and several other general officers, besides his usual brilliant staff. On his way from the Palace of Versailles to the plain of Satory, the streets through which he passed were densely crowded, and he was loudly cheered by the 'people'; but the greatest portion of the cries were "Vive le President!" with only a slight sprinkling of cries of "Vive Napoleon!" and "Vive la Republique!" General Changarnier was on the ground about half an hour before the arrival of the President. When the defiling of the troops in front of the President took place, the infantry passed without uttering a single cry. The cavalry followed, the van being led by the carabineers. The whole of the first regiment of carabineers, in passing the President, cheered with immense enthusiasm, and a great majority of them cried "Vive l'Empereur!" "Vive Napoleon!" The three other regiments of carabineers also cheered, but not with so much enthusiasm as the first. There were, however, a considerable number of cries of "Vive l'Empereur!" The regiments which followed were two fine regiments of heavy dragoons. They passed without uttering a single cry, although the colonel of one of them encouraged his men by crying "Vive l'Empereur!" at the pitch of his voice. In the light cavalry regiments there was very little cheering, and the only cry uttered was "Vive Napoleon!" "Vive la Republique!" After the troops had defiled, the usual refreshments were served out to them, and the President, accompanied by

his staff, paid a visit to the camp, but General Changarnier left the ground.

The *Process-verbal* of the meeting of the Council of Permanence, held on the 12th, drawn up by M. Dupin to the President, was to the following effect:—The violation of the promises made by the Minister of War, and the unconstitutional manifestations, provoked (or tolerated, are severely blamed. The committee did not think proper to invite the Minister of War to give further explanations. Deploring the incidents of the review, it still expressed complete confidence in the loyalty of the army, and is satisfied that the cries were not spontaneous on the part of the soldiers, but instigated by certain officers. In order to avoid alarming the country in the absence of imminent peril, it has not deemed proper to convoke the Assembly; but it deeply disapproves reviews so frequent, into which habits altogether unusual and foreign to military traditions have been so boldly introduced.

As a sequel to these disputes, General Hautpoul has found it necessary to resign his place in the government, and has gone to Algeria as Governor of that colony. He is succeeded as Minister of War by General Schramm. General Changarnier has forbidden all Buonapartist papers to be admitted into the barracks, and among others the *Pays*, a paper which was exclusively directed to the troops, and which was the most zealous advocate for the restoration of the Empire.

The government having lately received intelligence that a *Clandestine Manufactory of Gunpowder* on an extensive scale existed at Pouzin, in the department of the Ardèche, in the house of a man named Soubeyran, who was remarkable for much energy of character and desperate courage, an expedition was planned to capture him, and seize the gunpowder. A strong detachment of horse-artillery and four companies of the line, left Valence under the commandant of the place. At five in the morning they arrived at Soubeyran's door, and summoned him to come forth and surrender himself. No answer was made; a noise was heard inside as of the loading of a gun, and the ringing of a steel ramrod in the barrel. After some minutes, and when the Prefect was about to repeat his summons, the door was suddenly flung open, and Soubeyran, in his shirt-sleeves, a red silk handkerchief twisted round his head, his throat bare, and with sandals on his feet, presented himself before them. One hand grasped a blunderbuss, the other was extended forward. He evidently did not expect to see so many prepared to prevent his escape, and his surprise made him hesitate a moment. The Prefect rushed at him, seized with one hand the arm which held the blunderbuss, and with the other put a pistol to his temples, again summoning him to surrender. The soldiers were advancing, when Soubeyran by a sudden and violent movement freed himself from the grasp which held him, leaped over a table and some chairs, burst through a door, reached a window which hung over the water, and bursting through it, dashed into the Rhône and disappeared amidst its waves. The troops who were stationed outside ran at once to the bridge, and twenty or thirty of the horsemen were in a moment on the opposite side, while others lined the near bank. Once or twice the end of the red handkerchief which bound the outlaw's head was seen in the uncertain light of daybreak on the surface of the water; but Soubeyran himself was never seen more. The troops watched long on both banks of the river, expecting in vain to see him attempt to land—it was all useless. It is not known whether he perished in the dangerous current that shoots between the arches of the bridge, or whether he was able, by swimming for a considerable time under water, to find shelter in the hollow of the rocks that in that part hang over the stream; at all events, dead or alive, he has not since been heard of.

The Queen of the Belgians died on the morning of Friday, the 11th. She had laboured for two years under an affection of the lungs and a tendency to *dropical* consumption, and grief for her father's death appears to have aggravated her complaint, and led to their final termination. She died with pious resignation, and though in extreme pain, was able to console her afflicted husband.

She was in her 39th year, having been born at Palermo, on the 3rd of April, 1812. She was married to Leopold, King of the Belgians, on the 11th of August, 1832; and has constantly enjoyed, in the highest degree, the love and respect of her adopted nation. The deceased Queen has left behind her three children, of ages varying from eleven to sixteen. They are the Duke of Brabant, the Count de Flandres, and the Princess Charlotte; one child died in early infancy. The loss of the Queen will be the more severely felt, as the education of the royal children was under her own superintendence. The visits of the Queen of the Belgians to this country were frequent, and her virtues much endeared her to our Queen Victoria.

The war between Denmark and the Duchies is bloody and disastrous. The army of Schleswig-Holstein has made several attempts to take the city of Friedrichstadt by storm, none of which have been successful, and the losses sustained by General Willisen have been considerable, particularly in officers. After bombarding part of the town during the whole of the 4th inst., the town was in the evening attacked by two battalions of infantry and a detachment of riflemen. After a desperate struggle, in which both sides must have suffered very heavy losses, the Danes gave way a little, but only to seek the cover of new entrenchments and barricades thrown up in the middle of the town. The resistance which they met with here was so violent and determined, that notwithstanding the most brilliant bravery, the Schleswig-Holsteiners were compelled to retire at midnight. They took up a new position somewhat in advance of the old, and the conflict was renewed on the following morning, but with no better success. The troops advanced in three columns, and the Danes opened a severe fire along their whole line of defences. Before coming to close quarters the captain of the 6th battalion fell, mortally wounded, and the men he commanded were driven out of a small entrenchment they had taken possession of. The 15th battalion was thrown into disorder and retreated, their ammunition-car having exploded and caused great havoc. It received no support from any other troops, in consequence of a bridge between the Chaussée and the Blockhaus having fallen in. A retreat was sounded on perceiving new lines of defence not previously known of. The fighting continued till near midnight. Sixteen officers out of twenty belonging to the 5th battalion were slain. General Christiansen covered the retreat with his battery, while the flames of the burning city cast a ghastly light upon the retiring troops. After the failure of this desperate assault, General Willisen withdrew his troops from before Friedrichstadt. The heavy guns were taken back to Rendsburg, and the two armies were again in the same position they occupied before the 29th of September; the only result having been the almost total destruction of the unfortunate town, and the loss of many brave men on both sides.

A frightful calamity has occurred at the place of pilgrimage called Herrgott, in Austria. At one of the public-houses the pilgrims (of whom 3,000 were assembled at Herrgott) were spending the night in eating and drinking. While baking the fish the oven took fire. Behind the inn were a number of stables and barns, in which hundreds of the pilgrims were reposing, and almost all perished in the flames, which rose so rapidly through the thatched roofs, fanned by a strong wind, that there was no possibility of raising ladders to attempt to rescue a single person. Many threw themselves from the roofs, and, with broken limbs, half consumed with fire, flew hither and thither with the most piteous cries. Scarcely half of the pilgrims were saved, and those who survived have for the most part been much injured.

From Poland there is a singular account of a forest on fire. Near Cracow, adjoining the line of railway, there is a large peat ground, part of which runs below an immense forest. About the middle of last month some sparks from a locomotive engine were blown in that direction, and fell on the peat, the surface of which had been dried by the heat of the weather. A few days after, the ground in the forest was found to be very warm, and some rumbling and crackling noises were heard. Several large trees fell as if cut down by an axe,

and the leaves of others withered. As it was naturally considered that a subterranean fire must be burning under the forest, the officers charged with the inspection of it caused large trenches to be cut. This conjecture turned out to be well-founded, for the fire soon afterwards burst forth, and still continued its ravages. The forest presented the appearance of a vast sea of flame, which was every day extending. The country round to the extent of six leagues was perfectly illuminated, and it has been found impossible to stop the progress of the fire.

The crisis in the affairs of Electoral Hesse continues, and the accounts of the present state of things are confused and contradictory. The Elector remains with his minister Hasenpflug, at Wilhelmsbad, his provincial seat of government, while the people of Cassel persist in their opposition to his measures. There have been signs of indecision on his part, and at one time he was said to have even contemplated abdication. There were also some expectations of his dismissing his obnoxious ministers and consenting to the formation of a more popular government. With this view, it was understood, he sent for M. Elwers, a high judicial functionary of liberal tendencies, who, it was hoped, would be instrumental in forming a new cabinet; but this hope was disappointed, and M. Elwers had returned to Cassel. Dr. Oetker, the editor of a liberal journal, had been arrested by order of Haynau, and the Upper Court of Cassel had summoned the commandant of the city to effect his liberation, but at the last accounts he still remained in prison. The officers of the garrison had remonstrated with Haynau upon his proceedings, and had received for answer that he was determined to persist in his course. On this, to the number of two hundred, they had tendered their resignations, which were transmitted by Haynau to the Elector, but his decision on the subject had not been received. There is much uncertainty, too, about the views of Austria and Prussia in regard to the affairs of Hesse-Cassel. Very recent intelligence was to the effect that these two powers had come to an understanding that Hasenpflug should be dismissed from his office of minister; and that any military intervention in Hesse, if necessary, would be by Prussia and Austria jointly. According to the last accounts from Cassel, however, an invasion of Austrian and Bavarian troops was daily expected, for the purpose of supporting the Elector against his subjects.

The opening of the States-General of the Netherlands took place at the Hague on the 7th, by the King in person. The speech from the throne announced that the relations of the country with all foreign powers were satisfactory, and that as regarded the Duchy of Limburg, the difficulties which had arisen from the convulsed state of Germany were in course of arrangement by such negotiations as would best suit the interest and honour of the Low Countries. Trade was described as prosperous, and flattering hopes were put forth as to the future effects of the new navigation laws. The financial situation was satisfactory; the expected excess would cover the deficiencies left by the preceding year.

At a secret Consistory, held at Rome on the 30th of September, the following Cardinals were appointed: Monseigneur Paul Therese David d'Astros, Archbishop of Toulouse; Jean Joseph Bonnel y Orbo, Archbishop of Toledo; Joseph Cosenza, Archbishop of Capua; Jacques Marie Adrien César Mathieu, Archbishop of Besançon; Jude-Joseph Romo, Archbishop of Seville; Thomas Gousset, Archbishop of Rheims; Maximilian-Joseph Godefroi, Archbishop of Olmutz in Moravia; Jean Geissel, Archbishop of Cologne; Peter Paul de Figueredo de Cunha e Mello, Archbishop of Braga in Portugal; Nicolas Wiseman, Archbishop of Westminster in England, a metropolitan see recently formed by the Pope; Joseph Pecci, Bishop of Bugie; Melchior de Diepenbrock, Bishop of Breslau. Cardinal Wiseman is to return to England, to occupy his metropolitan see; and the whole of England has been partitioned into Romanish Episcopal Sees.

M. Franson, Archbishop of Turin, has been sentenced to banishment from the Sardinian territories, and the archiepiscopal possessions forfeited to the Crown. Thirteen judges out of fourteen pronounced the condemnation of *M. Franson*, who was escorted to the frontier on the 30th ult. The arrival of the Archbishop at Briançon, Hautes Alpes, is announced in the French papers. The same course has been pursued with the Archbishop of Cagliari, who had imitated the conduct of *Franson*, and even gone the length of excommunicating the authorities who called him to account. Sentence of banishment was pronounced against him, and he was put on board a steamer and sent to Civita Vecchia. The vacant sees are administered by the state department of the Apostolic Economist-General.

The Representative Constitution and the Liberty of the Press have been destroyed in *Tuscany*. On the 23d ult. two Decrees were promulgated: the first announced the dissolution of the Chamber of Deputies, and declared that till a fresh convocation of the legislature, all power would be exercised by the Grand Duke in the Council of State. The second declared that no journal or periodical should be published without first obtaining the written authorisation of the Minister of the Interior, to whom the names and other circumstances of the director and of the proprietor of the printing establishment are to be communicated.

A *Tragical Occurrence* has taken place at Kruziewis, in the Grand Duchy of Posen. At the commencement of the Russian campaign in Hungary, twelve Circassian noblemen engaged as volunteers in the Russian Circassian regiment, and returned to Warsaw decorated for good conduct. The campaign having terminated, they wished to return home; but they were detained, and placed in the same category as the common Circassians, serving in the army. All their prayers and remonstrances, even to the Emperor himself, remained unheeded. On the 28th September they quitted Warsaw, and passed the frontier cordon, a distance of thirty German miles, next day, after leaving two comrades killed by their pursuers. On the 1st of October, they arrived at Kruziewis, and were conducted by a gendarme before the Landrath. They expressed a wish to be conducted to Berlin, and there disarmed; but the Landrath refused, and expressed his intention of sending them back to Poland. They were then led to the barracks, but nothing could induce them to enter the barrack-yard. The squadron of dragoons quartered at that place received orders to mount and surround them. The moment the dragoons arrived, one of them fired on the Circassians. The Circassians, who were mounted, now galloped out of the town, pursued by the dragoons. One of their horses, already nearly exhausted, fell near the Landrath's office, and a Circassian was shot; so also was the dragoon. A little further on, two more Circassians were killed, and two wounded taken. The remaining five took refuge in a farm-house, after letting loose their horses. They refused to surrender, and prepared for defence. The dragoons seeing this, set fire to the outhouses, and then to the barns and stables, but the house in which the poor men had taken refuge, could not be burned, as they prevented all approach with their rifles. The other buildings burned all night, but the five Circassians still held out. At length infantry was sent for, and during the night of the 1st and 2nd a detachment of forty men arrived from Bromberg. Measures were taken for burning down the house, and they succeeded. Deprived of their last refuge, the Circassians rushed upon their enemies. One of them killed a foot soldier, and was killed himself, pierced with balls. The remainder, pierced with wounds, were at length captured, and brought into Kruziewis on waggons. The barbarous conduct of the Prussian authorities is attempted to be justified by the cartel between Russia and Prussia for the capture and mutual surrender of deserters.

The advices from *New York* come down to the 9th inst. Congress adjourned on the 30th of September, after a long and momentous session. One of its latest measures, the Fugitive Slaves' Act, had come into opera-

tion, and was producing great excitement among the coloured population, and large public meetings had been held in *New York* and other cities, at some of which, resolutions advising resistance to the Government officers were passed. A vast number of fugitive slaves were escaping into the British North American possessions.—It was said to be likely that Frederick Douglass, the well-known anti-slavery lecturer, would be apprehended under the new act, unless he escaped to Canada.

Congress, before its adjournment, passed the Bill to suppress the slave trade in the district of Columbia, which completes the series of measures proposed by Mr. Clay in his "Compromise Bill" for the settlement of the slavery question.—A bill was also passed prohibiting the lash in the naval service, and abolishing the use of ardent spirits, except in the cabin.

Advices from *Texas* of the 20th ult. state that the passage of Pearce's Boundary Bill by the United States Congress had been announced to the legislature, and the indications were that it would be passed. The papers state that the popular feeling was decidedly in favour of accepting the propositions of the United States Congress.

A serious disturbance had taken place at Sacramento city in *California*. A number of "squatters" had occupied and erected buildings on grounds to which, it was contended, other parties had rights. A writ of ejectment was obtained against them, but they resisted its execution, and a sanguinary conflict ensued, in which the mayor of the city, and the leader of the squatters, were killed, and a number of persons wounded. A report, that the city had been burnt, proves unfounded.

The American steam-boat, *Pacific*, as she was leaving *New York* on the 28th of September, was detained for a day, by a *Calamitous Accident*. As she was passing out of the dock she struck the wharf, broke down a large shed, and injured herself considerably. There were several hundred people under the shed, and the moment the crash commenced a general panic took place. Many persons in their fright jumped overboard into the river. Some were rescued, but two men were crushed to death in a most horrible manner, by the falling beams under the shed.

Jenny Lind had sung at several *Concerts* at *New York* and *Boston*, and has been received with an enthusiasm that beggars anything ever witnessed in this country. At both the above places the tickets of admission were sold by auction; at *New York*, one *Geniu*, a hatter, purchased one seat for 225 dollars; and at *Boston* a Mr. Dodge, a music-seller, was the buyer of a seat at the price of 625 dollars—125*l.* sterling! This looks like more madness; but there must be something under it which does not appear.

Advices from the *Sandwich Islands* reach to the 22nd of June, and describe in the highest terms their rapidly increasing prosperity. Liability to desertion continued to cause the visits of whaling ships to be less frequent, but the extraordinary growth of a more permanent commerce in connection with *California*, and indirectly with *Australia*, *New Zealand*, *Calcutta*, *China*, and the *Indian Seas*, rendered this of no account. The Harbour of *Honolulu*, which at particular seasons used to be entirely deserted, was now at all times a scene of activity from the arrivals and departures of merchantmen, and the construction of additional wharves had become necessary. Many new buildings were in the course of erection, and the cultivation of vegetable produce was stimulated to the utmost by the fact that supplies of all kinds were taken off as fast as they could be raised. To aid the extension of agricultural operations, a public assembly was fixed to be held in *Honolulu* on the 12th of August, for the purpose of forming an association to collect implements and machinery, plants, and seeds, as well as to promote by periodical exhibitions, improvements in the breeding of live stock, and, if possible, to establish a magazine, which should contain such selections from the standard agricultural publications of *Europe* and *America* as might be likely to prove most useful to the members. It was also proposed that the association should give attention to the question of the introduction of Coolie labour from *China* to supply the places of the rapidly decreasing native population.

NARRATIVE OF LITERATURE AND ART.

THE progress and successful conduct of the University Commission is matter of the deepest anxiety to all who feel the questions involved in it to be paramount in importance to almost every other. It has commenced its sittings, but as yet has been occupied exclusively with mere arrangements for taking evidence. Most of the heads of houses who signed the remonstrance against the inquiry, it is now understood, will no longer decline to be examined; but we still hear muttered threats of "violent opposition from the Tractarian members of the board." Happily these bode less than they did. The precipitate descent of the Pope and his bishoprics has fluttered the pro-papists in Oxford and elsewhere, and their means of mischief are not at all what they were even so late as ten days ago. The wedge had already been inserted before the hammer of his Holiness was applied. We shall shortly see Doctor Pusey and Mr. Sewell and Mr. Denison at quite harmless fusticuffs in the air.

These three gentlemen aptly represent the present split of the Tractarian schism. Mr. Denison is for denying the Romish supremacy, and creating a supremacy of his own. Doctor Pusey will not deny the Romish supremacy; but, with a resolve as stern and mournful as Mr. John O'Connell's when he contemplated his final struggle on the floor of the house, he promises to die in the bosom of the Church of England. Mr. Sewell is as little for denying as for admitting the supremacy of Rome, but, swaying to either side with the current of his interests and hopes, appears to have simply made up his mind to die in the possession of a good English benefice. Not any of the three will occasion much more trouble. As soon as the choice must be taken, Mr. Denison and Mr. Sewell will be found side by side where the bishops and benefices are; and for the remaining section, the weakest but the most sincere, they will at least have the excuse of Benedict for marrying, that when they promised to die in the bosom of the Church of England, they didn't know that they would live to die in the bosom of the Church of Rome.

The publishers still pause and hesitate on the threshold of the winter season, and there has not been for many years so dull an October in the great publishing houses, east and west.

The most important of the month's scanty publications which we are called to record is that of the first portion of a very able and laborious compilation on *Commercial Law* by Mr. Leone Levi. The object of the entire undertaking, which may well be termed a gigantic one, is to survey the principles and administration of all the various commercial laws of foreign countries, with a view to a direct comparison with the mercantile law of Great Britain. Mr. Levi appears to have been engaged for years, with this object, in correspondence with the merchants of upwards of fifty countries remarkable more or less for distinct and separate commercial usages; and to have obtained in every instance the information he sought. His first volume opens with a sketch of the leading epochs in the history of commerce, and of the existing condition of commercial law in the countries embraced by his scheme. Then, after giving a table of international usages and days of grace now current in all countries, Mr. Levi presents an extraordinary mass of information at once extremely condensed and most lucidly arranged, on the laws of merchants, minors, married females, aliens, books of commerce, and partnership, respectively prevailing in Great Britain (which occupies the post of honour across the top of each page,) and in all the other leading countries (which are duly arranged in parallel and corresponding columns below). Mr. Levi's ultimate object, and one to which intelligent law reformers will earnestly desire success, is the establishment of a national and international code of commerce among all civilised countries, rejecting what is inconvenient or unjust in all, and retaining and codifying what is best in each.

A traveller and literary labourer of the same race as Mr. Levi, the Rev. Moses Margoliouth, a converted Jew, has been employing his time not quite so profitably in writing and publishing long-winded letters descriptive of a *Pilgrimage to the Land of my Fathers*, addressed to all sorts of fine folks here, countesses, bishops, lords, and baronets, who must have had a surprising quantity of patience, and a more than ordinary amount of nothing to do, to be able to read them. It is very doubtful if the public will follow their example. The letters, orations, and other tracts on Italy, which M. Mazzini has just republished with an eloquent and earnest appeal to the English people, in a small volume entitled *Royalty*

and *Republicanism in Italy*, would merit a different kind of mention, if this were the place in which to give it. Suffice it to say that M. Mazzini repels in this book, it seems to us successfully, the charge so often brought against him of having distracted and divided the forces of his native country, at the time when they ought to have been concentrated on the paramount duty of driving out the Austrians.

There is no other original book deserving notice in our present Narrative, but some welcome re-appearances deserve a grateful word. First, and most delightful, is a re-issue of the Spectator's papers of *Sir Roger de Coverley*, now for the first time collected in a single volume, forming a connected narrative of the most fascinating kind, and characteristically illustrated by notes as well as woodcuts. Then we have a re-publication by Mrs. Crowe of some stories of murders, ghosts, and circumstantial evidence, highly pertinent to the time, and entitled *Light and Darkness*. Also we have to note the issue in three goodly volumes of Mr. Robert Bell's English story of the *Ladder of Gold*. And finally there have been new editions (with numerous and important additions in both cases) of Mr. Leitch's excellent translation of Müller's *Ancient Art and its Remains*; and of Dr. Latham's admirable treatise on the *English Language*.

A great quantity of *Assyrian and other Antiquities* have arrived at the British Museum, from Bussorah. Among them are the Great Bull from Nineveh, with a man's head and dragon's wings, weighing twelve tons, and a lion sculptured in the same manner, weighing nine tons. There are also several coffins, containing many curious relics of the manners and usages of Eastern countries regarding the ceremonies observed in burying their dead.

The metropolitan theatres have all opened for the season. Mr. Charles Kean and Mr. Keeley are now the losers of the Princess's, which they are managing with much success. No new dramatic piece of any importance has been produced at any of the theatres.

A series of "Grand National Concerts" has been commenced at Her Majesty's Theatre, under the direction of a committee of gentlemen. They are promenade concerts, after the manner of Julien's entertainments at Drury Lane, but on a greater scale, and with a larger infusion of classical music.

COMMERCIAL RECORD.

BANKRUPTS.

From the Gazette of Sept. 27. JOHN THOMAS BRANFELD, Tichborne-street, and Great Windmill-street, Westminster, china dealer.—JAMES HORSFIELD, Wheelock, Cheshire, coal dealer.—WILLIAM KEEFING, East-street, Walsworth, common brewer.—EDWARD HAMLIN KIDDLE, Valentine-place, Blackfriars-road, miller.—HENRY LLOYD and THOMAS LLOYD, Carmarthen, drapers.—THOMAS PROBYN, High-Holborn, licensed victualler.—HENRY FRANCIS ROSA, West Cowes, Isle of Wight, and JOHN WYLLIE BARROW, Philpot-lane, City, commission and shipping agents.—HENRY WILKINS, High-street, Kensington, draper.

Oct. 1. THOMAS GILSON, Mark-lane, City, corn and seed factor.—WILLIAM MAYES, Bateman's-Row, Shoreditch, timber merchant.

Oct. 4. THOMAS FIELDING, Rhyll, Flintshire, hotel keeper.—THOMAS HORATIO JOLLEY, Farringdon-street, City, fruit salesman.—GEORGE LITTLE, Holborn-bars, City, and Commercial-pl., Commercial-rd., New Peckham, electrical apparatus maker.

Oct. 8. WILLIAM GRAYSON, Mordlake, Surrey, marketgardener.

Oct. 11. WILLIAM GOODE, jun., Moomouth, linen draper.—JAMES HORSFIELD, Wheelock, Cheshire, coal dealer.—BENJAMIN MURRAY, Stockton-upon-Tees, Durham, innkeeper.—JOSEPH WORSEY, and JAMES BIGGS, Aston, Warwickshire, wire manufacturers.

Oct. 15. WILLIAM HENRY BOON, Plymouth, ironmonger.—THOMAS DALBY, Hythe, Kent, builder.—HENRY POOLEY, Wisbeach St Peter's, Cambridgeshire, carpenter.—THOMAS WESLEY, Newport Pagnel, Buckinghamshire, hotel keeper.

Oct. 18. JONAS CLARK, Soham, Cambridgeshire, dealer in flour.—JAMES FIELDING, Middleton, Lancashire, provision dealer.—WILLIAM FORD, High-Holborn, haberdasher.—CHARLES JONES, Llanfyllin, Monmouthshire, grocer.—WILLIAM PIGOTT, Great Eversden, Cambridgeshire, general shopkeeper.—BENJAMIN TEBBITT, Ventnor, Isle of Wight, draper.

Oct. 22. EDWARD ARMITAGE, Halifax, and Huddersfield, Yorkshire, cotton spinner.—JOHN INGS, Henley in Arden, Warwickshire, surgeon.—FREDERICK LA MARK, and GEORGE LA MARK, Water-lane, Tower-street, shipbrokers.—JAMES M. MONTES, Liverpool and New York, America, corn merchant.—JAMES STEVENS TRIPP, Lombard-street-chambers, Clement's-lane, City, dealer in railway shares.

Oct. 25. WILLIAM BINDER, Orsott, Essex, builder.—CALEB EVANS, Merthyr Tydvil, Glamorganshire, ironmonger.—GEORGE HALL and FRANCIS SKELTON FELL, Tynemouth, timber merchants.—JOHN RODEN, Stamford, Lincolnshire, draper.—ROBERT TURNER, Worthing, Sussex, draper.

BANKRUPTCIES ANNULLED.

Sept. 24. FREDERICK JOHNSON, Lincoln, watchmaker.

Sept. 27. WILLIAM EDWARD FERRISON, Macclesfield, Cheshire, surgeon.

Oct. 1. WILLIAM JOHNSON, West Drayton, farmer.

THE STOCK AND SHARE MARKETS.

City, Oct. 28.

During the early part of the month, in consequence of the transfer books of the various descriptions of home securities being shut, Consols were the only stock in which business could be done; but, notwithstanding, the operations were of a very quiet character, and failed to sustain the market, the price receding to 96½, which it marked on the 5th inst. With the commencement of the payment of the dividends, however, an upward movement set in, and the price went rapidly up till the 18th, when Consols were done at 97½. They then remained pretty steady till the 23rd, when a speculative action to depress prices came in force, and they gradually drooped to their yesterday's quotation, 96½ to 97. To-day the market leaves off rather steadier, with Consols quoted at 97½ to 1. Within the last fortnight a very large business has been transacted, not only in Consols, but also in the Reduced 3 per Cents, the New 3½ per Cents, and the other stocks which have recently opened.

The Railway Share Market on the whole has been good this month, and characterised by a strong tendency to improvement, as will be seen upon an inspection of the extreme prices given below. Very extensive purchases were made in nearly all the railway stocks during all the first half of the month; and though the tone of the market of late has been slightly depressed, this is generally regarded as arising from causes which are easy of explanation, and of a merely temporary character.

STOCKS.

Prices during the Month.

CORN MARKET.

Mark Lane, Oct. 26.

The tendency of the prices of home-grown wheat has been slightly declining during the month, the supplies from the country being of a fair amount, and millers purchasing with extreme caution, so as only to meet immediate wants. Where sales have to be made, a slight concession is generally obliged to be yielded. The London averages (announced last night), which are given below, show a reduction of full 3s. per quarter in wheat, as compared with those published in our last monthly notice. Foreign grain has generally been sold more firmly.—

Wheat, per quarter, 42s. 8d.

Barley, 25s. 4d.

Oats, 17s. 2d.

Rye, 25s. 7d.

Beans, 25s. 8d.

Peas, 32s. 11d.

Flour, Town made, delivered,

per 280 lbs., 37s. 1s. 4½s.

„ Norfolk and Suffolk, 29s.

to 32s.

„ American and Canadian,

per barrel, of 196 lbs.,

22s. to 25s.

PROVISIONS—LATEST WHOLESALE PRICES.

Bacon, per cwt.—Waterford

heavy, 34s. to 42s.; Belfast,

42s. to 50s.; Hamburg, 47s.

Cod's, 38s.

Oliva, Gallipoli, per 22s. gals. 45s.

Pale rape, per cwt., 28s.

Linseed, 32s. 6d.

THE
HOUSEHOLD NARRATIVE
OF CURRENT EVENTS.

1850.]

FROM THE 29TH OCTOBER TO THE 28TH NOVEMBER.

[PRICE 2d.]

THE THREE KINGDOMS.

IT is remarked by Mr. Macaulay that the trial of the seven bishops was the first and last occasion on which two feelings of tremendous potency, which have generally been opposed to each other, and either of which, when strongly excited, has sufficed to convulse the state, were united in perfect harmony. Those feelings were love of the church and love of freedom. The fact is pregnant with significance, that the two should have been combined so rarely; and that as surely as church manifestations have in general led to results unfavourable to civil liberty, so has the outbreak for liberty as commonly brought about limitations of the power of the prelacy and priesthood. Whether love of the church or love of freedom be predominant at present, or whether the second instance of their combination be arrived in our English history, results will have to determine. One thing only is certain at present. Of the strength and intensity of the agitation which shakes the kingdom from end to end, there can be no doubt whatever. It occupies every class and sect to the absolute exclusion of every other interest or subject. The excitement is now in its third stage. The first was that of the Papal Bull; the second, that of the Pastoral Letter; the third, the attempted defiance to both in the Appeal to the English People. The Appeal seemed at first a sort of bathos after the Bull and the Letter; but the affected humility of the one, and the declared arrogance of the others, meant precisely the same thing, and the last has but served therefore, after brief consideration, as fuel to the other two.

The Papal Bull of the 29th September declared not simply that a Romish hierarchy was re-established in England, but that all constitutions, privileges, and customs of the church in England were abolished, whatever their antiquity, and the new bishops invested with full episcopal power. There was no disguise about this document. It created twelve new bishoprics, dividing the island into corresponding dioceses. It assigned an archbishop to Westminster, a bishop of Southwark to the two divisions of the metropolis and the adjoining counties, and a bishop of Beverley to Yorkshire. It divided Lancashire between the sees of Liverpool and Salford; and Wales, between Salop and Merthyr-Tydvil cum Newport. It erected bishoprics of Clifton and Plymouth in the west of England, each comprising three counties; in the midland district, it raised two episcopal sees of Nottingham and Birmingham; and these it flanked by that of Northampton in the east. Nor had the general amazement at the act yet subsided into a clear comprehension of all the insolence comprised in it, when forth came a Pastoral Letter from "Nicholas, by the Divine mercy, of the holy Roman Church by the title of St. Pudentiana, Cardinal Priest, Archbishop of Westminster, and Administrator apostolic of the diocese of Southwark," addressed "to our dearly beloved in Christ, the clergy, secular and regular, and the faithful of all the said archdiocese and diocese." In this letter the faithful were ordered to offer up a thanksgiving that "the great work is complete, and your beloved country has received a place among the fair churches which form the splendid aggregate of Catholic communion, and has been restored to its orbit in the ecclesiastical firmament from which its light had long vanished, and begun anew its course of regularly adjusted action round the centre of unity, the source of jurisdiction, of light, and of vigour." The saints of England, "whether Roman or British, Saxon or Norman," were invoked to "look down from their seats of bliss with beaming-glance upon this new evidence of the faith and the church which led them to glory;" and were invited to behold, from their habitations of joy, "the lamp of the temple again enkindled and rebrighting, and the silver links of that chain which has connected their country with the See of Peter in its vicarial government changed into burnished gold, not stronger nor more closely knit, but more beautifully wrought and more brightly arrayed!" Then there was added to this infinite rubbish about the raiments of chains, a quite equal amount concerning his own dignity, and his cardinal's hat, and his red stockings, and his archiepiscopal pallium, and his title derived from "the church of St. Pudentiana, in which St. Peter is groundedly believed to have enjoyed the hospitality of the noble and partly British family of the Senator Pudens" (about which there has of course been a letter to the *Times* suggesting St. Impudentiana as the more accurate title). But finally, in the midst of all this ridiculous arrogance, it was not forgotten expressly to announce that "until such time as the Holy See shall think fit otherwise to provide, we GOVERN, and shall continue to govern, the counties of Middlesex, Hertford, and Essex as ordinary thereof"—without the least reservation of the pretended authority to the Roman Catholic inhabitants of those counties, or any recognition of the positive authority of the ordinary of the diocese. The deaconry of such a reservation never seems to have occurred to his Eminence, till a cry of indignation and disgust, from one end of England to the other, somewhat rudely aroused him from his exulting dreams as Cardinal Archbishop to his less gorgeous position as Nicholas Wiseman. Then came forth his Appeal, no longer treating us as if, since the days of the Reformation, we had been savage or barbarian, but to all appearance recognising us for rational folk, appealing to us in the name of religious liberty, demanding full completion of the Emancipation Act, and remonstrating with us for denying to a section of our fellow christians what he had thought it our pride and boast freely to extend to all. At least this Appeal is an argument purporting to be addressed to the reason, and inviting fair examination.

Stripping it, then, of its uneasily assumed humility, and paying no heed to the bitter sneers and bursting

hate which that assumption so scantily veils, the argument contained in it is briefly this, that its author, the Cardinal Archbishop, comes after all merely as a dissenting minister, the head of a voluntary association, to take the management of the spiritual affairs of the Catholics, and to assume nothing that a Wesleyan or Baptist might not claim. But do the Wesleyan and Baptist reject every other christian? Do they treat as non-existent whatever exists not within their pale? Do they refuse to see anything in the land but their own chapels, or to acknowledge a fellow citizen that is not subject to their Conference? Do they think it seemly or right to insult a great nation in the very name of its greatest act of religious freedom, to trample on its generous tolerance, to ignore its noble struggles, and for its good return evil, for its charity contumely? There is no Protestant in England desiring with all his heart to live in peace with his Catholic fellow subject, and to know him only as a fellow countryman, who does not from the very strength of that feeling spurn and resist an aggression of which the manifest claim is to apply the rights of freedom to the uses of tyranny, and convert an act of justice into a means of domination. Let us not be ashamed of arguments in behalf of justice to the Romanists simply because we see them Jesuitically quoted to palliate Romanist encroachment. It was quite within the power of the Pope to have provided for the spiritual government of the English branch of his church without offence or insult. He was not called on to assume that the entire country had just been rescued from heathenism and restored to the supremacy of the Papal hierarchy. He needed not to have swept away the whole Protestant population to make room for the hierarchy of something less than a million of his fellow-believers. He needed not to have revelled in the anticipated fall of our national faith by way of exalting and aggrandising his own. One of the most intelligent and liberal Roman Catholics in England, Lord Beaumont, has put the case unanswerably. "To send a bishop to Beverley for the spiritual direction of the Roman Catholic clergy in Yorkshire," he remarks, "and to create a see of Beverley, are two very different things: the one is allowed by the tolerant laws of the country; the other requires territorial dominion and sovereign power within the country. If you deny that this country is a fief of Rome, and that the Pontiff has any dominion over it, you deny his power to create a territorial see, and you condemn the late bull as 'sound and fury signifying nothing.' If, on the contrary, you admit his power to raise Westminster into an archbishopric and Beverley into a bishopric, you make over to the Pope a power which, according to the constitution, rests solely with the Queen and her Parliament, and thereby infringe the prerogative of the one and interfere with the authority of the other." Nothing could more tersely express the dilemma in which the Papal aggression has placed the honest English Catholic. It is manifest to him, as to every other rational person, that for all due purposes of internal government in regard to the Roman Catholic ministry, the vicar-apostolic, or the bishop with a title from his flock, was enough; but for purposes of spiritual government and domination, the territorial and purple prelate, with his retinue of synods, dioceses, and indefinite powers, was needed; the entire Canon Law must be indicted upon us, even at the cost of the Queen's prerogative: and not alone the Roman Catholic community, subject to spiritual penalties and pains for temporal fidelity, but we, the unenthralled and free community of Protestants, are expected to submit to the infliction. The English people say they will not submit, and who can blame them! Who can therefore charge them with bigotry or injustice? It is no violence to the principles of toleration that a creed, to which not only liberty of conscience is yielded, but also all reasonable means of promoting and propagating itself, should be denied such privileges of external action as are utterly inconsistent with the rights of other beliefs. The very territorial titles assumed, the claim of a disposal of the soil, the assumption to govern England by provinces and dioceses with local titles and unlimited jurisdiction, constitute a temporal pretension to which the rules of temporal government apply. Nothing of all this was required to meet merely the spiritual wants of the Roman Catholic population. Nothing of it was implied in the compact with our Roman Catholic fellow-citizens at the period of the Emancipation Act. Rome, says the authorised organ of Roman Catholic opinion, "has more than spoken. She has spoken and acted. She has again divided our land into dioceses, and has placed over each a pastor, to whom all baptised persons, without exception, within that district, are openly commanded to submit themselves in all ecclesiastical matters, under pain of damnation; and the Anglican sees, those ghosts of realities long since passed away, are utterly ignored." Was this the meaning of the compact of 1829? Is it within the limits of any kind of allowable toleration, that a paramount spiritual authority derived solely from a foreign prince should be permitted, ever in name, to lord itself over the crown and constitution of England? Why, it is a claim at this day rejected in every Roman Catholic country with the smallest title to independence; and ought it to be suffered in a country emphatically Protestant? There is a Gallican Church in France; there is a Catholic Church in Prussia, where education is free, and where prelates cannot be chosen without the sanction of the sovereign; but, according to Cardinal Wiseman, there can be no such thing in England. The assertion is a disingenuous artifice; nor is there anything more worthy of remark in the Appeal than the manner in which important points of this nature are slurred, and others elaborately dwelt upon which no one is disposed to call in question.

It is not the denial of the Queen's spiritual supremacy, nor is it even the creation of a hierarchy (supposing a case of necessity made out for it), which we would refuse to the Roman Catholic. The Emancipation Act may have led to both, as it certainly did to one. But in conceding to the Catholics what we believe to be theirs, it did not surrender to them what we know to be our own. It warranted nothing offensive or aggressive. It may have been simply an act of justice on the part of the State to extend frank recognition to the Roman Catholic people; but after such an act the State should not have been ignored by the class it had just raised and strengthened. Let the relative numbers of Catholic and Protestant in England be compared; and the propriety of demanding for the minority an organisation co-extensive with the wants of all, will be brought to a simple test. The insolence of the act did not even stop short, however, at that monstrous inaptitude of means and ends. The vast majority of the nation has been treated as absolutely non-existing, and authority over all baptised souls conferred without misgiving, as if the Roman Catholic church were again predominant, and the privileges of Christianity denied to souls not baptised within its pale. The question which arises upon this is a somewhat serious one. The most ardent friends of freedom have to ask whether any sort of concession, directly leading to such encroachment, should have place in a scheme of religious liberty. A State which has to care for the rights of many denominations, can have no title to make concessions incompatible with the rights of any; or a perfect Roman Catholic freedom might include a perfect Protestant subjection. If simply the claims of conscience were in question, the

course would not be difficult to take; but it is not so; and the pretence that would make it so is notoriously false. Cardinal Wiseman's Appeal proceeds wholly on the separability of the spiritual from the temporal authority of Rome; and every one who has read history knows that they are inseparable. The one has always proceeded in direct sequence from the other, just as the temporal persecutions of the Roman church have been but the natural expression of her spiritual infallibility. An absolute right to persecute only ceases when a church no longer claims an absolute right to know. This is what the Cardinal means by his sneer at the absence of "clear, definite, and accordsant teaching" from the English establishment; and this is what now suggests to all men the necessity of defining the amount of religious concession which shall not be allowed to frustrate the ends of temporal legislation. It would have been thought intolerable in England, even six centuries ago, that the country should have been mapped out into ecclesiastical districts, and subjected to ecclesiastical governors, by the sole voice of a foreign potentate; and most certainly the Emancipation Act of the nineteenth century did not contemplate any such thing. So far, the existence of Roman Catholicism is quite distinct from the uses and powers which the toleration of its existence is now sought to subserve. Nor can we admit that the clause by which the authors of the Emancipation Act expressly prohibited Romanist prelates from assuming the titles of sees of the Established Church, is by any means an argument for the assumption of titles from places contained within those sees, and the pretence to authority over them. Even if the law shall declare that the letter of the Emancipation Act has in that respect been kept, most assuredly its spirit has been violated.

But wonderful is the coolness with which the Cardinal throughout his Appeal treats the records of times past, as well as of our own. We have but to listen to him, and believe that wherever a religious house existed in old Roman Catholic days, a paradise of comfort and happiness spread itself around, taking and giving blessings. A pretty picture; and a pity that any rude hand should deface it! But did it never occur to his Eminence that some one might have time and patience to call History itself into court? Here it is, within reach, and in tones undistorted by prejudice or faction. We have but to open, no particular or party record, but the statute book of the reign preceding that of the Reformation—while Luther was still but a poor Franciscan school-boy at Magdeburg, singing songs in the street for bread—to find what a crying evil and grossness the lives of the Romish clergy had become. In one enactment, passed by our English parliament, it is expressly declared to be lawful for bishops and other ordinaries to punish priests, clerks, and religious men for incontinence; for which offence, so flagrant and uncessant its occurrence, they might commit them to prison at discretion, and should be liable to no action for so doing. Nay, in the reign preceding, some ten years before the accession of Henry VII., we have the direct authority of a great dignitary of the Roman Church for the profligacy prevailing among its members. Archbishop Bourchier, in a commission empowering his commissary general to take measures for the establishment of an improved discipline, refers to numbers of the clergy both secular and regular as persons wholly destitute both of literature and capacity, profligate as they were ignorant, neglecting their cures, spending their time in strolling about the country in the company of loose women, and their incomes in feasting, drinking, and other excesses. It is to be observed, too, that in the popular outcry against the church which these excesses roused, the storm fell as heavily on the regular clergy or monks, as on their secular brethren, the parish priests. The increase of wealth had done its evil work in all directions; and an affection of conceit, which for a time preserved the shows of decency, had long been put aside. Pope Innocent VIII. issued a bull soon after Henry VII.'s accession, wherein, after stating the intelligence he had received of the reprobate lives led by all the monastic orders in England, he ordered Archbishop Morton to admonish the heads of convents of the necessity of reform, and to threaten compulsory proceedings if the admonition appeared to be neglected. Morton sent letters in consequence, and that which he addressed to the Abbot of St. Alban's has been preserved. It describes the monks of his abbey as notoriously guilty, not only of libertinism in all its forms, but of almost every other kind of enormity. The abbot individually is reproached with having filled two neighbouring nunneries, over which he pretended to have a jurisdiction, with women of infamous character, after having turned out their proper inmates; and he and his monks, besides openly keeping concubines, are accused of being in the habit of frequenting these convenient establishments in the most shameless manner. Specific instances are mentioned not fit to be recorded here, but within easy reach of all who wish to consult them. Was it such a Moslem "paradise" as this to which his Eminence referred? Or, was he momentarily confusing past and present, and thinking of the little paradise of comfort, knowledge, and happiness, left behind him as he quitted "the Flaminian gate." Under the very shadow of the Papal Palace at this moment there is a papist population, of which the proportion of priests is little less than one in eighteen, more ignorant, depraved, and criminal than anywhere else on the face of the civilised world. Nor does any man know better than Doctor Wiseman that the tendency of his religion, as at present professed, is to continue large masses of its population in that state; for, all genuine power having departed from it when its power of inspiring genuine belief passed away, the strength of his church now mainly depends upon this, and this alone.

The English people know it, and it is too late now to persuade them otherwise. They know that wherever knowledge, freedom, and the arts of life have made advance during the last three centuries, the advance has been in the teeth of the Roman Catholic Church, and in the inverse ratio to her power. Where she has been, they know that the richest lands on earth have become sterile; where she has not been, they know that the blessings of abundance have replaced sterility. They have but to look at Spain; or think of Holland; or, sending a glance across the waters of the wide Atlantic, to compare the career of the respective populations in the New World who have continued or escaped that thralldom. The plain and simple truth therefore is that the English people won't have it. They spurn it for every reason that has most weight with man. Spiritually it jars with all that is most dear to them—their principles with their love of religious truth, its practice with their love of religious liberty; driving them to shows of persecution that they may vindicate their hatred of its reality, and forcing them into the ranks of intolerants to fight the fight of toleration. Nor is it less opposed materially, than spiritually, to all that has made them what they now are. What Father Newman said the other day in Birmingham is true, though in a sense different from that in which he said it. English people had had enough of blessings and absolutions, and quite enough of the intercession of saints, when, "preferring the heathen virtues of their original nature," they fell back with closed affections

and haughty reserve upon their worldly integrity, honour, energy, prudence, and perseverance; and forthwith began to rise to a station higher than the heathen Roman, and in three centuries have attained a wider range of sovereignty, "from which they look down in contempt on what they were, and on the religion which reclaimed them from paganism." And why should they not? Is it in the nature of the divine law that man should go backward, or forward? It may be very melancholy to contemplate the full of any faith, whether paganism or popery; but history records no such catastrophe from which new development has not begun. The law of the earth is to advance; and what seem to be retrograde movements are but so many furtherances of it. The straight line in civilisation may be no where discoverable; but progress, its object and law, never comes to a stand. The fire is dark when new fuel has been flung upon it, but the light is not extinguished. New strength and brilliancy are to follow.

Nor is it simply Doctor Nicholas Wiseman and his friends whom it behoves to take this truth to heart. Does any one doubt that our own divisions have been the chief inducement to the papal aggression? Does any one, who looks the truth boldly in the face, hesitate to feel or say that something more must result from the existing agitation, than the mere defeat of Roman Catholic pretensions? It is little to repel the enemy from the gate if the traitor remains in the citadel. Nor will it suffice to remove individual offenders. The ground of offence, the pretence for treason, must also be rooted out, at once and for ever.

The English Church was the result of a compromise with Romanism, which still lingers too much in her constitution, her doctrines, and her services. Let her be compared with the protestant churches of France, Germany, and Geneva, and this will be seen. Let comparison be made of her doctrinal confessions and discourses with her thanksgivings and prayers. Let the agitation which denounced Doctor Hampden be examined side by side with the determination which supported Mr. Gorham. Acts of uniformity have been passed in vain. Between churches of the same profession, within a hundred yards of each other, are seen daily such differences of doctrine and ceremonial as would only be intelligible in churches the most widely apart even to the denial of a common Redeemer. Yet against the long and quiet usage of the one, the other can oppose its rubric; and in the very face of the simple grandeur of the Liturgy may be flaunted the mystical pretensions of the Articles. It is time that an end should be put to this, and that "new presbyter" should be no longer mistakable for "old priest writ large." Let us tolerate no longer in the English Church even as matter of obsolete language, that blasphemous assumption of a power of absolution which the form of Ordination allows, and which the simplicity of the Morning Service condemns. Let us expunge those curses and mysteries of the Athanasian Creed for which the Litany offers no sanction. Let us have no more unseemly disputes over that power of regeneration in baptism which no other permitted miracle in our English Church warrants us in extending to an English minister. Mr. Bennet told his audience at St. Barnabas three days ago that he could give rubrical authority for lighting candles on the altar table and other fooleries committed in his church. This may be little excuse for a man who knows the history of that rubric, and is under obligation as a Protestant minister to act in the spirit of the intelligent faith he professes; but it is excellent reason for the instant abolition of all further pretext or warrant for such absurdities. They cannot have any meaning within the walls of a Protestant church. There, they are simply what Lord John Russell calls them in his admirable letter, mummeries. What they may be where the Catholic worship is still believed in, and they form but part of the outward signs of mysteries which still have awful sanction in the hearts of worshippers, is not to the present purpose in the least. No Protestant has the right to affix Catholic signification to them.

What is the position of our leading English bishops, then, in this very matter? It was the Bishop of London who officiated at the consecration of St. Barnabas, who previously approved of its Popish foppery of decoration, and who, amid the candles and surplices and gorgeous accompaniments of the altar, did not scruple to declare "his admiration of the splendour of God's house which shone around him, and his appreciation of the imposing services in which he was engaged." Mr. Bennet is now using this fact as he has a perfect right to do. Those very ceremonies and decorations, so stamped with Episcopal approval, have since attracted crowds of Sunday rioters to interrupt the worship which they hold to be debased by their continuance, and the interior of an English church has again been the scene of gross and revolting disturbance. Mr. Bennet's last sermon, protected by closed doors and many policemen, was in the form of an appeal against the scandal and desecration of such scenes; but incidentally it exposed the much greater scandal. "The Bishop of London," said Mr. Bennet, "came to this church on St. Barnabas day, the 11th of June last. He entered this house of God, and examined with a critical eye every portion of it. Everything was pointed out to him by me; nothing was omitted. He came on a grand festival of the Church: he consecrated this house of God; he gave us his blessing, and went away leaving us his benediction and God speed you. Now, what difference can there be between June the 11th and November the 24th?"

Ah! what difference indeed! How striking is this simple comparison of dates. God speed you! on the 11th of June. The devil fly away with you! on the 24th of November. But a great deal had happened in the interval. In that interval the hope of establishing a Popery in England had been frustrated by the over-eagerness of a Pope in Rome; and the spiritual tyranny which Charles James had been labouring for, Pio Nono came too suddenly to claim. Let not this be forgotten in the midst of the present excitement, or its result will be to abridge our liberties instead of extending and securing them. The Bishop of London, in his charge of the 2nd of November, took the lead in denouncing "anything which may seem to indicate a wish to make the slightest approach" to what he had previously encouraged and assisted without scruple; and he has been followed by men, formerly more active even than himself in sanctioning covert Popery under the guise of Puseyism, who are now the loudest in swelling the general clamour, in denouncing the rival Pope, and in crying out for stringent measures against him. This is what, most of all, we have to guard against now. "We think we are carrying the Tractarians with us," says the excellent Dean of Bristol; "but in fact they are tricking us into support of them."

Following the inestimable counsel of that true and honest divine, we repeat that all of us will have reason to deplore the unexampled excitement now going on around us, if we do not pluck the flower from beneath the nettle. What we want is not simply to drive away the Pope of Rome, but to extirpate the popes of England. "If it could be proved to be really true," said the Dean of Bristol, at a meeting in that city, "that the Church of England does speak with so uncertain a voice as to admit within her pale the superstitious spirit of Rome, and its rites and observances, the people of England owe a great duty to the Almighty God

of truth, and that is, not to rest until a Church speaking so uncertainly be again reformed, and brought nearer to the principles of the Reformation: that is, to the principles of the pure, sincere word of God. There is a great contest going on in the world; we have not only to contend against Roman Papacy, but we have to contend against Anglo-Papacy." With the comment of these admirable sentences let the reader compare the Bishop of London's charge; and still more the recent public addresses of such men as Dr. Philpotts, Dr. Bagot, and Dr. Wilberforce; and say whether the indignation so expressed against Popery be not simply the irritation of a would-be rival popedom. They advance the most insolent pretensions, in the very act of repelling the insolence of others; and would resist an organisation against human liberty, by an authority as powerful, compact, exclusive, and domineering. They deny the spiritual supremacy of the Queen, they affirm the sacredness of the Episcopal office, they claim unbroken descent from Apostolic times, and they challenge for the "Anglican" priesthood the precise authority and power which it possessed in the three first centuries of Christianity. In short they ignore the Reformation altogether, except so far as it secures them their benefices; and set up in its place those preternatural pretensions, and that mystical character, which, during the whole of the present agitation, has been more heartily denounced than even Popery itself by the manly intelligence and spirit of Englishmen. These are the men that now require watching yet more than the Cardinal and his master. These are the men to be now, if ever, dispossessed of the power of future mischief. Our danger from them is not the less because their outcry is just now loudest against the common danger. The more they bully the Pope at present, the better their chance of escape from what is so richly their own due. Perhaps no man ever said more insulting things of Popery and its advocates than the Bishop of Oxford, the other day, to his clergy; and this at the very instant when he was claiming for his own Church precisely that for which all freemen hate the Church of Rome. He called Popery by every evil name; charged it with all abominable and hypocritical practices; and, himself the brother of a Romish convert, with marvellous taste selected a particular Romish convert for the special vials of his wrath and scorn. Father Spencer, it seems, has lately been recommending a general conversion of the families of England, by means of the scullery-maids; and this proposition, which one would have thought harmless enough, Dr. Wilberforce protested had made his heart's blood run cold. "To think," he exclaims, "that such words should be used by one bearing one of the noblest names in English history, and born in all those particulars of freedom which have so long given to the English mind that frankness of character, honesty, and openness of purpose, and the firm determination to hate and oppose all that is subtle and unclean, because untrue, for which it is distinguished!" Wondrous that the ignorant speaker did not think of the *multa nominat*, &c.! It is for others to do so. It is for Englishmen generally to examine into the nature and power of the influence which has converted no less than three members of a family "bearing one of the noblest names of English history" into allies and furtherers of Romish superstition, open or concealed. The first and greatest of the family knew it well, and his life was, for the most part, devoted to open antagonism with it. No man more resolutely opposed High Church pretensions than William Wilberforce. No man more hated priestcraft, or preached with a more ardent zeal the necessity of breaking down the organisation by which alone its evil potency is continued in England.

The conclusion of the great task, in whose commencement he was one of the leading workers, is the duty that now waits the people of England. They are called to a new Reformation, and ought not to shrink from that glorious labour. They win thus prove that love of the Church and love of freedom may be one indeed; and that English history, which has but one such example to show in the past, may for the future be filled with its triumphant manifestations.

NARRATIVE OF POLITICS.

THE following Letter from Lord John Russell to the Bishop of Durham has been published. It is dated the 4th inst.

MY DEAR LORD,—I agree with you in considering "the late aggression of the Pope upon our Protestantism" as "insidious and insidious," and I, therefore, feel as indignant as you can do upon the subject.

I not only promoted, to the utmost of my power, the claims of the Roman Catholics to all civil rights, but I thought it right, and even desirable, that the ecclesiastical system of the Roman Catholics should be the means of giving instruction to the numerous Irish immigrants in London and elsewhere, who without such help would have been left in blather ignorance.

This might have been done, however, without any such innovation as that which we have now seen.

It is impossible to confound the recent measures of the Pope with the division of Scotland into dioceses by the Episcopal Church, or the arrangement of districts in England by the Wesleyan Conference.

There is an assumption of power in all the documents which have come from Rome—a pretension to supremacy over the realm of England, and a claim to sole and undivided sway, which is inconsistent with the Queen's supremacy, with the rights of our Bishops and Clergy, and with the spiritual independence of the nation, as asserted even in the Roman Catholic times.

I confess, however, that my alarm is not equal to my indignation.

Even if it shall appear that the ministers and servants of the Pope in this country have not transgressed the law, I feel persuaded that we are strong enough to repel any outward attacks. The liberty of Protestantism has been enjoyed too long in England to allow of any successful attempt to impose a foreign yoke upon our minds and consciences. No foreign Prince or Potentate will be permitted to fasten his fetters upon a nation which has so long and so nobly vindicated its right to freedom of opinion, civil, political, and religious.

Upon this subject, then, I will only say that the present state

of the law shall be carefully examined, and the propriety of adopting any proceedings with reference to the recent assumption of power deliberately considered.

There is a danger, however, which alarms me much more than any aggression of a foreign Sovereign.

Clergymen of our own Church, who have subscribed the Thirty-nine Articles, and acknowledged in explicit terms the Queen's supremacy, have been the most forward in lending their backs, "step by step, to the very verge of the precipice." The honour paid to saints, the claim of infallibility for the Church, the superstitious use of the sign of the Cross, the muttering of the Liturgy so as to disguise the language in which it is written, the recommendation of auricular confession, and the administration of penance and absolution—all these things are pointed out by Clergymen of the Church of England as worthy of adoption, and are now openly reprehended by the Bishop of London in his Charge to the Clergy of his diocese.

What, then, is the danger to be apprehended from a foreign Prince of no great power, compared to the danger within the gates from the unworthy sons of the Church of England herself?

I have little hope that the prebendaries and framers of these innovations will desist from their insidious course. But I rely with confidence on the people of England, and I will not bate a jot of heart or hope so long as the glorious principles and the immortal martyrs of the Reformation shall be held in reverence by the great mass of a nation which looks with contempt on the hummeries of superstition, and with scorn at the laborious endeavours which are now making to confine the intellect and enslave the soul.

I remain with great respect &c.

Many addresses to the bishops from the clergy of their respective dioceses have received replies from the reverend prelates:—

The Archbishop of Canterbury briefly thanks the parties who had addressed him, for "protesting against the unexampled encroachment upon our constitution in Church and State attempted by the Pope of Rome;" the spirit roused is gratifying to him, and he hopes that the assault will only confirm more strongly the

principles of the Reformation. The Bishop of Lincoln urges temperate and unexaggerated exposure of the erroneousness of the Romish tenets; and prays God to remove internal dissension, and whatever may hinder godly union and concord.—The Bishop of Chester resents the treatment of our Established Church as a novelty, and the taking possession of the country as a spiritual waste; he confidently relies that the Government and Legislature will take effectual care of the Royal supremacy and national independence.—The Bishops of Bristol and of Bath and Wells concur in deeming the act schismatical; and the Bishop of Ripon reminds the Pope of the declaration by his predecessor Gregory the First, that “whosoever doth call himself universal bishop doth forerunn Antichrist.”—The Bishop of Exeter, speaking of Lord John Russell’s letter, “which throws the whole blame of encouraging the Pope on a few silly or unfaithful ministers of our own church,” declares that he “stands aghast at the prodigious hardness of the noble lord’s reliance on such entire forgetfulness of recent facts, or such utter disregard of truth and justice, as he is thus pleased to attribute to the people of England.” With reference to “the Roman Catholic schism in this country,” he counsels his clergy “to avoid giving any reasonable ground of offence to the feelings or even the prejudices of your people. As far as outward observances are concerned, I repeat what I said to you five or six years ago, ‘The peculiar dangers of the times, as well as the prevailing tone of public opinion, call upon you most powerfully, as you would avoid being in the number of those by whom offences come, to forbear all unnecessary innovation, especially that worst kind of innovation the revival of obsolete usages not required by law, which are associated in the minds of the people with the superstitions and corruptions of Rome.’” And he meekly thanks them for their affectionate attachment to their bishop, through twenty years of more than ordinary difficulties and perplexities.

The Dean of Bristol, in a speech delivered at a meeting of clergy in that city on the 6th, entered fully into the different points of the question. He warned his hearers against being hurried into exaggeration, and into complaints and fears which would eventually only excite ridicule. “Let us feel,” he said, “very contentedly aware that the Pope can neither confirm nor invalidate our orders, nor any other orders than those of his own communion; and let us feel perfectly persuaded that our two most reverend prelates have not less sure and comfortable possession of the rights and revenues of their provinces at this moment than they have had hitherto. And let us not for a moment believe that the Pope can secure to himself, or to any delegates of his, so much as one atom of jurisdiction in England, no, not even over the most abject slave to his superstition. Nor let us trouble ourselves to show, as some take great pains to do, that the Pope has no claim to dominion in this realm, because of some independence of the Church of England prior to the Pope’s usurpation of supremacy here, through Augustine, or through the Norman princes. Let us be very well content to know that, if this priest of Italy had had dominion over us up to this very hour, it would have been quite enough cause and excuse to us that he should cease to have it simply in our choosing no longer to submit to it. Let those grovel who will in this unworthy inquiry. Let us rather learn to know what is Christian liberty, and to thank God that we have it. Nor let us rail against ‘the schism’ of the Pope’s measure, and talk of its being a ‘fundamental principle of the universal church that there can be but one bishop in a diocese.’ So doing, we condemn our own church, who at the Reformation sent bishops to Ireland, in my opinion then Catholic, and since to Canada, and to our colonies, to Malta, and to Jerusalem; we condemn the Bishop of London, who does not scruple to confirm when he is in France, and to license a clergyman in a Roman diocese at Madeira; we condemn the episcopal church of Scotland, who sent a bishop to reside at Paris; we condemn ourselves, who, I presume, without scruple, would use the ministrations of a Protestant bishop if we happened to sojourn in a Catholic diocese.” He considered, however, that the manner of the Pope’s measures should

meet with proper reprobation; and he suggested that an address should be prepared to the Queen, conveying —“First, our regret that any foreign potentate should appear to lay claim to supremacy which is vested in the Crown, and to a jurisdiction in direct contravention to our law; next, our very humble but urgent request that her Majesty should withdraw those marks of favour and of confidence which she has been pleased so graciously to confer on the prelates of a church, both in Ireland and the colonies, who gave her no other return than ingratitude and indignity; and lastly, a renewed declaration of our perfectly unreserved attribution to the Crown of ‘the supremacy in all causes, &c.’ adding that we feel ourselves impelled to that declaration because of the denial of that supremacy by some who, having made the declaration at their ordination, think fit now to modify it, and yet to retain their degrees and benefices. I would further suggest that we adopt partially the advice of the Bishop of London, and petition Parliament to the effect that if the law be not already such as shall prevent any person or persons whatever from claiming jurisdiction in the British dominions, or delegating an authority independent of the Crown, or superior to the law, or conferring titles of honour, or designations which seem meant to convey independent authority, a law shall be forthwith passed which shall secure such result.” But, the Dean contended, the real danger arose from the Tractarian party in the Church itself. “The Papists, themselves,” he observed, “seem to admit that all this unwanted success, astonishing themselves, and all their new-born hopes, are attributable to the existence and to the working of Tractarianism. They allege freely, they have never concealed that Tractarianism is doing their work. It is when Tractarianism has unsettled the Protestant that the Romanists step in. They haunt Tractarian congregations; they track and note those unto whom they think they may most safely address themselves; they arrange the meeting with them, as if it were casual; they convey letters to them—I speak of what I know; their argument is, that the Church of England does not, with any certainty, teach or offer what the Tractarian minister tells them, and as they admit, rightly tells them, is necessary either to a saving faith, or to spiritual life, but that the Church of Rome does; and so they ply and gain their victims.” “But how,” the Dean asked, “was the evil to be counteracted? How best oppose Tractarianism? How best not only show its identity with Romish falsehood, and its most plain contrariety with the history, the formularies, the temper, and aim of the Church of England? How best remove it from contact with our unsuspecting people? The Bishop of London desires us, in this crisis, to preach controversial sermons; I presume his lordship means against the Romanists, and not the Tractarians. But what if we preached controversial sermons all our lives long, and every day of our lives, either against Romanism or Tractarianism, what effect would this have if our authorities countenanced, shielded, promoted, or were by law unable to rebuke the Tractarians? Tractarianism will never be effectually checked; Tractarianism will only smile, or deride our every effort, until the authorities of our church can be induced to perceive and acknowledge the utter repugnance between Tractarianism and the teaching of our church, and the teaching of the Saviour and his Apostles.” The Dean therefore concluded that the Bishops should separately be memorialised by the clergy and laity, in conjunction, of their several dioceses, urging them to remove, or at least to discontinue and restrain, Tractarian teaching and practice. He desired that such addresses should emanate from mixed meetings. “For too long (he said) and too much it has been the effort of one part of the clergy to make a distinction, and so cause division, between the clergy and the laity. We cannot too soon connect ourselves with the laity in all common counsels, and most especially connect the laity with the Bishops in kind, equal, and unreserved communication on all that concerns the interests of the church and of religion.”

Numerous public meetings on the subject of the *Papal Aggression* have been held in the metropolis and

in all parts of the kingdom. A few only can be mentioned as specimens.

The Court of Common Council held two meetings, on the 7th and the 21st. At the former, Mr. J. Wood gave notice of motion for an address to the Queen in reference to the proceedings of the Pope of Rome, and expressing the undiminished attachment of the Corporation to her Majesty's person, authority, and government. As he resumed his seat, amidst "immense cheering," Mr. Blake started up, and moved the rescinding of standing orders, so that he might propose a vote of thanks to Lord John Russell for the noble letter addressed to the Bishop of Durham. He read the letter, amidst loud cheering, tumultuously renewed, with clapping of the hands from all members of the court. Mr. Bennock, Mr. R. Taylor, and Alderman Wilson, supported the motion, and it was carried by acclamation. A resolution of thanks was then proposed and unanimously carried; and it was ordered that a copy should be presented to Lord John Russell. At the latter meeting, Mr. Wood moved the address, which was seconded by Mr. Blake. Mr. Carr, a Roman Catholic, opposed the address, as promoting deplorable excitement which would separate man from man. The address was carried with the single dissentient voice of Mr. Carr.

At a meeting of the parish of St. Mary-le-Strand, the Rev. Dr. Jelf, Principal of King's College, in moving a resolution acknowledging the Queen's supremacy, and repudiating the ecclesiastical authority of the Pope in this country, made the following statement:—"The Queen herself had been the first to resent the recent audacious usurpation of the Pope. She sent speedily for the Home Secretary, who found her in her drawing-room in a state of great excitement, and her Majesty exclaimed, 'Sir George, I am Queen of England, and I will not bear this.' (Cheers.)" Mr. Daniel, a barrister, gave the version of the same story, with a little more theatrical embellishment, at a meeting in St. Andrew's, Holborn. He said: "A very few days after the Pope's bull was published there was a report current amongst them that her Majesty, the first time she read it, sent instantly to Lord John Russell, commanding his immediate attendance. On arriving, his lordship found her Majesty reading the bull, and the first thing she said to him was this: 'My lord, am I Queen of England?' Lord John Russell replied, 'Who dares doubt it, madam?' and her Majesty's rejoinder was, 'Look to it, my lord.' Hence, they might depend upon it, had arisen Lord John Russell's movements, and the invitation which had been given to her Majesty's subjects to do what those assembled were doing that night. Her Majesty was as sound as the British oak. (Tremendous and long-continued cheers for her Majesty followed this statement.)" Archdeacon Hale appeared at another meeting, also to vouch for expressions which, of course, were never uttered by her Majesty.

Among the most remarkable provincial meetings was that held at Bristol, on the 20th. It was one of the largest and most influential ever held in that city. The Dean of Bristol enforced the sentiments which he had previously delivered at the meeting of the clergy, in a speech of great power, which made a deep impression on the assembly.

The meeting at Liverpool, on the 20th, was attended by a numerous body of Protestant inhabitants; and a number of Roman Catholics were also present, in consequence of placards in the streets, "to prevent their religion from being insulted and their rights trampled upon." They interrupted the proceedings by hooting and groaning; and, when some of their number attempted to speak, they met a similar reception from the other side. When the Rev. Hugh McNeile rose to speak, the uproar became an absolute riot. When he found he could not obtain a hearing, he drew a chair, and sitting down, leisurely began to make a speech to the reporters. The gentlemen of the press stood up, and, leaning forward with their note-books, formed themselves as well as they could into an audience for the reverend gentleman. This proceeding was at first received with shouts of laughter and great cheering by the vast meeting. But presently the malecontents jumped upon the reporters' table, and made a sortle upon the platform. The confusion at this moment was inde-

scribable. Inkstands were upset, and note-books and slips of copy were flying about in all directions. The reporters were compelled, of course, to leave their seats and take refuge upon the platform. At this moment a body of the police, armed with their staves, made their appearance, and attempted to drive the invaders back into the pit. The mayor mounted the table, and exclaimed that he would not desert his post, although his worship's voice was all but inaudible in the uproar. In a few minutes, through the exertions of the police, the disturbance was subdued, and the proceedings were resumed.—Dr. McNeile finished his speech, and the Protestant party carried all their resolutions.

The meeting of the county of York on the 22nd was attended by above 9000 persons, comprehending the principal noblemen and gentlemen of the county. A letter from Lord Beaumont to the Earl of Zetland, intended for that meeting, did not reach Lord Zetland till after the meeting had taken place, but has since been published. It expresses the entire concurrence of the writer, though a Roman Catholic, with the object of the meeting.

The following address, said to be from the pen of Mr. Wiseman, has been circulated for the purpose of obtaining signatures:—

"TO THE QUEEN'S MOST EXCELLENT MAJESTY.

"May it please your Majesty—We, the undersigned subjects of your Majesty residing in England, and professing the Roman Catholic religion, beg to approach your Majesty's throne, there to express our sentiments of unimpaired and unalterable fidelity to your Majesty's royal person, crown, and dignity.

"At a moment when attempts are being made to impeach our loyalty, we consider it a duty to give fresh utterance to these our feelings.

"During centuries of exclusion from the privileges of the constitution, and from the rights enjoyed by their fellow-subjects, the Catholics of England remained true to their allegiance to the Crown of this realm, and yielded to none in their readiness, at all times, to defend its rights and its prerogatives against every foe. And now that, under your Majesty's wise rule, we enjoy equal participation with others in the benefits of the constitution, we are more than ever animated with the same sentiments of fidelity and attachment, and are equally ready to give proof whenever occasion may present itself of the sincerity of our loyal professions.

"The dearest of the privileges to which we have thus been admitted by the wisdom of the British Legislature is that of openly professing and practising the religion of our fathers, in communion with the See of Rome. Under its teaching we have ever learnt, as a most sacred lesson, to give to Caesar the things that are of Caesar, as we give to God the things that are of God. In whatever, therefore, our Church has at any time done for establishing its regular system of government amongst its members in this island, we beg most fervently and most sincerely to assure your Majesty that the organisation granted to us is entirely ecclesiastical, and its authority purely spiritual. But it leaves untouched every tittle of your Majesty's right, authority, power, jurisdiction, and prerogative, as our Sovereign and as Sovereign over these realms, and does not in the leastwise diminish or impair our profound reverence, our loyalty, fidelity, and attachment to your Majesty's august person and throne; and we humbly assure your Majesty that among your Majesty's subjects there exists no class who more solemnly, more continually, or more fervently pray for the stability of your Majesty's throne, for the preservation of your Majesty's life, and for the prosperity of your Majesty's empire than the Catholics of England, in whose religion loyalty is a sacred duty and obedience a Christian virtue."

Cardinal Wiseman has published an *Appeal to the People of England*, in justification of the recent measures of the Pope; a document of great length and ability. Prefixed to it is an introduction, purporting to be a history of the Catholic hierarchy in England; and he proceeds to treat the question under the following heads:—1. The royal supremacy, and bishops named by the Crown. 2. What was the extent of religious toleration granted to Catholics—Have they a right to prebends or a hierarchy? 3. How could Catholics

their hierarchy? 4. Does the appointment of a Catholic hierarchy trench on the prerogative of the Crown? 5. Has the mode of establishing the hierarchy been insolent and insidious? 6. The title of Westminster. In repelling the charge, in Lord John Russell's letter, that the Pope's measure is "insolent and insidious," Dr. Wiseman quotes a letter which he had written to Lord John from Vienna, on the 3rd instant, in which he said—"I cannot but most deeply regret the erroneous and even distorted view which the English papers have presented of what the Holy See has done in regard to the spiritual government of the Catholics of England; but I take the liberty of stating, that the measure now promulgated was not only prepared but printed three years ago, and a copy of it was shown to Lord Minto by the Pope, on occasion of an audience given to his lordship by his Holiness." And he proceeds to say that he could have anticipated no objection to the establishment of the hierarchy in England, after what had been sanctioned and done in Ireland, and in many of our colonies and dependencies. He thus defends his assumption of the title of Archbishop of Westminster:—"The selection of this title for the Metropolitan See of the new hierarchy has, I understand, given great offence. I am sorry for it. It was little less than necessity which led to its adoption. I must observe that, according to the discipline of the Catholic Church, a bishop's title *must* be from a town or city. In re-establishing a Catholic hierarchy in England, it was natural and decorous that its metropolitan should have his see at the capital. The very term metropolitan signifies the bishop of the metropolis. This being the principal or basis of every hierarchy, how was it to be acted on here? London was a title inhibited by law; Southwark was to form a separate see. To have taken the title of a subordinate portion of what forms the great conglomerate of London, as Finsbury or Islington, would have been to cast ridicule, and open the doors for jeers, upon the new episcopate. Besides, none of these are towns or cities. Westminster naturally suggested itself, as a city unoccupied by any Anglican see, and giving an honourable and well-known metropolitan title. It was consequently selected, and I can sincerely say that I had no part whatever in the selection. But I rejoice that it was chosen. The Chapter of Westminster has been the first to protest against the new archiepiscopal title, as though some practical attempt at jurisdiction within the *Abbey* was intended. Then let me give assurance on that point, and let us come to a fair decision and a good understanding. The diocese, indeed, of Westminster embraces a large district, but Westminster proper consists of two very different parts. One comprises the stately Abbey, with its adjacent palaces and its royal parks. To this portion the duties and occupation of the Dean and Chapter are mainly confined; and they shall range there undisturbed. To the venerable old church I may repair, as I have been wont to do. But perhaps the Dean and Chapter are not aware that, were I disposed to claim more than the right to tread the Catholic pavement of that noble building, and breathe its air of ancient consecration, another might step in with a prior claim. For successive generations there has existed ever, in the Benedictine order, an Abbot of Westminster, the representative, in religious dignity, of those who greeted, and beautified, and governed that Church and cloister. Have they ever been disturbed by this 'titular?' Then let them fear no greater aggression now. Like him, I may visit, as I have said, the old abbey, and say my prayer by the shrine of good Saint Edward; and meditate on the olden times, when the church filled without a coronation, and multitudes hourly worshipped without a service. Yet this splendid monument, its treasures of art, and its fitting endowments, form not the part of Westminster which will concern me. For there is another part which stands in frightful contrast, though in immediate contact, with this magnificence. Close under the Abbey of Westminster there lie concealed labyrinthine lanes and courts, and alleys, and slums, nests of ignorance, vice, depravity, and crime, as well as of wretchedness, and disease; whose atmosphere, whose ventilation is cholera; in which swarms and almost countless population, in great measure, at least, Catholic; haunts of filth which

no sewage committee can reach—dark corners which no lighting board can brighten. This is the part of Westminster which alone I covet, and which I shall be glad to claim and to visit as a blessed pasture in which sheep of holy church are to be tended, in which a bishop's godly work has to be done, of consoling, converting, and preserving. And if, as I humbly trust in God, it shall be seen that this special culture, arising from the establishment of our hierarchy, bear fruits of order, peacefulness, decency, religion, and virtue, it may be that the Holy See shall not be thought to have acted unwisely when it bound up the very soul and salvation of a chief pastor with those of a city where the name indeed is glorious but the purities infamous; in which the very grandeur of its public edifices is as a shadow to screen from the public eye sin and misery the most appalling." He denounces the conduct of the Anglican clergy on this occasion; thanks the "brave and noble-hearted people of England, who would not be stirred up by those whose duty it is to teach you gentleness, meekness, and forbearance, to support what they call a religious cause by irreligious means; and would not hunt down, when bidden, your unoffending fellow-citizens, to the hollow cry of 'No Popery,' and on the pretence of a fabled aggression;" and concludes by advising his fellow-religionists:—"Let your loyalty be unimpeachable, and your faithfulness to social duties above reproach. Shut then the mouths of adversaries, and gain the higher good-will of your fellow-countrymen, who will defend in you, as for themselves, your constitutional rights, including full religious liberty."

The Roman Catholics have also had meetings. At one of them, held at Birmingham on the 18th, a temperate address to the inhabitants was moved by Dr. J. H. Newman, the Oratorian, and unanimously adopted. Dr. Waring has also published a mild and noble address to his townsmen of Northampton, in which he concludes thus:—"For the ten years and upward that I have resided at Northampton, I have found nothing but civility and good feeling among you; and it will be something surprising to me if this feeling is disturbed by an accidental change which concerns no one but myself and my flock. I leave you to enjoy your own opinions, and follow out your own views in religious and spiritual matters. Surely I may claim this same liberty from you. In exercising this liberty, I violate no law, I am guilty of no disloyalty to our gracious Queen. Neither the law of the land, nor her Majesty Queen Victoria, requires me to swear any belief in the spiritual supremacy of the Crown. In all temporal matters I cheerfully obey the laws of the land I live in, and am loyally and devotedly attached to my lawful Sovereign, Queen Victoria; whom may God preserve to reign over us."

The proclamation of a Romish hierarchy in England had an effect in reviving the celebration of the gunpowder plot on the 5th inst., not only in the metropolis, but in the provincial towns. It was no longer a mere amusement for the street rabble; but many displays evidently emanated from a class having larger means at their disposal. Besides the usual parading of ridiculous effigies by bands of boys, regular processions were formed, in which men carried larger figures, or conveyed them in vehicles drawn by horses. Pope and Popery came in for plentiful denunciation and ridicule, and much money was got by those who exhibited for the purpose of getting it. A remarkable demonstration of the popular feeling was spontaneously made by the numerous congregation assembled in St. Saviour's Church on that day. When the congregation arose to leave the church at the close of the service, the organ began to play the air of the national anthem; upon which the whole congregation suddenly commenced the words, and sang two verses with great enthusiasm. Mr. Curling, one of the chaplains, then succeeded in procuring a pause, and remarked, that as some expressions in the remaining verses were not quite hefitting the sanctity of the edifice, they had better substitute the doxology. The organ began to play the "Old Hundredth," and the people sang "Praise God from whom all blessings flow," with a fervour and universality that evinced their cordial concurrence in the suggestion of their pastor.

Exeter distinguished itself by the splendour of its display. There was a mock procession and "induction of the Cardinal Archbishop of Westminster and his gang." Thirty bareheaded friars preceded a train of some two hundred other Popish orders and dignitaries, who bore gigantic effigies of the Pope and Cardinal Wiseman, and of the Inquisitor-General, surrounded by masked familiars, bearing gridirons, shackles, and other instruments of torture. The processionists marched to the Cathedral-yard, and placed the effigies on an enormous pile of wood. The whole was consumed amidst a display of fireworks and coloured lights, that astonished and gratified ten thousand spectators.

The pageant of *Lord Mayor's Day*, the 9th, was got up in an unusual manner. The custom of parading a man in armour, which is said to have cost a life per annum for a generation or two past, was discarded; and an attempt was made to organise a processional feature, emblematic of the widened dominion of man over nature, and especially illustrative of our own civilisation among the nations of the world. The cortège took the usual route to the foot of Blackfriars Bridge; thence, according to ancient usage, it went by water to Westminster. In Westminster Hall, Recorder Stuart Wortley did the honours of introduction, with a brief biographical notice, setting forth the industrial career of John Musgrove, Esq., the new Lord Mayor. Chief Baron Pollock congratulated the Lord Mayor and the citizens alike, on the election which had given the one so high a dignity and the others so good a magistrate. The Chief Baron concluded his remarks with an eulogium on the great event of the coming year. "On the subject of the approaching gathering of the works of all nations, I entertain the opinion," said the Conservative but liberal-minded judge, "that the beneficial results will be incalculable." After the usual invitation from the Lord Mayor to the Judges for the evening banquet in Guildhall, the Corporation officer withdrew, and returned by water to Blackfriars Bridge. Here the Lady Mayoress's carriage was received into the grand cortège, and the procession wound its way back to Guildhall. The citizens crowded to the streets in numbers beyond precedent, to witness the new allegorical display, which gained universal approbation. The evening banquet was held with customary splendour. The company began to arrive soon after five. At half-past six, Lord John Russell crossed the hall, amidst a vociferous chorus of cheers. Besides the Premier, there were present the Marquis of Lansdowne, the Marquis of Clanricarde, the Earl of Carlisle, Viscount Palmerston, Sir George Grey, Mr. Fox Maule, the Lord Chancellor, the Lord Chief Justice of the Queen's Bench, and other Judges, Mr. Lawrence, and some others of the Foreign Ministers, Lord Wharnccliffe, Lord Dudley Stuart, M.P., with other Peers and Members of Parliament. The speech of the evening, of course, was that of the Prime Minister. When he rose, his appearance was the signal for the renewal of applause. Ladies waved their handkerchiefs, and gentlemen vied with one another in expression of approbation and delight, and it was some time before the noble lord could proceed. At length, as by common assent, the welcome terminated in one loud cheer, and almost in an instant there was throughout the hall an entire silence, interrupted by occasional cheers during Lord John's speech. He said,—"On behalf of her Majesty's Ministers, I have to return our most grateful thanks to the Lord Mayor and to this distinguished company for the honour that has been done us. I trust we deserve the praise which he has been pleased to bestow upon us—that it has been our endeavour to promote the best interests of the country; and it is a source of the greatest gratification to us that at this moment the tranquillity of the country and the general state of trade betoken a state of well-being and of comfort which we cannot but look upon with the highest gratification; and, gentlemen, if, as I am sorry to say, some of the powers of Europe seem disposed to interrupt that peace which has happily prevailed for so many years, I can only say that the best endeavours of her Majesty's Government will be applied to preserve that peace—that we trust we may be successful in that endeavour—and that, at all events, deep

and heavy will be the responsibility of those who wantonly incur the miseries of war. With regard to this country, we can have no hesitation in pronouncing that we are preserving terms of amicable relations with all the countries of the world, and that we trust those relations may be maintained. The Lord Mayor, in speaking of any merits which her Majesty's Ministers may have, has alluded to declarations which have been made on my part. I can only say, gentlemen, that that attachment to the religious freedom of this country which I have hitherto felt will always continue to animate my breast, and that it will be my duty to maintain to the utmost of my power the supremacy of our Sovereign (a loud and general burst of cheering), and the religious liberties of the people, from whatever quarter they may be assailed. Let me add, however, one thing further. When perils much more grave, much more imminent, impended over this country, a wise Princess, who at that time ruled our destinies, thought fit to call to her aid all those, whatever might be their religious persuasion, who were faithful to the throne and true to the interests of their country. Such was the conduct of Elizabeth in times of as great danger as ever occurred to this country. Such conduct, I will venture to say, is worthy of imitation; and I believe that with religious liberty established in this country, person of all religious persuasions, while obeying the dictates of their conscience as to the mode of worship they think it right to adopt, may rally round the institutions of the country, pay a grateful homage to the Crown for the protection they receive, and rejoice that they live in a land where freedom is generally, and I trust I may say permanently, established." Speeches were also made by Lord Lansdowne, Lord Campbell, Lord Palmerston, Mr. Masterman, and lastly by Sir Peter Laurie, who energetically declared that "Britons never would be slaves, either to Pusey or Pope."

NARRATIVE OF LAW AND CRIME.

In December last, the shop of Mr. Cohen, a jeweller at Newcastle, was robbed of a large amount of property. Not a single article has been recovered. At the Summer Assizes, John Bell was sentenced to transportation for a burglary; since his conviction he has made some revelations with respect to the robbery at Mr. Cohen's. Mr. Simeon Joel, a bullion-dealer at Newcastle, has been arrested, and was examined on the 7th. Nothing suspicious was found on his premises. The police proved that notice was given of the robbery to Mr. Joel the day after it had been committed, to put him on his guard in buying goods. Matilda Bell, wife of the convict, stated that her husband came home on Friday night (the burglary was committed on a Friday) with a number of gold and silver spectacles and eye-glasses. Bell took some of the glasses out of the rims, and left the house with them. He returned with two earthen pots, in which he melted the gold and silver rims. Next day he took the bullion and the pots in a basket to Mr. Joel's shop; his wife waited without. Bell gave her 2*l.* and the empty basket when he came from Joel's. Some months afterwards, when Bell was in custody, he told her to go to Mr. Joel for a sovereign which was owing to him; Mr. Joel told her he did not know her husband, and did not owe him anything; and hence arose Bell's revelations implicating Joel. The police have found a number of eye-glasses buried in Bell's yard; and on the premises other things taken from Mr. Cohen were discovered. Mr. Joel was remanded.

A new *Cabman's Trick* has just been mentioned; which is worth notice as a caution to the public. A gentleman hired a cab to take him and his luggage, amongst which was a gun-case, from Euston Square to the railway station at Paddington. When he arrived at the station, the cabman, with obsequious activity, proceeded to unload, and very quickly drove off upon receiving his fare, but scarcely had the cab disappeared when the gentleman missed his gun-case. The consequence was, that the journey was postponed, and the gentleman returned to his house, but on his way he was

informed by a policeman that the cabman who had just left him at the station was by that time in Broad Street depositing the gun-case which had been left in the cab, and to a considerable portion of the value of which the driver would be entitled for his honesty in giving it up. The owner of the property went to the Commissioners at Broad Street, representing the fact that the cabman had made the "mistake" intentionally, for the purpose of establishing a claim to the reward, and received an answer from the depot expressive of belief that the case was exactly as the complainant had described it, but admitting that the delinquent must still be rewarded, in the apprehension that a refusal would aggravate the system of robbery which the plan of compensation had been made to diminish. The complainant was then obliged, before he received the gun-case, to pay 10s. as a recompense to the rascal by whom he had been put to expense and subjected to disappointment.

Eliza Smalley, a girl of seventeen, *Murdered her Mistress*, at Stow in Lincolnshire, and endangered her master's life, by putting a solution of arsenic in the coffee they took for breakfast. Solutions of arsenic and mercury were used at the farm to soak wheat. A portion of the arsenical solution was in an iron pot, accessible to the girl. Mr. and Mrs. Page (her master and mistress) were taken ill after breakfasting, and Mrs. Page died before surgical aid could be brought to bear: her husband was saved. The girl confessed her guilt. At the inquest, Cheney, a constable, stated that she voluntarily said to him, her breast heaving violently—"Last Saturday my mistress said I had killed a fowl: I told her I had not: yesterday morning I took some mercury [arsenic] from an iron pot that stood against the back-door, and put it into the coffee-pot: I did not think it would kill her; I only thought it would have made her badly." "When I asked her where the pot was," continued the constable, "she went and showed it me. I held out no inducement to her. She confessed freely and voluntarily." The Coroner, cautioning her that what she said would be written down, asked Smalley—"Is this what you told Mr. Cheney; and is it the truth?" Prisoner (hanging down her head)—"Yes, sir." Coroner—"How old are you?" Prisoner—"I am seventeen years of age, and have lived here ever since last May-day. I have no reason to complain either of my master or mistress. The pot stood at the back-door for two days. I took the poison out with a gill mug; I took it away and put it in the dairy after having washed it. When I put the poison in the coffee-pot, I was in the kitchen. I put in a gill-full, and the coffee was boiled afterwards for a few minutes. My master and mistress got their breakfasts immediately after the coffee boiled. I saw both of them after they had done their breakfast. I was with my mistress when she died. I have never been either to church or chapel since I have lived here, but I used to go to church before I came here. I never had a Bible, but I could read a little in it if I had one. I know the Commandments, and I perfectly remember the sixth; it is, 'Thou shalt do no murder.' I cannot write." The verdict was "Wilful murder" against Eliza Smalley.

Warren, the man charged with *Fraudulently obtaining Letters* from the post-office, and Hannah Leonard, a woman connected with him, were re-examined by the Leeds Magistrates on the 9th. In addition to the affair of the bill for 744l. stolen by Warren, a number of other cases were investigated. Warren had obtained letters containing a post-office order for 5l., and a railway dividend-warrant for 6l. 9s. 6d., which were intended for Titley and Co., of Leeds; the money for each was obtained by forging the signatures. A letter addressed to Mr. Thomas Craven, a corn-factor, was got by some one from the post-office; it contained three railway dividend-warrants—more than 80l. together; and they were cashed at the bank. Mr. Craven's signature having been forged on the back of the check, and the money got from the bank. A watch found on the prisoner was identified by Mr. Parker, the keeper of a coffee-house, from whose premises it was stolen. On the 11th more evidence was taken. The magistrates considered the testimony with respect to the 744l. bill, the 60l. check, and the post-office order, sufficiently strong to warrant the committal of Warren for trial on the

other charges arising out of them. But with respect to cases, he was again remanded. The woman was discharged.

At the Mansion-house, on the 12th, Mr. Williams, a tradesman in Regent Street, was brought before the Lord Mayor on the charge of *Stealing Silk*. On the preceding Friday, 60 pieces of plain and fancy silk were stolen from the warehouse of Messrs. Watts, in Gutter Lane; the silk was of peculiar manufacture, and was worth from 500l. to 600l. On Monday, Mr. Williams applied to Messrs. Shoolbred and Co., of Tottenham Court Road, to know if they would buy a quantity of silk: he produced twenty-two patterns; the price asked was 1s. 9d. per yard; he said the goods were to be sold that evening, and that he sold them for himself. The buyer at Shoolbred's recognised in the patterns silk for which Messrs. Watts had asked him more than 3s. a yard; he desired Williams to leave the patterns for a time; a communication was made to Messrs. Watts, and the patterns were identified. The police were informed of the matter. Persons went to Mr. Williams's in the evening, and made further inquiries about the silk. He now said that he had only the patterns, but he could communicate with the person for whom he wanted to sell, in an hour's time. When the police appeared, he could give no good description of the two men from whom he said he received the patterns. Mr. Northover, clerk to Messrs. Watts, identified the patterns before the Lord Mayor: the price of the silks varied from 3s. to 4s. 6d. a yard. The prisoner's counsel urged that it was not likely that he had been engaged in a burglary, and asked for his liberation on bail, that the real offenders might be taken. The Lord Mayor decided that bail might be put in on a future day—two sureties of 250l. each, and Mr. Williams in 500l.

At Marlborough Street Police Office, on the 12th, the four men charged with the *Burglary* at Mr. Holford's were finally examined. Mitchell, who was so badly wounded, appeared to have made considerable progress to recovery. The only witness examined was Mr. Wakefield, the surgeon at the House of Detention, who has had Mitchell under his care. He described the wounds he found upon him—in the body, the arms, the neck, and the scalp; he thought that sixty or seventy shot had taken effect. The riddled and bloody hat found in the grounds was shown to Mr. Wakefield, and he thought it probable that the shot-holes had been made by the portion of the charge which entered the scalp. When all the depositions had been read over, the prisoners were asked if they wished to say anything; but they declined. The magistrate discharged Robinson, who was not proved to have been engaged in the robbery, but who had been the companion of the other prisoners, with advice to quit evil companions and get his living in an honest way. The other men were committed for trial.

Mr. John George Symes, lately a surgeon at Hungerford, in Berks-hire, *Poisoned himself* in London on the 9th. The deceased, who was a man of sixty-three, accompanied a friend to see the Lord Mayor's show, and parted with him about twelve, promising to meet him again in an hour, but his friend never saw him again. A cabman drove Mr. Symes on Monday night, the 11th, from the Prince of Wales, Elizabeth Street, Eaton Square, to a house in Tavistock Square. On arriving there, Mr. Symes was found dead in the cab, and as the owner of the house knew nothing of him, the cabman drove with the body to the University College Hospital. The deceased was sober when he entered the cab, in which no phial or vessel was found. When the body was examined by the house-surgeon, prussic acid sufficient to cause instant death was found in the stomach. At the inquest, a relative of the deceased stated that he was exceedingly sober and correct in his habits; and the landlord of the Prince of Wales said the deceased, who was then a little the worse for liquor, left his house shortly after twelve o'clock on Monday night. His conduct had been most gentlemanly, and did not betray the least symptom of insanity. The verdict was, that the deceased committed suicide in a certain cab, but what was his state of mind there was no evidence to prove.

The Reverend R. A. Johnstone, rector of a parish

adjoining Brentwood, was charged with a *Criminal Assault on his Servant Girl*, of fifteen; and the preliminary depositions of the girl and her mother made the affair look very disgraceful. On the day appointed for the second examination, both the women were absent; and it was stated that the family, a very poor one, had been hurried up to London, and could not be traced by the police. Mr. Johnstone was held to bail to appear again. He (the accused) attended before the Brentwood Magistrates on the 7th. Mr. Clarkson was his legal adviser. The police had not yet succeeded in bringing forward the girl and her mother, though on Thursday the officers entered a house in the suburbs of London only a few hours after the fugitives had left it. Mr. Clarkson tried to make the magistrates believe that as there were no witnesses against his client they ought at once to discharge him: but the bench refused, and again remanded Mr. Johnstone. The accused has been a very popular man in the locality, and an effective preacher. He is married, but has no children. He holds the rectory of West Horndon with Ingrave. On the 11th he again appeared before the magistrates. The girl (Mary Anne Doe by name) and her family had been at length discovered in London, and captured by the police. When Mrs. Doe saw her daughter in custody, she ran towards her, grasped her hand, and exclaimed—"Now, mind, my child, you tell the gentlemen it was all wrong which you told them before: and if they ask you how you came to tell such a tale, say you wasn't in your right mind, and you didn't know what you said." When the other witnesses were ordered out of court, that the girl might be questioned, her mother held up her finger to the daughter in a threatening manner. Mary Anne Doe's former deposition was read, and she declared it was untrue—she did not know what she was after when she made it. Mr. Johnstone had not touched her—she believed he had not, but she fainted away in the kitchen; she had been ill all night before. In a word, Mary Anne utterly denied all her former statements against the defendant. Mr. Tower, a magistrate, expressed his opinion that the complainant had been most disgracefully tutored. The chairman said, they had two depositions before them—one sworn in defendant's absence; the other made in his presence, and entirely rebutting the other. The case must therefore be dismissed. The bench subsequently directed that a bill of indictment for perjury should be prepared against the girl.

An inquest was held on the 14th on the body of Emily Nott, a servant girl of one-and-twenty, who had committed *Suicide* at Blackfriars Bridge. The girl had formed an attachment to a police constable, who being engaged to another woman, gave no encouragement to her passion. On the preceding Monday she left her situation and went to the Borough, where the officer was, but before doing so, she placed on the window-sill a letter which ran as follows:—"Dear Madam,—By the time you receive this I shall be no more. I am, madam, your unhappy servant, Emily Nott." She inquired the way to Blackfriars Bridge, and having reached it, mounted to the top, and plunged head foremost on to the causeway below. The policeman at the bridge saw her fall, and on going to her, found her head battered in. He lifted her up, when she groaned twice and expired. The jury returned a verdict of Temporary Insanity, and were further of opinion that the police constable was free from blame.

Mr. Pennington, who for fifteen years past has filled highly important offices in her Majesty's Treasury, committed *Suicide* on the 14th. About half-past 4 o'clock, a police constable heard the report of fire-arms in one of the plantations in Hyde Park, almost opposite Gore House. He immediately entered the park at the small wicket gate close to the spot, and discovered Mr. Pennington lying on his back in the plantation, with his arms extended. In his right hand a double-barrelled pistol was tightly grasped, one of the barrels of which had just been discharged; and on the lock of the other barrel was a percussion cap, and the lock was cocked. He was then still breathing, a motion of the lips and mouth being perceptible for five or six minutes. Mr. Bonney, a surgeon of Knightsbridge, examined the body, found that the deceased had shot

himself through the temple, and that the ball had passed out at the back of the head. The body was then removed to the dead-house of the parish, and the clothes of the deceased were searched, where, besides money and other effects, was a card-case, in which were two cards with his name and address. Subsequently the butler in the family went to Knightsbridge, and identified the body as that of his master. Mr. Pennington had a fit about three months since, from the effects of which he had scarcely recovered, and about a fortnight since he had resigned his situation. He had left his house about half-past 2 o'clock in the afternoon, to take a walk with his daughter, and returned home in about an hour. Shortly afterwards he again went out alone, saying he would take another walk. At the coroner's inquest, on the 16th, it appeared clearly that he had suffered from aberration of the mind. He was in his fifty-sixth year, he was Auditor of the Civil List, and had been a barrister. On one occasion, he told a friend that he had experienced suicidal feelings—a desire to throw himself from a cliff at Brighton, or to shoot himself if a pistol had been within reach. Sir Frederick Thesiger saw him a few days before his death, and felt sure his mind was not in a sound state. This was the impression of the other gentlemen who were examined. Before his illness, Mr. Pennington "was of a particularly calm and well-disciplined mind," said Sir Frederick Thesiger, "and was the last man who would commit suicide." The jury at once gave this verdict—"That the deceased had died by his own hand, while in a state of unsound mind."

John Onslow, a policeman, was charged at the Lambeth Police Court on the 16th, with having made a *False and Malicious Statement* against Mr. Brookes, the proprietor of the Jolly Butchers' beerhouse, in Loek's-fields. On Sunday evening, the 3d, Onslow presented himself at the door of the Jolly Butchers, and having beckoned out the landlord, addressed him in a low and confidential manner, saying, "Tell them not to make such a noise." Mr. Brookes, surprised at his manner, asked him what he meant; and Onslow, in the same tone, said, "Why, they are a-playing at cards in your parlour." Mr. Brookes denied the assertion, and asked him to go into his parlour and disabuse his mind on the subject. Onslow went into the parlour, and on his return said he knew the company had been playing at cards, but had put them away. Soon after this a sergeant came up, when Onslow improved upon his story by saying that he had been watching the house, and that he distinctly heard the parties inside call out "High, low, jack, and game," as if they had been playing at all fours; and further he said he mounted the window, and saw the party engaged in playing cards. The landlord, astonished at the hardness of the man's statement, spoke to his customers, and it was agreed that they should at once proceed to the station-house, and mention the circumstance to the inspector on duty. On reaching the station-house, however, they found Onslow there, and that he had actually made a report of card-playing at the house. No information was laid on his representation, but on the complaint of Mr. Brookes, through Mr. Robinson, the superintendent, the Commissioners of police ordered the present inquiry. A number of respectable witnesses, who had been in the parlour of Mr. Brookes from 7 o'clock in the evening until they went to the station-house, were called, and swore distinctly that not only were there no cards played, but not a single syllable was uttered about cards or gaming of any sort, and therefore that the statement of the defendant was a deliberate falsehood. The magistrate considered the charge clearly established against the defendant, and that he was a most improper person to hold the situation of constable longer. He then convicted him in a penalty of 10s., or four days' imprisonment, which would lead to his immediate discharge from the force.

A *Fearful Outrage* has been committed at Leeds by a band of Irish immigrants. On the night of Saturday, the 16th, a body of men, armed with pokers, bludgeons, and other weapons, marched to the Foresters' Arms, and finding it barred against them, broke the windows and did other damage. They then proceeded to Bull's beer-house, at the door of which stood a pony, and one

of the ringleaders, named Hogan, who was armed with a heavy bludgeon, struck the poor animal upon the head and stunned it. Two others, named Haley and Cratty, the one armed with a poker, the other with a stick, then forced their way into the house, and at once demolished all the china, glass, and other articles in the lower rooms. They next raised a wild Irish cry, and in a minute stones and brickbats poured through the bar-window, compelling the landlord and landlady to seek shelter in a corner. Haley coolly drew out the money-bill, and cleared it of its contents—some 14*l.* or 15*l.* Further damage was done to the premises; then they retired, and met two policemen, upon whom they made a furious onslaught. The officers were knocked down, beaten, kicked, and jumped upon until they were to all appearance lifeless, and are lying in a dangerous state. About this time a man named James Rhodes was passing along the street, in company with his son, a boy of 10 or 11 years; three men stepped from the crowd; one of them flung a brick at Rhodes, which struck him upon the temple and knocked him to the ground insensible. He was conveyed to the infirmary, where he lay in a state of unconsciousness until Monday evening, when he became delirious, and died on Thursday. Six of the men and a woman have been apprehended and examined before the borough magistrates, by whom they have been remanded.

A remarkable case of *Fraudulent Concealment and Disposal of Property* occurred at the Insolvent Debtors' Court on the 18th. Hugh Swan, the insolvent, had been a linendraper, in Camden Town. He had been a bankrupt, and his last examination was adjourned *sine die*. He had, since he petitioned the insolvent court, applied to the Court of Bankruptcy to pass, but had not been allowed. The opposition now made against him was that he had kept fraudulent books, had defrauded his creditors of goods, and concealed and made away with considerable property. It appeared that in January, 1849, he contemplated a failure, and schemes were concocted to defraud his creditors. In April of the same year he was made a bankrupt, having previously offered his creditors a composition of 6*s.* in the pound. He now admitted that he had removed, by the assistance of one of his shopmen, George Boone, 300*l.* worth of stock just before his failure. He also admitted that other property had been removed to several persons to conceal. Also, that he had 400*l.* in money, which he concealed, and spent after his bankruptcy. He had some plate which his wife concealed, and which was pledged after the bankruptcy. He had a lease of his house in Camden-town, which was mortgaged to be kept for him after his bankruptcy. For some months before his failure he had sold goods in his trade by auction. In the month preceding his bankruptcy he got 1500*l.* of goods from his creditors, and sent about 800*l.* worth to an auctioneer's to be sold, and destroyed the documents, to conceal it from his creditors. He also omitted debts from his balance-sheet, and concealed the bills, in order to receive the money afterwards. He advanced, prior to his bankruptcy, to a market-gardener, named Bishop, at Mortlake, 350*l.* to lay out on a farm, so that he might have the benefit of it after his bankruptcy. In order to account for about 700*l.*, he got a hairdresser named Main to swear in the Court of Bankruptcy that he had pressed him for payment. Both Main and the insolvent swore to the transaction, and the latter now admitted that there was nothing due. The insolvent declared that he was assisted by Boone and an attorney named Albert Reed in his affairs. They tutored him, and he lent himself. Both these parties were in court; but as neither side would call them they were not examined. The insolvent declared that Reed, to whom he was recommended by Boone, owed him 100*l.* prior to his bankruptcy, and since he had advanced him (Reed) 350*l.*, of which he was to return him 200*l.* He, however, had turned upon him, and he (the insolvent) had given all the information to his assignees. Property to about 1400*l.* had been recovered for the creditors. He made the disclosures in court without hesitation. The details of fraud and perjury amazed the auditors. He had been in prison since March, and during the time his wife and two children had died! He was now without funds, and appeared to receive the judgment of the court

for his offences. The judgment was that he should be discharged when he had, from the date of his vesting order (made about three months back) been in prison for two years.

At Westminster Police Office, on the 18th, Goss, butler to Mr. H. Drummond, of Bryanston Square, was charged with attempting to create a *Disturbance at St. Barnabas Church* on Sunday morning. A police inspector said he hastened to St. Barnabas Church on Sunday, in consequence of information which reached him that a very large mob had assembled round the church, threatening to break open the doors and commit other acts of violence. On his arrival he saw a crowd of several thousand persons around the church, principally composed of thieves and low characters, who were threatening to break open the doors. He desired his men to disperse the crowd; and while they were doing so, the defendant, who had made himself particularly active, endeavoured to force his way into the church. Upon this, the crowd became more excited, and made use of the most violent and threatening language. The defendant was then taken into custody. A number of policemen corroborated the evidence of the inspector. Several witnesses were called by the accused; tradesmen residing near the church, who were present at the disturbance, attempting to gain admission to the church. They averred that Goss was not disorderly, and merely tried to enter the church when it was known that there was standing-room within. The man at the door produced a "warrant" to exclude people, which was read aloud. One witness stated, that during the altercation at the door, a gentleman came out, got over the boundary wall of the area of the church, and said he was disgusted; the candles were lighted, and it was Popery in the most malignant form: and that led to the mob crying out "No Popery!" Up to that time nineteen-twentieths of those present were respectable persons. A boy then came up with a life-preserver swinging in his hand. The witness called a policeman's attention to him, and said it was calculated to excite a breach of the peace. The knot of persons of whom Goss was one were inside the wall, not part of the mob outside. The Magistrate said—"I have now heard the whole of the case, and the evidence on both sides is now before me. It is quite clear that a very large mob of persons was present, a proportion of whom were highly respectable, and a portion thieves and low characters. The question is, whether the person before me was at all active in leading the mob, or doing that only which he might have a right to do—attempting to gain admission to the church. Now it appears from the evidence, that there was room inside the church when admittance was refused. I find that all he is charged with is, putting his foot to the door to get in; but a great many of the witnesses swear that he did not do so, and therefore I do not think it is a case for me to call on the defendant for sureties for his good behaviour, and I must dismiss him. But the Queen's peace must be preserved, and I am determined to preserve it within this district: but those persons have much to answer for, and undertake a serious responsibility, who provoke breaches of the peace by exciting the indignation of their fellow-subjects by the ceremonies of the Romish Church at such a time as the present." These expressions produced a general burst of applause—clapping of hands, &c., which was taken up by the persons assembled outside the court.

At Bow Street, on the 29th, Catherine Priestly, a servant, was charged with obtaining a situation by means of a *False Character*; and an elderly woman, named Ashley, was charged with having *Forged the Letter of Recommendation* by which the situation was obtained. Priestly had applied for a situation to Mrs. Farrell, of Craven Street, Strand, and had given a reference for character to a Mrs. Angell, whose address was given. Mrs. Farrell wrote accordingly, and received an answer, giving the servant a high character. She soon found it was wholly undeserved; and on making inquiry respecting Mrs. Angell, discovered that Mrs. Angell was dead, and that the letter had been fabricated by the woman Ashley, who was a gentleman's house-keeper. The magistrate observed, that so many robberies were committed in the families of gentlemen by servants of disreputable character obtaining false recom-

mentations, that it became necessary to visit such offences with the utmost severity. The persons who gave the false character were usually the worst of the two, but it was not his intention to make any distinction in the present case. He then fined the prisoners 10*l.* each, and, in default of payment, committed them each to three months' imprisonment.

The proceedings in the Bankruptcy Court, on the 20th, in the case of Lakeman and Co., produced some curious disclosures respecting *Commercial Transactions of the late King of the French*. Stephen Charles Lakeman carried on business in copartnership with one Châlè and General de Rumigny, chief aide-de-camp to King Louis Philippe. The place of business was in St. Mildred's Court, Poultry. They were commission-agents. This was a meeting for the last examination of Lakeman. Rumigny has not yet surrendered to his fiat, and he has up to this time alleged, upon affidavit, as a reason for his non-surrender, and to prevent his outlawry, that he is unable to obtain a passport, the prefect of Police, for State reasons, refusing to grant one. Lakeman, being examined at great length, gave a history of the transactions of the firm. He stated that the partnership of Rumigny was established in May, 1848, soon after the arrival of the late King in this country, solely for "political purposes." The object was to purchase the debts of the Civil List on account of the Royal Family of France. This he clearly understood from conversations with Rumigny and with the King. A loan was to be negotiated with Messrs. Baring to the amount of 800,000*l.* on the landed property of the house of Orleans in France. This money, when raised, was to be applied to the purchase of the debts of the French civil list, on account of the Royal family, it being specially provided and determined that no debt should be purchased at a less advantageous rate than 40 per cent. discount. Such was the object to be attained by the house of Lakeman, De Rumigny and Co., in May, 1848. A short time afterwards the copartnership was modified by the introduction of Châlè into the concern, and a second commission was given to the establishment as thus amended. They were "to receive goods and consignments from French manufacturers and tradesmen, advancing them money on account of such consignments, so as to gain their sympathy for the Royal Family of France." Circulars were accordingly despatched to certain French houses; a place of business was taken, "the General attended daily at the office," and customers, when they offered themselves, were introduced, in the presence of Lakeman and Co., to the Ex-King at Claremont. The concern did not prosper. Rumigny went to France, and Lakeman was left behind to face the responsibilities of the firm, which terminated in bankruptcy. It appeared by the balance-sheet that Lakeman was victimised by his partner Rumigny, who was to have brought money into the concern, but brought none, while he drew out 1300*l.* The Commissioner allowed the bankruptcy to pass.

The celebrated Don Pacifico, whose claims upon the Greek government have made so much noise, has applied in the Court of Queen's Bench for a *Criminal Information against the Morning Herald for an alleged Libel*. The libel is in a letter from the private correspondent of the *Morning Herald* at Athens, dated the 28th of February, which contains the following passages:—"The Jew Pacifico, before his fraudulent bankruptcy at Constantinople, and before his consulship in Greece, held an inn in a village in Portugal." "On one occasion Don Pedro, on his way to Lisbon, first sent to say that he would stop there, and having changed his mind and taken another route, was much astonished some time afterwards to see mine host arrive with a bill for 150*l.* for the cost, he said, of his preparations to receive his Majesty. Don Pedro took the thing as a joke, but gave him 25*l.* and sent him to the rightabout." "Since then Pacifico, having changed for the third time his nationality, and put himself under Sir E. Lyons' protection, raked up this old account, which he pretends to have been torn or lost in the pillage of his house, and which suddenly took the fearful proportion of 25,000*l.* This is the principal item of the Pacifico affair, which also comprehends the indemnities for the harm done to his house, such as 2000*l.* for bronzes and crystals broken,

and the rest in proportion. Now it happens, that before the riot in his house Don Pacifico had had the misfortune to have one of his daughters run away with twice—first by a merchant's clerk, and secondly by an apothecary's boy, and on this second and catastrophe he addressed himself to King Otho, protesting that his daughter had stolen everything he possessed, and that he had nothing left to live on, and consequently asking for alms. The King, it is a well-known fact, lent him more than once 100 drachmas at a time. You may judge, therefore, of the crystals and bronzes there must have been to break in his miserable dwelling." Don Pacifico's counsel, in applying for a rule, denied all these assertions. Don Pacifico had never been at Constantinople, and had never been a bankrupt. He had three daughters, the eldest of whom married with his full consent, and the youngest, who was thirteen years of age, was still living under the parental roof. With regard to the second, to whom the libel was supposed to refer, she had been married to an officer named Lante, M. Pacifico, being a Jew, had objected to that marriage on the ground of Captain Lante's religion, and his daughter had been married without his consent; but as to her running away, or taking away with her any part of her father's property, there was no pretence whatever for the charge. The rule was granted.

Newmarket fair was infested by swarms of pickpockets and rogues of all kinds. Many persons were robbed in the street. James Betts, a young man from Snailwell, while defending his wife and sister from a gang of thieves, was struck down, and died in a little time. The murderers escaped detection. The crime so alarmed the people, that they would not leave the town but in large bands; and the first market after the fair was thinly attended, though it has been usually thronged; terror kept many away.

NARRATIVE OF ACCIDENT AND DISASTER.

THE splendid steam-yacht called the *Peterhoff*, built at Blackwall, for the Emperor of Russia, has been *Lost* on her passage to St. Petersburg. Her transmission was intrusted to an eminent firm on Cornhill, who took every care to supply her with an efficient crew. A master mariner, Mr. James Boniland, who had been employed in the Baltic for the last twenty-four years, was appointed to take charge of her, her crew being selected from men who had been trading in that sea. Some five or six weeks ago she took her departure from the Thames, having on board, in addition to her crew, Mr. George Rennie, the engineer, and Mr. Waterman, jun., who designed the yacht, and who, we understand, was charged with its delivery to the emperor, with Mr. Eschapper and one or two other gentlemen. She reached Copenhagen in safety, and having taken on board two ladies attached to the embassy there for conveyance to Revel, she resumed her trip on the 22d ult. Going up the Baltic, the wind blew a hurricane; and, while making for the island of Dago, at the entrance of the Gulf of Finland, she struck on a reef of rocks. By this time the weather had moderated to a calm, otherwise every soul on board would have perished. As soon as they were seen from the land, three boats were despatched to their relief, and the weather favouring their exertions, the wreck was gained, and the whole of those on board were taken off. On reaching the shore every relief was afforded them, and it appearing impossible to rescue the wreck with the means then at command on the island, Mr. Waterman, jun., with Mr. G. Rennie, proceeded on to St. Petersburg overland, with a view of procuring assistance. The journey being one of considerable difficulty, much delay must necessarily take place ere any relief can be rendered the wreck. Very trying weather has since set in, and the last accounts speak of her loss.

A melancholy case of *Hydrophobia* has occurred at Lochend, near Edinburgh. About seven weeks ago, a boy named Weston, between eight and nine years of age, a farm-servant, was bitten by a little dog belonging to the neighbourhood, which had been observed on the day of the accident howling and roaming about the

place in a rather unusual manner. The boy's father, in consequence, cautioned him not to approach the dog, but, heedless of the advice, he stole out unobserved, and ran to caress the little favourite, when the animal immediately leaped upon him and bit him above the eye. Having told what had taken place, the dog was immediately killed, and medical aid having been procured, the wounded part was cut out of the boy's brow, and other measures taken to prevent the virus from spreading. The wound healed up, and all seemed well, but on the 13th symptoms of hydrophobia began to appear, and although the most eminent of the medical faculty of both Edinburgh and Leith were consulted, all was unavailing, and the unfortunate sufferer died two days afterwards.

On the morning of the 16th, an explosion took place in a coal-pit at Singing Clough, near Manchester, belonging to Messrs. Knowles and Scott. Two men were killed on the spot, and two have been so much injured that but little hope can be entertained of their recovery. There were sixteen colliers in the pit, and these had descended between five and six o'clock on the above morning. At the bottom they met the underlooker, who had examined the workings to try the air, and reported all of them free from danger except the furthest point of the level, in which he directed that no one should begin to work. Shortly before seven o'clock, however, a young man, named Peter Tonge, declared his intention of going there for a tub of "sluck" (small coal), and persisted in doing so, despite all remonstrance from the other workmen. Two of his fellow-workmen, named John Stone and John Lever, went with him, and so incautious were they, that although provided with safety lamps, they used a naked candle. On reaching the end of the bay, Stone is said to have "flashed" the light up to see if there was any danger, and in an instant a loud explosion took place. Lever was in the direct way of the current, which the explosion of course followed, and his life was sacrificed in an instant, the top of his skull being blown off, and his brains scattered about. Tonge was suffocated, and Stone was so fearfully scorched with the flash of the explosion that his life is in great danger. The other workmen, with one exception, were all in bays off the main level or drift way, and the ventilation of the mine being good they received no injury.

On the evening of the 15th, a *Frightful Collision* took place on the Lancashire and Yorkshire Railway, near the Huddersfield Junction. An engine which had been undergoing repairs in the engine shed, was being replaced on the line on which it was to be worked, when it came into violent collision with the passenger train from Bradford. The shock was so violent as to smash completely the engine and tender, as well as the engine belonging to the passenger train, bringing the train itself to a dead stop. The passengers in alarm jumped out of the carriages, but had hardly time to become conscious of their fortunate escape when a goods train dashed into the standing train, doubling up all the carriages in a moment and knocking them to shivers. The scene that presented itself after this second catastrophe is described as terrible, the entire line being blocked up with a huge mass of fragments of broken carriages and engines. It was remarkable that none of the passengers were killed or injured by the flying splinters. The line was completely choked up, and men were immediately set to work to make a temporary line of rails for the usual traffic. This affair is to be made the subject of an inquiry.

On the evening of the 21st, an *Extensive Fire* broke out in the premises of Mr. Hynam, chemical light manufacturer, in Prince's Square, Finsbury. The property formed two sides of the square, and stretched across the entire length of the public road. The flames were first perceived bursting through that portion of the building between the two wings, and so high did they rise as to illuminate the principal portion of the city. The engines of the London Brigade and West of England Company speedily attended, but by that period the principal portion of the manufactory, a building 74 ft. long by 32 ft. wide, was, with the exception of a fire-proof apartment, wrapped in a general blaze. The firemen, however, kept to their work, and by carrying

the hose from the engines on to the roofs of the surrounding buildings, were enabled to cut off the fire from the two wings, which contained a vast quantity of property, and also the steam-engine; and at length the fire was extinguished: but by that time part of the works where the fire began was nearly burnt out, and the adjoining buildings severely damaged. Their occupiers were poor people, who had the whole of their humble furniture removed into the street to save it from the ravages of the flames. None of the property destroyed was insured.

A young man was *Injured by a Lion*, while visiting Wombwell's menagerie, at Durham. He laid his hand on the lion's paw, which was protruded through the bars of his cage,—a familiarity which the brute resented in a fearful manner. With the quickness of lightning the animal laid hold of the young man's hand, and, drawing him close against the bars of the cage with his other paw, he fastened upon his head. The cries of the lad instantly attracted the attention of the keeper, who flew to the spot, and, after severely beating the infuriated brute upon the paws, compelled him to relinquish his hold. The whole proceeding was the work of a moment, but the unfortunate lad retains traces of his fearful rencontre which he will bear with him to the grave.

An *Explosion of Fire-damp* has taken place in a coal-mine at Hlaydock, in Lancashire, by which nine men were killed and many others severely burnt. Four ponies were also found dead. Thirteen lives were lost in the same pit in 1845. At the inquest, it appeared that the system of supervision in the mine was very defective. The underlooker said there was great difficulty in preventing the men from working with unprotected candles, and ascribed the explosion to their negligence. But some of the miners stated that they had never been interdicted the use of candles, and that the underlooker did not visit the mine for intervals of a fortnight together. The underlooker admitted that several days might have passed without his going over the mine. The Coroner thought it was usual to inspect coal-mines every morning before the men entered to work. Mr. Tremheere, the Government Inspector, was present; he questioned the witnesses, assisting to elicit information on the defective management of the colliery, and made some observations before the jury gave their verdict. Their finding was "Accidental death." The owner of the mine, Mr. Evans, was then sent for, and the Coroner advised him to adopt an improved system.

Houghton Pit, near Newbottle, in Durham, the property of the Earl of Durham, has been the scene of a *Similar Accident*, still more fatal. The colliery is said to have been considered in a good general condition. On the 11th, while one hundred and fifty miners were in the workings, a very violent explosion of fire-damp occurred; many of the people were blown to pieces or destroyed by the flames, but the great majority were in a safe spot. They occupied a position where the air was respirable, while they were hemmed in on all sides by the fatal choke-damp. Some who attempted to gain the shaft perished by suffocation, and others with difficulty regained their refuge. Here one hundred and twenty persons remained for hours in utter darkness, and momentarily expecting to be suffocated by the foul air. Fortunately a communication was at length opened, and all the living miners were got to the shaft. It was found that no fewer than twenty-six men and boys had been killed.

A fearful *Explosion of Naphtha* has occurred at the Roman Catholic school and reading-room at Seacombe in Cheshire. Mr. Johnson, the schoolmaster, was filling a lamp from a can of the liquid, six of the boys standing around, one holding a lighted candle; Mr. Johnson poured too much naphtha into the lamp, and it ran over, caught fire at the candle, and then the whole quantity exploded with a report like that of a cannon. Mr. Johnson and the boys were enveloped in flames, and were all much burnt; one boy died next day, and others were thought to be in danger. The people in the reading-room above were so much alarmed by the explosion that several of them jumped from the window. A number of accidents have lately happened from the incautious use of this dangerous substance.

An emigrant ship, the *Edmond*, of London, was *Lost During the Storm* which raged on the Irish coast on the night of the 19th. She had sailed that evening from Limerick, and went ashore on a dangerous point called Killee, near Kilrush. She soon went to pieces; and, of the two hundred and sixteen persons on board, ninety-six perished.

SOCIAL, SANITARY, AND MUNICIPAL PROGRESS.

THE Registrar-General's Quarterly Returns of the births and deaths, and of the marriages, in England and Wales, are favourable in a high degree. The return of the births and deaths extends to the 30th September; that of the marriages to the 30th June last. The deaths were but 86,044; whereas the deaths in the same quarter of 1849 were 135,358. The last number is of course swelled by the mortality from the cholera; but the provincial returns generally concur in declaring that sanitary measures have increased the chance of life throughout the kingdom. The Registrar thus sums up the results of his tables:—"The mortality is much below the average, and the public health has never been so good since 1845 as in the present quarter. The rate of mortality is 1.901 per cent. per annum. At this rate one in 211 persons living died in three months. The chances of living through this quarter were 210 to 1; the average chances of living through three summer months (1840, 50) for persons of all ages, being 192 to 1. The rate of mortality in 506 districts, comprising chiefly small towns and country parishes, was 1.635 per cent. per annum in the quarter; the average summer rate (1840, 50), being 1.832 per cent. The rate of mortality in 117 districts, comprising the large towns, was 2.206 per cent. per annum; the average rate (1840, 50) being 2.517 per cent. The juxtaposition of the figures in the table suggests the melancholy reflection that more than seven millions of people, inhabiting the Metropolis and all the cities and great centres of industry, are still exposed to a mortality which is not inherent in their nature, but is due to the artificial circumstances in which they are placed. The waters, the sewers, the soils, the churchyards, the houses, emit poisons. To every 10 natural deaths, 4 violent deaths—deaths from these poisonous exhalations—are superadded."—The marriages are returned by more than 12,000 churches or chapels, 2869 registered places of worship connected with the Established Church, and 623 superintendent registrars' offices. The results are given collectively, and in groups, showing the special movement of particular districts. It is, that the average increase of marriages invariably accompanies prosperity, and the average decrease attends a reverse of prosperity in manufacturing and commercial pursuits; the remarkable exception of agricultural Lincolnshire may be held to prove the general rule:—"The marriages in all England in the quarter ending June 30, 1850, were 39,018. The numbers in the spring quarter declined rapidly from 1846 to 1848, and rose still more rapidly up to 1850; thus following and portraying the state of the country. London, Cheshire, Lancashire, the West Riding of Yorkshire, and South Wales, presented the greatest fluctuations, and the greatest increase of marriages in the June quarter 1850. The marriages increased in Middlesex, Hertford, and Buckingham; in Essex and Suffolk the marriages declined, as they did also in Devon and Cornwall; in Shropshire, Staffordshire, Worpshire, and Warwickshire—the coal and iron regions—the marriages increased; they increased also in Leicestershire, Nottinghamshire, and Derbyshire—the seats of the thread, lace, and other manufactures. In the great agricultural county of Lincoln the fluctuation was in an opposite direction; the marriages rose from June 1846 to June 1848, and then declined. In the East and North Ridings, Durham, Northumberland and Cumberland, and Westmoreland, in Monmouthshire, and North Wales, the marriages increased in 1850. The marriages in Portsmouth and Plymouth declined; in Bristol and Cheltenham they increased; in Stoke-upon-Trent (the Potteries), in Coventry, and in Birmingham, Liverpool, and Manchester, the increase

was considerable. It was still greater in Leeds; Halifax and Sheffield shared in the general advance. Hull, Wolverhampton, and Salisbury—where cholera was exceedingly fatal in 1849—have little more than the average marriages."—Of births, 146,970 were registered. "The births are invariably more numerous in the first and second than in the third and fourth quarters of the year; and they are in the last fewer by 8,757 than in the previous June quarter. The number and the proportion to the population are, however, greater in this than in any of the corresponding quarters since 1839. The increase of births is greatest in London, in the West Midland Counties, and in the North Western Counties, Cheshire, and Lancashire." The bearing of these details on the statistics of our population, is thus shown:—"The excess of births registered over deaths in the quarter was 60,926; which, if all the births were registered, would be the natural increase of the population. In the same time, 53,703 emigrants sailed from three ports of England; 1394 from Plymouth, 7684 from London, and 41,625 from Liverpool. This leaves a narrow margin for the increase of population; but many of the emigrants entered at the English ports are from Ireland, which has been for many years diffusing a stream of natives over England as well as America. The progress of the whole fixed and moving population of the country can only be determined accurately from a comparison of the returns of births and deaths, of emigrants and immigrants, with periodical enumerations."

The Lancashire Public Schools Association held a conference at Manchester on the 27th ult. Mr. Alexander Henry, M.P., presided; Mr. Cobden, Mr. Brotherton, Mr. J. B. Smith, and most of the prominent friends of the movement in London, Liverpool, and Leeds, and in Scotland and Ireland, together with the Rev. Dr. Bacon, a gentleman of learning and personal weight from Newhaven, in the American State of Connecticut, were present. Letters of regretful excuse were read from Mr. C. P. Villiers, Mr. Hume, Mr. Ewart, Colonel Thompson, and some other members of Parliament, and from the Archbishop of Dublin, Mr. John Stuart Mill, Mr. Curly, and the Messrs. Chambers of Edinburgh, and other friends of the movement.—The principal speakers were Mr. Samuel Lucas, of London, Mr. Abalom Watkin, the Rev. Mr. Thorp, rector of Burton Overy in Leicestershire, and Mr. Cobden. A change in the title was suggested by Mr. Cobden—from *Secular Schools to Public Schools Association*; on the ground (he said) that Dr. Samuel Johnson defines "secular" to be not merely non-sectarian, but a great deal more—"not spiritual—relating to the affairs of the present world—not holy—worldly." Now he did not think that this School Association was unspiritual; he did not think it deserved the name of irreligious. There was no greater foe to religion than vice, and no greater support to vice than ignorance. In fact, ignorance was the great parent of vice. The association sought to promote knowledge. They were promoting religion by promoting knowledge in its highest form, and that form of religion, too, which when understood must have the support of all classes. The suggestion caused a good deal of verbal criticism; but in the end Mr. Cobden's suggestion was adopted, and the title of the new organisation will be the National Public School Association.

The annual election of children to the *Asylum for Idiots* took place on the 31st ult., when 15 of this unhappy class were elected out of no fewer than 170 eligible candidates. Previous to the election, a general meeting of the subscribers was held, at which Alderman Sir George Carroll presided. In advocating the claims of the charity, he observed that two great fundamental objections had met them at the very threshold of their undertaking—one was, that they could do nothing for the idiot; and the other was, that there were comparatively no idiots. The first objection had been fully answered by the patient efforts of the last two years, for though they were unable to point to any positive instance of a perfect cure, there were at this moment many cases exhibiting a considerable state of improvement. A poor laundress, whose child had been at the asylum, was so struck with the great improvement that had taken place in him, that with tears in her eyes she had

recently called upon the secretary, and had insisted upon his accepting half a guinea as a mark of her gratitude. As regarded the second objection, it was not at that time, perhaps, known that a multitude of these cases were hidden, from shame or sorrow, not only from the eye of the world, but from the observation of social intercourse; for it was now ascertained from correct statistics that the number of idiots exceeded that of lunatics. The report stated that the board had taken two houses of great capacity—one at Highgate, and the other at Colchester. Those establishments at present contained 129 inmates, which, with the 15 elected on the 31st, made a total of 144. There was ample accommodation for additional inmates, but though the receipts of the past year had amounted to between 4000*l.* and 5000*l.*, additional support was necessary to enable the board to extend to any sensible degree the benefits of the institution.

The principle of *Singing Classes* is beginning to be introduced into the army. The United Service Gazette says—We observe that singing classes have been introduced into the 76th Foot. We learn that the general officer commanding the Portsmouth district intends inviting Mr. Hullah to the garrison for the purpose of inoculating the troops with his admirable system; and we hear from a corps in Ireland that not only are the men encouraged to glee and part singing, but are now in the habit of chaunting the whole of the service in the parish church of the town in which they are quartered. We hope to hear of the extension of the rational and harmonious pastime. Not only should singing classes be instituted, but music might be taught and facilities afforded for its cultivation at a very moderate expense.

The *Common Law Commissioners* are prosecuting their labours with great diligence. It is believed that their report will be ready before the meeting of Parliament, and that it will contain some valuable recommendations. The attention of the Commissioners has been especially directed to the effects of the County Courts Extension Act upon the business of the Courts at Westminster Hall. It is apprehended, not without great reason, that, in addition to the inducements of a cheap tribunal and a speedy administration of justice in the local courts, the existing costly and complex mode of proceeding by action in all courts of common law will continue still further to crowd and increase the popularity of the inferior tribunals. To remedy this evil, it is expected that the report will enforce the necessity of the utmost simplification, economy, and despatch, in all future proceedings in the common law courts, and the abolition of all technicalities which impede a speedy trial on the merits.

An association for *Improving the Social and Moral Condition of Labourers and others residing in the Parishes of Windsor, Eton, and the neighbouring districts*, has just been formed at Windsor, under the immediate auspices and patronage of the Queen and the Prince Consort. The Duchess of Kent has consented to become the lady patroness, and Prince Albert to be president of the society. The vice-presidents include Major-General Wemyss, Sir George Couper, the Dean and Canons of Windsor, the Mayor of Windsor, and many of the most influential residents of the vicinity. The Hon. Colonel Phipps, the Hon. Colonel Grey, the Hon. and Rev. Gerard Wellesley, and the neighbouring clergy, are members of the provisional committee. The design of the association is to encourage among labourers and their families, and domestic and other servants, habits of morality, good order, providence, and industry, by the annual distribution of rewards in money and appropriate medals. Medals will also be presented by the royal president in special cases to the most deserving.

The Manchester Chamber of Commerce has resolved to send a commissioner to India, at its own cost, to inquire into the obstacles which prevent an increased growth of cotton in that country. Mr. Alexander Mackay, author of "The Western World," is the gentleman selected for the duty.

The Commissioners of Woods and Forests have completed the arrangements for carrying into effect the projected Park in Battersea Fields. They have purchased, for the sum of 11,000*l.*, the shooting-grounds and

pleasure-gardens of the famed Red House, on the river-bank; and will commence without delay the erection of the iron suspension-bridge which is to cross the Thames immediately below Chelsea Hospital.

At a court held on the 13th, the Goldsmiths' Company unanimously decided to award *One Thousand Pounds for Prizes* to be given to those artists of the craft, of the United Kingdom, who can produce works of the highest design and merit in gold and silver plate, for the Exhibition of 1861. The sum of 1000*l.* is to be divided into prizes varying in amount from 300*l.* to 20*l.* and 10*l.* for works of the most costly description, which it is more than probable will be eventually purchased by the Company. There will be services, candelabra, church plate, and smaller objects, even to a salt-cellar; so that the most humble artisan in the craft shall receive his impulse, to encourage him in honourable exertion, as much in proportion as the first goldsmith in the land. The various works for competition are to be forwarded to the Goldsmiths' Hall without the name of the owner; when each piece will be rigidly scrutinised, and those possessing the highest standard of merit in both design and workmanship will be accepted and forwarded to the Exhibition of 1861, and take their stand in competition against the whole world.

A meeting of the *Peace Society* was held at Wrexham, on the 12th. An announcement that Mr. Cobden was to be present had doubtless the effect of increasing the attendance. About 2000 persons were present, though the admission was by ticket at one shilling and sixpence each. Townsend Mainwaring, Esq., formerly member for Denbigh, was in the chair. Mr. Sturge gave a detail of the recent endeavours of Messrs. Burrett, Wheeler, and himself, to put a stop to the war between Denmark and Schleswig-Holstein. Mr. Cobden entered fully into the objects and history of the Peace Society; and, in the course of his speech, adverted to the fact that in 1841 Sir H. Peel was the very first to recommend that agitation in which the peace party and himself were engaged. That statesman spoke of the enormous standing armaments, and of the dangers of the governments of Europe, and he showed that the English government ought to endeavour to come to some terms by which they might effect a mutual reduction of armaments. They could therefore claim for their movement the sanction and approbation of the most practical statesman that had lived in our age. Mr. Cobden then briefly adverted to the Peace Congress doctrine; and said that the society wished, if possible, to prevent the people from lending their money to bankrupt governments, and those governments keeping up great military establishments. With reference to the scorn cast upon them that they were enthusiasts or Utopians, let people not think that he was dreaming of the Millennium, but let them think that he entered upon this work with the impression that he would never see the Millennium, but that the sword would continue to be drawn and war waged long after his time. He did not believe that they were going to bring about any sudden and instantaneous change in the policy of states, but he firmly believed that they were engaged in a work in which conscience and holy Heaven would find cause of approbation. Mr. Williams, M.P. for Macclesfield, moved a resolution to the effect that this meeting, having heard the explanations of the objects of the Peace Congress, was of opinion that every effort should be made to induce the government to substitute reason for physical force in deciding international disputes; and that it is the duty of Great Britain to set an example to the civilised world by greatly reducing its present extensive armament. Mr. T. Edgeworth, of Wrexham, seconded the resolution, which was carried.

The imperfect protection afforded by the existing law of patents, and the injurious consequences of obtaining that protection, have lately led to the formation of a *Patent-law Reform League*. On the 13th, a deputation from this body had an interview, by appointment, with Sir George Grey and Mr. Labouchere, at the Home Office. The deputation having reporters with it, Sir George Grey guarded himself, and also warned Mr. Labouchere, when he entered the room, against expressing any opinion. He remarked that the society had presented a memorial to the Queen, and asked had they any state-

ments to add to that memorial: or had they any suggestions to make beyond those contained in the report of the committee on the Privy Seal and Signet Office. Mr. Campin replied, that "the suggestions of the committee's report are good, but they do not go far enough: the main object is to have an immediate reduction of the cost of the patent from its present prohibitive amount of 100*l.* for each of the three United Kingdoms, and to have preliminary registration at no cost. In America the cost of a patent is about 6*l.* or 7*l.* to a citizen; to an Englishman it is 500 dollars, because we charge so much in our country." Mr. Price stated that he had been secretary to a society formed to assist poor inventors; but the society fell to the ground, from inability to meet the immense charges of the Patent Office; if a society was so beaten, how fatally must the poor inventors themselves be repressed? Mr. Campin, Mr. Waller, and Mr. Townley said, that if something be not done immediately, a number of persons intending to prepare models for the exhibition next year must hold back. Mr. Labouchere observed, that what the applicants wanted seemed to be not so much a general measure of Patent-law as an immediate measure to reduce the expenses. Mr. Campin assented; and Mr. Labouchere expressed his wish to receive a written communication stating how it was proposed to accomplish this object.

At the yearly meeting of the *Burton-on-Trent Farmers' Club*, on the 14th, Mr. Adderley, M.P., Mr. Evans, M.P., and Mr. W. Gishorne, gave expression to their views on the difficult position of the agricultural interest. Mr. Adderley urged on proprietors the necessity for meeting, in a temporary manner, the depression of the present transition state. Mr. Evans acknowledged that if prices continue as they are, there can be no doubt that the relations of landlord and tenant must undergo considerable alteration. Mr. Gishorne declared his opinion, after giving the whole subject his most impartial consideration, that the landed interest is unequally and unfairly burdened in respect of local taxation; nevertheless, with respect to burdens, he was little sanguine of a reduction; he did not blame members of parliament, nor the ministry, on this subject; for the real fact was, the constituencies themselves cared nothing at all about economy. He ascribed the fall of prices to the fact that commodities have for many years increased faster than gold; larger supplies of gold, especially those from recently-discovered sources, would check this. And on the whole his opinion was, that the lowest point was passed, and that there were signs of improvement.

The Board of Health has published a report by the Honourable William Napier on the gathering-grounds of the proposed *Water-supply to the Metropolis*. Mr. Napier had been commissioned to gauge the streams and make a careful re-examination of the capabilities of the country for the purpose intended. He states that, at first view, he rather feared he should not find sources that would yield as much as the present supply—equal to a canal nine feet wide and three feet deep, flowing two miles an hour throughout the day and night; but a month's search has produced the result. He gives a table of forty springs which yield at their source nearly forty millions of gallons per day, of a quality at and under one degree of hardness, equivalent to the supply of more than half a million houses, at the rate of seventy-five gallons for each house per day; and he can answer for at least ten more millions of gallons per day at and under two degrees of hardness. He gives the names of these springs, in a table showing the yield and hardness of each. Mr. Napier's researches, however, have thrown so much doubt into his mind in reference to the plan of gigantic reservoirs for storing the supply for months, that he proposes a plan of tile-drains which shall catch the waters as they issue from the earth, and lead them to a main trunk that shall flow into a covered reservoir on Wimbledon Common, large enough to contain two days' supply against any emergency, and throwing its waste into the Thames. He promises in a future report to give the details, and estimate the cost of his proposed plan.

A correspondence, respecting the *Boys who were expelled from Woolwich and Carshalton*, has taken place between Mr. J. Leveson Gower (on the part of the

parents and guardians of the boys) and the Master-General of the Ordnance. Mr. Leveson Gower urges Lord Anglesey, amongst other points, to revoke the sentence passed upon the boys, and re-investigate the case, which the Master-General declines to do on various grounds—one of the most cogent being, that to do so would involve a publication of the whole evidence; which Lord Anglesey not only deprecates, but warns the parents and guardians against having recourse to. Lord Anglesey further denies that his circular ordering the removal of the boys can justify the assertion that it tended to impute the worst of crimes to a single individual implicated. Mr. Leveson Gower closes the correspondence by stating that such further measures in the conduct of the case will be adopted, as upon consideration may be deemed to be expedient.

The Admiralty have determined to put an end to the practice of having "*Mess-men*" in the Navy. No person is in future to be entered on board her Majesty's ships, or to be employed in the service, as a "*mess-man*," whether in the gun-room mess or the ward-room mess; it having been found that most of the extravagance, and nearly all the intemperance, with their concomitants—ruin, disgrace, degradation, and loss of position in the service, and society—are attributable to the practice of the gun-room mess of large ships appointing a regular "*messman*," from whom any quantity of spirits or wine could be procured by paying for it.

At a meeting of the *Law Amendment Society*, on the 18th, Mr. Dudley Field, one of the Commissioners who prepared the Amended Code for the State of New York, was introduced, and gave an account of the improvements made by that code in the system of legal procedure. He stated, in the first place, that the courts of justice in the State of New York were originally modelled on the old system of England. They had a Chancellor and a Vice-Chancellor, whose jurisdiction was modelled on the English Courts of Equity; they had a Supreme Court, like the Court of Queen's Bench; they had a Court of Appeal, consisting of the Senate, answering to the House of Lords; and when an appeal came from the Court of Chancery, the Judges of the Supreme Court sat with the Senate; when, on the other hand, the appeal came from the Supreme Court, the Judges of the Court of Chancery sat in the Senate. Thus they had two systems—that of Common Law, and that of Equity; and suitors were bandied about between both till their patience or their purse was exhausted. They had also different forms of procedure in actions at common law, which added to the difficulty and uncertainty of obtaining justice. Such were the intolerable evils of the system, that the first thing the Convention did was to abolish the Court of Chancery in toto, and to create one supreme tribunal, which should administer all the laws of the land, whether in law or in equity; and that testimony should be taken, whenever the witnesses were within the State, *circa voce*. This was in 1847, and three commissioners were appointed to carry their recommendation into effect. The commissioners reported from time to time; their first report being made in February 1848, and their recommendations passed into a law on the 1st of July in the same year. In the next year some additional portions of the code were prepared, which were passed into a law in the course of last session; and on the last day of last year the whole code, civil and criminal, was given in by the commissioners, but that had not yet been passed into a law. What had been made law comprised nearly all the provisions relating to civil actions, by which all the previously existing rules of pleading were abolished, and one uniform course of procedure for all kinds of actions was established. They had adopted such a system of pleading as parties would naturally adopt in a case of private arbitration. The plaintiff, in his first pleading, stated in plain and ordinary but precise language what was the nature of his complaint, and what the ground of his remedy. Then the defendant put forth his answer, specifically denying those portions of the plaintiff's allegation which he meant to controvert, and admitting those which he did not, besides stating any new matter on which he might rely. To that new matter the plaintiff was allowed to reply, and then the proceedings closed and the cause was ready for trial.

This was the whole system; and it was found completely to obviate the whole difficulties that might be expected to arise in fusing the legal and equitable proceedings. With regard to the practical results of the system, he might state that he had not found the slightest difficulty in the world, and he did not know of a single person at the bar of New York who asserted that the union of the two practices was attended with any difficulty. Of course there was great clamour at first, and many prophecies of failure; but in practice no difficulty had been found. The code had been copied, in whole or in part, by the States of Missouri, California, and Mississippi; and conventions for adopting it were about to be held in Kentucky, Iowa, Tennessee, and Massachusetts.

In answer to questions put to Mr. Field respecting the working of the new system in New York, he said, that the parties in a cause are sworn to the truth of their statements according to their knowledge and belief; with this exception, that if the plaintiff dispenses with the oath of the defendant, he is not called upon to give his own. They may also be brought before the jury. One effect of this rule is, that a plaintiff sometimes at once proves his case without the expense of other witnesses, and at other times he learns immediately that which shows him that he cannot prove his case at all. As to costs, between the lawyer and client, the old fee-table has been abolished: the law does not interfere with bargains for remuneration between the lawyers and client; and if no specific bargain is made, the court decides according to the custom of the profession—as it does on the fees of doctors, and of gentlemen in other professions. Between party and party, the scale of costs is regulated by stages of the proceeding—so much up to preparation for trial, so much more for the next stage, and so on. Any cause may be got ready for trial in forty days—an ordinary one in twenty days; and, when the heavy arrears of the old system shall have been cleared off, it will be possible to carry a case wholly through in a single year, including a first appeal before three or four judges, and a second appeal before eight judges. The meeting cordially thanked Mr. Field for the valuable information he had given.

The *Dangers of the Navigation of the Channel* are strikingly exhibited by an important document just published, compiled by Mr. J. Young, of the Underwriters' room at Lloyd's, giving a list of the wrecks and casualties to shipping which have been officially reported to have occurred between Dungeness and London during a period of eighteen months, from January, 1849, to June, 1850, inclusive. To each casualty is affixed the extent of damage sustained, estimated as nearly as could be ascertained. The result is, that during the eighteen months in question the amount of property destroyed by known wrecks and casualties, is between 400,000*l.* and 500,000*l.*, besides the sacrifice of a great number of lives. The object of the compiler is to show the enormous annual destruction of property occasioned by the dangers of navigation between the Isle of Wight and the Thames, which would be avoided by homeward-bound ships discharging in the Southampton docks, besides the saving that would be effected in the rate of insurance, time occupied between the island and London, and the extra cost of wages, provisions, and incidental expenses. It is a remarkable fact that few wrecks ever take place in that part of the British Channel to the westward of the Wight, but that the real dangers commence after passing the back of the island to proceed to the Thames. To this document is subjoined an abstract of the loss of shipping and life, between the Isle of Wight and London, for the seven years from 1837 to 1843 inclusive, by which it appears that during that period 499 vessels lost anchors and cables, were partially dismantled by bad weather or being run foul of, or sustained other damage; 560 vessels took the ground, but were got off again; 260 vessels entirely wrecked or foundered, of which the crews and passengers were saved; 66 vessels were totally lost, with all or several of the crews or passengers; the total number of casualties being 1375. Amongst the ships lost in 1842 and 1843 were those splendid Indianmen, the *Reliance* and the *Conqueror*, nearly every soul on board of which, amounting to little short of 200, perished. In the latter year

the ship *Burhampooteer*, with emigrants from London for New South Wales, was, a few hours after leaving the Thames, utterly wrecked near Margate, on which occasion the people on board had a hair-breadth escape with their lives, losing all the property they had. The loss of the *Amphitrite* is also too recent to be forgotten; she was riding at anchor in the Downs, was driven out by violent weather, and totally wrecked near Boulogne; she had on board nearly 200 female convicts, bound to Australia, all of whom, with the whole of the crew, were drowned, and the vessel scattered in fragments on the shore. During the first six months of 1850 it appears that no less than eight vessels have been lost between London and the Wight, with all on board; and the number of lives so sacrificed is estimated as little short of 500.

PERSONAL NARRATIVE.

THE Queen and the Royal Family returned from Osborne to Windsor Castle on the 1st instant. Her Majesty's private band, which had not played before the Court since the death of Sir Robert Peel, resumed its rehearsals on the day before her Majesty's arrival.

Mr. George Arbuthnot has been appointed *Auditor of the Civil List*, one of the most important offices in the Treasury. Mr. Stephenson succeeds Mr. Arbuthnot as private secretary to Sir Charles Wood.

At a Court of Directors, held in the East India House on the 13th, Lieutenant-General Sir John Grey, K.C.B., was sworn in *Commander-in-Chief of the Company's forces*, and second member of Council on the Bombay Establishment.

The Right Honourable Richard Lancelot Shill has been appointed her Majesty's *Minister Plenipotentiary at Florence*, in the place of the late Sir George Hamilton.

It is understood that Sir John Herschel will succeed Mr. Shill as *Master of the Mint*. This appointment will no longer be held by a member of parliament, and the salary will be reduced to 1500*l.* a year.

The *Gazette* of the 5th announces that the Queen has granted to Sir Robert Monsey Rolfe, late Baron of the Exchequer, the office of a *Vice-Chancellor of the Court of Chancery* in England.

The Queen has granted a *Pension* of 109*l.* a year to Mr. John Payne Collier, the editor of "Shakspeare," and author of the "History of the English Stage." The warrant expressly mentions that the pension is given "in consideration of his literary merits."

Mr. (now Sir Charles) Eastlake has been elected *President of the Royal Academy*, and has received from the Queen the honour of knighthood.

Obituary of Notable Persons.

The Dowager Lady SUFFIELD died at Blickling Hall, in Norfolk, on the 27th ult.

Dr. INGLIS, Bishop of Nova Scotia, died in Curzon Street, May Fair, on the 27th ult., in the 73rd year of his age.

Sir DONALD CAMPBELL, Bart., Lieutenant-Governor of Prince Edward's Island, died at the Government House, Charlottetown, on the 18th ult., aged 50.

Mr. Commissioner HARRIS, of the Insolvent Debtors' Court, died at his residence in Chester-place, on the 25th ult., in his 77th year. He had been a commissioner of that court for nearly thirty years.

LORD HANCLIFFE died on the 1st inst., at Bunney Hall, near Nottingham. He was in his 65th year; the title is extinct.

ANNE LANCEY, widow of the late Thomas Lancey, Esq., died on the 9th, at Greenwich, in her 101st year.

The Countess of CRAWFORD and BALCARRES died at Haigh Hall, Lancashire, on the 16th, in her 67th year.

ALEXANDER RAPHAEL, Esq., M.P., died at Surbiton, on the 17th, in his 76th year.

The Right Rev. Dr. KENNEDY, Roman Catholic Bishop of Killaloe, died at Farnhamtown, King's County, after a protracted illness, in his sixty-third year. Dr. Kennedy had attended the synod at Thurles, where he had taken an active part in opposing the condemnation of the Queen's Colleges; and he was one of the thirteen prelates who subsequently signed a memorial to the Pope, with respect to those institutions. The deceased prelate had been most earnest and successful in his exertions to discourage the "Young Ireland" movement during the excitement of 1845.

The Right Hon. Lord NUGENT, M.P. for the borough of Aylesbury, at his seat, Lillies, on the 26th.—

COLONIES AND DEPENDENCIES.

THE intelligence from India contains no item so interesting as the commencement of the Bombay railway. From the Australian Colonies there is as great a void of political news; but we have tidings, which to many will be extremely welcome, of the landing of the first batch of female emigrants sent out by Mr. Sidney Herbert's Committee. Thirty-eight had been landed at Port Philip; sixty-five at Adelaide; and all had been placed in excellent situations within a few days after landing. The Sidney paper tells us much of Doctor Lang, and the doctor adds a little from himself. He has fulminated a sort of bull or allocution against the new constitution, and has given formal notice of a motion in the Council Chamber which is to do nothing less than annihilate Lord Grey. We shall see.

The *Overland Mail* bring dates from Bombay to the 17th ult. British India was quite tranquil. The civil war in the Nizam's territories still lingers on, and another affair has taken place in the neighbourhood of Ellichpoor between the troops of its Nizam and those of the Nizam, in which the latter were defeated, and lost two guns, but no particulars have yet transpired.

The Governor-General was expected at Simla on the 5th or 6th instant. His party were all in excellent health. Lord Falkland was at the Malaheshwar hills; he had had another severe attack since the departure of the last mail, but was better. His state of health, however, continued to occasion serious apprehensions of his being ultimately obliged to resign his post for the same cause as his two predecessors, Sir G. Arthur and Sir G. Clerk. The works of the Bombay Railway had commenced.

The accounts from *Hong Kong* are to the 29th of September. There had been a very great improvement in the health of the men belonging to the 39th Regiment. The fever had greatly abated. There were still many in the hospital, but the deaths latterly had only averaged about three a week. The insurrection in one of the adjoining provinces to Canton had become of such magnitude, that a body of Government troops had been defeated, and the rebels were said to be already in the Canton province. The authorities there were preparing all the force they could muster to march against the rebels. The movement is said to be directed against the Tartar dynasty, but it is impossible to obtain correct information.—The alarming state of the country occasioned much uneasiness to the Chinese population in Canton.

A *Piratical Mutiny* had taken place on board the ship *Kelso*, which arrived at Hong Kong on the 14th of September from San Francisco. About three weeks before the vessel's arrival Captain Innes was informed by two of his crew that a mutinous feeling prevailed among part of the ship's company, who had determined to murder him, the steward, and carpenter, and seize upon the vessel, in which they expected to find a large amount of treasure. Captain Innes, with the energy and coolness which mark the true sailor, adopted the requisite means to insure the safety of the ship. The plot had been hatched by some sailors shipped in San Francisco to replace men who had left the vessel after her outward voyage. On the evening on which the piracy was attempted, Captain Innes, having previously had information of the intention of the ringleaders, retired—not to the cabin he was accustomed to use, but to an adjoining one—the steward also, by his orders, changing his sleeping place. Under the dread of momentary attack sleepless vigilance was called for. The night progressed, the mutineers broke open the arms' chest and possessed themselves of its contents; but, fortunately, it contained no powder. One of the mutineers crawling on his hands and knees into the cabin which had been vacated, gave information to Captain Innes that the moment for action had come. He fired at the ruffian and shot him dead. He then made his way through the skylight to the poop, where he found the mutineers all armed. Calling upon them to lay down their arms, his order was obeyed by all but one, who endeavoured still to intimidate and approach him. Captain Innes told the man he would call upon him three several times to lay down his weapon and go forward; and that, failing his doing so, he would shoot him. He persisted. The captain fired, mortally wounding him, when the mutiny was quelled. The man, at the date of the account, was

lying at the point of death in the Hong Kong hospital, and his fellow-criminals were under examination before the police magistrates.

The accounts from *Jamaica* are highly important. The cholera was raging fearfully in Kingston, Port Royal, and St. Catherine's; and, up to the time of the packet's departure, the deaths in Kingston averaged at least 30 a day. The latest official accounts published up to the morning of the 27th of October showed a total of 266 deaths in Kingston alone. In Port Royal and St. Catherine's the actual numbers were less; but, compared to the population of Kingston, the mortality has been far greater, particularly in Port Royal, where about an eighth of the population has been cut off. The deaths in all parts, with two or three exceptions, occurred among the lower orders of the black people, some of whom resided in miserable hovels and damp localities. An order has been issued by the Governor in Council forbidding communication coastwise between Port Royal and Kingston, and the uninfected ports, under certain restrictions. In all districts the want of medical men was much felt. Kingston, with a population of some 40,000 inhabitants, contains only ten doctors, who, in addition to their private business, have in various instances to attend the public prisons and institutions. Spanish Town contains but three doctors, and Port Royal none at all. At the latter place the services of the surgeons attached to the Royal army were secured through the influence of the Kingston authorities. The House of Assembly met on the 22d of October, and passed a short act, appointing local boards of health in the different parishes, and authorising the issue of 5000*l.*, or less, in island notes, to put such boards in funds to carry out the sanitary regulations. After the enactment of this law, the Legislature, with the sanction of the Governor, adjourned until the 19th of November. Commercial matters were quite unsettled; indeed, a general gloom was spread over all interests and all classes. The Governor had issued a proclamation, ordering that a day of general prayer and humiliation should take place on the 1st of November.

From the other *West India Colonies* the news is not important. In *Trinidad*, *Barbadoes*, and *Antigua* the weather is described as remarkably fine, and the crops extremely promising.

The city of *Fredericton, New Brunswick*, was desolated by a dreadful fire on the 11th instant. Upwards of one-half of the city, it is stated, is burnt, and above 3000 people rendered houseless. Few particulars have as yet been given.

The intelligence from the *Cape of Good Hope* is to the 28th of September. The arrival of the Queen's letters patent for constituting a Local Government had excited much discussion.

The Legislative Council was opened on the 6th September. Sir Andries Stockenström, Mr. Brand, Mr. E. W. Reitz, Mr. Fairbairn, and Mr. Goddington took their seats as five of the six members nominated in conformity with the votes of the municipalities and the divisional road boards of the colony. Mr. Cocks took his seat as the Governor's nominee. The election qualification of the members of the Council afforded the first point for discussion. The officials proposed a property qualification of 2000*l.* above all encumbrances; the popular members rejected any property qualifica-

tion, and proposed that the members of the Council should be chosen by "the combined votes of all persons possessing the electoral franchise in the whole colony,"—arguing that the possession of the confidence of so vast and varied a constituency would be a qualification higher than the ownership of 2000*l.* or even 4000*l.* fixed property. The popular proposal was supported only by the elected members, Stockenstrom, Fairbairn, Brand, and Reitz: Mr. Godlonton joined the officials, and made the division against it one of seven to four. By a similar vote the property qualification was affirmed; and it was resolved that the members of Council should be elected for ten years. On the 20th September, the secretary of government having presented some drafts of ordinances for consideration, Sir Andries Stockenstrom moved as an amendment, that the ordinances for constituting the local parliament should be proceeded with till completed and passed, before any others be taken up. He was supported by the same three popular members who before sided with him: Mr. Godlonton again joining the officials, he was beaten by seven to four, and a resolution the reverse of that which he had moved was affirmed. Sir Andries handed in a paper of "reasons for dissent," signed by himself, Mr. Fairbairn, Mr. Brand, and Mr. Reitz: he and those gentlemen then tendered the resignation of their seats in the Council, and retired.

On the 21st September, the representatives who had resigned issued a joint letter to their constituents, assuring them, that within a few days some proposal would be publicly submitted for bringing their wishes explicitly before the Queen, the parliament and the people of England.

The accounts from *New South Wales* reach the 30th of July. The Legislative Council at Sydney was in full session, and applying itself to measures of a useful and practical character, some of them rendered necessary by the exigency of peculiar circumstances, and others consequent upon the rapid advancement of the colony in population and commercial prosperity. The question of steam communication with England was brought before the Council by Mr. Donaldson, in a series of resolutions which excited an animated and interesting discussion, in the course of which the several speakers were unanimous in condemning the tardiness of her Majesty's government in completing the necessary arrangements. The subject was referred to a select committee, with an instruction to report upon the propriety of withdrawing the vote of 6000*l.* per annum, already placed at the disposal of the Executive, and offering it as a bonus open to private competition. A select committee of the Legislative Council was also appointed to inquire and report upon the expediency of forming a settlement at Cape York, on the north-west coast of New Holland, or in the immediate neighbourhood. Its eligibility has long been the subject of investigation and favourable recommendation by naval surveyors, and it is expected that a staff of government surveyors will be speedily despatched to the projected colony. The geographical position of Cape York is such as is said to render its occupation an object of paramount importance. The mover of the resolution in reference to the proposed settlement was Mr. Nicholls, a native of New South Wales, born of European parents; and the conclusion of his speech affords gratifying evidence of the feelings entertained by that class of the community towards the mother-country. Such a settlement (he observed) would undoubtedly be another step in the progress of civilisation—another outpost of the great Australian nation which was destined to perpetuate the religion and the language of the Anglo-Saxon race in the southern hemisphere. It was by such steps as these—by pacific triumphs—by establishing educational institutions, and by fostering commercial enterprise, that Australia would become great, and never by the arms of its children being turned against their forefathers.

Prince Frederick of Schleswig-Holstein, travelling as Lieutenant Gronwald, and accompanied by Captain Carr, a British officer, had arrived at Sydney on the 10th of Philip, and was a guest at Government House. It was expected that the young prince would shortly return to Europe by the way of India.

The *New Zealand* papers have been received to the 12th of June. They announce the return of Capt. Imprey and party to the Wairau, from an expedition undertaken with a view to find a road to Port Cooper. They went about 120 miles up the country in a southerly direction, crossing several streams, all falling into the river between the White Bluff and Cape Campbell. They discovered an opening into the Port Cooper plains, but a heavy fall of snow compelled them to return. They entertain no doubt, however, that a fair road for drays may be made between the Wairau and Port Cooper. The party saw two birds standing each five feet high, supposed to be emus, and made several interesting botanical discoveries. They report the country over which they travelled as eligible for sheep runs and cattle stations, and some of it as well wooded.

A letter, dated Nelson, 16th May, states that the accession to the population of the settlement, received by the Lady Nugent, had been most opportune.

PROGRESS OF EMIGRATION AND COLONISATION.

The work of *Emigration* goes on rapidly from the west and south of Ireland. In the end of October a crowd of peasants passed through Athlone on their way to the New World. The local paper states that they came from the village of Clonora, about two miles distant, and had been but a few days previously evicted from their holdings. While going through the town they were cheering and shouting, and appeared in the best possible humour. On inquiry as to the cause of their unusual mirth, it was ascertained to have arisen from the circumstance of their having received a large sum of money from their friends in America, which came to hand on the very morning they were ejected from their cabins.

A remarkable case of *Successful Emigration* is that of Mr. James Wilson, a native of Guithness, who lately arrived in England from Australia. Two-and-twenty years ago he landed as a young emigrant at Van Diemen's Land with 50*s.* in his pocket; fifteen years ago he crossed over to Port Philip, when there were only two huts in that now flourishing colony, and there he has remained ever since. He is the largest individual sheep farmer in the colony, being the owner of 30,000 sheep, and land sufficient, reckoning, as he does, an acre to a sheep, to feed 60,000. He is now worth 3000*l.* a-year. His visit to England is to see the old country once more, when he purposes to pass the remainder of his life in South Australia.

Intelligence has been received of the arrival in Australia of the first parties of *Female Emigrants* despatched by the Committee of the Female Emigration Fund. The ship *Culloden*, with a party of 38 girls, arrived, all well, at Port Philip on the 6th of July; the ship *Duke of Portland*, with 65 on board, arrived, all well, at Adelaide, on the 2d day of August. The young women are stated to have behaved with great propriety during their passage out, and to have had good health throughout their voyages. The most favourable testimony is borne to the good conduct of these in charge of the emigrants, and to the well working of the arrangements which were made by the committee here on their behalf. Both at Melbourne and at Adelaide this immigration appears to have been very favourably regarded by the colonists. Of the 38 landed at Port Philip on the 8th of July, it appears by the Melbourne papers that 31 were engaged as servants at wages varying from 12*l.* to 20*l.* a year before the evening of the 10th, and subsequent advices state that every one of the girls had obtained employment. All the girls landed at Adelaide had secured employment at fair wages within four days after arrival. The ladies' committee, who provided for the reception of the young women at Port Philip, appear to have been most favourably impressed by their appearance and demeanour; and one of the Melbourne papers says, "They appear to belong to a class of immigrants peculiarly adapted to this country, being young, healthy, and intelligent, and apparently possessed of that happy buoyancy of mind, and that hearty determination of purpose, that will enable them to act well their part in any of the many situations of usefulness which lie so invitingly before them."

NARRATIVE OF FOREIGN EVENTS.

PRUSSIA with twice three hundred thousand men has accomplished the great feat of marching up a hill and marching down again. She has shown all her teeth, that the world may perceive she is unable or indisposed to bite with them. Industry and commerce have been suspended, the workshop and the farm have been deserted, all the ordinary hopes and avocations which make up the everyday life of Prussia have received a check of the most disastrous kind; and, as far as yet appears, for no earthly object but to show how eager the king is to obtain the domination of Germany, and how utterly unable and imbecile to accomplish his desire. It remains to be seen whether the people, thus bodily dragged into the conflict, may not take upon themselves at length the authority of ending it.

The French President has delivered a message as meek as Cardinal Wiseman's appeal. He promises nothing less nor more but that he will be a good boy in future, and attend to all the tasks which the Assembly may choose to set him. He is delighted that France should be so prosperous, and is preparing all kinds of things to make her more so. Will the Assembly be so hardhearted as to turn him off when he is so good a boy?

Pio Nono, after dispatching his bull to England, favoured Sardinia with an "allocation." In this document his Holiness adopts all the acts of the Cardinal Archbishop Franzoni, formerly commemorated in this narrative; and distinctly approves of the refusal of the holy sacrament to a dying statesman, who had been active in promoting a law hateful to the Roman See, because favourable to the equal civil rights of priest and layman! Let Lord Beaumont, and other Catholics in England, take warning in time.

The man-hunts continue in America; and a real rebellion has broken out in China. The earth is full of portents of which the issue must be waited quietly. Mr. Webster preaches not only the sacred duty of obedience, but the infamy of resistance, even to the law which creates a property in the bodies and souls of human creatures; but even in quiet and stationary China, it would seem, and with little more than tariffs and duties at issue, a termination is apt to come, sooner or later, to these duties of obedience and penalties of resistance; and Mr. Webster may yet live to discover that there are inhuman laws which carry with them no obligation of human acquiescence or submission, even for a day.

The *National Assembly of France* met on the 11th. On the following day it chose its officers. M. Dupin was elected President, by 383 votes out of 594 present; the other votes being divided between M. Mathieu de la Drome and two or three more. M. Dupin took the chair, and immediately declared M. Baroche, the Minister of the Interior, to be in possession of the tribune. M. Baroche proceeded at once to read the "Message of the President of the Republic; presenting, in virtue of the 52d article of the Constitution, the *exposé* of the general state affairs of the French Republic, addressed to the Legislative Assembly in the session of the 12th November, 1850." The Message treats its subjects under the headings of Interior, Finances, Public Works, Agriculture and Commerce, Justice, Public Instruction and Religious Worship, War, Marine, and a concluding *Résumé*.

Under all these branches the view given of public affairs is highly favourable. In the Interior, confidence and tranquillity have been restored. The finances progress favourably; international commerce has been raised; and everything concurs in warranting the hope that the deficit of 1850 will be sensibly diminished, and that the equilibrium announced for 1851 will be realised. Great reductions are making both in the army and navy. Foreign relations are satisfactory. The benefit to the French flag of the liberalised navigation-law of England is acknowledged; and hopes are expressed that pending negotiations will end in arrangements still more in conformity with the interests of the two countries.

The reading of the Message was listened to with fixed attention, and the closing passages called forth loud applause. The favourable impression made by the Message had even increased on the 13th. Twelve hundred copies were posted up in the different quarters of Paris, by orders of the Prefect of Police; and 37,000 copies were sent to the provincial communes.

At the commencement of the sitting on the 13th, the result of the ballot for the vice-presidents was announced. MM. Daru, Léon Faucher, Benoist d'Asy, and General Bédou were all re-elected and proclaimed vice presidents. The old secretaries, MM. Arnauld (dol'Arrière), Lacaze, Chapot, Heckeren, Beraud, and Peupin were also re-elected. The business transacted was not of public interest, except perhaps the motion made by M. Antony Thourret, who proposed that the prorogation committee should deposit what it has drawn up on the incidents which have created so much agitation in the course of the vacation, and that the minutes of the

different meetings of the committee should be printed and distributed. The motion was seconded by another Montagnard (M. Baudin), but was received with loud expressions of disapprobation by the majority. M. Odilon Barrot then rose and said that the prorogation committee did not consider it necessary to present a report, and that he had therefore no further explanations to give on the subject. He terminated by moving the order of the day, which was voted by an immense majority. The House then rose.

The subsequent business of the Chamber has hitherto been of little interest.

A serious occurrence has taken place in a small town of about 5000 inhabitants, called Bourg St. Audéol, in the Ardèche. On the morning of the 18th the Attorney-General of the department, accompanied by 90 men, comprising gendarmes and troops of the line, proceeded to effect the arrest of a person named Morrice, Deputy-Mayor of the town, on a charge of being implicated in the Lyons affair. The arrest was effected; but as they were escorting him the troops were followed by a large crowd, and when they were about to issue from the streets to the country, they found their way stopped by barricades, from behind which they were received with a volley of stones and some musket shots. The soldiers fixed bayonets and moved steadily on, while those who were mounted were preparing to leap the barricade, when the lieutenant who commanded the gendarmes was struck by a bullet which broke his under jaw. The troops halted for an instant, loaded with ball, fired a volley at the assailants, charged, swept in an instant the barrier before them, and scattered the infuriated rabble in all directions. One of the insurgents lay dead behind the barricades, and several wounded. The gendarmes arrested seven, and led them off with the prisoner to rescue whom the revolt was got up.

The intelligence from *Germany* during the past month has constantly fluctuated between peace and war; and the innumerable conferences and negotiations between Prussia, Austria, Russia, and the smaller German states, have as yet led to no ascertained results. In consequence of the failure of Count Brandenburg, the Prussian Minister, to effect an amicable arrangement with Austria, the whole Prussian army has been placed on a war footing and the landwehr has been called out.

The Prussian chambers were opened on the 21st by the King. The following is the portion of the Royal

speech which relates to the different branches of the German question:

"A full account of the use made of the credit of 18,000,000 thalers, voted for military purposes, will be laid before you.

"The dangers by which you were induced to grant that credit have not yet been removed. My pacific relations to the great Powers of Europe have not indeed been interrupted; but, unhappily, it has not been possible to carry into effect my intention to create for the German States a Constitution equal to their necessities. I cling to the idea which was the foundation of my efforts, in firm hope in the future; but I will only again attempt its realisation on new grounds, when a decision has been come to on the future organisation of the German Bund.

"I hope that the negotiations on this subject will soon lead to a successful result.

"The peace with Denmark is concluded and ratified; but it has not been possible as yet to carry it in all points into effect.

"In a neighbouring German State disputes of the most irreconcilable character have taken place. An attempt to interfere, made from one side only, threatened to violate the rights of Prussia, and has led to misunderstandings in which we are directly involved. Our representations, founded on the conditions of our geographical and military position, did not meet with proper attention on the part of the Sovereign of the State and his allies. Besides this, concentrations of troops were made close on our frontiers, in places distant from the scene of those embarrassments, by which the security of the monarchy was menaced. Then I could no longer defer what had been long postponed. I have called out the whole warlike power of the land, and I see with pride and joy that all my people capable of bearing arms have risen like one man, and joined themselves to my brave and faithful army.

"In a short time we shall stand more strongly armed than at any period of old or modern time. We do not seek war; we wish to lessen no one's rights, or force our proposals on any one; but we require an organisation of collective Germany, consistent with our present position in Germany and in Europe, and commensurate with the sum of the rights that God has placed in our hands. We have a good right; that we will defend, and we will remain in powerful preparation, under our weapons, till we are certain it has obtained recognition.

"This we owe to Prussia and to Germany.

"I hope that our rising will be sufficient to assert our right; if this is attained, it is without danger to the peace of Europe, for my people are reasonable in the same degree as they are strong.

"It is for you, gentlemen, to furnish me with the means by which this end is to be secured. I lament the sacrifices which on this account must be imposed on the nation, but I know, gentlemen, that your zeal will not be behind that of the whole people. You will furnish a proof that our Constitution, to which I inviolably adhere, hinders not, but on the contrary promotes strength of action in Prussia.

"And as all party spirit has been merged in the enthusiasm of the moment—as the people and the army feel themselves united with me and each other—you too, the representatives of this admirable people, will stand by me, unanimous and firm, in the dangers of the present.

"Well then, let our watchwords be, union in fidelity, confidence with God in one spirit—in the real old Prussian spirit.

"God has often and largely helped us with it, and will help us still further.—Such is my trust."

The latest accounts from Berlin state that the Emperor of Russia has reiterated his demand for the immediate intervention in Schleswig Holstein, and threatened Prussia with his army if she opposes it. The Czar would not object, however, to the pacification being accomplished by Prussia.

The Austrians are reported to be in Saxony.

Letters from Munich state that the Hessian question will be settled by mutual declarations.

The seculding of provisions from Lower Hesse to the neighbourhood of Fulda has been forbidden by the commander of the Prussian troops.

The *Queen of Spain* in person opened Cortes on the 31st October. The royal speech was of unusual length. It announced the happy resumption of diplomatic relations with Great Britain in a manner worthy of both nations; proudly referred to the brilliant results of its intervention on behalf of the Pope, and to the expedition of foreign pirates in Cuba, who had been obliged to fly before the loyalty of the population and the resolution of the forces; it referred to considerable reforms in the administration of roads and institutions, in the conduct of prison discipline, and in the removal of obstacles to agricultural and commercial industry; and it promised schemes for the definite settlement of the public debt, and for the settlement of the fueros of the Basque Provinces.

The accounts from *Constantinople* mention the *Destruction of the Flag-ship* of the Turkish Admiral, with the loss of 500 men. She was a beautiful ninety-gun ship, and was moored in the harbour, near the Arsenal; on either side of her lay a three-decker or a ninety-gun ship. At half-past 9 on the 24th of October, without any kind of warning, or anything having occurred to excite suspicion, the powder in her magazine ignited, no one knows how, and she blew up; nor were there more than a dozen barrels of powder on board. The explosion was just sufficient to separate her sides and lift her decks. She opened forwards, broke in the middle, and sunk bodily. It was all over in three minutes. Five hundred men perished with her, including 16 officers; 163 men have been saved, of whom 43 are badly wounded. Her band was playing when the explosion took place.

A letter from *Aleppo*, of the 26th of October, gives an account of a *Dreadful Massacre* of the Christian population by the Moslems; a sudden outbreak, it appears, of fanaticism. On the night of the 16th numerous armed bands of Moslem people forcibly entered the dwellings of the Christians inhabiting three-quarters of the town called Sulibi and Fedida, plundering every house of what it possessed; and, whenever the least resistance was shown, wounding and murdering the inmates. On the 17th the same scenes continued to be perpetrated. The roads everywhere leading from the above quarters were thronged with Christians, men, women, and children all hurrying away in the terror with which they were inspired by the burning of their churches, the desecration of their homes, the spoliation of their wealth, the destruction of their property, the dishonour of their wives and maidens, and the ruthless slaughter of their relatives. All these atrocities were committed in broad daylight, and under the eyes of Turkish soldiery; there were none to prevent these ruffians from accomplishing their horrible designs on an inoffensive people. Three handsome churches, worth upwards of 25,000*l.*, were burnt; five churches have been plundered; an invaluable library, containing ancient Syrian manuscripts, destroyed; three priests and several other Christians were killed; many, among whom is the Syrian Bishop, a highly respected octogenarian, were wounded, and some of them afterwards died. The principal Christian quarters, such as Sulibi, Fedida, Toomayat, Harot, Il Un Kabott, Tudrebes, Bowabet, Butrosse, Bowabel Aset, Esas il Khul, were sacked. The loss of property is estimated at nearly a million sterling. In the space of 24 hours several hundred families, comprising the most respectable native Christians of Aleppo, and consisting altogether of about 7,000 individuals (*Rayahs*) have been rendered houseless.

On the morning of the 17th the Pasha hastily removed to the military barracks, where, surrounded by the troops, he remained an almost passive spectator of what was going forward in the town beneath. General Rem pledged his life to stop the persecution if he were allowed a few pieces of artillery and 500 soldiers, but the Pasha would not grant them, on the plea that they would prove insufficient. He rather preferred to yield to popular fanaticism than set Moslem to fight Moslem in defence of the Christians. At the date of the account, ten days had elapsed since the Christians fled from their houses, and none had yet ventured to return to them. The khans were full of the fugitives—680 in one, 2200

in another, 700 in a third, 400 to 500 in a fourth; and in the other 11 or 12 khans there were as many as made up the number of 7000. Honourable mention is made of the conduct of M. Lesseps, the French Consul, who distinguished himself in his unceasing endeavours to provide for the wants of the distressed, of whom he received in his Consulate upwards of 200, and the personal requirements of about 800 others he daily supplied. An account three days later states that a reinforcement of troops had arrived, that the fugitives were beginning to return to their homes, and that an appearance of tranquillity was restored, though there was still a strong undercurrent of evil.

The latest accounts from New York are dated the 15th instant. The excitement caused by the operation of the Fugitive Slaves Bill still continued, and serious disturbances had taken place at Philadelphia and other places. On the other hand, a great meeting had been held in New York, at which leading citizens expressed their regret that a measure regarded by the greatest statesmen as a portion of a fair compromise, and declared

by them to be strictly constitutional, should now be denounced as unjust and unconstitutional, and as warranting resistance by physical force. A letter from Mr. Daniel Webster gave his firm adherence to the resolutions.

"The measure," he said, "is not such a measure as I had prepared before I had left the Senate, and which, of course, I should have supported if I had remained in the Senate. But it received the proper sanction of the two Houses of Congress and the President of the United States. It is the law of the land, and as such is to be respected and obeyed by all good citizens. I have heard no man whose opinion is worth regarding deny its constitutionality; and those who counsel violent resistance to it, counsel that which, if it take place, is sure to lead to bloodshed and to the commission of capital offences. It remains to be seen how far the deluded and the deluders will go on in this career of faction, folly, and crime."

This demonstration at New York is said to have had much influence on public opinion in the Northern States.

NARRATIVE OF LITERATURE AND ART.

THE Laurel has been bestowed on Alfred Tennyson, and could not have had a worthier recipient. It would be well if the *detur digniori* could be as certainly put in practice in every office. It is understood that the offer was accompanied with an intimation that the usual birthday odes had been now for some years discontinued; and whether or not this implies that they will not in future be expected, it is yet satisfactory to feel that an ancient office which directly connects the highest person in the realm with its literature is not altogether abolished. Certainly the salary was not worth saving. Originally it was a hundred marks, which James the First raised to a hundred pounds and a tierce of canary, for poor old Ben Jonson's sake. The tierce of canary is now commuted to some five-and-twenty pounds; but, nevertheless, what with income-tax, land-tax, pension-fees, and other fees and taxes, the whole remuneration is little more than ninety pounds. Another appointment of the past month has given equal satisfaction. Sir Charles Eastlake is the new president of the Royal Academy, his talents and accomplishments having marked him out without a competitor for that distinction.

The publication of new works has been more active than usual, but very few books of importance are discoverable among them. Not a small proportion have been pamphlets and treatises connected with the current agitation against popery, of which it would be a waste of space even to transcribe the titles.

Miss Strickland has commenced a series of *Lives of the Queens of Scotland* in the manner of her book about the English queens, and with promise of an equal amount of gossiping detail. A certain Baroness Von Beck has published *Personal Adventures in Hungary* during the late civil war, proving herself a heroine of some of the most daring attempts and most marvellous escapes on record. Another lady has given us a novel of earnest and highly-wrought incident called *Olive*. Nor will it be much out of place to conclude this list of feminine achievements with the mention of a book which Sir Francis Head has dedicated to the ladies, on the *Defenceless State of England*. Its object is to show what Lord Ellesmere formerly demonstrated, that if a French army resolves to invade England, it can easily do it; and when it reaches London, which there is nothing to prevent, it will only have to walk in at one end while everybody else is marching out at the other.

Lord Ellesmere himself has been meanwhile engaged in the less alarming work of writing an agreeable introduction to a translation of Michel Amari's *War of the Sicilian Vespers*. Southey's *Life and Correspondence* has been brought to a completion. A clever little compilation of *Narratives of Shipwrecks of the Royal Navy*, between 1793 and 1849, has been issued in one volume. Another book has been added to the many that may now be consulted for the terrors and enjoyments of *Sierra Leone*. A treatise on the *Distribution of Wealth*, by a Mr. Thompson, has been disinterred from its sleep of a quarter of a century to show (which was quite needless) that the French Socialists have had English precursors. And from a profound rest of

nigh fourteen hundred years the *Makamet of Hariri* has just been awakened by the translation of Mr. Preston, an able English scholar. The design of this Eastern classic was to display the vast resources of Arabic in a series of rhythmical and metrical anecdotes containing all the riches of the language, and illustrating its rare words, proverbs, and figurative and enigmatic expressions. From this the character of its interest may be estimated, as well as those difficulties of translation which Mr. Preston has mastered admirably.

The fact that the *Kempsake* has appeared once more may still interest some readers. A sort of ghost of the book of beauty in the shape of *A Court Album* which visits us at the same time, and another volume of *The Drawing-room Scrap Book*, are all of the once gay and crowded ranks of "Annuals" which appear to have survived the revolution in this kind of literature. Its passing away leaves nothing to regret.

Mr. Macready is giving a series, or rather completing the series which was interrupted by ill-health last year, of farewell performances at the Haymarket Theatre. He has appeared, during the month, in all his principal characters, and has been received by crowded audiences with the utmost enthusiasm.

The principal dramatic novelties produced during the month have been Marston's play, *Philip of France* and *Marie de Meranion*, at the Olympic; Slous's play, *The Templar*, at the Princess's; Mr. Lemon's farce, *The School for Tigers*, and Messrs. Brough's melo-drama, *Jessie Gray*, at the Adelphi; and *The White Hood* at the Lyceum.

Webster's tragedy, *The Duchess of Malfi*, has been revived at Sadler's Wells, adapted to the modern stage by Mr. Horne.

The Marylebone Theatre has re-opened under the management of Mr. Joseph Stammers.

COMMERCIAL RECORD.

BANKRUPTS.

From the Gazette of Oct. 29. WILLIAM ALSOP, Plymouth, potter.—ANDREW LITTLE, York, draper.—MICHAEL LORD, Lower-Heald, Lancashire, sheep salesman.—JAMES PORTER, High-street, Camden-town, upholsterer.—HENRY GROSSE STANISCHMIDT, Fenchurch-street, City, merchant.—THOMAS WOODHOPE, Webb's-county-terrace, New-Kent-road, druggist.

Nov. 1. WILLIAM GIBBS, Throgmorton-street, City, stockbroker.—EPHRAIM GWALTER, Plamstow, Essex, horse dealer.—ADOLPHUS MILLER, Emsworth, Hampshire, rope-maker.—HENRY BROOKE MURIEL, Brighton, Sussex, chemist.—THOMAS SEAM, Wandsworth-road, and Battersea, Surrey, builder.—HUGH SWELLING, Brighton, Sussex, grocer.—SAMUEL ALFRED WARNER, Southampton-street, Strand, projectile manufacturer.

Nov. 5. JOHN BERRY, Luton, and Dunstable, Bedfordshire, salt merchant.—CHARLES BRADY, Rood-lane, Fenchurch-street, City, merchant.—JAMES COLEMAN, Old-Broad-street, City, coal merchant.—WILLIAM COLES, Hammer-street, Milton-next-Gravesend, pastrycook.—ALFRED FRENCH, East-Grinstead, Sussex, plumber.—JAMES GILSTON, Leeds, woollen-draper.—ABRAHAM HOOLEY, Macclesfield, silk manufacturer.—JOHN LIVERLEY, and JOHN PRINN, New-Lenton, Nottinghamshire, lace makers.—ROBERT DUTTON REEVES, and RICHARD HERDMAN DAWSON, Liverpool, wine and spirit dealers.—WILLIAM TAYLOR, Newcastle-upon-Tyne, auctioneer.

Nov. 8. ALEXANDER BLACK, Wellington-street-north, Covent-garden, bookseller.—WILLIAM COLES, Milton-next-Gravesend, pastrycook.—ROBERT GARTON, Kingston-upon-Hull, boot and shoe maker.—JOHN ROWBOTHAM, Sutton, Cheshire, silk manufacturer.—GEORGE CLIVE SHARLE, Tyndale-place, Islington, apothecary.

Nov. 12. THOMAS BROWN, Preston, Lancashire, draper.—JOHN LITTONER FRANKLY, jun., Birmingham tailor.—WILLIAM HARRISON, Tyne-mouth, Northumberland, merchant.—HENRY HIGGINS, Bliton, Staffordshire, grocer.—GROVER STILLWELL, JENES, Hammerwith, cheese-maker.—WILLIAM SIMPSON, Manchester, starch manufacturer.—ROBERT STONE, Corby, Lincolnshire.—WILLIAM TRECO, Coleman-street, City, builder.—SILVANUS VICK, Hrocon, victualler.

Nov. 15. JAMES AMOS, Coventry, Warwickshire, trimming manufacturer.—JOHN FREDERICK BRITT, Gateshead, Durham, tailor.—WILLIAM CARTER, High-street, Southwark, boot and shoe maker.—GEORGE HAND, Wolverhampton, Staffordshire, grocer.—WILLIAM FRANCIS HARRIS, Friday-street, Cheapside, City, Manchester warehouseman.—WILLIAM RANDALL, Manchester, calico printer.—JOSEPH WATKINS, Belmont-row, Vauxhall, draper.—JOHN WHITE, Birmingham, hay and straw dealer.

Nov. 19. WILLIAM BENNETT, jun., Worley Wigan, Worcestershire, brick-maker.—EDWARD BRISTWICK, Hand-court, City, printer.—JAMES BUTTFIELD, Newbury, Berkshire, grocer.—ABRAHAM CHADWICK, Burnage and Fair View, Lancashire, cotton-spinner.—EDMUND CHADWICK, Manchester, starch manufacturer.—ANN ELIZABETH HICKMAN, Cannon-road, St. George's-in-the-east, and MOSES JOHN HICKMAN, Princes-place, St. George's-in-the-east, undertakers.—WILLIAM NEGUS, Bagnigge-wells-road, victualler.—JOSEPH SMITH, Liverpool, haberdasher.—THOMAS TUFFIELD, Hoxton-old-town, tallow-chandler.

Nov. 22. ARTHUR BEARD, Liverpool, wine merchant.—WILLIAM BRADBURY, Shiffall, Shropshire, corn-dealer.—GEORGE AUGUSTUS CLARE, Mount-street, Grosvenor-square, house decorator.—ROBERT GIBSON, York, ironmonger.—EDWARD KEDDOR, Chilton Foliat, Wiltshire, builder.—WILLIAM HUXE, Stockport, Cheshire, draper.—WILLIAM KING, Gravesend, Kent, draper.—EDWARD LEIGH, Ghorop, Derbyshire, cotton-manufacturer.—ROBERT MILLS, Pontypridd, Glamorganshire, grocer.—JOHN SAMPSON, Manchester, grocer.—FRANCIS FELIX VOULLON, Princes-street, Grosvenor-square, court milliner.

Nov. 26. EDWARD BRISTWICK and EDWARD WEST, Hand-court, Dowgate, printers.—ROBERT DEVER, Cornhill, City, cook and confectioner.—WILLIAM GOODCHILD SHIPLEY, Market-row, Oxford-street, corn-dealer.—HENRY JOHNSON, Bishopsgate-street-without, City, tea-dealer.—WILLIAM SMITH, Canal-road, Kingsland timber merchant.—JAMES HOWELL BROWN, Newcastle, wine and spirit merchant.—GEORGE AUGUSTUS DAVIES, Skinner-street, City, distiller.—RICHARD PRACOCK, Ladbrooke-grove, Nottingham-hill, plumber.—CHARLES MACKENZIE, Lower-Crown-street, Westminster, bookbinder.—HENRY RICHARD HOLLOWAY, Ryde, Isle of Wight, bookseller.—DAVID DOUGLAS, Charlton-upon-Medlock, Lancashire, draper.—JAMES MATTHEWSON, Ferry-hill, Durham, builder.—WILLIAM STANLEY, Huddersfield, woolstapler.

BANKRUPTCIES ANNULLED.

Oct. 21. JAMES VILLAR, Southampton and Cheltenham, Gloucestershire, maltster.

Nov. 12. GEORGE PRICE HILL, Fleet-street, City, common carrier, Sept. 11.

THE STOCK AND SHARE MARKETS.

City, Nov. 28.

The Stock Markets have been subject to a good deal of movement this month, principally owing to considerations arising

out of the aspect of Continental politics. On the 29th ult., Consols were depressed to 96½, and though the price afterwards recovered, and touched 97½ on the 6th; the uneasiness caused by the extensive military preparations on the Continent caused a further heavy fall, the price receding to 96 on the 11th. More firmness then became apparent, and the quotation on the 22nd stood at 97½; but the market has since been heavier. To day's quotation is 96½ to 97.

The Railway Share Market has been steady, with a fair amount of business going forward; this description of investment appearing to attract more attention of late. As regards prices, the quotations ruling to day, show a rise over last month of from 2 to 4 per cent. for most of the leading stocks.

CORN MARKET.

The arrivals of English wheat have been upon a limited scale during the month, and in consequence buyers have been firm, and have obtained rather better rates, though no quotable advance has been established. Of foreign wheat the supplies have also fallen off. The London weekly averages last announced are as follows:—

Wheat, per quarter, 43s.
Barley, 26s. 9d.
Oats, 18s. 1d.

Flour, Town made, delivered per 80 lb., 37s. to 40s.

PROVISIONS—LATEST WHOLESALE PRICES.

Bacon, per cwt.—Waterford, 44s. to 45s.; Belfast, 42s. to 44s.	Hams, per cwt.—York or Cumberland, 74s. to 84s.; Irish, 60s. to 68s.;
Beef, per 8 lbs. mid. to prime, 2s. to 2s. 10d.	Lamb, per 8 lbs., 6s. 4d.
Butter, per cwt. Dorset, 82s. to 88s.; Cork, 74s.; Friesland, 82s. to 84s.; Fresh, per lb., 10d. to 1s.	Mutton, per 8 lbs., mid. to prime, 2s. 4d. to 3s. 4d.
Cheese, per cwt. Cheshire, 50s. to 74s.; Wiltshire, double, 50s. to 55s.; Edam, 44s. to 45s.	Potatoes, per ton.—Yorkshire Prince Regent's, 70s. to 80s.; Scotch, 50s. to 65s.;
Eggs, English, per 120, 8s. 6d. to 9s.	Pork, per 8 lbs., 2s. 8d. to 4s.
	Veal, per 8 lbs., 2s. 6d. to 3s.

GROCERY—LATEST WHOLESALE PRICES.

Cocoa, per cwt.—Grenada, 40s. to 42s.	Sago, per cwt.—Pearl, 30s. 6d. to 32s.
Coffee, per cwt.—Good ord. native Ceylon, 54s.; good ord. Jamaica, 44s. to 46s.;	Sugar, per cwt.—Brown tops, 50s. 6d. to 51s.; good brown Jamaica, 37s. 6d. to 38s.
Bahia, 40s. to 42s.	Tea, per lb.—Good ord. Congou, 1s. 1d.; full flavoured Souchong, 1s. 4d. to 2s.;
Rice, per cwt.—Carolina, 21s. to 22s.; Bengal, 9s. to 11s. 6d.	Hyson, 1s. 6d. to 2s. 6d.
Candles, per 12 lbs., 4s. 6d. to 5s. 6d.	Coals, per ton, Wallsend, 13s. 6d. to 15s. 6d.

OILS.

Pale Seal, per ton, 38l.	Oliver, Gallipoli, 44l.
Sperm, 87l. to 88l.	Linnseed, 31s. 6d. to 32s.

THE
HOUSEHOLD NARRATIVE
OF CURRENT EVENTS.

1850.] FROM THE 29TH NOVEMBER TO THE 28TH DECEMBER. [PRICE 2d.

THE THREE KINGDOMS.

THE Religious Agitation has continued during the month with little abatement, but the pretensions of his Holiness at Rome have not shared so largely in it as those of some smaller popes here in England. Mr. Bennett has been turned out of St. Barnabas by the Bishop of London. Not, however, for denying the supremacy of the Crown in spiritual affairs or discipline; not for asserting the Church's infallibility and supremacy; not for calling the Protestant Establishment a statesman's tool; not for the identification, in short, in all material respects, of the teaching of the church of St. Barnabas with that of the Church of Rome: but for a certain indiscreet excess in gestures, postures, ceremonies, forms, and intonations, which seemed to the Bishop to be "carrying things too far." There is nothing in the decision pronounced against this refractory teacher by his diocesan, which in any manner touches the questions most gravely in issue between the Protestant Church and her Romanising ministers. If other than the mere forms are to be grappled with, it must be by a mode of censure far other than Doctor Blomfield's. Happily, however, it is the substance of the thing called Tractarianism, and not its mere "limbs and flourishes," against which the people generally are now eager and aroused; and a beginning of the work most needful to be transacted at the present time has been already made. A lay society has been formed in Plymouth, to promote and bring about a reformation of the Church services, a better administration of ecclesiastical revenues, and improvement of the discipline of the Church. Such societies should be formed everywhere; and their invariable bases should be a reassertion of the right of private judgment, and a claim of increased power for the laity in matters ecclesiastical.

These are the views and efforts which will alone save us, as Protestants, from the mischiefs incident more or less to all religious agitation; and without which there is even yet a danger that the present excitement may leave us exposed to a worse intolerance than that against which it has protested. In regard to Roman Catholicism itself, whatever legislation may be found expedient or necessary, it will be assuredly not less so to keep in mind the just distinction between what may fairly warrant interference, and what cannot without danger be meddled with. That distinction is, not to prohibit the spiritual authority of the Pope in any extent of unrestricted communication that may be called for by full toleration of the profession and exercise of the Roman Catholic religion in England; but at the same time so to legislate, that this papal authority shall be kept really and strictly spiritual, that its mandates shall not be suffered to run co-ordinate in civil matters, such as that of education, with those of the head of the state, and that all its missives which in any manner trench on the temporal province shall be rendered subject to the temporal laws.

Sir Edward Sugden has decisively pronounced that the Papal brief of September exposes its promulgators to legal penalties, though he has failed to explain what they are; but be they small or great, it is a different kind of protection that true Protestants in England now sorely need. They pray for sound education; and against all "high" priests who would oppose it, whether English or Roman. It may be true that Pío Nono impudently claims spiritual headship in England, and that his emissaries convene synods of Thurles practically to enforce his claim; but it is not less true that Henry of Exeter insolently refuses to address the Queen as the "earthly head of the Church in this kingdom," and defies and obstructs her Privy Council in their exertions for popular education. The legislation that reaches not both these evils, will leave the most deeply-felt practical grievance untouched. Now or never, guarantees must be obtained for educational as well as religious freedom. Now must be commenced, if ever, that good work, of which a thorough reform of both universities will go far to the glorious completion.

Mr. Sewell, well knowing this, has made a feint to draw off the University Commission of Inquiry from Oxford by proposing to turn Oxford itself into a travelling Commission of Instruction. He is not for letting Manchester go to college, but for carrying college to Manchester. He won't have any one come to Oxford to reform its abuses, but he'll consent to carry Oxford anywhere, abuses and all. His scheme is to set up Oxford lecture-rooms all over the country, subject to the control of the far-famed Hebdomadal Board; and, opening these lecture-rooms to people of all sorts of opinions, to reward dutiful attendance thereupon by degrees from travelling examiners. Of which mission the expected advantage evidently is, that it may in time reclaim the barbarous from their objections to Oxford systems and teachers, while it leaves the hallowed place itself quite unpolluted by the heathen, and keeps sacred the mysteries of Isis to Mr. Sewell and his friends. But the bait has not caught; and Mr. Sewell has taken nothing by his motion but the disadvantage of having let slip the not unimportant admission that "the university possesses a large amount of available resources and machinery with which the present state of education conferred by it is by no means commensurate." It is to be hoped that the Ministerial Commission will not relax in its exertions till it bring these means and ends into better correspondence.

Even amidst the religious hubbub have been heard some faint Protectionist cries. Messrs. Spooner and Newdegate have protested at Sutton Colfield against sinking to the condition of the foreigner, to which chawbacon, pondering between his seven shillings a-week and the union next door, cries out Anan!

Mr. Muntz has called attention to the remarkable fact that the manufacturing interest gobbles up a farmer for its supper every night. And Mr. George Frederick Young has vowed at the London Tavern that his neck shall not be bent to the yoke "unresistingly," which seems to promise a tough job to the manufacturing interest if it thinks of gobbling up Mr. Young. However, there is no saying now-a-days what any amount of resistance is worth, seeing that it needs but a square inch of damp sponge to bring even a grizzly bear of the Rocky Mountains under the knife of an operator as merciless as a Bright or a Cobden.

An incident of the month, which deserves record in even this brief retrospect, has been the defeat of the Tenant League agitation in Ireland, at the election for the county Limerick. It is too decisive to admit of any doubt. Failing their own candidate, the Leaguers would gladly have assisted the Protectionists, but the latter was also turned to the right-about, and the Free-trader chosen. This result is important in so far as it goes very unexpectedly to prove that there is some limit to impracticable and mischievous agitation, even in Ireland.

NARRATIVE OF POLITICS.

THE Repeal Association has been *Rebaptised*, and is now denominated the "Royal Catholic and Repeal Association." In the course of the proceedings on the 2nd, Mr. John O'Connell announced that the word "Catholic" was to remain as a prefix until the intended persecution of Lord John Russell and the bigots of England was effectually repelled. In a financial point of view the additional cognomen of "Catholic" appears to have been, so far, a failure, the rent having declined from 14l. odd shillings, the previous week's receipts, to 9l. 19s. 1d.

The *Enthronement of Cardinal Wiseman* took place on the 6th, at the church of St. George's, Southwark. The choir commenced chaunting the Hallelujah, and the procession moved up the nave in the direction of the central altar. Foremost was borne the cross, with lighted candles on either side. Then came the Roman Catholic clergy, subject to the new Archdiocesan's jurisdiction, two by two, habited according to their respective ranks and orders. At length the Cardinal himself appeared, wearing a gorgeous mitre and pallium. A canopy, fringed with silk and gold, was borne over his path by the "converts" exclusively. Lastly came the Very Rev. Dr. Doyle, robed in the usual sacerdotal vestments, preceded by the Very Rev. Dr. Cox, the Rev. Mr. Cotter, and the Rev. Mr. Daniel, as masters of the ceremony, deacon, and sub-deacon. Having reached the screen which fronts the sanctuary, the Cardinal was led to a small compartment at the left of the principal altar, called the chapel of the Blessed Eucharist, whence, after a brief interval, the procession moved within the sanctuary, Cardinal Wiseman kneeling at the foot of the altar, and the celebrant clergyman ascending its steps, assisted by the deacon and sub-deacon. The customary form of prayer having been read, the mitre, which had been exchanged for a scarlet cap a short time before, was formally placed upon the head of the new Archbishop, whilst the crozier, emblematic of his authority, was also placed in his hands. He was then conducted to the archiepiscopal chair, at the foot of which the whole of the clergy made the usual obeisance—kissing the Cardinal's ring in recognition of his spiritual authority. The solemnities of high mass were then proceeded with, after which the Bull was publicly read, in virtue of which Cardinal Wiseman assumes the archiepiscopal jurisdiction of Westminster. The proceedings closed with the presentation of an address to the new "Archbishop," and an exhortation, in which he impressed upon his clergy the duties and obligations incidental to their important mission.

The following is a translation of the *Papal Bull establishing a Romish Hierarchy in England*. This important document is entitled "Apostolic Letter of our Most Holy Lord by Divine Providence Pope Pius IX., by which the Episcopal Hierarchy in England is restored."

"Ad perpetuam rei memoriam."

"The power of governing the universal Church intrusted by our Lord Jesus Christ to the Roman Pontiff, in the person of St. Peter, Prince of the Apostles, has maintained for centuries in the Apostolic see the admirable solicitude with which it watches over the welfare of the Catholic religion in all the earth, and

provides with zeal for its progress. Thus has been accomplished the design of its Divine founder; who, by establishing a chief, has in his profound wisdom insured the safety of the Church unto the uttermost time. The effect of this solicitude has been felt in most nations, and amongst these is the noble kingdom of England. History proves that after the first ages of the Church, the Christian religion was carried into Great Britain, where it flourished until towards the middle of the fifth century: after the invasion of the Angles and Saxons in that island, government as well as religion fell into the most deplorable state. At once our most holy predecessor Gregory the Great sent the monk Augustine and his followers; then he created a great number of bishops, joined to them a multitude of monks and priests, brought the Anglo-Saxons to religion, and succeeded by his influence in re-establishing and extending the Catholic faith in all that country, which then began to assume the name of England. But to recall more recent facts, nothing seems more evident to us in the history of the Anglican schism of the sixteenth century than the solicitude with which the Roman pontiffs our predecessors succoured and supported by all the means in their power the Catholic religion, then exposed in that kingdom to the greatest dangers and reduced to the last extremities. It is with this object, apart from other means, that so many efforts have been made by the Sovereign Pontiffs, either by their orders or by their approbation, to keep in England men ready and devoted to the support of Catholicism; also that young Catholics endowed by nature might be enabled to come on to the Continent, there to receive an education, and be formed with care in the study of ecclesiastical science, especially in order that, being in sacred orders, they may on their return to their country be able to support their countrymen by the ministry of their word and by the sacraments, and may defend and propagate the true faith.

"But the zeal of our predecessors will perhaps be more clearly admitted as regards what they have done to give the Catholics of England pastors clothed with an episcopal character at a time when a furious and implacable tempest had deprived them of the presence of bishops and their pastoral care. First, the Apostolic letter of Gregory XV., commencing with these words, 'Ecclesia Romana,' and dated the 23rd of March 1623, shows that the Sovereign Pontiff as soon as possible deputed to the government of English and Scotch Catholic Bishops, William Bishop consecrated Bishop of Chalcis, with ample faculties and powers. After the death of Bishop, Urban VIII. renewed this mission in his Apostolic letter dated the 4th of February 1625, addressed to Richard Smith, and conferring on him the bishopric of Chalcis, and all the powers previously resting on Bishop. It seemed subsequently at the commencement of the reign of James II. that more favourable days were about to dawn upon the Catholic religion. Innocent XI. profited at once by the circumstance; and in 1685 he deputed John Leyburn, Bishop of Adrumedo, as Vicar Apostolic for all the kingdom of England. Subsequently, by another Apostolic letter, dated the 30th January 1688, and commencing as follows, 'Super cathedram,' he joined with Leyburn three other Vicars Apostolic, Bishops in partibus; so that all England, under the care of the Apostolic Nuncio in this country, Ferdinand, Archbishop of Amasia, was divided by that Pontiff into four districts; those of London, the West,

the Centre, and the North, which at first were governed by Apostolic Vicars furnished with proper faculties and powers. In the accomplishment of so grave a charge, they received rules and succour either by the decisions of Benedict XIV. in his constitution of the 30th of May 1753, which commences with the words 'Apostolicam ministerium,' or by those of other Pontiffs our predecessors and our Congregation for the Propagation of the Faith. This division of all England into four Apostolic Vicarages lasted till the time of Gregory XVI.; who, in his Apostolic letter, 'Muneris Apostolici,' dated the 3rd of July 1840, considering the increase of the Catholic religion in England, and making a new ecclesiastical division of the country, doubled the number of vicarages, and confided the spiritual government of England to the Vicars Apostolic of London, the West, the East, the Centre, Lancaster, York, and the North. The little we have just said proves clearly that our predecessors applied themselves strongly to use all the means their authority gave them to console the Church of England for its immense disgraces, and to work for its resurrection. Having before its eyes, therefore, the good example of our predecessors, and desirous, by imitating them, of fulfilling the duties of the Supreme Apostolate—pressed, besides, to follow the movements of our heart for that portion of the Lord's vineyard—we proposed to ourselves, from the commencement of our pontificate, to pursue a work that was so well begun, and to apply ourselves in the most serious manner to favour every day the development of the Church in this kingdom. For this reason, considering as a whole the state of Catholicism in England—reflecting on the considerable number of Catholics, which keep still increasing—remarking that every day the obstacles are falling off which stood in the way of the extension of the Catholic religion—we have thought that the time was come when the form of ecclesiastical government should be resumed in England such as it exists, freely exists, in other nations, where no particular cause necessitates the ministry of vicars apostolic. We have thought that by the progress of time and things, it was no longer necessary to have the English Catholics governed by vicars apostolic, but, on the contrary, that the changes which had already been made necessitated the ordinary episcopal form of government.

"We have been confirmed in these thoughts by the desires expressed to us by the vicars apostolic in England, as well as by numbers of the clergy and laity distinguished by virtue and rank, and by the wishes of the great majority of English Catholics. In maturing this design, we have not failed to implore the aid of the Almighty and most gracious God, and that he would grant us grace in this weighty affair to resolve upon that which should be most suitable to augment the prosperity of the Church. We have further besought the assistance of the blessed Virgin Mary, mother of God, and of the saints whose virtues have made England illustrious, that they would deign to obtain by their intercession with God the happy success of this enterprise. We have since commended the whole business to the grave and serious consideration of our venerable brothers the Cardinals of the holy Roman Church forming our congregation for propagating the faith. These sentiments having been found completely conformable to our own, we have resolved to sanction them, and carry them into execution. It is for this reason, after having weighed the whole matter most scrupulously, that of our own proper motion, in our certain knowledge, and in the plenitude of our apostolic power, we have resolved and do hereby decree the re-establishment in the kingdom of England, and according to the common laws of the Church, of a hierarchy of Bishops deriving their titles from their own sees, which we constitute by the present letter in the various apostolic districts. To commence with the district of London, it will form two sees,—to wit, that of Westminster, which we hereby elevate to the metropolitan or archiepiscopal dignity; and that of Southwark, which we assign to it as a suffragan, together with those which we proceed to indicate. The diocese of Westminster will include that portion of the aforesaid district which extends to the banks of the Thames, and comprehends the counties of

Middlesex, Essex, and Hertford; that of Southwark, on the south of the Thames, will include the counties of Bedford, Southampton, Surrey, Sussex, and Kent, with the Isles of Wight, Jersey, Guernsey, and others adjacent. In the district of the north there will be but one episcopal see, which will take its name from the town of Haggilestown, and have for its circumscription that of the existing district. The district of York will also form a diocese, whose capital will be the town of Beverley. In the district of Lancaster there will be two Bishops; of whom one, the Bishop of Liverpool, will have for his diocese the Isle of Mona, the districts of Lonsdale, Amounderness, and west Derby; and the other, the Bishop of Salford, will extend his jurisdiction over Salford, Blackburn, and Leyland. The county of Chester, though belonging to this district, will be united to another diocese. In the district of Wales two episcopal sees will be established,—that of Salop, and that of Merioneth and Newport united. The diocese of Salop will contain the counties of Anglesea, Carnarvon, Denbigh, Flint, Merioneth, and Montgomery; to which we join the county of Chester, detached from the district of Lancaster, and that of Salop from the centre. To the diocese of the Bishop of Merioneth and Newport are assigned the counties of Brecknock, Glamorgan, Carmarthen, Pembroke, and Radnor, also the English counties of Hereford and Monmouth. In the district of the west we create two sees, Clifton and Plymouth: the first comprehending the counties of Gloucester, Somerset, and Wilts; the second those of Devon, Dorset, and Cornwall. The district of the centre, from which we have detached the county of Salop, will have two episcopal sees, Nottingham and Birmingham; to the first we assign the counties of Nottingham, Derby, Leicester, Lincoln, and Rutland; to the second, the counties of Stafford, Buckingham, Oxford, and Warwick. In the district of the east there will be one see: which will take its name from the town of Northampton, and retain the present circumscription of the district, except the counties of Lincoln and Rutland, which we assigned to the diocese of Nottingham.

"Thus, in the very flourishing kingdom of England there will be one single ecclesiastical province, with one archbishop and twelve suffragans, whose zeal and pastoral labours will, we hope, by the grace of God, bring new and daily increase to the power of Catholicism. For this reason, we reserve to ourselves and successors the right to divide this province into several, and to increase the number of its bishoprics as new ones may be required; and in general, to settle their boundaries as it may appear meet before the Lord.

"Meanwhile, we enjoin the archbishop and bishops to furnish, at stated seasons, reports of the state of their churches to our congregation of the propaganda, and not to omit informing us on all points concerning the spiritual good of their flocks. We shall continue to avail ourselves of the aid of the congregation of the propaganda in all that concerns the affairs of the church in England. But in the sacred government of the clergy and people, and all which concerns the pastoral office, the archbishop and bishops of England will enjoy all the rights and faculties which bishops and archbishops can use, according to the disposition of the sacred canons and the apostolic constitutions; and they will likewise be equally bound by all the obligations to which other bishops and archbishops are held by the common discipline of the Catholic church.

"Their rights and duties will not be in any case impaired by anything that is at present in vigour, whether originating in the ancient form of the English church, or in the subsequent missions instituted in virtue of special constitutions, privileges, or customs, now that the same state of things no longer exists. And in order that no doubt may remain, we suppress, in the plenitude of our apostolic power, and entirely abrogate, all the obligatory and juridical force of the said special constitutions, privileges, and customs, however ancient their date. The archbishop and bishops of England will thus have the integral power to regulate all that belongs to the execution of the common law, or which are left to the authority of bishops by the general discipline of the church. As for us, most assuredly they

shall never have to complain that we do not sustain them by our apostolic authority; and we shall always be happy to second their demands in all which appears calculated to promote the glory of God and the good of souls. In decreeing this restoration of the ordinary hierarchy of bishops in England, and the enjoyment of the common law of the church, we have had principally in view the prosperity and increase of the Catholic religion in the kingdom of England; but we have also desired to gratify the desires of so many of our reverend brethren governing in England under the style of vicars apostolic, and also of a great number of our dear children of the Catholic clergy and people. Many of their ancestors presented the same prayer to our predecessors, who had begun to send vicars apostolic to England, where no Catholic bishop could exercise the common ecclesiastical law in his own church, and who afterwards multiplied the number of vicars apostolic, and of districts, not because religion was submitted in this country to an exceptionable rule, but rather because they would prepare the foundation for the future rebuilding of the ordinary hierarchy.

"This is why we, to whom it has been given by the grace of God to accomplish this great work, declare here that it is not in any manner in our thoughts or intentions that the Bishops of England, provided with the name and rights of ordinary Bishops, should be destitute of any advantages, of whatever nature they may be, which they formerly enjoyed under the title of Vicars Apostolic. It would be contrary to reason to allow any acts of ours performed at the earnest prayer of the English Catholics, and for the benefit of religion, to turn to their damage. Rather we cherish the firm hope that our dear children in Christ, whose arms and largesses have never been wanting to sustain in England religion and the prelates who govern there as Vicars, will exercise a still larger liberality to the Bishops who are now attached by permanent bonds to the English Church, in order that they may not be deprived of temporal aid, which they will require, to ornament their temples and adorn the divine service, to support the clergy and the poor, and for other ecclesiastical services. Finally, lifting the eyes to the Almighty and gracious God, from whom comes our help, we supplicate him with all instance, obsecration, and action of grace, to confirm by Divine grace all that we have decreed for the good of the Church; and to give of His grace to those whose it is to execute these decrees, that they may feed the flock of God committed to their care, and that their zeal may be applied to spread the glory of His name. And, in order to obtain the most abundant succour of celestial grace, we finally invoke as intercessors with God, the holy Mother of God, the blessed Apostles St. Peter and St. Paul, with the blessed patrons of England, and especially St. Gregory the Great, in order that the solicitude we have displayed, notwithstanding the insufficiency of our merit, to restore the episcopal sees of England, which he founded in his days with so much advantage to the Church, may likewise redound to the good of the Catholic Church. We decree that this Apostolic letter shall never be taxed with subtlety or obreptice, nor be protested for default either of intention or any defect whatever, but always be valid and firm, and hold good to all intents and purposes, notwithstanding the general Apostolic edicts which have emanated from Synodical, Provincial, or Universal Councils, the special sanctions, as well as the rights of former sees in England, missions apostolic, vicarages constituted in the progress of time, notwithstanding—in one word, all things contrary whatsoever. We likewise decree, that all which may be done to the contrary by any one, whoever he may be, knowing or ignorant, in the name of any authority whatever, shall be without force. We decree that copies of this letter, signed by a notary public, and sealed with the seal of an ecclesiastic, shall be everywhere received as the expression of our will.

"Given at St. Peter's, at Rome, under the seal of the Fisherman, the 24th of September, 1850, and in the fifth year of our pontificate.

"A. CARDINAL LAMBRUSCHINI."

The Queen gave audiences on the 10th to deputations from the Corporation of London, the City Lieutenancy, and the Universities of Oxford and Cambridge, and received the addresses adopted by them in reference to

the Papal measures for establishing a Romish hierarchy in this country. The deputation from Oxford was headed by the Duke of Wellington; that from Cambridge by Prince Albert. The following was her Majesty's reply to the Corporation of London:—"I sincerely thank you for your renewed assurances of unaltered attachment to my person and throne, and to the constitution of this country. Your tried and consistent advocacy of the equal enjoyment of civil rights by all classes of your fellow-subjects entitles the expression of your sentiments on the present occasion to peculiar consideration. You may be assured of my earnest desire and firm determination, under God's blessing, to maintain unimpaired the religious liberty which is justly prized by the people of this country, and to uphold, as its surest safeguard, the pure and Scriptural worship of the Protestant faith, which has long been happily established in this land." To the University of Oxford her Majesty replied:—"I accept with much satisfaction the renewed proof afforded by your address of your attachment and loyalty to my person and government, and of your steadfast adherence to the principles of the constitution. It has ever been, and ever will continue to be, my endeavour to promote the efficiency and maintain the purity of our Reformed Church, the supreme government of which, under God, is by law confided to me; and it is highly gratifying to me to be assured of your faithful adherence to its principles, doctrine, and discipline. While I cordially concur in the wish that all classes of my subjects should enjoy the free exercise of their religion, you may rely on my determination to uphold alike the rights of my crown and the independence of my people against all aggressions and encroachments of any foreign power. Your earnest endeavour, in the discharge of your important duties, to train up the youth intrusted to your care in faithful attachment to the truths of holy Scripture, cannot fail, under God's blessing, to have a powerful effect in strengthening the defences of our Protestant faith, and in preserving inviolate the privileges which are justly dear to the people of this country."

The Commission of the Church of Scotland have adopted strong resolutions, moved by Mr. Hill, upon the *Romish invasion*; and the Commission of the Free Church have taken a similar step. The resolutions were moved by Dr. Candlish, who referred with contempt to the opposition of Tractarians, as meant to beguile the public; but confessed that he has great apprehensions of a large outbreak of Popery in a circle of individuals of the highest and most cultivated minds in Scotland.

An address from the Archbishops of Canterbury and York and the whole of the suffragan bishops (with the exception of the bishops of Exeter and St. David's,) on the subject of the papal aggression, has been presented to the Queen. The omission of the bishop of Exeter's name is explained in a correspondence which appeared in the newspapers. A copy of the address as originally drawn up having been transmitted to him by the Archbishop of Canterbury's secretary, he returned it, refusing to give his name, and objecting to several passages, particularly the phrases "insult to your majesty's prerogative," "inconsistency with the constitutional laws of the country," and "defiance of the principles of the constitution;" phrases which concerned the relations between the queen and her subjects, of which a foreign potentate could not be supposed to be cognizant; and further, among other things, demurring to the designation of Her Majesty as "the earthly head of the church in the kingdom." The address was revised, and again sent to the bishop with some alterations; but he again declared it unsatisfactory, and refused to sign it. He drew up a separate petition from himself, and transmitted it for presentation, but it was returned to him by the Secretary of State, as being informal.

The Rev. Mr. Bennett has resigned his perpetual curacy of St. Paul's, Knightsbridge, and his ministrations at St. Barnabas, Piccadilly. This step followed a long correspondence with the Bishop of London, which has been published. It appears from this correspondence that, as far back as the beginning of 1847, the bishop's attention was drawn to the peculiar observances or "excessive ritualism" of Mr. Bennett, and these deviations were pointed

out, with the request that they might be discontinued. It would seem, however, that the remonstrance produced no effect; for two years later a parishioner of Mr. Bennett's wrote to the bishop, complaining of the forms which the former persisted in adhering to. Later in the same year (1849) came the consecration of St. Barnabas, and with it not only a repetition, but an augmentation, of the obnoxious practices referred to. The bishop then became more earnest in his remonstrances, to which Mr. Bennett replied by defending his practices and declaring his intention to persist in them. On the 16th of November the bishop declared the practices in question to be inconsistent with the duty of a minister of the English Church, and formally called on Mr. Bennett to relinquish them. Mr. Bennett having continued to justify the course he followed, the bishop, on the 27th, concluded his answer by saying—"Upon the whole, if you are not prepared to comply, *simpliciter* and *ex animo*, with the requisition contained in my letter of the 16th inst., I must call upon you to fulfil your offer of retiring from a charge which I deliberately think you could not in that case continue to hold without great injury to the church." Mr. Bennett states, in reply to this, that being unable conscientiously to comply, "*simpliciter* and *ex animo*," with the bishop's requisition of the 16th of November, it follows, he says, that he must submit to the "call" made upon him in that of the 27th, which, as it involves the continued opinion that he is guilty of unfaithfulness to the Church of England, he considers it his duty to submit, and therefore sends in his resignation of the perpetual curacy of St. Paul's, Knightsbridge. The bishop closed the correspondence by accepting the reverend gentleman's resignation.

The meetings throughout the country on the subject of the *Papal Aggression* have been so many and so similar in character, that it would be useless to enumerate them.

The meeting of the County of Surrey was marked by the appearance of Sir Edward Sugden, who gave his view of the present state of the law as applicable to the case. Sir Edward was clear and unhesitating in his opinion that the "illegality" of denying the queen's supremacy, and of introducing "bulls" into this country, remains untouched by the minor Relief Act passed in 1847, which only repeals certain of the severer "penalties" enacted by the 13th Elizabeth. Sir Edward stated, that though he voted for Catholic Emancipation, with doubt and hesitation, in 1829, he has never repented of that vote, and would repeat it to-morrow if occasion called for it.

The Roman Catholic Peer Lord Beaumont has been joined by the hereditary head of his English co-religionists in a pronouncement against the *Aggressive Reorganisation of their Hierarchy*. The Duke of Norfolk has written the following letter to Lord Beaumont, with leave to make what use of it he likes; and the latter has sent a copy from his residence in Ireland for publication in London:—

"Arundel Castle, 29th Nov.

"MY DEAR LORD,—I so entirely coincide with the opinions in your letter to Lord Zetland, that I must write to you to express my agreement with you. I should think that many must feel as we do, that ultramontane opinions are totally incompatible with allegiance to our sovereign, and with our constitution.

"I remain, my dear Lord, faithfully yours,
"To the Lord Beaumont."

"NORFOLK."

An address has been presented to the Bishop of London, signed by a large number of Mr. Bennett's congregation, some parishioners and some non-parishioners, entreating the bishop to reconsider his decision respecting Mr. Bennett's offer of *Resignation*. The bishop, in his answer to the address, stated that he is under the painful necessity of adhering to that decision.

The Bishop of London has directed the archdeacons of London and Middlesex to visit all the churches and chapels in which it is alleged that *Romish ceremonies* are practised, and to report to him every case in which any ceremonies or forms are used not authorised by the rubric, nor sanctioned by established custom.

St. Barnabas Church, Piccadilly, was again opened for divine service, on Sunday the 22nd, the suspending notice having been removed in the course of last week.

Mr. Bennett took no part in the conduct of the service, which was performed by the Revs: G. F. De Gex and W. Kyfe. The rites and symbols appear to have undergone no modification, save that the candles on the altar remained unlighted after the chanting of the Litany. Mr. Cowie, of Putney College, preached the sermon, in which the peculiar views of the Puseyite party on baptism were advanced.

The Election for the County of Limerick took place on the 10th, when W. Gould, Esq., was returned in preference to Captain Dickson and Mr. Ryan. The last, the Tenant League agitator, was the lowest on the poll.

The Cattle Show of the Smithfield Club in Baker Street, which was opened to the public on the 10th, was remarkably large and excellent. The first prizes were generally won by breeders or farmers. The greater number of secondary prizes were gained by amateur noblemen and gentlemen—Prince Albert, the Duke of Richmond, the Duke of Wellington, the Earl of Warwick, and others. The usual dinner took place on the 13th. The Duke of Richmond presided, and was supported by a miscellaneous body of members from all shades of party; including the Earl of Hardwicke, Colonel Sibthorp, Mr. J. Vilers Shelly, and Mr. Mechi. The Chairman congratulated the society on the honour done to them by the Queen and Prince Albert in visiting the show on Monday; and stated that affairs are so prosperous that the prizes can be paid out of yearly subscriptions without encroachment on capital, and yet a considerable fund be appropriated for a large extension of the show next year. The Earl of Hardwicke struck out an innovating plan of competition, believing that the present mode of awarding the prizes does not select and compare the true criteria of excellence. He said, that it cannot at present be told with certainty how long the animals have been under feeding, how they were fed, or what was their real age. The proper method would be, to take the animals when they are lean, put them up together, and feed them upon the same food; and then it will be ascertained by the speed with which they fatten which animal is of the best blood. He was prepared to put up his animals under that system, though he was aware it might be attended with some difficulties; and he challenged all England to compete with him.

The National Association held a general meeting at the London Tavern on the 12th. The attendance was very small. Mr. George Young presided, and Major Bertford was the sole M.P. present. The tone of all the speakers was one of very great hostility to landlords. Mr. Young stated the society's programme to include now the equalisation of poor-rates, and its imposition on personal as well as real property, abolition of malt-tax, non-renewal of income-tax, a just revival of tithe-commutation, reduction of local rates, and a law to enable tenants to revoke leases made before 1846. Mr. Young himself declared his belief that "the day of high prices is over."

[Parliament has been further *Prorogued* from the 17th inst. to the 4th of February, when it will meet for the despatch of business.

LAW AND CRIME.

THE men who committed the *burglary* in the house of Mr. Hollard, in the Regent's Park—Dyson, Mitchell, and Mahon—were tried at the Central Criminal Court on the 30th Nov. Dyson and Mitchell pleaded guilty, and Mahon was convicted by the jury. They were sentenced to transportation for life.

The magistrates of Cambridge have fined the Reverend John Fenwick, M.A., a proctor, and his two attendants, or "bull-dogs," Robinson and Boning, for an *Assault* on Emma Thompson. While the three defendants were out at night searching for improper persons in the streets, they encountered Emma Thompson, a respectable modest girl; and she was detained for some time, and questioned. When Mr. Thompson waited on Mr. Fenwick respecting his behaviour to his daughter, the proctor made some very lame excuses or explanations.

He was fined 20s., and his assistants 10s. each, with costs. But the fines were not paid by the proctor and his assistants till the form of capturing them had been gone through. An arrangement was made, by which the superintendent of police formally arrested them at the office of Mr. Fenwick's solicitor, and the fines were paid. This was done to form the basis of an action for false imprisonment by the University authorities against those of the town.

Mary Ann Doe, the girl who told two such different stories respecting the conduct of the Rev. R. A. Johnstone, was brought before the Brentwood magistrates on the 2nd, on a charge of *Perjury*. The information was laid by Superintendent Coulson. The girl's solicitor objected, that it was incompetent for any one but the person injured, or a Judge of Assize, to lay an information of the kind. The bench overruled this objection. Another objection was about to be raised, when the chairman made an inquiry as to the amount of evidence at present obtained; and the answer of Mr. Coulson induced the magistrates to stop the case. The chairman said—"This case is dismissed, on the ground that there is insufficient evidence to support the complaint. The bench have come to this decision with the less reluctance, in consequence of their confident belief that subornation of perjury has been committed; and they are determined that the matter shall be fully investigated." Some difficulty was anticipated in the apprehension of the girl, and an artifice was adopted to place her in custody. A man dressed in rustic attire, with a gun in his hand, was sent into a field at the back of the cottage where her parents reside. He fired off the gun several times, and the girl presently came out of the cottage to see what he was shooting at. She walked up to him; and as soon as she came within reach, the disguised officer intimated to her that she was a prisoner, and immediately took her to Brentwood.

A *Burglary with Violence* was committed at Frenchay Common, near Farnham, on the evening of the 30th ult. About eight o'clock, Mr. Marshall, who lives with his sister alone, was aroused by a loud knock at his front-door. On opening, he found a group of seven men standing round it; and as soon as he presented himself, one of their number inquired the road to Guildford. Mr. Marshall was in the act of stopping out to direct them, when he was suddenly knocked down, it is supposed by a life-preserver. The men immediately entered the house; but they were encountered by Miss Marshall, who, with great presence of mind, rushed up stairs to procure a gun which her brother always kept loaded, calling out at the same time, "I'll fire at them." The villains caught her upon the staircase, and presenting pistols at her, dragged her to the front-door, where they pointed out her brother lying in an insensible state on the ground, and cautioned her to be quiet. They then ransacked the house of everything of a valuable character, it contained, taking off amongst other property a number of old guineas. Before leaving, they abused Miss Marshall in good set terms for not having more property in the house. Mr. Marshall was insensible for two hours, and has suffered much since.

Mr. Thomas Waters, a gentleman of Bedminster, while staying at Wrington in Somerset, made a very determined attempt to *Murder his Wife*, in a fit of delirium. He sharpened a knife, went into his wife's room, locked the door, and endeavoured to cut her throat; she struggled with him, and they fell on the floor; he there persevered in his efforts, but she held down her chin on her neck, and so preserved herself from a mortal wound, till relatives, attracted by her screams, burst open the door and saved her life. She was terribly disfigured on the face, and had one of her fingers cut off. Her husband was removed to a lunatic asylum; he sank into a state of prostration, and died after three days of reaction from the intensely excited state in which he had been.

The Consistory Court gave judgment on the 7th, in the divorce case of *King v. King*, promoted by the Honourable Robert King, eldest son of Lord Lorton, on the ground of the adultery of his wife with a French gentleman called Vicomte de Saint Jean; and resisted by Mrs. King on the grounds of her husband's connivance at her immorality, and of his own adultery

with Madame de Saint Jean and other persons. The Judge, Dr. Lushington, held that the wife's unfaithfulness was proved; that the proof of the husband's connivance failed, but that the husband's own unfaithfulness was established; he therefore dismissed both parties, and refused to pronounce for a divorce.

At the Liverpool Winter Assizes, on the 9th, William Threlfall pleaded guilty to *Forging a Bill of Exchange* for 1,000*l*. It was stated for the prosecution, that the prisoner had uttered forged bills by wholesale. His forgery of thirty, for 32,811*l*., and his guilty knowledge with respect to a hundred and fifteen others, for 133,000*l*., could be proved. It was said in defence, that in nearly every instance the bills had been taken up before they became due—113,801*l*. in all. Others would have been met but for the breaking up of his business by the discovery of the forgeries; still his estate would pay from 12s. to 15s. in the pound. Morally speaking, he had no intention to defraud. Mr. Justice Talfourd said that; morally speaking, as well as legally, he considered a person who should commit forgery with the intention of taking up the bill before it was due was guilty. When the offence was punishable by death, many persons had been executed who, no doubt, intended to do what it was said had been the prisoner's intention. He had no doubt that Dr. Dodd never intended to defraud Lord Chesterfield when he forged his name. It was quite impossible that he could adopt a notion that, in such cases, there was not a moral as well as a legal guilt. The prisoner was sentenced to be transported for life.

An action of *Libel*, at the instance of Captain Aaron Smith, against Captain Cook, formerly in the Merchant Service, and now the agent in London of the Scotch Equitable Association, was tried before the Court of Queen's Bench on the 9th inst. It arose out of some statements made at a public meeting held in January last, on the subject of piracy in Borneo. Captain Smith having spoken of circumstances which, from his own personal knowledge, placed the existence of the alleged piracy beyond a doubt, was at once accused of having been one of the very miscreants he denounced, and Mr. Cobden afterwards stated in the House of Commons that Capt. Aaron Smith was an ex-pirate. A hostile correspondence ensued, in which Capt. Smith demanded satisfaction, which was refused; and, in the course of the correspondence, Capt. Cook came forward, and adopted the full responsibility of the charge affecting Smith by distinctly reiterating it in a letter to the "Times." This letter was the subject-matter of the action. It appears that as far back as 1823 Capt. Smith was formally put upon his trial for his share in the capture of two vessels (one being Capt. Cook's), and he was formally acquitted. In 1829 he was again tried for supposed complicity in a similar act perpetrated by the same band. His defence on each occasion was, that he was a prisoner, completely in the power of the pirates, and that he acted by compulsion. Capt. Cook was examined as a witness at the first trial, and was present at the second, when the jury, after hearing a single witness for the prosecution, stopped the case. On the present trial the whole of the former evidence was recapitulated, and at its close Lord Campbell summed up. Capt. Smith, he said, was placed in a situation of great hardship in this trial, the occurrences with which he was charged having taken place thirty years ago. It was true that the law did not recognise limitation to charges of crimes; but men would not fail to see that after a certain period a charge could not be brought without pressing with undue hardship on the accused, and especially in a case like this, when the party had already three times successfully answered it. By this libel Capt. Cook charged Capt. Smith as a pirate and a murderer. Now the question for the jury to consider would be, first, whether there was any evidence at all of murder; and secondly, whether he had voluntarily taken a part in the piratical transactions. There was no evidence either that the pirate captain was dead, or that Captain Smith took his place. If the jury believed that he had voluntarily joined the pirates, and voluntarily remained with them, when it was said he might have escaped, they would find their verdict for the defendant; but if the contrary, for the plaintiff; and in this latter

event, it would be for them to say what amount of damages they considered him entitled to. The jury retired, and after a short absence returned into court, and gave a verdict for the plaintiff—Damages, 10*l*.

An extraordinary charge of *Domestic Cruelty* was investigated at Guildhall police court on the 7th. Mr. George Sloane, a special pleader in the Temple, was accused of having starved and maltreated Jane Wilbred, a young girl in his service, as maid of all work. The girl's weak and emaciated condition had been observed by the neighbours, and they had learned from herself that she was nearly dead from starvation and ill usage. Two gentlemen, who had chambers adjoining, called on Mr. Sloane, and insisted on obtaining the custody of the girl, and with some demur he gave her up. She was found to be in a dangerous condition, and conveyed to the Royal Free Hospital. On the above day she was brought to Guildhall, a summons having been issued against Mr. Sloane. The girl's appearance, as she was carried into the court in an easy chair, excited groans and exclamations of horror. She was described by witnesses as having been eighteen months ago a comely girl, plump and healthy. The surgeon of the hospital thus described her appearance when she was brought there: "The pulse was scarcely perceptible; the extremities very cold and livid; the respiration feeble; and she was almost unable to speak." There was no disease: the appearances resulted entirely from want of food; and this must have been the case for many months. There were marks of violence about her neck and shoulders; but they had not been inflicted by anything hard, such as a stick, for if that had been used the bones must have been broken. She could not have existed in that state many days longer. "I have been," he said, "in the constant habit, during the last twenty years, of seeing cases of extreme distress, in many of which the persons have died in a few hours after their admission into the hospital; but I never saw a case at all approaching the appearance presented by that girl. I could not have believed a person could be so reduced and live. She was certainly the most perfect living skeleton I had ever seen in the course of my life." The girl herself was then examined.—Placed beside the alderman, her voice was inaudible to any person but himself: he questioned her aloud, held his ear close to her mouth, and catching her replies repeated them aloud. She stated herself to be going on for eighteen, and to have been taken from the West Union Work house by Mrs. Sloane, "on the 19th July going on for two years." She received no wages. At first they treated her pretty well; but after three months they took away the clothing from her sleeping-mattress, and stinted her meals. At last they gave her only "a little bit of bread and mustard for breakfast, with coffee and caraway seeds"; and it was often noon or later before she got that, though she rose at six. For dinner she had a "little bread and broth, with a quantity of mustard in it." "The last time I had meat was about a month before Mr. Phillimore saw me; then I had a little beef, but not nearly so much as I could eat. It was generally six or seven o'clock in the evening before ever I got any dinner, sometimes before and sometimes after Mr. and Mrs. Sloane dined. I used then to have for tea a little bread and pepper or mustard; but they would not allow me anything to drink with it. I was not even allowed to take any water. I could not get at it without Mrs. Sloane seeing me, and she would beat me if I attempted it." She was often beaten—nearly every morning, by Mrs. Sloane, for wearing the sleeves of her shift on her arms when it was cold. "Once when Mrs. Sloane had gone out and boiled some meat for her cat, when the meat was boiled and the cat had the meat, the water it was boiled in was put in a basin, and she accused me of drinking a little of the water. I said I had not, but she beat me very much for it." The girl then revealed an almost incredible instance of obscene cruelty. Mrs. Sloane once ordered her to eat some of her own excrement, and actually called Mr. Sloane to aid her while she forced the revolting substance into the girl's mouth. [The whole of the persons in court here burst into a yell of indignation: the officers made no attempt to repress the manifestation, and Alderman Humphrey declared that his feelings

would hardly allow him to continue the examination.] The girl went on to give further details of beatings, and of the precautions taken to prevent the participation of any food not given by the hands of Mrs. Sloane herself. Alderman Humphrey now found that her voice was growing inarticulate; she murmured something in which the word "Hospital" was alone distinguishable. Mr. Clarkson (who appeared for Mr. Sloane) rose to cross-examine her, and asked, "When did Mr. Sloane beat you?" After a long interval, she whispered, "Mr. Sloane beat me about a month ago"; and then she seemed to become unconscious. The surgeon found that she had not fainted, but had fallen asleep; and he forbade any further questioning, as impossible to be borne. Mr. Clarkson, with evident feeling, bowed to the interdict; but stated his belief that "when the case came to be further investigated, it would present a different aspect." Alderman Humphrey (with emphasis) —"There shall indeed be another inquiry, and Mrs. Sloane must also appear to answer this serious charge." — Mr. Sloane was liberated on bail to the amount of 400*l*., for his reappearance next week.

Mr. Sloane appeared again on the 13th, when further evidence, corroborative of the above, was taken. Mrs. Sloane was excused from attendance, having met with an accident. A witness swore to having seen Mrs. Sloane beat the girl and drag her by the hair of her head. Alderman Humphrey censured the authorities of the West London Union for their lukewarmness in not prosecuting. Mr. Pontifex, the clerk, excused the officers by reference to difficulties respecting the expenses: but, after an indignant demonstration from the Alderman, he took up the case for the Union. Mr. Clarkson again, out of humane consideration for the weak state of the girl, abstained from any questions; but re-stated that Mr. Sloane's friends rely with confidence on his exculpation in the sequel. The investigation was continued on the 20th, and particulars even more disgusting than those already disclosed were elicited. Mr. Sloane appeared alone. Mrs. Sloane had evaded the search of the officers, and it appears intends to remain in concealment till the day of trial at the Old Bailey, when it is said she will surrender. Mr. Huddleston appeared for the West London Union, who now intend to prosecute with vigour. He applied, however, for a further remand, in order to make himself fully master of the case; and intimated that if Mrs. Sloane does not appear when he shall prosecute the examination in full detail, he shall oppose the permission of Mr. Sloane to be at large. Alderman Humphrey adjudged that the bail be increased, and required two sureties for 250*l*. each, and the recognizances of Mr. Sloane himself for 600*l*. Mr. Sloane, after the examination was adjourned, requested permission to leave by one of the private entrances to the court; and, having first sent out the gaoler to ascertain if the coast was quite clear in Church Passage, peeped round the corner of the door in every direction, and, feeling satisfied that no one saw him, made a sudden rush, and at the top of his speed made the best of his way into Gresham Street, where he was recognised by a person who had seen him in court during the proceedings. It was soon passed from one to another, until a mob collected round him so dense, that he was quite unable to escape. Mud was heaped upon him from all sides, and his ears were greeted with various shouts: "Down with the wretch who starved the girl!" "Death to the cruel monster!" "Give it to him; show him no mercy; he had none for Jane Wilbred!" and such-like phrases. In order the more effectually to prevent his escaping, one of the mob knocked his hat over his eyes, and it was not until he was dragged and pulled about in a very rough manner that he was able to get away from them, when he ran towards the Post-office, with the mob in full chase after him, yelling and hooting at his heels at every step, until he fortunately met a policeman, who took him under his protection, and hurried him into a public-house in Gresham Street, where he remained until a cab was called, and he was got into it with great difficulty and conveyed to his chambers in the Temple. On arriving there, however, a fresh surprise awaited him, for there were from 500 to 600 persons collected round the house in Pump Court, anxiously waiting for Mr. Sloane. The officer who had accom-

panied him in the cab then directed the cabman to drive along the Strand, but the mob who had followed the vehicle from Gresham Street so annoyed him by mud and other missiles, that Mr. Sloane expressed a wish that the cabman should cross Waterloo Bridge and put him down at the railway station, and he ultimately escaped without any serious injury.

Several cases have occurred of workmen being driven from their employment by *Combinations of their Fellows*. A labouring cooper complained at the Thames Police Court, on the 17th, that his trade association had fined him 10*l.* for entering a workshop where steam is employed, and that they now persecuted him, and got him turned out of work to such a degree that he must starve. The magistrate could only say that the association might be liable to an indictment.

A mill-sawyer was charged at Lambeth Police Office, on the 14th, with leaving his employment under threats by fellow-workmen, because the master, Mr. Woods of Nine Elms, employed men not members of the Sawyers' Society. The man was engaged to work eleven hours a day for 2*s.* a week; but after working a few hours, went "pale and trembling" to Mr. Woods, and prayed to be free, or his society would scratch him off their roll. The magistrate found that one rule of the society is—"That if any member of the society shall introduce his son into a situation as a saw-sharpener, thereby depriving another member who is qualified, or out of employment, of taking the same, he shall be excommunicated." This rule would prevent a man from performing his first natural duty of providing for his own child; and it must be wrong in morals. But it is also in clear contravention of the 6th George IV., commonly called Mr. Hume's Act, which declares, "That if any person shall, by threats, intimidation, or by molesting, in any way obstruct another, force or endeavour to force any journeyman, workman, or other person hired or employed, from his work or hire, all such persons so offending are liable to be sent to the house of correction for three calendar months." After conversation, Mr. Woods offered the sawyer constant work if he would give up the society; and the sawyer consented to stick by his master. On that understanding, the magistrate allowed the summons to stand over for a fortnight.

The persons charged with the robbery on the premises of Mr. Chapman, jeweller, in the Strand, were tried at the Central Criminal Court on the 20th. Clinton, the shop-boy, who admitted the robbers in the evening after the manager had gone, Shaw and Badock, the shoemaker's, Clinton's friends, with Gardner and Buncher, two reputed thieves, were tried as principals; Mary Buncher and Mary Cheroneau were tried as comforters and abettors. Clinton pleaded guilty. The trial of the others had an unexpected result: Clinton's former statements, incriminating the others, have been so contradictory, and his whole conduct so untruthful, that the Crown prosecutors would not put him in the box as Queen's evidence; and the other witnesses failed to make out a case against the other prisoners, who, except Clinton, were consequently acquitted. Clinton was sentenced to be transported for twenty years.

A *Melancholy Suicide* has been committed by Mr. Spence, Q.C., the eminent barrister. He was sixty-three years old, and had for some time been in declining health, and afflicted with a deep mental despondency. He became at last possessed by the delusion that he was dying from an internal disease which his father had laboured under; and his medical attendant was quite unable to remove the wholly ungrounded impression. On the 10th, his mind wholly gave way, and in the dead of the night he opened veins in his neck, his thighs, and his wrists; and his summoned household found him at the point of death from loss of blood. Still rational, he said—"My sufferings were greater than I could bear: you see what a dreadful thing I have done. I am pleased that I have been punished in this world; and I hope I shall escape hereafter." By medical skill his life was preserved till the 15th, when he died from exhaustion. A coroner's jury, at his house in Hyde Park Terrace, returned a verdict of "suicide under the influence of temporary insanity."

Another case has occurred of *Robbery attempted by means of Strangulation*. Mr. Adolphe Dubois, a

dentist in Princes Street, was passing through Norton Street, near Portland Place, about half-past nine o'clock on the night of the 18th, when he noticed three men in a doorway, as if they were there to get out of the rain. As he was passing, one of them ran down the steps and rushed against him, at the same time throwing a rope or gag over his head, which was instantly forced round his neck, and tightened so as nearly to choke him. Mr. Dubois endeavoured to give an alarm; but the rope was twisted tighter, a man being at his back, using something like a lever to effect this compression. He contrived, however, to call out; upon which the other two men ran down the steps and held his hands. By the time he had nearly lost consciousness, he felt the pressure removed, and then saw the three men running off by different ways. He called out "Murder! Police!" and he then noticed that his outside coat was torn, and that his watch and chain had been taken from him. In a minute or two afterwards, a man who called himself William Thompson was brought to him, and he instantly identified him as the man who had used the gag or rope to him. The watch was soon afterwards produced in a shattered condition, having been found in an area close to where the prisoner was stopped. He had marks on his neck from the violence to which he had been subjected; and he suffered a kind of spasm every five minutes from the same cause. Thompson was brought before the Worship Street Police Court, next day, and remanded on a statement by the police that they expected to capture his accomplices.

A recent Trial for *Murder in France* has created a great sensation from the atrocity of the circumstances. The Abbé Gothland, a priest, and Madame du Sablon, the wife of a physician at Arzoulême, were placed at the bar on a charge of having wilfully murdered a woman named Deguial, who lived with Gothland as his servant. The corpse of the deceased had been exhumed upon suspicion, and was found to contain arsenic; in addition to which it was testified that the deceased had sickened suddenly, and had suffered from violent vomitings previously to her death. These facts suggested that she must have come to a violent end; suspicion fell upon the prisoners; and evidence was brought to show that Gothland had been living in adulterous intercourse with Madame du Sablon; that this illicit connexion had been discovered by Deguial; and that the murder had been devised and perpetrated by the joint exertions of the pair to remove this witness of their guilt. Proof was brought that Gothland, in parishes where he had formerly officiated, had been notoriously inculpated with other married women, and that Madame du Sablon had maintained a similar connexion with Gothland's predecessor in the curacy. Evidence of a less direct kind was also taken to prove the criminal dispositions of both the accused parties. On the other hand, it is particularly remarkable that the defence was made to rest more on the probability of suicide, than the improbability of adultery and murder; nor was any testimony offered to the sanctity or innocence of the priest beyond the simple evidence, that, with the fate of his predecessor before his eyes, he had resolved to exercise greater caution in his intercourse with his female parishioners. The question of the "probabilities" was complicated by an incident so wholly French in character, that it is difficult to attach to it, according to the English notions, any decided purport. As soon as the accusation had become known to Dr. du Sablon, the husband of the female prisoner, he held a long "explanation" with his wife, the result of which was they both shut themselves up in a room with a little boy their son, kindled some pans of charcoal, and thus endeavoured to terminate at one stroke their existence and their difficulties. In the execution of this resolve they were interrupted, though not until their purpose had been nearly effected; and both the parties to the trial endeavoured to turn the fact to their own peculiar benefit. Madame du Sablon insisted that if her husband had considered her guilty, he would not have sacrificed his life with her; to which the prosecutor replied with more plausibility, that if he had been persuaded of her innocence he would not have proposed suicide at all, or, at any rate, would not have included his little son in the sacrifice. In the end, after a melo-

THE
HOUSEHOLD NARRATIVE

OF
CURRENT EVENTS,

(FOR THE YEAR 1850.)

BEING
A MONTHLY SUPPLEMENT TO HOUSEHOLD WORDS,

Alton Locke, 191; Amari's Sicilian Vespers, 265; Baxter's Southern and Central Europe, 47; Baroness von Beck's Adventures in Hungary, 263; Carlyle's Latter-Day Pamphlets, 67; Cathcart's Russian and German Campaigns, 94; Charles V., Correspondence of, 167; Chesney's Expedition to the Lufhrates, 119; Christianity in Ceylon, 279; Christmas with the Poets, 279; Cochrane's Young Italy, 167; Coleridge's Essays on his own Times, 94; Life of Andrew Combe, 94; Conversations with Goethe, 279; Miss Cooper's Rural Hours, 211; Correspondence of Sir Isaac Newton, 279; Mrs. Cowe's Light and Darkness, 239; Cunningham's Hunter's Life in South Africa, 113; D'Israeli's Commentaries on the reign of Charles I., 279; Dixon's London Prisons, 23; Dynamical Theory of the Earth, 279; Dyer's edition of Kit Marlowe, 23; Evelyn's Diary and Correspondence, 47; Grote's History of Greece, 71; Head's Defenceless State of England, 263; Guizot's English Revolution, 47; Field's Life of Howard, 143; Knight Hunt's Fourth Estate, 94; Leigh Hunt's Auto-biography, 143; Mrs. Jameson's Legends of the Monastic Orders, 191;

Key's Social Condition and Education in England and Europe, 94; Kenrick's Egypt under the Pharaohs, 197; Kieckhefer on the Rhine, 278; Klappa's War in Hungary, 94; Knight's Life of Shakespeare, 94; Laine's Social and Political State of the European People, 94; Latham's Varieties of Man, 191; Levi Leone on Commercial Law, 239; Lingard's History of England, 71; Lyrics of the Heart, 279; Mackay's Progress of the Intellect, 143; MacFarlane's Turkey and its Destiny, 47; Makamet of Harai, translation of, 263; Margoliouth's Pilgrimage, 239; Mazzini's Royalty and Republicanism in Italy, 239; Memoirs of Cardinal Pacca, 47; Merivale's Rome under the Empire, 93; The Moorland Cottage, 279; Mure's Language and Literature of Ancient Greece, 93; Newman's Phases of Faith, 119; Norman on the Pressure of Taxation, 71; Pamphlets on Papal Aggression, 279; Henry Rogers' Essays, 118; Sedgwick's University Studies, 191; Sydney Smith's Moral Philosophy, 94; Spectator—re-issue of the Covenly papers, 138; Strickland's Queens of Scotland, 243; Tales, by the Author of "Jane Eyre," 279; Hayard Taylor's El Dorado, 119; Ticknor's Spanish Literature, 23; Townshend's Modern State Trials, 118; Village Notary, 47; Wailly's Stella and Vanessa, 191; Robert Plumer Ward's Memoirs, 143; Wordsworth's Prelude, 167.

Music, Beethoven quartet society, 95; Elsteddfod, 215; grand national concerts, 239; Jenny Lind, concerts of, 113, 191; musical festival, Gloucester, 215; musical union, 93; Her Majesty's Italian Opera, 71, 95, 119, 143, 191; Royal Italian, 71, 95, 119, 143, 191; Philharmonic Society's concerts, 71, 95, 119, 143.

Nelson column, bas-reliefs, 94.

Nineveh, Mr. Layard's excavations at, 95, 139, 259.

Pictures, sale of the Barbarigi gallery, 191; of the Hague collection, 190, 191; opening of the British Institution, 143; of the gallery of the National Institution, 94; Royal Academy, 119; Society of Water Colours, 119; New Society of Water Colours, 94; removal of the Vernon gallery, 191; number of pictures imported in 1849, 94.

Planet, discovery of a new, 215.

Seaford, removal of cliffs at, 215.

Theatres, Adelphi, 95, 119, 263; Drury Lane, 95, 119; Haymarket, 71, 95, 119, 263; Lyceum, 95, 119, 263; Olympic, 71, 25, 47, 263; Princess's, 95, 269, 263; Sadler's Wells, 47, 263; Saint James's, 23, 95, 167; Strand, 71, 95, 119, 143; Surrey, 47; Mr. Macready's farewell performances, 263.

dramatic display protracted through a whole week the jury acquitted the woman, and convicted the priest, but with a reserve of "extenuating circumstances" in his favour, and he was condemned to the galleys for life; but it is said that he intends to appeal against the sentence.

An *Extraordinary Escape* from the Pentonville prison was made by a convict named George Hacket on the evening of Sunday the 1st inst. Having lately escaped from a cell at the Marlborough police court, and also attempted to escape from Newgate, he was removed to Pentonville, and placed under the surveillance of the prison officers. After service on the above evening he was missing, and it was by finding the sheets of his bed, a rope, and his clothing on the parapet-wall that his mode of escape was detected. It appears that he had wrested off the spring of the door of his cell, which he formed into a "jemmy," and concealed about him a weight and the sheets and rope of his bed, which he must have wrapped round his body under his clothes. As soon as he was conducted to his seat in the chapel he must have slipped down off it on to the flooring, and by the "jemmy" and weight forced out the boarding, thus enabling him to descend to a small closet beneath. A window with trifling protection afforded him access to the parapet-wall some few feet below. Gaining it, he proceeded along to one of the main walls, 50 or 60 feet long, communicating to the governor's house, on the north side of the prison. Reaching the end, he must have got on to the roof of the house, a height of more than six feet from the wall. He then must have divested himself of the prison clothing, save his trousers and blue shirt, and with the "jemmy," rope, sheets, &c. left them on the roof, and by sliding down one of the gable-end walls got clear of the gaol. The governor despatched officers to the different police stations with a full description of his person, and the inspector of prisons instituted an inquiry into the circumstances attending the convict's flight. Next evening the governor received by post the following note:—

"MORLEY, Dec. 2, 1850.

"George Hacket presents his compliments to the Governor of the Model Prison, Pentonville, and begs to apprise him of his happy escape from the gaol. He is in excellent spirits, and can assure the Governor that it will be useless for his men to pursue him; that he is quite safe, and in a few days intends to proceed to the continent to recruit his health."

All endeavours to discover and recapture him have been unavailing.

NARRATIVE OF ACCIDENT AND DISASTER.

Two fatal accidents have happened in the *Tunnelling Operations* now going on under the streets. To divert, or suppress, the stench of a sewer discharging itself near the New Houses of Parliament, a sluice-grated sewer has been in course of excavation at the bottom of Northumberland Street, Charing Cross, which would carry the sewage into the Thames below the low-water mark. On the 16th, there was a spring-tide; extra precautions had been taken to keep out the water, and they were thought to be sufficient. But while sixteen persons were employed in the subterranean works, the river suddenly made a breach through all obstructions, and flooded the works. The men strove hard for life; but two of them, Edward Gorman and William Gardner, were overwhelmed by the rush of waters, and drowned. The drowned men have each left widows and families destitute; for whom the contractors, Messrs. Humphreys and Thrist, declared their intention to provide. At the inquest held on Wednesday, it appeared that the contractors, without consulting the Sewer officers, for a temporary facility to their works, made an extra tunnel under the Regent Street sewer, with a roof of from four to six feet thickness of mud and earth, resting on timber supports. On Monday morning the men went down to work while a high tide was in the dock; the earthy crown of the tunnel could not bear the pressure, and the water rushed in. The inquiry was adjourned till the 23d, when the Jury found the

following Verdict:—"Accidental death by drowning; and the jury cannot separate without expressing their opinion that great negligence is attributable to Messrs. Humphreys and Thrist, and their foremen, Messrs. Wheeler and Perrott, in not consulting the engineer connected with the Victoria sewer."

More disastrous accidents from the *Explosion of Engine-boilers* have occurred. At Halifax, on the 29th ult., the boiler of a manufactory exploded while the people were all at work in the afternoon: the boiler was the centre one of three; above was a part of the premises occupied by the workers, and this became a heap of ruins, which the fires of the boilers set in a blaze, that was with difficulty extinguished. Many were buried in the rubbish, and it was a long time before the debris could be cleared away to get at the unfortunate people. Nine were taken out dead, and others were found very much hurt. Another explosion subsequently occurred at Bilston, in Messrs. Baldwin's colliery. Though very violent, large masses of iron flying to a long distance and destroying buildings, no one was killed. The engineer was scalded, but is going on favourably.

The Duffryn mine, a new colliery in the valley of Aberdare, has proved fatal to at least two lives. Fifty-two persons were down a pit more than five hundred feet deep, when an explosion shattered the "bratishing" which lines the shaft, and closed up all means of escape, and apparently all means of ventilation. After an hour or two of painful suspense, a single bucket was got down the pumping-shaft; and by its slow instrumentality all the poor prisoners were drawn out but three. Two lifeless bodies were extricated.

In the Morfa pit of Messrs. Vivian and Son, at Tailbach, Glamorganshire, at least two persons have been killed, and some thirty wounded, by an explosion.

In the Abergwydden colliery, Monmouthshire, the gearing of the lifting apparatus having gotten out of order, the heavy "carriage" ran down the shaft with frightful rapidity. A man stood beneath; panic rooted him to the spot, and he was crushed to death.

Two *Collisions on the Eastern Counties Railway* took place during the dense fog in London on the evening of the 23rd. They both took place at Stratford, near the Brick Lane goods station. The half-past four o'clock down train to Hertford was standing at the Stratford station, and on the eve of resuming its journey, when the Enfield express, which left Bishopsgate at a quarter to five, came in fearful contact with it, causing considerable injury to the passengers in the two rear carriages—a first and second class. The train, however, went on, and ran into the Hertford carriages. The first struck was a second-class, which was shattered in all directions; the unfortunate occupants, with fractured limbs and contused wounds, falling amongst the fragments. The next carriage, a first-class, was then driven in, and the escape of a lady and gentleman, Mr. and Mrs. Head, connected with the firm of Charrington and Co., the brewers, who occupied the coupé, was most surprising. They were exposed almost to the full force of the collision. On being extricated, however, although much shaken and bruised, their limbs were not found to be fractured. The density of the fog tended much to the alarm and confusion, and during the period employed in removing the injured persons from the wreck of the carriages their cries for aid excited much sensation. At length they were all extricated, and, apparently, every one who was seated in the last two carriages was hurt, more or less. The second collision was of a similar character; the Norwich evening express overtaking the Colchester parliamentary train, near the Brick Lane goods station, and running into it. Both trains were overdue—the Colchester about half an hour, and the Norwich an hour; the fog and slippery state of the rails being the primary cause. As in the other case, many persons were hurt, some of them seriously, but no lives were lost. Investigation, in both cases, will take place.

A *Railway Accident* occurred on the 23rd on the Leeds and Selby line, near the Melford station. A heavily laden luggage train from Leeds, arriving at a rather steep ascent, the engine was unable to drag it up, and it recoiled down the incline, running into another luggage train coming from Leeds on the same line of rails. The engine and tender were smashed to pieces, and the

engineman, the stoker, and another man (employed as a pointman) were all killed, or received such injuries as caused their death the same evening.

SOCIAL, SANITARY, AND MUNICIPAL PROGRESS.

EARL FITZWILLIAM, when his rent audit took place last month, announced to his tenants his intention to make an *Equitable Adjustment of their Rents*, in accordance with the circumstances of the times. He stated, that, in consequence of the legislative changes that had taken place, and their now ascertained effect, he did not think that the basis on which his rents had been hitherto fixed would be an equitable basis for the future. When the last basis was adopted, his private opinion was that it was a little too high, but it had been settled by others, on whose judgment he relied. And he was bound to say that the average prices since that settlement had justified the adoption of that basis in 1843. For the future, however, it would certainly be too high, and he intended, therefore, that his rents should be re-adjusted on a lower basis. What that would be he could not then say. He should leave the matter in the hands of persons competent to advise him, but the result, he was convinced, would be a general reduction of rents. This, of course, would not apply to accommodation land, which derived its value from peculiar circumstances.

At the Town-hall of Windsor, on the 3d, there was a *Distribution of Prizes by His Royal Highness Prince Albert*, to labourers and other deserving persons. A list was read over of twenty-one persons who had been selected from the parishes of New and Old Windsor, Eton, Clewer, Sunning-hill, and Sunning-dale, as the most deserving to receive rewards for cleanliness and tidiness in house and person, the best cultivators of gardens, or allotments, being also persons of sober and good moral character. Each person was then called up separately, and presented by the Prince with a sum of money varying from 10s. to 30s., and also a card bearing an inscription recording the fact, on which his name was written, and to which the Prince added his autograph.

The Magistrates of Surrey, at a large special meeting on the 2d, adopted the report of their Committee recommending the establishment of a *Rural Police* in those portions of the county without the limits of the Metropolitan Police district. The Committee concluded, after examinations of persons and documents, that the rural portion of the county, which contains ninety-six parishes, should be formed into three Police divisions; to be called the Chertsey, Dorking, and Godalming divisions. The Chief Constable should reside at Dorking, as the most central point. The various lock-up houses should be repaired, and stationhouses erected, at an estimated cost not exceeding 3000*l.*; "which would be raised upon the security of the police-rate, and repaid with interest in twenty yearly instalments." The total expenditure will be 6284*l.* 7*s.*, the total savings 2574*l.*; there will be a balance of 3710*l.* 7*s.* for the cost; and this balance will be so much further reduced when the proposed force shall have been a short time in operation, that the expense of maintaining the Police will, it is believed, be little felt by the rural portion of the county. A Committee is to select a fit person for the important office of Chief Constable; and the full Bench will elect the officer next Epiphany Sessions.

It has been determined by the Court of Directors of the East India Company that the appointment of Governor of their *Military Seminary at Addiscombe* shall in future be quinquennial—that is, to be vacated after five years—like the appointments to the Councils of India and to the General Staff and commands of the Army. This is a measure well calculated to secure efficiency in the performance of the duties. No officer has yet been selected as successor to Colonel Stannus, whose death was reported more than a month ago; but many very distinguished officers are reported to be candidates for the situation.

A return of the number of *Cotton, Woollen, Worsted, Flax, and Silk Factories*, subject to the Factories Acts

in each county; of the aggregate of steam or water power by which they are worked; of the number of persons employed in them; distinguishing children under 18 from adults, and males from females; which has been made under an order issued by the Crown, in compliance with the prayer of an address agreed to by the House of Commons on the 10th of June last; gives the following general results. Total number of factories for the different processes of manufacture in silk, cotton, woollen, and flax in England and Wales, 3089; working 22,850,010 spindles, and 272,588 power looms, by means of steam power and water power equal to 91,810 and 18,214 horses respectively. The number of persons employed, 495,707, of whom 216,464 are males, 279,243 females, 130,259 of the former being above 18, 57,453 between 13 and 18, and 260,378 of the latter above 13 years of age. 19,042 male and 15,113 female children under 13 years, and 1710 male and 3752 female children between 11 and 13, are employed in silk throwing mills. In Scotland the number of factories is 550; spindles, 2,256,403; power looms, 23,811; steam power, 13,857 horses; water power, 6004 horses; children between 11 and 13, in silk throwing mills, 27 males and 164 females; children in other factories under 13, 351 males and 578 females; males between the ages of 13 and 18, 6982; females above 13, 52,806; males above 18, 14,780; total number of males, 22,140; females, 53,548—grand total, 75,688. In Ireland the number of factories is 91; spindles, 532,303; power looms, 2517; steam power, 2646 horses; water power, 1886 horses; children under 13 years of age, males 7, females 31; males between 13 and 18 years old, 3429; females above 13, 16,393; males above 18, 44827; total, males, 8263; females, 16,424—grand total of persons employed in factories in Ireland, 24,687. Total for the United Kingdom: factories, 4230; spindles, 25,638,716; power looms, 298,916; steam power equal to 108,113, and water power to 26,104 horses; children between the ages of 11 and 13 in the silk throwing mills, 1737 males, and 3916 females; children under 13 in other factories who attend the schools, 19,400 males, and 15,722 females; males between 13 and 18, 67,861; males above 18, 157,866; females above 13, 329,577; total, males, 246,867; females, 349,215—grand total, 596,082. These returns show the great seats of the various manufactures in England to be Lancaster for cotton, York for wool and flax, and Chester for silk. In Ireland, Waterford for cotton, Cork for wool, Dublin for worsted, and Antrim for flax. In Scotland, Lanark for cotton and silk, Clackmannan and Stirling for wool, and Forfar for flax.

The fifth annual *Report of the Commissioners of Lunacy*, now issued, gives the following summary of the number and classes of insane persons confined in asylums, hospitals, and licensed houses on the 1st of January last:—Asylums: private patients, males 120, females 112; paupers, males 3160, females 3758, total 7140. Hospitals: private patients, males 412, females 453; paupers, males 175, females 168, total 1206. Metropolitan licensed houses: private patients, males 574, females 546; paupers, males 737, females 1038, total 2945. Provincial licensed houses: private patients, males 800, females 757; paupers, males 1106, females 1123, total 3786. Grand total of sexes and classes 15,079; of this number 238 have been found lunatic by inquisition, 264 are criminals, and 1036 are chargeable to counties or boroughs.

The Electric telegraph now gives notice of the *Approach of Storms*. This property of the invention has been discovered in America. The telegraph at Chicago and Toledo makes ship-masters at Cleveland and Buffalo, and also on Lake Ontario, aware of the approach of the north-west storm. The result is practically of great importance. A hurricane storm traverses the atmosphere at the rate of a carrier pigeon, namely sixty miles, an hour. A vessel in the port of New York, about to sail for New Orleans, may be telegraphed 20 hours in advance, that a south-west storm is advancing on the coast from the Gulf of Mexico. In Great Britain and Ireland the advantages to the shipping interest by the announcement of approaching storms, would be incalculable, by preventing them leaving safe harbours until after they had passed, or by signals on various parts of the coast, directing them to take shelter at the nearest port.

PERSONAL NARRATIVE.

(ON the evening of the 12th, the Queen gave the first of a series of *Dramatic Entertainments* at Windsor Castle, under the direction of Mr. Charles Kean. The play was the First Part of King Henry the Fourth. The veteran Bartley, after a long retirement from the stage, re-appeared in the character of Falstaff.

Viscount Ponsonby has *Resigned the Embassy at Vienna*, and Mr. Magenis will continue to act as *Chargé d'Affaires* until the arrival of his Lordship's successor.

The Honourable George Jerningham, now Secretary of the Embassy at Constantinople, is appointed Secretary of the Embassy at Paris.

The place of Deputy Ranger of Windsor Park, vacant by the death of Sir Thomas Fremantle, has been conferred on Captain F. H. Seymour, one of the Equerries in Waiting to Prince Albert.

The Rev. R. J. Butler, M.A., of Brasenose College, Oxford, and Chaplain to the Lord High Commissioner of the Ionian Islands, was received into the Catholic Church at Rome on the 23rd of November last. This gentleman was formerly Warden of the House of Charity in Rose Street, Soho.

Sir Robert Monsey Rolfe, Vice-Chancellor, has been raised to the Peerage of the United Kingdom, by the title of Baron Cranworth, of Cranworth, in the county of Norfolk.

Mr. Joseph Hume having visited Southampton on the 3rd, to start a son for the West Indies, the Mayor of Southampton and about four hundred citizens of the town gave him a public entertainment. It was remarked that the admirers of the veteran economist were not solely of the Radical class, but included a good sprinkling of frugal Conservatives. Mr. Hume made a speech of encouragements, founded on the reminiscences of his long political experience; a marked feature of which was his declaration of opinion that Lord John Russell would willingly be a more liberal minister if supported by a more liberal house of commons.

Pensions on the Civil List of 1861, a year each have been granted to George Petrie, Esq., LL.D., and to J. Kitto, Esq., M.D. Mr. Petrie is a member of the Royal Hibernian Academy of Arts, and Vice-President of the Royal Irish Academy of Science. He is author of the well-known treatise on the "Round Towers of Ireland," and of many other antiquarian works. Dr. Kitto has been deaf and dumb from an accident when a boy, in spite of which difficulties he travelled through many lands in connection with the Missionary Society. With his physical failings he has done much for the cause of biblical literature, and is the author of many works, such as the "Pictorial Bible," "History of Palestine," "Cyclopædia of Biblical Literature," &c.

The committee of subscribers to the monument to the memory of the late Lord Jeffrey have decided that the memorial shall be a work of sculpture. The subscriptions in the hands of the committee amount to 2200*l.*, a sum which, it is hoped, will suffice to defray the cost of the statue, and to leave enough besides for the erection of a slight monument over the grave in the Dean Cemetery, at Edinburgh. The statue will probably be placed in the Outer Parliament House.

At a *Sheriff's Sale at Derrynane* some time since, the whole of the splendid furniture and other household goods were sold for the sum of 364*l.* 3*s.* 8*d.*, and were bought in by the National Bank of Ireland. The purchase has been impeached as fraudulent, and on application to the court, an issue has been granted to try the fact by a jury. The prices at which the National Bank bought the furniture may be imagined from the fact, that the entire furniture, &c., of the "Liberator's Room," state bed, &c., sold for 3*l.* 8*s.* 6*d.*

A young lady has *Escaped from the Convent at Banbury*. She was known there as sister Antonia; her "worldly name" is unknown, but she is understood to be very highly connected. The local newspaper gives the following particulars:—"Her dissatisfaction with a conventual life was first made known out of the house by letters, which she contrived to have conveyed by children in the school, to parties of the Protestant faith

in Banbury. An English New Testament, which by chance came into her possession, disturbed the opinions in which she had been educated; she determined on getting away from St. John's, and resolved to do so early on Monday morning, and again on Tuesday morning; but at the moment of the contemplated escape her heart failed her. Shortly after nine o'clock, the school hour, on Tuesday, while the other inmates were engaged, she took an opportunity of getting away unobserved; and, for some reason, instead of going to the parties in Banbury, with whom she had been in communication, and who had offered her shelter, set off on the road for Oxford. At Adderbury, three miles from Banbury, she became tired and inquired for a Protestant minister; she was taken to the house of the Rev. Mr. Crickett, an Independent minister, where she was kindly received, both by Mr. and Mrs. Crickett, with whom she was remaining yesterday. She has been supplied with clothing, and the garments peculiar to the sisterhood, in which she went away, have been returned to the convent. Before she left St. John's, we believe, an application was made by the parties with whom she had been in communication, to a neighbouring magistrate, for his aid to remove her; and he wrote on the subject to Sir George Grey, the Secretary of State; but she did not wait for their interference, but took an opportunity of acting alone, as we have described."

The *Will of the late King of the French* has been proved at Doctors' Commons. The personal property is sworn at under 100,000*l.* The will is dated at Claremont, October 16, 1848, and is very concise. He bequeaths his house and gardens at Palermo to Queen Marie Amelie for ever. He gives all his property in England and America to the Queen, for her life, with reversion to her children, subject to such provisions as her Majesty may make in her life-time, and in the case of any informal or incomplete bequest of it by the Queen, it is to be divided into nine shares. Two of these shares go to the Duc de Nemours, and one to the Comte de Paris and the Duc de Chartres—to be held by them as joint tenants—that is to say, to be divided between them. The remaining shares are divided, one each to Louise, Queen of the Belgians, the Prince de Joinville, the Duc d'Aumale, the Duchess de Saxe Coburg Gotha, the Duc de Montpensier, and Philip Alexandre (a grandson), Duc de Wurtemberg. The ex-monarch bequeaths all his money in the house at Claremont, and in the bank, at his death, to his Queen, subject only to the payment of his just debts and funeral expenses. The Queen is appointed executrix of this will during her life-time; and after her decease, Mr. W. E. Marjoribanks, Sir E. Antrobus, Bart., Mr. W. M. Coulthurst, Mr. E. Marjoribanks, jun., and Mr. J. Parkinson, of Lincoln's Inn Fields, are to act as trustees. The dispositions of his property in France are not proved in England.

Obituary of Notable Persons.

Colonel H. M. JOHNSON, Vice-President of the Republic under the Van Buren administration, died on the 19th ult., at his residence in Kentucky state, in the 70th year of his age.

Lieutenant LORIMER, one of the senior military knights, died at Windsor on the 25th ult. He entered the army in 1805, and served in the Peninsula, at Walcheren, and at the siege of Flushing. He was severely wounded at Corunna and Flushing, and had received the war medal and clasp for Corunna.

Sir WILLIAM WHYMPEY, M.D., died on the 28th ult. at Dover, aged 65 years. He served in the Coldstream Guards as Surgeon, throughout the Peninsular war, and was present at Waterloo. He had received the war medal with five clasps. In 1826 Dr. Whympsey became Surgeon-Major of the Coldstream Guards, and in 1836 he retired on half-pay. He was in 1839 knighted by the late king.

Mr. R. GILFILLAN, well known as the author of several beautiful songs in the Scottish dialect, died suddenly on the 4th inst. from a fit of apoplexy, with which he was seized while in attendance at his office as Collector for the Commissioners of Police in Leith.

General The Hon. Sir WILLIAM LUMLEY, G.C.B., died on the 15th inst., aged 82 years. He was son of the fourth Earl of Scarborough. At the age of eighteen he entered the cavalry service, in 1787, as a cornet in the 10th Dragoons, and served in

Ireland during the rebellion of 1798, in Egypt, South America, and the Peninsula. The coloncy of the First Dragoon Guards is vacant by his death.

Admiral PAYNE died of apoplexy on the 9th inst. He was hunting, when he fell from his horse in a fit, and died in a few minutes. He was between 70 and 80 years of age, and, on account of the tendency which he had exhibited for such attacks, had been warned by his medical attendants to avoid the excitement of the chase.

Mrs. BELL MARTIN died recently at New York, after a short illness, within ten days of her arrival in the United States. She was, previous to her marriage, Miss Martin, of Galway,

and her husband took the family name when she married. Her estates were the largest in Ireland, her tenantry amounting to twenty thousand, and her lands extending over two hundred thousand acres; but the property on her succeeding to it was so heavily mortgaged that she was obliged to relinquish all, and trust to her literary talents for her support. It was with this object she went with her husband to the United States. A premature confinement was the immediate cause of the illness which terminated in her death. Mrs. Bell Martin was a large contributor to the "Encyclopédie des Gens du Monde." She was the author of "St. Etienne," a tale of the Vendean war, and of "Julia Howard," a novel recently published.

COLONIES AND DEPENDENCIES.

THE principal and most unhappy feature of the month's Colonial news, is the almost utter desolation of the southern shores of the island of Jamaica by the scourge of cholera. Its ravages began with the opening of October; and, when the last accounts left, in the middle of November, had not perceptibly abated. The chief mortality had been at Port Royal, Spanish Town, and Kingston. The deaths in the latter place (a town of forty thousand inhabitants, of which nine-tenths are Negro) averaged a hundred and fifty a-day, and on some days greatly exceeded two hundred. Resources had failed both for the dead and living; neither doctors nor medicines were procurable; it was impossible to supply coffins in any proportion to the demand; and crowds of dead bodies, carried in carted heaps to the graveyards, and exposed for want of hands to bury them, lay poisoning the panic-stricken survivors, till at last flung into trenches opened by convicts and soldiers. The accounts read like pages torn out of De Foe's History of the Plague; and it is well worthy of note that the previous condition of the island confirms all that has been lately ascertained of the sanitary laws that govern the disease, and the causes that contribute to its virulence. It is another lesson for ourselves,—with none of our metropolitan graveyards yet closed by the Extra-mural Act! with oven some re-opened that were shut in sheer fright at the cholera last summer! and with the imminent prospect before us of enormous additions to our London population without approach to any means of accommodation at all adequate to the increase!

The last *Overland Mail* from Bombay brings no political intelligence of interest. The greatest tranquillity prevails in India. The Governor-General was preparing to proceed to Lahore and the Peshawur frontier. The Nepaulesse Ambassador arrived at Bombay on the 6th ult. from Suez. The Nimrod government iron steamer has been wrecked. The late rumour of the Affreedees having made a descent upon the salt-mines of the Kohat frontier remained without confirmation. Piracies were of frequent occurrence in the waters of the Indian Archipelago; Java is tranquil. The Chinese on the Western coast of Borneo have discontinued their resistance against the Dutch. At Hong Kong the fever has declined among the troops. The gangs of Chinese robbers in the province of Kwangse are gradually dispersing. A fearful occurrence took place at Macao on the 29th Oct., when the Portuguese frigate the Donna Maria blew up, and officers and men, about 200 in number, perished, with the exception of one officer and fifteen men.

The accounts from Jamaica are to the 1st instant. The ravages of the cholera have rendered this island a scene of desolation. On the 7th of October last, Mr. Watson, the surgeon of the naval hospital in Port Royal, announced that Asiatic cholera of a malignant type had made its appearance in that town. The inhabitants were at first incredulous, but facts soon convinced them of the truth, and plans were devised to stay the plague. A cholera hospital was established, and some of the surgeons of the fleet were sent ashore to assist. Government medical stores were distributed freely, but it was soon found that both the quantity of medical stores, and the number of medical men, were totally inadequate to the frightful extent of illness and suffering that prevailed. Upwards of 5000 persons have died in Kingston and Spanish Town alone. Numbers were so panic-stricken, that they would not apply for assistance, and no one knows that they have been ill and died. Some were found dead in cellars, where they had been lying dead for days. One of the most distressing things is the number of orphans, both black and white children, and their condition and future provision are now occupying the serious attention of the Jamaica authorities. Hundreds of children of tender age are left utterly destitute; for fathers, mothers, brothers, and sisters have been

swept away by the pestilence. They are to be seen in houses, forlorn and helpless. Infants are found lying on the floor, forsaken by friends and relatives, for they are sleeping in death, and these innocents are kept from perishing by the visits of the benevolent. The dread of cholera seems to have destroyed the social affections. Some of the poor blacks have been found to place their dead relatives before the doors of their neighbours, to avoid the infection, or because they were unable to pay the expense of burial. It was urgently suggested that trenches should be dug, and that corpses should be buried without coffins, in order that the expense of the latter should be saved, and go towards providing an orphan fund. On the 23rd the cholera abated in Spanish Town, Port Royal, and Kingston, but broke out in other places. On this day Dr. Macfayden, an eminent physician, died. As there was not above one medical man to 5000 persons in Jamaica, and as four medical men had already fallen victims to their unremitting exertions in the cause of suffering humanity, it may easily be imagined how ill he could be spared.

From Canada we learn that there is a rumour that the seat of government is about to be removed 500 miles down the St. Lawrence in June or July next.

A *Temperance Meeting* at St. Hyacinthe, Lower Canada, recently excited the people so much against drunkenness, that a mob collected, proceeded to a building occupied as a brewery and distillery, owned by Mr. Phillips, of Laprairie, and entirely demolished it, smashing everything they could lay their hands on. Similar outrages were committed at a neighbouring tavern, and further mischief was threatened.

The *Sydney* journals contain reports of a great public meeting on the 12th of August, to consider Governor Fitzroy's despatch to the Colonial Office on the meetings in June last, on the subject of transportation. The following chief resolution was carried unanimously—"That this meeting having had under its consideration a despatch from his excellency Sir Charles A. Fitzroy, dated 30th June 1849, transmitting to Earl Grey the great protest of the inhabitants of Sydney, in public meetings assembled, against the renewal of transportation, hereby declares, that in that despatch his Exci-

lency has, in a case of the utmost importance to the general welfare of this colony, grossly misrepresented a series of facts of public notoriety, traduced the character of a large majority of the colonists of all classes and in all parts of the territory, and betrayed the interests of the colony into the hands of its enemies."

The papers also contain reports of the great debate in the Legislative Council, which ended on the 21st of August, on Dr. Lang's own motion inviting inquiry into the charges preferred against him by the Secretary of State for the Colonies. The Council unanimously resolved, that there were "foundations for the charges," and particularly for the one which accused Dr. Lang of pledging the duplicates of land-orders representing land of which he was only the trustee—the said pledging "was a fraud upon his costly que trusts, and highly discreditable."

The *Hobart Town* papers describe, what some of them declare to have been, an attempt to escape to California by Mr. Smith O'Brien. So far as they agree, they state that a rowing-boat approached a sandy cove; that Mr. O'Brien ran up to his waist to get to it; that a soldier rushed and knocked a hole in the bottom of the boat

with his gun, and so took possession of Mr. O'Brien and the men. But the different accounts are at variance with each other; and it seems agreed by all that the Government has made no difference in the treatment of Mr. O'Brien.

PROGRESS OF EMIGRATION AND COLONISATION.

A meeting of the *Colonist Society* was held at the rooms of the Canterbury Association on the 4th inst., to promote arrangements for the simultaneous departure of the next or main body of the Canterbury colonists. Captain Simeon presided and gave the necessary explanations. The main body of the substantial colonists will sail the first week in next June in a fleet of ships; but in the mean time there will be no intermission of the arrangements for pouring out a constant stream of labouring emigrants. The Rev. Dr. Rowley, who is going out to the colony as "head of the chapter," read a correspondence between the society and the association on the subject of the coming departure, and also on a proposal to give the colonists some additional facilities in dealing with the grants of land which they buy in this country.

NARRATIVE OF FOREIGN EVENTS.

PENDING the new "Congress of Vienna" which is about to be held under the name of the "Conferences of Dresden," the interest of Continental politics is almost wholly suspended. France is so marvellously quiet, that there is nothing better worth mention than the fact of M. de Montalembert's introduction of a bill against the desecration of the Sabbath, founded doubtless on the principle which he naïvely expressed in his report, namely, that though the State is not strong enough to govern the Church, the Church is abundantly so to govern the State. And Prince Schwarzenberg has found himself with so little to do, that he has been publishing his correspondence with Lord Palmerston in the matter of hangman Haynau's mustachios, and the damage they received at Messrs. Barclay and Perkins's brewery. From those documents it would seem that, because the English Government refused to institute any inquiry into the details of this alleged outrage other than by the usual forms and processes of English law, the Austrian Government "reserves to itself the right to consider, in a similar case, whether it should or should not act reciprocally towards a British subject in Austria." We transcribe the warning, for the benefit of British tourists, especially such as may not think Haynau a hero.

The anniversary of the election of the President of the *French Republic*, the 10th instant was celebrated in Paris by a splendid fête. The Prefect of the Seine was the nominal host; and besides the chief guest, there were gathered round him, in the Hôtel de Ville, ministers, ambassadors, and distinguished politicians, nearly two hundred. The programme prescribed the single toast "To the President of the Republic," and relied on a calculated spontaneity for the President's complimentary return of a toast "To the City of Paris." M. Berger, the Prefect of the Seine, in proposing the toast, congratulated his hearers on the fact that now the noise alone of its fêtes interrupts the laborious calm of the Hôtel de Ville; and then ascribed it to the President Napoleon's efforts and devotedness, that citizens were at length permitted to set aside all the interests of politics and speak of the interests of Paris only. The President replied in a dexterous speech which was well received. One passage in it, however, gave rise to much comment: "To tell me," he said, "that France has beheld her prosperity increase during the last two years, is to address to me the eulogium which touches me the most. At present I am happy to be able to admit that calm has returned to men's minds; that the dangers which existed two years back have disappeared; and that, notwithstanding the uncertainty of matters, a future is reckoned on, because it is felt that if modifications are to take place, they will be accomplished without trouble." After the banquet, the magnificent salons of the Hôtel de Ville, which are unique in Europe, were thrown open to between five and six thousand guests. Bands of music were stationed in the Salle des Fêtes, the Salle du Trône, and the great ball-room; and the dancing was kept up with great spirit till four o'clock in the morning.

General Schramm, the Minister of War, has demanded an extraordinary credit of 3,218,601 francs, for the

expenses during the first six months of 1851 of the army of occupation in Rome. He stated, that it was impossible as yet to predict the precise moment when the presence of the French troops may be dispensed with.

A Bill has been introduced into the Assembly by M. de Montalembert, for the better observance of the Sabbath.

A Bill introduced into the National Assembly by the Minister of War, for an extraordinary credit of eight millions and a half of francs to meet the expenses of the levy of 40,000 men which is to compose the army of reserve on the north-eastern frontier of France, was referred to a committee, who made a report, drawn up by M. Remusat, proposing that the Bill should be adopted, but at the same time proposing that the Assembly shall adopt a resolution declaring its convictions that in the questions which divide Germany at this moment, the policy of neutrality, such as is expressed and defined in the Message of the President of the Republic, is the only policy suitable to France. On the report being made to the Assembly, the proposition was adopted without any debate.

The affairs of Germany have been greatly tranquillised by a convention concluded at Olmutz on the 29th of November, between the ministers of Austria and Prussia. It was agreed that the Prussian troops should co-operate with the Federal armies for the restoration of the electoral authority in Hesse; that a Prussian commissioner should proceed with a Federal commissioner to the Duchy of Holstein to summon the insurgents to lay down their arms; and that in the event of refusal, a body of Prussian troops would join with the Federal forces in the necessary coercive measures. The question of the internal constitution of Germany was reserved for the Free Conferences of Dresden, which commenced on

the 23rd inst. This convention was ratified by the King of Prussia on the 1st inst., and about the same day by the Imperial Government. Advice from Berlin, of the 10th inst., state that the reduction of the army has been decreed. The Prussian troops were still in the positions of Hiersfeld. The Austrian forces continued to advance, having occupied Marburg, where they command the railroad from Frankfurt to Cassel. General Von der Horst had been appointed Commander in Chief of the Holstein army, *vice* Willisen, who has resigned. Herr von Manteuffel, who has been appointed the Prussian Minister for foreign affairs, has left Berlin to attend the Dresden conference. It is not known what are his plans, nor what arrangement respecting the future was come to at Olmuts between him and Schwarzenberg, the Austrian Minister; but it has been asserted in Vienna that the admission of the whole of the Austrian provinces into the confederation will not be proposed, but merely a sufficient portion to equalise the power of Austria to that of Prussia; and the province of Galicia is mentioned for this purpose. The incorporation of Posen, and Prussian Poland, in 1848, increased the extent of Prussian territories within the confederation, and therefore, it is believed, Austria will demand a corresponding increase of her German territories. The commercial relations of Germany will probably form one of the topics of discussion, and it is expected that Austria will propose the same plans for a commercial system which she put forth last year. It is even stated that a provisional arrangement will be proposed which is to last until 1866, when the definitive arrangements are to come into existence.

The *Sardinian* Chambers were opened by the King in person on the 23rd of November. The following passage of his speech, referring to the differences with the Holy See, was greatly applauded by the Chambers and the people:—"The efforts of my government have not succeeded hitherto in overcoming the difficulties which have arisen with the Court of Rome, in consequence of certain laws which the powers of the state could not refuse to introduce in the new political and legal organisation of the country. The rule of our conduct has constantly been the respect we all profess for the Holy See, in conjunction with a firm resolution to uphold the independence of our legislation. Faithful to our duties, and persevering in the exercise of our rights, we hope that time and the happy influence of religion and civilisation will enable us to establish that harmony which is one of the first wants of the social state."

The Senate of *Piedmont*, in its sitting of the 16th, passed the bill abolishing the laws on primogeniture, by a majority of 34 votes to 49.

The most remarkable news from *Spain* is that M. Bravo Murillo, the Minister of Finance, has resigned his office in consequence of a difference with the Minister of War, relating to reductions in the expenditure of his department.—The municipality of *Seville* has decided that the portrait of Cardinal Wiseman should be placed in the hall of the chapter, as being one of the most illustrious sons of the capital of Andalusia.

Accounts from *Aleppo* state that a dreadful chastisement has been inflicted on the rebels who were the perpetrators of the massacre of the Christians, which we recorded last month. On the evening of the 7th ult., Kerim Pasha invited the principal chiefs of the insurgents to come to him. They accepted his invitation, persuaded that the fear of fresh disturbances would make them respected. Kerim Pasha had them placed under arrest. The insurgents, finding their chiefs did not return, rushed to arms, to the number of about 10,000, and insolently demanded their liberation. The Ottoman General replied by charging them at the head of 4000 Imperial troops, whom he had assembled in the inside of some barracks. The combat was desperate, and lasted more than twenty-four hours. Three Mussulman quarters of the city, which were the seat of the revolt, have been almost entirely destroyed; 1800 of the rebels fell in the struggle, and the remainder, with the in-

habitants of the above quarters, have fled from Aleppo, the Turkish cavalry pursuing them. Not a single Christian fell in this terrible affair. All the property of the rebels will be devoted by the authorities to indemnify the Christians for their losses on the 14th and 15th of October, and to rebuild the three churches which were burnt.

The Message of the President of the *United States* to Congress, on the commencement of the session, was presented on the 3rd inst. It is a temperate document, and appears to have given general satisfaction. Its tone with reference to the foreign relations of the *United States* is decidedly pacific. With respect to the new territories, he urges a prompt adjudication on the Mexican land titles in California, and presses for the extension of the land laws to Utah and New Mexico. He recommends that the gold lands should be sold in small quantities, and that a branch mint should without loss of time be established in California. He also calls attention to the necessity that exists for organising one or more regiments of mounted men for the protection of the frontiers of New Mexico, and to help to repress the predatory Indians. The message contains important suggestions respecting the revision of the republic's naval code, rendered necessary by the recent abolition of flogging; the establishment of lighthouses and improvement of harbours; and the appointment of a tribunal to adjudicate all claims upon government. Not less interesting is the president's recommendation that an uniform rate of postage, of three cents for prepaid letters and five cents for unpaid letters, should be adopted, whatever the distance that they are conveyed. The most unsatisfactory parts of the message are those which relate to customs duties and to the Fugitive Slave Bill. Respecting the former, Mr. Fillmore's views are decidedly protectionist. He is of opinion that the federal revenue should be raised mainly by import duties; that these duties should be as far as possible specific, *ad valorem* rates when unavoidable being estimated on the home instead of the foreign valuation; and that those rates should be so levied as to benefit incidentally home industry by shielding it from destructive foreign competition. On the subject of slavery, the president takes his stand on the Fugitive Slave Act, the principle and policy of which, in every particular, he strenuously defends.

Since the meeting of Congress, no business of importance has been transacted in either house. With respect to the revenue and expenditure of the Union, it is stated, that the receipts for the last year into the *United States Treasury* were 47,421,748 dollars;—expenditure, 43,002,168 dollars; and that the public debt has been reduced 495,276 dollars.

Mr. George Thompson, the Member for the Tower Hamlets, attempted to deliver an anti-slavery lecture at Boston, on the 14th of November, but was not allowed a hearing. He was attended on the platform by William Garrison, Frederick Douglass, and other representatives of the anti-slavery party. The assembly determined to drown the voices of the orators: they began with groaning and hissing; then they cheered for "the Union," "Daniel Webster," "old Briggs," and "Jenny Lind;" they groaned for "John Bull;" a ring was formed on the floor, and one or two commenced dancing; the gas was turned down, and the proceedings terminated with the canticle "We won't go home till morning," in general chorus.

The existence of a third ring around Saturn, which has been some time suspected, has been positively ascertained by the astronomers at Cambridge, Massachusetts. It is interior to the two others, and, therefore, at less distance from the planet.

Submarine electric telegraph wires have been laid down on the bed of the Hudson, above Fort Lee, so as to give a free communication with the south and west.

A temperance demonstration on a large scale was held at the Tabernacle, New York, on the 18th of November; 1700 dollars were collected, including 250 dollars from P. T. Barnum. Life memberships of the society were bestowed on Mlle. Jenny Lind, President Fillmore, Hon. Henry Clay, Hon. Mr. Clayton, General Cass, Hon. W. H. Seward, Governor Hunt, &c., &c.

According to the report of the chief of the police in New York, there were more than 10,000 persons arrested for misdemeanours and felonies in that city during the past three months, where there are also 4267 licensed drinking-houses, and 718 unlicensed ditto!

There are at present seventeen lines of submarine telegraph at work in the United States under the Hudson, Harlem, Connecticut, and Delaware rivers.

The number of immigrants who arrived in New York during the month of October, amounted to upwards of 36,000.

At Queensborough, North Carolina, a man named M'Bride was lately sentenced to receive twenty lashes and to be exposed in the pillory—because he was an abolitionist.

Near Victoria, Texas, the Indians have committed several murders of late, and carried off two daughters of Mr. Thomas, who were fearfully outraged, and afterwards found nearly dead in the woods.

An instance of summary justice by *Lynch Law* has taken place at Georgetown, in California. A man, named Devine, had taken to gambling, and as he was in the habit of losing his money, his wife hid all that came into her possession. One day, having lost all his money, he demanded the money she had hid. She refused to deliver it if he intended to use it in gambling, whereupon Devine threatened to kill her. As he seized his gun, she blew out the candle and fled into another room. He, however, discharged it at her. The contents passed through the door, and killed her. An enraged crowd, several hundred strong, assembled forthwith, set

Devine on a horse, and rode him off to a tree. Here they made him kneel upon the horse's back, put the rope around his neck, and drove the horse off, leaving him hanging from the branch of the tree.

A terrible steamboat disaster occurred at San Francisco on the 29th of October, by which a number of lives were destroyed, variously estimated at from seventy-five to a hundred. This was caused by the explosion of the boiler of the steamer *Sagamore*, which took place just as she was leaving her wharf for Stockton. A large number of passengers were on board. Human bodies and masses of timber were at once scattered in every direction. The boat was a complete wreck, and from her fragments were taken the dead and dying, mutilated in the most shocking manner. The master of the boat was blown a distance of fifty feet into the water. He escaped with his life, but not without considerable injury. The cause of this dreadful waste of human life has not been ascertained.

An attempt was made on the life of General Belza, President of *Bolivia*, on the 6th of September, while walking with Colonel Laguna, President of the Senate, Don Augustine Morales, and others, when a student named Sotomayer fired a pistol, which wounded Belza in the face. As he fell, another pistol was fired by Morales, but the ball only slightly grazed him. Some slight attempt at a revolution appears subsequently to have been made, but without success. The President of the Senate was implicated in the conspiracy, condemned to be shot, and executed on the 13th of September. Morales and Sotomayer have also been condemned to death.

NARRATIVE OF LITERATURE AND ART.

THE question of a possibility of English copyright in books by foreign writers has again been raised in the courts, and a decision pronounced in the very teeth of that which was last recorded. Vice-Chancellor Knight Bruce has declared that the object of the Act of Anne *must have been* to promote literature in general. The Court of Exchequer has declared that the object of the Act *could only have been* to protect the rights of British authors exclusively. Between these two decisions a Court of Error will shortly have to pronounce, when there surely can be little doubt that the strict construction of the Copyright Act will be adhered to, and the decision of the Exchequer affirmed. In such case it will be hardly possible to avoid the necessity of fresh legislation on the subject, and it is desirable that the opportunity should not be lost of placing the entire law affecting an author's rights in England on a more satisfactory basis than it rests upon at present.

There have been few books of the higher class among the publications of the past month. The most prominent have been an excellent translation of Eckermann's *Conversations with Goethe*; a treatise on the diffusion of *Christianity in Ceylon*, by Sir James Emerson Tennent, with the opportune and valuable moral that general education is the only sound basis or preparative for intelligent religion; a somewhat elaborate dissertation on the *Dynamical Theory of the Earth*, by Mr. Tucker Ritchie; a republication of Dierckx's *Commentaries on the Reign of Charles the First*, revised by the author, with a preface by his son; and a volume of *Correspondence of Sir Isaac Newton and Professor Cotes*, curiously illustrative of the philosopher's life and history.

But Christmas has brought its usual supply (though somewhat less abundant than in former years) of pictorial volumes, and gift-books adapted to the season. The most rich in point of engravings is Mr. Alaric Watts's *Lyrics of the Heart*, which comes nearer to the graphic wealth of the Stothard and Turner illustrations of Rogers's poems, than any book which has been published recently. Another pretty present is *Christmas with the Poets*, with woodcuts by Mr. Birket Foster. Another is *Winged Thoughts*, being a series of illuminated pictures of birds, by Mr. Owen Jones. The author of "Mary Barton" has given us *The Moorland Cottage*, Mr. Thackeray's *The Kickshaws on the Rhine*, and Mr. Leigh Hunt a volume of *Table-Talk*, to promote the good feeling and mirth of the season; Mr. Richard Doyle, with the same praiseworthy purpose, has illustrated afresh the *Story of Jack and the Giants*, with very marvellous and peculiar knowledge of the wonders of nursery and fairy land; and Mr. Ruskin has had the help of the same ingenious

pencil in setting forth a not less marvellous and delightful *Legend of the King of the Golden River*.

To enumerate the mere titles of the pamphlets which have been suggested by the *Papal Aggression*, would more than fill the whole of the present sheet. But we must not omit to record that Doctor Pusey has come forward with a Letter, vindicating the practice of confession, asserting that whenever it is freely sought he administers it, that he has done this most extensively, and that he looks upon the popularity of the practice, since he moved it, as the manifest work of God.

The tales called *Wuthering Heights* and *Agnes Grey* have been republished, with a preface by the author of "Jane Eyre," in which she avows herself a woman, states that the names of Currer, Ellis, and Acton Bell, were assumed by three sisters, daughters of a clergyman in Yorkshire, and that of these she is now herself the only survivor. The brief narrative of the early ambition and premature death of Ellis and Acton Bell is a very sad one.

The month has produced no dramatic novelty, the theatres being occupied with preparations for their Christmas entertainments, produced as usual on "boxing night" the 28th, and consisting of burlesque extravaganzas and pantomimes.

Mr. Bartley, after appearing in his old character of Falstaff before the Queen at Windsor, has repeated it several times at the Princess's Theatre.

The "Grand National Concerts" at Her Majesty's Theatre have been brought to a close, after having, it is understood, been attended with considerable pecuniary loss to the body of amateurs by whom they were carried on.

COMMERCIAL RECORD.

BANKRUPTS.

From the Gazette of Nov. 29.—JOSEPH CURT, East-Winch, Norfolk, grocer.—THOMAS DYSON, Bradford, Yorkshire, linen-draper.—MORRIS POWELL EDWARDS, Tredegar, Monmouthshire, linen-draper.—ANN CHAVES, Bnaith, Yorkshire, innkeeper.—WILLIAM HARRIS, Courland-grove, Clapham, and Lavender-hill, Wandsworth-road, builder.—WILLIAM STANSON, sen., Navarino-grove, Dalton, bookseller.—ROBERT JOHN WALLIS, Loughborough, Leicester-shire, wine and spirit merchant.—CHRISTOPHER WARE, York, saddler.

Dec. 3. NUMA HERTON, Princes-street, Hanover-square, tailor.—HENRY MATTHEW EAST, Mark-lane, City, stationer.—JOHN FINTH, Leeds, linen-draper.—JOHN GOLLOP, Beaminstor, Dorsetshire, builder.—JOHN MOORE, Nottingham, cabinet-maker.—RICHARD NORTHOVER, Skinner-street, Bishopsgate-street, and Cheapside, City, hat-manufacturer.—ROBERT RISING, Frith-street, Soho, and Lower Berkeley-street, bookbinder.—HENRY SMITH, Woolwich, Kent, linen-draper.—JAMES SMITH, Darlington, Durham, boot-maker.

Dec. 6. HENRIET TAYSON BAINES, Camden-road, Camden New Town, linen-draper.—GEORGE BLAKY, Lincoln, dealer in perfumery.—HENRY IVYSE, Brighton, builder.—JAMES CARTER, Manchester-terrace, Kilburn, builder.—MANY ANN COLLINSON, Middle-road, Brixton, milliner.—WILLIAM SOLOMON COWPER, Bishopsgate-street without, and New-street, Dorset-square, grocer.—THOMAS DAVEY, Liskeard, Cornwall, seedsman.—JOHN DAVIES, Kingston, Herefordshire, grocer.—ANTONIO GIUSEPPE GAUDIANO, and ENRICO CIOPIERRE ST. CLAIR, Great St. Helen's, City, merchants.—RICHARD GREEN, jun., Brighton, ironmonger.—JOSEPH HARPER, Ponsonby-place, Vauxhall-bridge-road, coal-merchant.—WILLIAM HETGATE, Watford, Northamptonshire, and Chardstock, Dorsetshire, brickmaker.—JAMES JULLEY and WILLIAM JACKSON, Wigan, Lancashire, acetic acid manufacturers.—RICHARD KATZ, Liverpool, butcher.—FREDERICK GEALE MONSIEUR, Cheltenham, wine and spirit merchant.—SAMUEL PEARSE, Topham, Devonshire, coal-merchant.—ABRAHAM PROVOST, Peterborough, linen-draper.—WILLIAM HANTON, Buckingham, watchmaker.

Dec. 10. ADOLPH BREND, and ISIDORE BLOOMENTAL, Weymouth-place, New-Kent-road, cigar-merchants.—JOHN PALMER BURNELL, Moorgate-street, and Coleman-street, City, earthenware dealer.—GERALD BUTTON, Whitechapel-road, linen-draper.—EDWARD CALDWELL, Manchester, share-broker.—EDMUND CHADWICK, Manchester, starch manufacturer.—JOHN CURD, Grove-street, Camden Town, cheesemonger.—NATHANIEL JOHN HONE, Reading, Berkshire, common-brewer.—ALEXANDER HONEYMAN, Deptford, builder.—JAMES KITH, Crewkerne, Somersetshire, wine and spirit merchant.—WILLIAM SIMPSON, Manchester, starch manufacturer.—GEORGE MORTIMER SMITH, Ironbridge, Shropshire, bookseller.

Dec. 13. SIMON BERKHAUD, Warwick-street, Regent-street, embroiderer.—WILLIAM COUSINS, Wolverhampton, Staffordshire, coach-builder.—HENRY MATTHEW EAST, Mark-lane, City, stationer.—GILES ECKERSLEY, Tyldesley, Lancashire, victualler.—CHRISTOPHER GRINDALL and JAMES GRACE, Jetmyn-street, St. James's, licensed victuallers.—SAUL INGAMMELS, March, Cambridgeshire, machinist.—GEORGE JOHNSTONE, Newbury, Berkshire, publican.—JAMES LETTS, Leamington Priory, Warwickshire, miller.

Dec. 17. GEORGE BOWRY, Gravesend, licensed victualler.—GEORGE LEA, Upper Belgrave-place, Piccadilly, and Nunhead-lane, Peckham-rye, coal-merchant.—THOMAS MATTHEWS, Kenilworth, Warwickshire, licensed victualler.—GEORGE MAY, Curator-street, Chancery-lane, builder.—SAMUEL MOTER, Old-street, St. Luke's, linen-draper.—JOHN PULLEN, Powls-place, Great Ormond-street, lodging-house keeper.—GEORGE STEKLE, Durham, grocer.

Dec. 20. JAMES MATHEW, Canale, Norwich, draper.—THOMAS BYRNE, Fen Diton, Cambridgeshire, innkeeper.—SAMUEL JEFFREYS, Eldham, Kent, maltster.—WILLIAM LAYCOCK, Liverpool, iron merchant.—JOHN LINDSAY, Neash, Glamorgan-shire, grocer.—SIMPSON FREDERICK MATTHEW, Bishop Auckland, Durham, draper.—CHARLES ROBINSON, Liverpool, sail-maker.—JOHN VOLKER, Landport, Hampshire, builder.—SAMUEL WILLET, sen., Cheltenham, plumber.

Dec. 24. JOHN BARKER, Eaton Lecon, Bedfordshire, builder.—HENRY HAMER, Blackfriars-road, linen-draper.—JOHN NIX HARLOW, Hamagata, wine merchant.—CHARLES MARSON, New-market, Cambridgeshire.—GEORGE MILTON, Elizabeth-terrace, Liverpool-road, Islington, contractor.—JOHN BURGESS PILLIN and GEORGE ALFRED PILLIN, Featherstone-buildings, Holborn, sword-cutlers.

Dec. 27. FREDERICK YOUNG, North-place, Kingsland-road, cheesemonger.—WILLIAM MITCHELL and WILLIAM BIRNS, Barnsley, Yorkshire, iron-founders.—JOSEPH UNWIN, Bradford, stuff-manufacturer.—JOHN BARKER, Newcastle-upon-Tyne, merchant.

BANKRUPTCIES ANNULLED.

Nov. 28. JOHN ROBERT WRIGHT, Leeds, cutter.

Dec. 8. JOSEPH NYP, Milkpond wharf, Park-road, Old-Kent-road, machinist.

Dec. 13. WILLIAM MAYER, Bateman's-row, Shoreditch, timber merchant.

Dec. 21. CHARLES MIDDLETON KENNOT, West Cowes, Isle of Wight, chemist.

THE STOCK AND SHARE MARKETS.

City, Dec. 27.

A steadily improving tendency was manifested in the English Stock Market at the commencement of the month. A good many operations, chiefly based upon the more favourable aspect of Continental politics, were entered into, and the price of Consols went gradually up from 96½ to 97, at which it stood on the 29th ult., to 98½, which it reached on the 12th inst. On that day the dividend of 30s. was taken off the price, making the quotation 96½ to 97. The market then remained very steady till yesterday, when the unexpected intelligence of the Bank of England having raised its rate of discount from 2½ to 3 per cent. caused a fall from 97½ to 96½. To-day the market leaves off with a steadier appearance at 96½ to 97 ex div.

The Railway Share Market has been the scene of great activity. Very extensive speculations have been entered into, besides a large genuine business, and prices of all descriptions have experienced a marked rise. The bank measure of yesterday, above referred to, caused a rapid fall in this market also, but prices to-day are recovering.

STOCKS.

	Prices during the Month.		
	Highest.	Lowest.	Latest.
Three per Cent. Consols . . .	98½	96½	96½ ex div.
Three per Cent. Reduced . . .	97½	95½	97½

CORN MARKET.

Mark Lane, Dec. 27.

There has been scarcely any fluctuation in this market during the month. During the first fortnight prices were held firmly, but since then the market, both for English and Foreign Wheat, though the quantity of the former on sale is far from large, has been a shade weaker. The London weekly averages last announced are as follows:—

Wheat, per quarter, 43s. 4d.
Barley, 26s. 8d.
Oats, 18s. 8d.

Flour, Town made, delivered, per 280 lbs. 37s. 4d. to 40s.

PROVISIONS—LATEST WHOLESALE PRICES.

Bacon, per cwt., Waterford, 36s. to 40s.; Belfast, 42s. to 44s.	Hams, per cwt.—York or Cumberland, 74s. to 84s.; Irish, 60s. to 68s.
Beef, per 8 lbs., mid. to prime, 2s. 4d. to 3s. 4d.	Mutton, per 8 lbs., mid. to prime, 2s. 10d. to 3s. 10d.
Butter, per cwt., Dorset, 84s. to 86s.; Limerick, 72s. to 78s.	Potatoes, per ton.—York Regent, 85s. to 100s.; Scotch, 85s. to 80s.
Cheese, per cwt., Cheshire, 50s. to 74s.; Wiltshire, 40s. to 44s.	Pork, per 8 lbs., 2s. 4d. to 4s.
Eggs, English, per 120, 9s. 6d.	Veal, per 8 lbs., 2s. 6d. to 3s. 6d.

GROCERY—LATEST WHOLESALE PRICES.

Cocoa, per cwt.—Grenada, 44s. to 47s. 6d.	Sago, per cwt.—Penri, 20s. 6d. to 25s.
Coffee, per cwt.—Good old native Ceylon, 56s. to 60s. 6d.; Bahia, 40s. to 45s.	Sugar, per gwt.—Good brown Jamaica, 22s. to 26s.; Yell Havana, 17s. 6d. to 22s.
Rice, per cwt.—Carolina, 21s. to 26s.	Tea, per lb.—Good ord. Congou, 1s. 1d.; full flavoured Soucheong, 1s. 4d. to 2s.

Candies, per 12 lbs., 4s. 6d. to 5s.; Coals, per ton, 12s. 6d. to 17s.

OILS.

Pale Seal, per ton, 30s. | Sperm, 88s.

THE
HOUSEHOLD NARRATIVE
OF CURRENT EVENTS.

1851.]

FROM THE 29TH DECEMBER TO THE 28TH JANUARY.

[PRICE 2d.]

THE THREE KINGDOMS.

THE second half of the Nineteenth Century having at length begun, men are very prone to ask themselves what new or hopeful prospect it opens with. What with the daily advances of science, and the applications of the arts to the purposes of life, in all that relates to material progress the answer can hardly be doubtful. We have built up two great empires during that part of the century which has passed away, in compensation for the empire we lost at the close of the century preceding: but a range of far wider dominion stretches out for days that are to come, in the triumphs of future acquisition held forth by scientific discovery; in the steamboat, the railway, the telegraph, the telescope: in the steady march of astronomy, chemistry, electricity, and steam: in the wondrous development of practical energy in every department of practical utility. It is neither possible nor desirable that politics and morals should keep pace with the consummation of physical change thus altering the face of the earth: but even in this direction the world does not seem likely to come to any sudden stand. If no very new discoveries have been made of late, several very ancient fallacies have at least been exploded. The period may hereafter be emphatically remembered as that in which a great many valuable things were *found out*. It has been found out, for instance, that a King Moh enthroned by street barricades may be quite as egregious an imposture as a King Louis Philippe crowned by the same process. It has been found out that when a people lose their wits, the best form of government is a military bedlam; but that when they recover their senses in the smallest degree, soldiers are worse than useless in the business of governing them. The abominable absurdity of such phrases as German unity and American equality has been found out. Mr. Hudson and Mr. Feargus O'Connor have been found out. The general unwholesomeness of dirt (marvellous to say) has been found out. Puseyism has been found out. And, to conclude, it has been found out that what Popery was in the fourteenth it would fain claim to be in the nineteenth century: and free states have been put upon their guard against it.

Nevertheless his Holiness Pío Nono exhibits certainly no sign of retreat at the approach of our British parliament. He has issued a fresh brief under the seal of the Fisherman, severing the united sees of Cloyne and Ross into two separate sees of Ross and Cloyne, and appointing one of the worst of the Irish bigots to rule over the new see. He has also clapped poor harmless Mr. de Vericour into the Index Expurgatorius. Contemporaneously with which events the Irish Protestant bishops have been loudly complaining of their brother bishops in England for not having invited them to take part in the recent Episcopal protest against such papal aggression. They declare that the Church of the United Kingdom being one and indivisible, no separate branch of it ought to move alone; they insinuate broadly the suspicion that it is the fact of the Irish branch being the most exposed to danger which had thus impelled the English prelates to get out of its company; and they avow, for the same reason, their own resolve of cleaving all the more closely to the main trunk, "with which it is our happiness and we hope our safety to be identified." This is frank; and very accommodating, as well as soothing, was his grace of Canterbury's answer; but nevertheless an impression prevails that the omission was not wholly accidental, and that in protesting against the Roman Catholic Church for its insolent encroachment on Protestant England, it was best to keep out of sight that Protestant Church which has so long been a grievance and unjust burthen on Roman Catholic Ireland. If the Protestant faith could have been diffused by the maintenance of such an establishment, it might have been well to keep it up even exclusively as a fortress militant for the gradual subjection of Rome. But the direct contrary has been the result. It has long been useless, even as a barrack. Gold and iron may be, as Milton calls them, the nerves of war; but, plentifully applied as they have been in the case of the Irish Church, they have certainly not proved to be the sinews of religion. Protestantism has constantly dwindled under the evil suspicions of a system which has spoken less from the altar in accents of peace and charity than in powder and shot out of mouths of iron. Such an eternal trouble, indeed, has this Establishment been to the state; so fatal to the religion it was meant to promote; so much has its manifest injustice scandalised Christianity, scared away tranquillity, and wasted and consumed its own congregations; that, viewing all these effects, and seeing how nothing so much as Popery has been promoted by such so-called enthusiastic Protestantism, it would have taxed the serpentine cunning of the school of Loyola to devise a more subtle or successful scheme for retaining Ireland within the pale of Rome. A more effective imprecation under cover of a pious aspiration could not have been invented by the Reverend Doctor Biber himself, who curses so readily and zealously; and who has just given fresh proof of the quality of his Christianity by denouncing every form of worship but that of the Protestant communion, and declaring his utter abhorrence of all religious sentiments except those of the Church of England.

This curious sample of Protestant Popery was exhibited on the occasion of a meeting of the highflyers at Freemasons' Hall, when the Church of England was declared to be in such a condition of "torpid paralysis," so "deserted and crippled," so "degraded and impotent," that nothing but Convocation could restore her: and a very pretty sample of the sort of Debating Club so invoked for the salvation of the Church was this meeting of its advocates. The means were noisy discussion, bitter altercation, unscrupulous banning and proscribing; and all for ends no better than the erection of a sort of Protestant Holy Office and Index Expurgatorius. The "censuring of books and persons," and the enforcement of "spiritual discipline," are alone, forsooth, according to these orators, what will save the Church. It is the vulgar cry for power—more power; when the remedy sorely needed is peace—more peace. The struggle has been long enough in progress

between the tendency on the one hand to contract the ritual in every direction but that of Rome, and on the other to bring within its embrace every form of spiritual Christianity. "I wish," said the good bishop Shirley, "to see the doors of the Church made as wide as the doors of Heaven." "I utterly abhor," cries Doctor Bibber, "all religious sentiments, except what I declare to be those of the Church of England." This is the issue broadly put; and can any one believe the final, determination of it doubtful, who believes in the tolerant origin of the Church, and has taken part in her simple comprehensive services? Show me the Christian who would fain get to heaven *alone*, exclaimed the pious Richard Baxter, and I will show you one who will never get there.

Greatly is it therefore to be deplored, in a state of feeling so rapidly approaching to extremes, that the Archbishop of Canterbury should have publicly deprecated any such revision of the prayer-book as would have a tendency to shut out Romish agreement, and embrace more largely Protestant difference. He does so on the ground that it is not a work to be undertaken in a time of excitement, when the settlement would be in accordance with one of two extreme views, and thus tend to give a triumph to one over the other. But men do not think of remedies when there is no complaint; and what in effect is such an opinion propounded from the highest place in the Church, but an encouragement to the prime movers of Tractarian disaffection to continue their agitation and disturbance. Nor truly do they seem disinclined. "Dear Dr. Pusey" passes half his time in writing letters to prove that he is anything but Puseyite; and hardly a day passes that does not exhibit some new move in a Jesuitical and quite desperate struggle to keep Mr. Bennett at St. Barnabas. Correspondences between Mr. Bennett's churchwardens and Mr. Bennett's bishop, showing a wondrous change of tone since his Holiness of Pinulico put the Premier to the question, have been oozing out in the *Times* continually. The *in terrorm* is dropped, the *ad misericordiam* takes its place; and the bishop is piteously reminded of the "deprivation of the means of subsistence," which perseverance in his resolve of accepting Mr. Bennett's resignation will entail on the unhappy minister. To which, the bishop, having fortified himself by prayer, responds, that not finding in the churchwardens' statement any suggestion calculated to change or modify his opinion of the principles which Mr. Bennett maintains, and on which he has declared himself unalterably determined to conduct the services in his churches, he, the Bishop, must persist in accepting his resignation. Whereupon the churchwardens, with a kind of blunt humility ask the bishop what he means by "principles," and the bishop warily declines reply. Then, after a few days' interval, steps forward Mr. Bennett himself, full of pious horror at the notion that he should be thought capable of evading his own voluntary proffer to resign. His bishop had pronounced him guilty of unfaithfulness to the Church of England, therefore he must resign. Is it conceived possible that he would take advantage of any point of law to make a bishop amenable to the state, to drag a bishop within the civil jurisdiction? Far from him be the profane thought of such spiritual disobedience. To be sure, the same objection would not apply to the dragging even of a bishop within Courts *Ecclesiastical*; but it was not for Mr. Bennett to suggest such a thing. Morally, he is under pledge to his bishop; and if it is sought to make a legal question of that moral obligation, it was not for Mr. Bennett to do it. Neither was it for Mr. Bennett, however, to obstruct the zeal of his churchwardens; and that they, therefore, may "pursue any further course in the matter which they may deem advisable," he will hold over his resignation till the 25th of March.

Such is faithfully the substance of these curious letters, from which any one who would study the art of at once keeping and evading a promise, and blarneying and bamboozling a bishop, may derive valuable hints. It would, nevertheless, have been well that the instruction should not have come from such pre-eminently holy men, who are not, in their judgments other men almost universally are, insensible to the higher ethics of religion and morality; irreverently regardless of episcopal authority, and impatient of that stringent discipline which is the very life of the Church. For one must confess, that, applied to the ordinary affairs of life, the policy of Mr. Bennett would have marvellously resembled the morality of a Tartuffe grafted on the practice of an Old Bailey attorney.

It is a gratifying contrast to turn to another class of ministers of the Church, who have come spiritedly forward in Manchester with a proposition for the establishment of schools on a large and liberal foundation. It is very possible that this plan has originated in fears, caused by the success of the National Public School Association, that the conduct of the bigoted party in the Church may end at last in some total exclusion of the Church element from the public education of the people. The basis of the new scheme is that of the National Association, its most characteristic feature is that of a general local rate, and it is no doubt in the nature of a compromise between what is called "secular" and mixed education, churchmen and non-churchmen. But the compromise is at least statesmanlike and bold. By adoption of a general rate it rests upon a large popular basis; its admission of lay control is not less valuable; and its inclusion of free schools in which a daily reading of the Scriptures is to be provided, but no special religious creed or formula taught, distinctly affirms the principle in educational efforts which churchmen have been most reluctant to sanction, and towards the full acceptance of which their co-operation is at present most valuable. But the scheme is in two parts—the one for rendering existing schools more efficient, the other for establishment of new schools where voluntary efforts have been insufficient; and it is objected to on the ground that employment of a general rate for existing schools would tax the dissenter for support of what he conscientiously disapproves. There is, however, no devisable scheme into which some part of this objection does not creep; and the present plan by no means proposes to dispense with those voluntary contributions by which existing schools are maintained, but simply to strengthen and complete such efforts. The evil, incident to the proposition, seems to us accidental and not great; the good, enormous and vital. It encourages individual effort; it admits the just interference of the state; it invites the large and liberal control of laymen; it respects the principles of every sect; it can offend only the prejudices of any. Above all we think it to be immediately practicable, which is not to be said of any other similar project.

Let but the experiment be made. Once put to trial, we believe that all which is doubtful in it would soon drop off, leaving only its advantages; and that the blessing of such a result would be quite inappreciable in future arrangements and discussions. For this is the question of questions. It includes Socialism, and Chartism; and all the other *isms* that are dangerous; and is the only conceivable method of finally determining the doubt which is now so sadly disturbing Downing Street, of how finally to deal with the Pope and his Cardinals.

A legion of tracts and pamphlets that might be counted by hundreds have rushed vainly to the ministerial rescue. The doubt is as great and distressing as before Mr. Ridgway let them loose. The two great reviews have also entered the lists of religious controversy: and it is an odd exemplification of the probable effect of the coming discussion on political parties, that the *Quarterly* should be recommending the state to consent to a concordat, with a view to peace with Rome; while the *Edinburgh* is declaring with horror that no state ever signed a concordat without signing away some of its rights, and legalising usurpation to the advantage of Rome. When established old doctors thus change sides, what hope of agreement is there among people of no authority? Nevertheless it may be worth while to mention what a third doctor remarks in one of the pamphlets—probably the only one worth separate mention. Doctor Twiss declares conclusively that the Papal Brief constituting the new hierarchy entails in one of its provisions a direct violation of the statute law of the land in reference to the see of St. David's; and that in its general object of erecting sees for bishops in ordinary, within the dominions of an independent sovereign without the consent of the crown, it involves a departure from long established practice which in such matters constitutes the law. The law therefore, it is presumable, will have to apply itself to those points; and it is more than probable that a fourth (this time a Right Reverend) doctor has hit accidentally, yet precisely on the head, the legislative nail now shaping in the forge of St. Stephen's, when he tells one of his "dear Mr. Archdeacons" in his diocese of Durham that it may probably be necessary to apply some restrictions to the future introduction and circulation of Papal bulls in this island, to forbid the existence of monastic institutions strictly so called, and to prohibit the assumption of episcopal titles conferred by Rome and deriving their names from any locality in the kingdom. It would not be unsafe to predict that somewhat after this design will be the plan of ministerial legislation against popery in the forthcoming session of the British Imperial Parliament; and that great will be the difficulty, and manifold the discontents, in legislating even thus far.

NARRATIVE OF POLITICS.

THE leaders of the Irish *Tenant League* having abandoned the idea of holding county meetings in Down and Antrim, the plan of the campaign underwent revision, and it was agreed to hold district meetings in various portions of the two counties. The first of these took place on the 30th December. The attendance was very thin, and in Newtownards, part of the northern estates of the Marquis of Londonderry, the proceedings did not present a single feature of novelty. Mr. Sharman Crawford was unable to attend, but wrote a letter expressive of his views on the question, which fully coincided with the objects of the meeting.

The Irish Poor-law Commissioners have dismissed the Ennistymon Board of Guardians, on the grounds of *General bad management and repeated acts of inhumanity to the paupers*. A shocking instance of the conduct of these Guardians will be found in the "Household Narrative" for October last, page 224.

The Great Meeting of the Ulster Protestant Association, on the 2nd, from which Irish Protestants expected such a vigorous and influential demonstration against the Roman aggression, proved a failure in point of numbers: an extremely thin attendance throughout the day is apologetically admitted, and the Northern Whig ascribes the circumstance mainly to the fact that in Ireland the agitation has been too exclusively clerical. The resolutions were in character, and passed of course.

The *Encumbered Estates Commissioners* carry on their proceedings in Dublin with much activity. Within the week ending on the 2nd instant absolute orders for sale were made in eleven cases, and conditional orders in twelve others. Further orders for the payment of money out of the proceeds of sales were made in fifty-five matters, the amount paid being 29,128*l.*, which, with 349,665*l.* previously paid, makes the total sum distributed by the commissioners 378,793*l.* During the same week eighteen new petitions have been filed, in fifteen of them the owners being also the petitioners, and the total number of petitions filed in the court to the 2nd instant is 1,477. The fresh batch of petitions present the same melancholy array of enormous liabilities and inadequate assets exhibited by the vast majority of those which have hitherto been brought under the operation of this court.

A numerous meeting, on the subject of the *Duty on Paper*, was held at the London Tavern on the 2nd instant. Mr. Cowan, M.P., presided, and, in his opening speech, forcibly sketched the oppressive limitations which clog the manufacturer—

"At the beginning of the century there were twenty-seven excisable articles; of which there remain but six or seven at the present time. Of these there is but one article which bears on the face of it *prima facie* evi-

dence of the duty having been charged by means of the label fastened on it: that article is paper. The absence of this label subjects the manufacturer to a tax of 10*l.*; it used to be 100*l.* There is but one article subject to detention for a single moment after the duty has been charged: that article is paper. Yet one would think that it should be the other way, in consequence of paper bearing the label on the face of it. But the contrary is the fact, for the Excise obliges the manufacturer to keep his paper twenty-four hours before he can send it out; and this time is calculated from the period when the officer visits his work. The process of charging the paper is also a peculiar one, for the paper label which is pasted on must be dry before the duty is charged. When this has to be done with regard to every description of paper and on every ream, and when moreover it has to be weighed and wrapped up by the officer, it imposes an amount of labour and consumes a quantity of time, which is very singular in this so-called free-trade country. If so much time were uselessly expended in the manufacture of any other articles—such as gloves, for instance—it would not be allowed to continue a week, for the voice of the country would be instantly raised against it. It is because the paper-manufacturers are a small body scattered over the country, and are not concentrated in a particular locality like the manufacturers of Birmingham and Sheffield, that these unfair restrictions are allowed to continue. Mr. Cowan showed the meeting some paper made in Gloucestershire from wheat-straw; the cost of the raw material was 2*s.* a hundredweight, and the tax on the manufactured result is 1*l.* 9*d.* per hundredweight. Sir Robert Peel took off a duty on cotton which was only five-sixteenths or rather less than a third of a penny per pound; but here the tax is more than a penny-half-penny per pound; the tax is 700 or 800 per cent. on the original value of the article; it is therefore a tax on labour. In Paris, 30,000 females find employment in making paper boxes; so that in that metropolis small purchases are presented, not in white-brown paper, but in elegant little boxes; those boxes come into this country at 10 per cent. on their value, but if they were made in this country they would be taxed 200 per cent. on the value of the material." Mr. Cassell, a publisher, showed the injurious manner in which the tax affected cheap literature; he was publishing a history of England for the working classes, which was brought out in sixpenny volumes; and when the work was completed the tax paid to the Government would not be less than 200*l.* If the tax were repealed, it would enable the publishers of cheap literature to employ and pay the first authors of the day, and to issue their publications in a neat and handsome garb that would adorn the shelves of the working classes. He could tell them that there was nearly 300*l.* of taxation upon every impression

of the *Working Man's Friend*. It had been alleged that if the tax were taken off, the country would be flooded with the vilest publications; but his opinion was precisely the reverse, for he believed if the tax were taken off that the people of England would not be bamboozled with cant and balderdash; they would demand good and sound literature, and if it were given to them they would understand it. As it is they prefer the translation of French literature to our own bad and trashy writing. In his own case, he had given in the *Working Man's Friend* an opportunity to the working classes to write in that periodical for themselves; and the result had been, that 596 articles had been furnished by the working men of England in the course of ten months. He had not been able to insert the whole of those articles, but he had printed and published 130 of them, all of which had been contributed by blacksmiths, colliers, and almost all sorts of working men. To those men he had awarded prizes and 130 books in payment of their writing, and 130 volumes had been given away. In no case had he been called upon in the distribution for a low class of literature, but on the contrary for the very highest that could be commanded. It was evident, therefore, that if the working classes possessed a cheap and healthy literature they would buy their magazine or newspaper to read at home instead of going into all sorts of places to spend their money."

Mr. Holyoake moved, as an amendment, an addition to the original resolution, to the effect of adding the repeal of the newspaper stamp and advertisement duty to that of the duty on paper. Mr. Milner Gibson supported the enlarged proposition, which was put and carried by acclamation.

There have been several other meetings on the same subject in the provinces. In the Town Council of Birmingham, on the 7th, Alderman Baldwin moved the adoption of a petition to Parliament against the taxes on paper and advertisements, and the stamp-duty on newspapers; especially founding his case on the grievances in connexion with the paper-tax, which he himself as a manufacturer effectively pointed out. Mr. Baldwin stated that if the paper-tax were repealed, he alone could give employment to five hundred additional persons within twelve months. Mr. Charles Sturge seconded the motion, and spoke especially against the penny-stamp. Alderman Smith and Alderman Martineau opposed the motion, as more fitting for the consideration of the Chamber of Commerce. Alderman Muntz declared against the principle of giving up altogether the discussion of such subjects: the town of Birmingham pays a larger proportionate share of the paper-duty than any community in the empire. The motion was carried almost unanimously; Alderman Martineau and Mr. Cox alone holding up their hands against it.

There was a meeting of Yorkshire paper-manufacturers, at Leeds, on the same date, at which resolutions against the tax were unanimously passed.

The Prelates of the *Established Church in Ireland* have addressed a letter to the Archbishop of Canterbury complaining, that in the recent addresses of the English prelates to her Majesty, they designated themselves the archbishops and bishops "of the Church of England," in place of "the united Church of England and Ireland," according to the act of George the Third, uniting the Churches of England and Ireland into one Protestant establishment. The complainants say:—"We have painfully felt that, of late years, as well in legislating on ecclesiastical affairs as on many public occasions, a disposition has been manifested to regard the Irish provinces of the United Church as if they did not form an integral portion of the one Church of the nation. We are conscious that the Irish branch of the Church is particularly exposed to the attacks of its enemies; and we are on that account the more apprehensive of any step being taken which has a tendency, even in appearance, to dissociate our provinces and bishoprics from that great community with which it is our happiness, and, we hope, our safety, to be identified. We therefore not unnaturally fear the effect which may be produced by a movement on the part of our English brethren against a common adversary, in which they have not only acted without any concert or communication with us, but have styled themselves by a name

which would seem to intimate that they are Prelates of a separate Church from ours, and wish to appear so before her Majesty. We beg to assure your Grace, that, in submitting this statement to your consideration, we are not actuated by any wounded feeling of disappointment or of dissatisfaction; but we deem that we owe it to the Church in which we bear office, to guard, as far as is in our power, against a separation being made between the component parts of the National Church, which were most solemnly and authoritatively united together in one. We confidently hope that the form of designation employed in your address was adopted inadvertently, and not from a design to disclaim a connection with the provinces of Armagh and Dublin. And we trust that we may reckon on having the aid, the sympathy, and the prayers of the Archbishops and Bishops of the provinces of Canterbury and York in whatever difficulties and dangers may yet await our portion of the Church."—The Archbishop of Canterbury in his answer, dated the 31st of December, and addressed to the Archbishop of Armagh, says:—"I am anxious to assure your Grace, and my other Right Reverend brethren in Ireland, that this designation did not originate in any desire to represent ourselves as a separate body, but was employed solely because in the present instance 'the movement of the common adversary' was immediately directed against ourselves. It did not appear to any of the Bishops whom I had the opportunity of consulting, that we could properly invite the Irish Bishops to complain of an aggression which only affected the Church in England. At the same time, I am ready, for my own part, to acknowledge that the document would have been more correctly worded if it had been written in the name of the English Archbishops and Bishops of the United Church of England and Ireland. It would have been better to have indited an inharmonious sentence, than to have given ground for the apprehensions expressed in your Grace's letter. I will take an early opportunity of communicating the letter to my episcopal brethren, who at present are dispersed in their various dioceses. But I can venture to say, in their behalf, that we all consider the Irish branch of the United Church to be so closely identified with our own, that if one member suffers the other cannot fail to suffer with it; and that in all cases where co-operation is desirable or practicable, we shall be ready to act with your Grace and the other Irish prelates as an united body."

The Irish Prelates have since presented an address to the Queen, chiefly relating to the above subject. In conclusion they pray that, "whatever may be the defensive measures determined on for securing the National Church against injury, the two portions of it may not be regarded or treated as having separate interests, but that one and the same legislative protection may be extended to both branches of the Church in common."

A meeting of the lay members of the Church of England, in the districts of St. Paul's and St. Barnabas, in the parish of St. George's, Hanover Square, was held on the 8th, for the purpose of addressing the Bishop of London against the *Romish Practices* still carried on in those churches. Mr. J. G. Harris, the chairman, after going into the details of those Romanising practices, concluded by stating, that all of them were still carried out, save the lighting of candles, and it behoved them to request the Lord Bishop of London to at once exercise his authority in removing evils utterly repugnant to the true principles of Christianity. Mr. Freeth, in moving the adoption of an address to the Bishop of London, observed that the doctrines of Mr. Bennett had caused amongst his own family much unhappiness and estrangement. He moved an address, thanking the bishop for "the firm and decisive manner" in which he had persisted in his acceptance of Mr. Bennett's resignation; stating, that the ceremonies introduced by Mr. Bennett were still continued, with the exception of lighting the candles; and praying the bishop to restore "that pure and simple form of worship which is especially adapted to the capacity and understanding of the poor, and which has been supplanted by an excess of ritualism, by tones and gestures, by bowings and crossings, and by other mummeries of superstition." Several speakers warmly denied the charges against

Mr. Bennett, and one of them, Mr. Gibson, as a member of Mr. Bennett's congregation, regretted that so good a man should have been spoken of in such unchristian and bitter terms by persons professing themselves to be members of the Church of England. He had been a constant attendant at St. Barnabas, and he declared that he never witnessed what were called Romanising mummeries. The proceedings were repeatedly interrupted by noise and uproar, but ultimately the address was adopted by a large majority.

A letter from the Bishop of Durham, on the subject of the *Papal Aggression*, has been published. It is addressed to the Archdeacon of Liadisfarne, and indicates the measures which, in the writer's opinion, are called for at the present time. On this head the bishop says:—"I am persuaded that no wish exists generally for any measure but what self-defence requires. An outrageous attack has been made upon us; but I trust adequate means may be devised for our own security without disturbing the free exercise of religion by others or infringing their rights of conscience. It surely cannot be necessary to the maintenance of these great ends that a foreign potentate should be permitted to insult a great nation, trample upon the rights of the sovereign as secured by law, and disturb the peace and good order of the Established Church. In order to prevent such evils, it may be necessary to provide some restrictions upon the introduction and circulation of Papal bulls in this island; and to prohibit the assumption of episcopal titles conferred by Rome and deriving the name from any place in this country. It may also be desirable to forbid the existence of monastic institutions, strictly so called; nor can the residence of any Jesuits appear otherwise than injurious among Scotch and English Protestants. That order is well known to have shown itself so dangerous, that it was suppressed by Clement XIV. in 1773, with the approbation of all wise and good men. What species or amount of merit may have brought them again into favour at Rome, I profess myself unable to determine: but I am sure you will agree with me, that a body of men whose principles and conduct have been so justly reprobated in Catholic countries cannot be looked upon as desirable neighbours among Protestants like ourselves."

A *New Romish Bishopric* has been formed in the south of Ireland, the late united diocese of Cloyne and Ross having, at the earnest prayer of Dr. Murphy, the present bishop, been divided by the Pope into two; Dr. Murphy to remain Bishop of Cloyne, and the Rev. Dr. Ryan, parish priest of Middleton, having been appointed to the diocese of Ross. The bull for the consecration of the new bishop has arrived, and is in the hands of Dr. Slattery, the Roman Catholic Archbishop of Cashel.

A correspondence, on the subject of *Mr. Bennett's resignation* of the incumbency of St. Paul's and St. Barnabas, has been published. Sir John Harrington and Mr. Gibson, on behalf of the Congregation, wrote to Mr. Bennett on the 7th instant, objecting to his resignation, on the ground that it was not valid in law; that it was a mere promise, inadvertently made, and should not be followed up. Mr. Bennett, in reply, declared that he repudiated the temporal law as binding on the conscience in spiritual matters; that though he should be found wrong in temporal law, he would not forgo his obedience to the far higher court of God, and to the Bishop's judgment that he is guilty of unfaithfulness to the Church of England: and that he would therefore sign the legal documents of resignation on the 25th of March. The congregation then applied to the Bishop of London, proposing that he should "specify what, in the administration of the services at St. Paul's and St. Barnabas, he wished to be altered, omitted, or supplied." They said that they desired to try in the Ecclesiastical Courts those questions for which Mr. Bennett had been pronounced unfaithful to the Church of England; and to raise those questions with the least possible delay and expense, admitted the facts in an amicable spirit, contending not for victory but truth. The Bishop, however, closed the correspondence by declining, through his secretary, to accede to the request.

A numerously attended meeting, having for its object the *Revival of Convocation*, was held at Freemasons'

Hall on the 14th. Mr. Henry Hoare presided. An address to the Queen was moved by Mr. Dudley Perceval, and seconded by Dr. Biber, praying, upon a variety of considerations, stated at great length, that her Majesty, "agreeably to the solemn pledge given at her coronation, would issue her royal licence to the Convocations of Canterbury and York, on their next assembling according to custom at the commencement of the session of Parliament, in order, that, upon their advice, and her Majesty's assent, such steps might be taken as should be best calculated not only to vindicate the Church of England from the recent aggression of the See of Rome, but to provide for the suppression within the Church of unsound doctrine of every description, by reason of which the Church is grievously divided, as well for the development of her internal resources in such wise as might best enable her to do her proper work in promoting the salvation of souls, and in dispelling the mists of ignorance, error, and superstition, by the bright beams of Christ's holy gospel." An amendment was moved by the Rev. W. Cox, and seconded by Mr. J. J. Cummins, to the effect that the independent action of Synods or Convocation is not sanctioned by the laws of England; that it is the prerogative of the Crown to convene both Houses of Convocation, to deliberate upon such matters as may be committed to them, but that it is equally the right of the Crown to prevent them from being made the arena of party discussions, as they have heretofore been, and would undoubtedly become again; and that in the present agitated state of the Church, it would not conduce to peace or concord, were the Houses of Convocation to be permitted to discuss any question of faith or discipline of the Church of England, as already settled by her articles and formularies. After a long debate the amendment was negatived, and the original address carried by a great majority.

A great meeting of the friends of the Liberal and Free-trade interests in the manufacturing districts of Lancashire and Yorkshire was held on the 23d at Manchester, mainly for the purpose of hearing addresses from the representatives of the largest of those constituencies upon the *present aspect of public affairs* previously to the opening of Parliament. The chief speakers were Messrs. Milner Gibson, Cobden, and Bright. Mr. Milner Gibson drew attention to the successful issue of the policy supported by Mr. Cobden and his friends, in reference to the national finances, and attributed the leaning towards reduction of taxation shown by the present government to the influence of the Council of the Free-trade party. He declared himself opposed to dealing with taxation upon the narrow grounds of whether there was a surplus or a deficiency, and wished to see it based upon well-considered principles. He then enumerated several taxes which might be reduced without losing revenue. He instanced the taxes on tea and coffee; and, referring to the rumoured abolition of the window tax, he censured the proposed substitution of a house tax. He then gave an eloquent summary of the arguments in favour of the abolition of taxes upon knowledge, and advocated the removal of the stamp, advertisement, and paper duties. Mr. Gibson and Mr. Bright dwelt chiefly upon the panic about Papal Aggression; and Mr. Bright stated that all the most widely-circulated local papers in Lancashire and Yorkshire, and the adjacent counties of the East and North, have refused to give any countenance to the cry, and in many instances have boldly and resolutely opposed it. Mr. Cobden marked the difficulty and incongruity of legislation on the subject, by a prominent statement of the qualification for a spiritual war with the alleged aggressor, of our House of Commons—containing its forty or fifty Roman Catholics, (and more of them coming from Ireland,) an Independent or two, three or four Unitarians, a Quaker, and the prospect of a Jew. He concluded by a reference to his own public career. Alluding to his having been called a disappointed demagogue, he said: "This disappointed demagogue wants no public employment: if I did, I might have had it before now. I want no favour, and, as my friend Bright says, no title. I want nothing that any government or any party can give me; and if I am in the House of Commons at all, it is to give my feeble aid to

the advancement of certain questions, on which I have strong convictions. Deprive me of that power; tell me I am not to do this, because it is likely to destroy a government with which at the present moment I can have no sympathy; I say, then, the sooner I return to printing calicoes, or something more profitable than sitting up in the House of Commons night after night in that way, the better both for me and my friends."

NARRATIVE OF LAW AND CRIME.

WILLIAM Henry Marshall, a servant out of place at Brighton, attempted to Murder his Wife, and afterwards committed suicide, on the 30th of December. At three o'clock in the morning his wife was awoke by a knocking at the door, on opening which she observed that her husband was almost in a state of nudity. "Why did he return home in that state?" she inquired. He replied "To kill you," and suiting the action to the word, he seized her by the shoulders, and then grasped her throat. Nearly naked as she was, she rushed into the street, followed by her husband, who caught her in the middle of the road. They then struggled together till she fell, and he upon her. She raised the cry of "Police" and "Murder," and then effected her escape. As she ran off she saw a razor in his hand, and he having raised himself again fell. She then returned to him and found the blood gushing from his throat and a razor lying beside him. By the time that several persons, alarmed by her cries, reached the spot, the man was dead. A coroner's jury gave a Verdict of Temporary Insanity.

On new year's eve a horrible Murder was committed in Paris. Two old ladies, Madame Ribault and Mademoiselle Lebel, jointly occupied an apartment in the Rue Bourbon Chateau, Faubourg St. Germain. The former has published several successful works on education, but has latterly devoted her time to writing articles for periodical publications, and more particularly for the "Journal des Demeiselles." The directors of this publication are always in the habit of sending one of the clerks to settle the monthly accounts of the parties who contribute articles to the work. A man named Laforcade, who was sent to settle the old lady's account, had some months since a violent altercation with her, he having made a mistake on his own side of 5*fr.* On this occasion the amount due to Mme. Ribault was 400*fr.*, when Laforcade offered her 200*fr.*, saying that she had already received 200*fr.* on account. This she denied, when the clerk presented her with a receipt for that sum with her name affixed to it, but which signature she immediately declared to be a forgery. On this a violent altercation ensued, when the clerk suddenly attacked Mme. Ribault, and struck her several blows on the head and chest with a sharp instrument, which he had concealed about him. She fell to the ground senseless, and apparently dead. The noise of her fall attracted the attention of Mlle. Lebel, who was in another room, and she hastened to ascertain the cause of it. The moment she entered the room, the clerk flew at her, and in a few moments she was lying on the floor a corpse. The murderer then returned to his residence at Montmartre. Madame Ribault, after some time, recovered from her state of insensibility, and although exhausted from loss of blood, managed to crawl to a table on which was a small bell, with which she hoped to bring assistance. The noise of carriages in the street prevented the bell from being heard, and it was not for some hours after that some persons ascending the staircase entered the apartment. The commissary of police was immediately sent for, and received from the lips of Madame Ribault a recital of what had taken place. A warrant for the arrest of the murderer was immediately issued, and he was taken at the office, to which he had gone as usual, in the belief that no one could appear against him. It appears that after the assassin had gone away, Madame Ribault, whilst lying bleeding on the floor, feared that she would die before assistance should arrive; she accordingly attempted to trace in blood on her chemise characters which would indicate the assassin; but,

reflecting that they would not be legible, she, by a great effort, managed to crawl to a chimney-board, where she traced with her finger, dipped in blood, the letters "Commis de M. T—." These letters are very irregular, but are perfectly legible; some others that follow the letter T. are illegible. After this Madame Ribault began to make as much noise as her failing strength would allow, in order to attract assistance, and at last the door of her apartment was forced open. The courage displayed by this old lady was extraordinarily great; for eight hours she remained lying on the floor in a pool of blood, and every hour became weaker and weaker, and, during all this time, the corpse of her murdered companion was lying near her. After Madame Ribault had been stabbed by the assassin in different places, he attempted to thrust a piece of cloth into her throat, but she succeeded in dragging it away. The cloth in question—a napkin—was found; it bore the marks of teeth and blood. It was believed that Madame Lebel had been strangled; but, on examination of her throat by medical men, none of the contusions caused by strangulation could be discovered. In examining her mouth a black pin was found, and afterwards a piece of black riband was seen in the throat. By the aid of instruments this was pulled up, and to it was attached the cap which Madame Ribault had worn on the previous evening. It had been pressed into a sort of hull, and thrust violently into the throat of the deceased by a stick, or some such sort of thing. The assassin attempted suicide by opening a vein with a piece of glass which he took from the window; but he was discovered in time.

A daring Robbery was committed during the night of the 1st inst., at Downlands, in Sussex, the house of the Misses Farncombe. At three in the morning five men broke into the house, through a window of the dairy. They went up stairs and entered the bed-room of Thomas Wood, the man-servant. Aroused by the noise, he leaped from bed and seized his gun, but before he had time to present it he was knocked down by a blow from the butt end of a pistol. Each man had a lighted candle and a pistol. They were disguised and wore masks. Upon coming into the room some of them exclaimed, "There is the —," and they threatened him with instant death if he did not remain quiet. One of them acted as captain, and he employed threats to his followers whenever they did not do as he requested. It is evident they were not quite strangers, for they called the servant by his name, "Tom," and one of the party demanded of the others that he should be quieted (killed) for having a gun in his hand at the time of coming in; and upon this two held guard over him, while the others went to a door at the other end of the room, and while there consulted whether they should kill him. Afterwards they burst in the panels of this door, and entered a dressing-room which led into Miss Susan Farncombe's bed-room. She screamed, but was compelled by the threats of the burglars to be quiet. When Wood heard his mistress scream, he implored the two fellows who guarded him to prevent their companions from injuring her or his other ladies, and one of them went away for such purpose. They demanded money, and commenced ransacking the boxes, cupboards, &c., passing quickly from room to room, and guarding the different passages of the house. They held possession of the house for two hours without being disturbed, and, after they had regaled themselves plentifully from the larder, and the wine-cellar, at length departed with their booty—a considerable sum of money and much valuable plate. At one o'clock on that night, some persons returning home from a party, had noted seven men on the road near Downlands; at half-past five the brother-in-law of Wood met seven men near Ringle's Cross-gate. Wood's sword was found near the Cross-gate, his gun was found in the river near Maresfield tan-yard, and one of the masks worn by the burglars was picked up on the road.

Six of the robbers have been arrested and committed for trial. The apprehension of three of them was accidental, and took place on the evening of the burglary, on another charge. The names of these three are John Hamilton, John Smith, and James Smith. They were at a village called Groombridge, where Hamilton gave John

Smith into custody on a charge of having taken a sovereign from him. In the meantime, the Police of the Tunbridge Wells district having received intelligence of a burglary committed at a Mr. Kenward's at Hartfield, and thinking the whole party suspicious characters, proceeded to search them, and found upon them a five-pound note of the Lewes bank, a coat, umbrella, and mask. These were taken to Downlands, and the coat and umbrella were at once recognised by the butler and housekeeper of the Misses Farncombe. Two more, named Hillyer and Morgan, were captured, after a desperate resistance, by the Guildford Police, in a beer-shop in that town, and several of the articles stolen from the house at Downlands found upon them. Another man, named Joseph Carter, was taken at Woking; on whose person was also found part of the stolen property, and a pistol loaded with slugs. Morgan was identified by the butler as the man who knocked him down with the pistol, and Carter as the man who kept guard over him. During the investigation, evidence was given of four other burglaries with which the prisoners appear to have been connected.

At the Warwickshire Sessions, on the 2nd, Holloway, a turnkey in the County Gaol at Coventry, was found guilty of procuring a key to be made which would fit many of the locks in the gaol, with the object of facilitating the escape of Thompson, a prisoner awaiting trial for forging Bank-of-England notes. Thompson had promised Holloway 100*l.* if he should escape. The treacherous turnkey is sentenced to transportation for fourteen years.

The Mounthfield Police, in Herefordshire, having lately discovered an illicit Distillery in the country, made three men prisoners. While conveying them away, the officers were fired upon from some heath, and one of them was wounded in the thigh. The Police replied with a running fire from their rear rank, and succeeded in carrying off their prisoners. It was found necessary to amputate the wounded man's leg.

In the Insolvent Court, on the 4th, Thomas Wallis, described as a "doctor of music," was opposed by several creditors, on the grounds that the debts had been improperly contracted, and that the insolvent's arrest was a friendly one to enable him to obtain the benefit of the act. The insolvent said he was a professor of music, and had been made a "doctor of music" by the late Archbishop of Canterbury, and was known as "Dr. Wallis." He denied that he obtained his diploma of doctor through his interest with the cook of the archbishop. Mr. Commissioner Phillips expressed his opinion that the Archbishop of Canterbury could confer such a degree. The insolvent's counsel said that the archbishop had the power to confer degrees, and the insolvent said he had not been examined by the archbishop but had been recommended by Sir H. Bishop. The insolvent denied that the arrest was a friendly one, but the arresting creditor, who was present, admitted that it was. The insolvent was remanded to prison; the commissioner declaring that he would never entertain a petition founded on false evidence.

A middle-aged married woman, named Elizabeth Poole, committed Suicide on the 4th. From an inquest held on her body, in University College Hospital, it appeared that she and her husband, who had been twenty-one years married, were mutually jealous of each other, and that during those jealous ebullitions she had frequently threatened suicide. On the above day one of those love quarrels between them took place, during which the husband struck her. Soon afterwards she went to a female friend named Hancock, to whom she related the circumstance of the quarrel, gave her some money to hand to her husband, and told her that when she was next seen it would be a corpse in an hospital. The same evening she was found insensible and dying on the steps of a gentleman's house in Seymour Street, Euston Square, whence she was conveyed to the hospital, and it was found that she had swallowed oxalic acid, of which she died the following day. A verdict of insanity was given.

A Den of Juvenile Thieves was discovered by the police on the Monday of the 5th, under one of the arches of the South Western Railway, nearest the vacant piece of ground in the York Road. The cave, which had a

fireplace in it, was most ingeniously fitted up, having a cooking apparatus, and nearly every article required for domestic purposes. A place to keep the victuals in was sunk in the ground, and secured from dirt by a lid similar to the iron-grating over the area coal-vaults in the public streets. By fastening boards and canvas to the cave, they succeeded in keeping out the weather, whilst a quantity of straw served the gang for a bed. How it was possible for any one to live in the place seems incredible, for neither of the officers were able to stand upright in the cave, and to enter it they were obliged to force their way backwards, the opening being too small to admit of their going in, in the regular way. Five of the youths were apprehended and conveyed to the station. Next day they were brought up before the Lambeth Police Court, and sentenced to terms of imprisonment from six to three weeks.

On the 6th, a respectable looking young woman was charged at the Southwark Police Court, on her own confession, with *Stealing a Gold Watch* from a gentleman in the city. On the previous night she had come up to a policeman on duty, and confessing the crime, told him she was impelled by remorse to give herself up to justice. On inquiry, it appeared that there was no foundation for this self-accusation; and the girl, questioned by the magistrate as to her motive in making it, said that she was out later than she was in the habit of being, and unwilling to disturb the family with whom she lived, and rather than remain in the streets, walking about all night, and subject herself to insult, she brought the whole accusation against herself, with a view of being taken to the station house. The magistrate censured her with a lecture on the folly and impropriety of her conduct.

A little boy, named Joseph Neville, was charged at the Mansion House on the 6th, with having picked a *Gentleman's Pocket* of a handkerchief. The prisoner was not expert in the office, and was caught in the act by the prosecutor, who seized and held him. The Lord Mayor: How long have you been picking pockets? Prisoner: I have been at it just three months, sir. The Lord Mayor: And how many pockets have you picked in that time? Prisoner: (shaking his head) I really don't know. The Lord Mayor: Do you mean that you don't know because they were so many? Prisoner: I do, your lordship. The Lord Mayor then sentenced the wretched child to be imprisoned for one month, and gave some particular directions respecting him to the principal gaoler.

Moses Barnett, a Jew dealer, was convicted at the Central Criminal Court on the 7th, of *Feloniously Receiving a quantity of Indigo*, knowing it to be stolen. The principal witness was Henry Sellers, a lad of fifteen, by whom the indigo had been stolen, from whose evidence it appeared that the prisoner was one of those persons who carry off a systematic plan of getting hold of young boys in service, and tempting them to rob their employers. He was sentenced to transportation for ten years.

At the Bristol Quarter Sessions on the 7th, James Simpson was indicted for having *Stolen a Purse* in a railway carriage from a young woman. The prosecutrix was journeying to Bristol by the express train, when the prisoner took his seat in the same carriage. She felt him force himself up against her three or four times, and at length, in consequence of a communication made to her by a lady who sat on the opposite seat, she was induced to search her pockets, when she missed her purse and its contents. Upon the arrival of the train at Bristol she gave an alarm, and the prisoner made a desperate effort to escape, but a hue and cry having been raised, he was pursued and seized by some of the company's officers, who found upon him various sums of money, evidently the proceeds of robberies, and a purse of gold, which was identified by a lady named Powell, as having during the day been abstracted from her pocket. The prisoner having been found guilty, the court ordered him to be transported for ten years; upon hearing which he fell down at the bar as if fainting, but upon being roused again by the gaolers, he thrust out his tongue in recognition of some friends in the gallery, and then left the court.

At the Reading General Quarter Sessions, Robert

Duce, a well-dressed young man, who had been a teacher of music at Abingdon, was indicted for having stolen a *Gold Pencil-case*. It appeared that on the 3rd of August the prisoner visited the house of a Mr. Davis, for the purpose of tuning a pianoforte. He was left alone some time in the room where the pencil-case was. He left as usual, and on the following morning it was missed from the work-box where it had been deposited. About the middle of the month the prisoner offered it for sale to a Mrs. Beckinsall, and she bought it of him for 10s. Some days after he had sold it he applied to have it returned, as he feared that "the person from whom he had had it had come by it dishonestly." The police then got a knowledge of the affair, and the prisoner was apprehended. The jury returned a verdict of guilty, and evidence was then gone into of two previous convictions for felony, upon which the prisoner had been sentenced to twelve months' imprisonment. The chairman, in passing sentence, observed that the court did not think that the prisoner, occupying such a position as he had, would be likely (having been previously convicted of felonies) to reform and become an honest man. They therefore deemed it necessary to inflict a severe sentence, and that was, that the prisoner be transported for the term of his natural life. The prisoner seemed astonished at the sentence, and a feeling of surprise appeared to be felt by the crowd which had assembled in the court.

William Strange, bookseller, in Paternoster-row, came up before the *Bankruptcy Court* on the 10th, on the question of passing his last examination. His name had acquired considerable notoriety in connexion with certain proceedings in the Court of Chancery, known as the Royal Etchings case. It may be remembered that Strange having been imprisoned for debt, his wife wrote to Prince Albert requesting a remission of the costs for the non-payment of which her husband was incarcerated. His Royal Highness acceded to the prayer of Mrs. Strange in a generous manner, and has since then acted towards the bankrupt in a still more munificent spirit. Prince Albert is a creditor under this estate for 200*l.*, law costs, but has, through Colonel Anson, intimated his intention to forego this claim. An application on behalf of the bankrupt, for an adjournment, as the balance-sheet was not yet in readiness, was made and agreed to.

Several cases of *Violent Assault with intent to Rob* have occurred in the streets of London.

Mr. Henry Francis Seymour, a retired military officer, was walking homewards to Hackney through Shoreditch late on the night of the 18th, when four men set on him at the corner of a street and tried to overpower him. He was struggling desperately when a policeman scared them, and they fled; but Mr. Seymour caught one, and held him fast. When the constable came up this ruffian audaciously charged Mr. Seymour with odious conduct; but the constable knew the accuser too well, and took him to prison.

As Mr. T. C. Wigs and his little son, a boy of twelve, were returning home on the night of the 13th, through Walworth Road, Mr. Wigs was *Attacked from behind*, and beaten heavily on the head; but his assailant presently ran away. A policeman shortly came up with the offender in custody; and at the police station it was found that he was Charles Wood, an omnibus driver, an associate of thieves, and brother of a "proprietor of omnibuses," who has just completed a term of imprisonment in Paris for a felony committed there. Close to the spot where the policeman caught Wood, a whip made of gutta-percha with a heavily leaded butt was picked up,—evidently the weapon employed in the assault. Mr. Wigs has been in a dangerous condition.

As Mr. Leffler, the singer, was going along the Kennington Road, about 12 o'clock at night on the 16th, he was run up against by a woman, and a man behind her, exclaiming, "What do you mean by insulting my wife?" immediately made a violent attack on him, in which the woman joined. He defended himself with his umbrella till a constable came up, when they were both taken into custody. Next day they were brought before the Lambeth Police Court, and remanded.

A gang of *Swindling Bill-discounters* has been discovered by the Police, and a person of gentlemanly ap-

pearance and manners, calling himself Capt. Routledge, has been arrested as being their chief. They have for some years carried on their practices with impunity, under a variety of designations; Wigram and Co., Taylor and Co., Hill and Co., Green and Co., Hankey and Co., Gurney and Co., and lastly Bruce and Co. Mr. Richard Johnson, of the flint-glass works, St. Helen's, Lancashire, was induced by the promising circulars of "Messrs. Bruce and Co." to apply for their pecuniary aid; and he received in the way of their business a bill of exchange for 213*l.* 16*s.*, drawn by them, and accepted and endorsed by other imaginary persons; for which he paid 10*l.* commission. Mr. Johnson got it discounted, and at the time of its maturity forwarded to "Messrs. Bruce" the funds to redeem it from the London banker at whose place of business it was made payable: but the bill was not taken up, and on inquiry no parties could be found who answered the description of "Messrs. Bruce;" so that Mr. Johnson had to pay a second time. The police traced the swindlers to their retreat in Stoke Newington, and bursting into the house, discovered Captain Routledge in the midst of all the paraphernalia of his fraudulent occupation. Bills of exchange were found amounting to 3517*l.*; money to the amount of 150*l.* in gold and half-notes; a vast number of pawnbroker's tickets for pieces of broad-cloth and other goods; and more than a truck-load of the circulars by which the Messrs. Bruce offered their pecuniary aid on easy and confidential terms. It appears from the investigations of the Police, that the address of the swindling firm has been successively in several of the suburban streets; that no number was ever given with the address on the circular; and that the address given was never that of the street at the time inhabited, but of one occupied some time before; and yet that the letters always found their way by regular course of post to the actual place of business of the swindlers. These circumstances had afforded them great additional means of concealment. The prisoner has been remanded, in expectation that a mass of additional charges will be made against him.

The protracted and important cause of *Thewles v. Kelly* was brought to an issue on the 11th, in the Court of Delegates at Dublin, when an unanimous judgment was given in favour of the appellant, Miss Thewles. The case arose out of the will of the late Mr. Edmond Kelly, a Galway solicitor and land-agent, who had accumulated an enormous fortune in real and personal property, to the amount of 3,000*l.* a-year in landed estates, and 250,000*l.* in the funds, which was left by the disputed will to the respondent, who, it is alleged, was married to him. On the part of the appellants, it was contended that the will was the result of undue influence, and the delegates were unanimous in annulling that instrument. Heretofore, in this long litigated case, the decisions have all been in favour of Mrs. Kelly, who had meantime made arrangements for lending 200,000*l.* to the directors of the Midland and Great Western Railway, charged as a mortgage on the new line from Athlone to Galway. There had been a previous suit between Mrs. Kelly and the heir-at-law for the freehold property, which was abandoned in consequence of an arrangement; and then the next of kin, Miss Thewles, instituted a suit for the invalidation of the will. The respondent was also condemned to all the costs of the proceedings, amounting to 15,000*l.*

An act of *Horrible Cruelty*, by which the whole live stock of a farmer was destroyed, was perpetrated on Sunday the 12th, at Dagnell near Dunstable. Mr. Cutler, a small farmer residing in the above village, was roused from sleep during the night, by the moaning noise of one of his pigs, and on going into the yard found the poor animal mutilated in a most shocking manner, being, in appearance, chopped in two across the loins with a bill or axe. Fearing that more mischief had been done to his stock, he went round his premises, and discovered, to his horror, that all his cows, six in number, had been cruelly cut about the hind-legs, the hamstrings completely separated, and the tail of one of the animals cut off. Mr. Cutler immediately sent for a butcher, and had the poor animals slaughtered. Suspicion fell upon a man who had recently been working for Mr. Cutler. This man

had disputed with his employer at the time of settling on Saturday night, and when he left the premises held out a threat that he would serve him out for it. Information was given to the police, who went to the cottage of the man and apprehended him while in bed. His clothes were marked with blood, and there were other suspicious appearances. He was taken before the magistrates and remanded for further examination. After the hearing, the man, whose name is Norman, and described as a labourer, was taken to Irvinghoe cage, but on the police officers going to the place on the following morning it was discovered that he had fled. It is supposed the prisoner had been assisted to escape from his confinement by persons on the outside, for, on examining the building, the wall was found to have been undermined, and a hole made large enough to admit a man's body.

Charles Gomez, a South American, was charged at Guildhall on the 14th, with *assaulting* Antonio Gomez, a Spaniard. The assault having been proved by a policeman, the prisoner told his story. I am (he said), a bow and arrow maker, and used to live in Liverpool-street. Antonio Gomez came to me and told me he could get me a great deal of custom among his connections in England. He often came to my house, and soon afterwards I found him with my wife in a dark room. I forbid him my house. I have often met him since arm in arm. Upon the last occasion I told him I would kill him if ever I caught them together again. After all this, last night I was walking through St. Paul's churchyard, and there I saw him walking with my wife again, and they were laughing and talking together; I was enraged at it and struck him, and I could not help doing so. Alderman Farebrother—And I think you served him right. If I had caught a man with my wife in the same manner, I would have broken every bone in his skin. You were wrong to attempt to make use of a knife though; and as for you (turning to the complainant, who was preparing to sneak out of the court), the sooner such disreputable characters as yourself return to their own country, the better. Such tricks as these may do there, where the people are not so particular; but in a Christian country like this we don't allow them. Now go away, and never let me see you here again under similar circumstances, or I shall place you where the prisoner now stands. I shall dismiss this case; and (to prisoner) I would advise you, if ever you find that man with your wife again, to give him a good thrashing, but use no knives.

In the Inland Revenue Court, on the 15th, a number of tradesmen were convicted of *Adulterating articles in which they Deal*. Thomas Christie, a grocer, in an extensive business at Whitechapel was fined 300*l.* for adulterating pepper with rice. Thomas Shulton Little, Pultney Street; Edward Shellis, Bedford Place, Commercial Road; William Lawson, Commercial Road; G. Johnston, Whitechapel; E. F. Lella, and B. Taylor, Whitechapel Road, were each fined 200*l.* for a similar offence. Others were fined in smaller amounts.

Mrs. Kinder, a farmer's widow, residing in the neighbourhood of Hattersley in Cheshire, was *Murdered* on the evening of the 16th. She had been left for a short time alone in the house, and was found by the maid-servant lying in the parlour, dead and covered with blood. The drawers in the room were open, and had been ransacked. The murderers have not been discovered.

The Rev. R. A. Johnstone, Rector of Ingrave, who was charged before the magistrates at Brentwood with a *Criminal Assault* on a servant-girl (see "Household Narrative" for November last, page 251), having received notice from the bishop of the diocese of his lordship's intention to issue a commission of inquiry into the scandal and evil report arising out of the proceedings in the case, has presented a petition to the bishop, praying that he may be allowed to withdraw from the charge of the parishes of Ingrave and West Horndon. The bishop has appointed a curate to reside in the rectory house.

Mr. Richard Randall, a gold-beater in Norton Street, *Committed Suicide* on the 17th in Kensal Green cemetery. He was found by a policeman, lying on his face in a pool of coagulated blood, on the north side of the

cemetery, close to the shrubbery which divides the grounds. A razor was found at his side, with which he had inflicted two frightful gashes in his throat. The body was quite cold and stiff. In deceased's pocket were his name and address. At the inquest on his body, a lady deposed that at twelve o'clock on Friday she was in the cemetery, when deceased rushed towards her, and standing in front of her stared wildly at her a few seconds. He then rushed behind the monument where he was found, and cut his throat; the blood gushing out. A labourer stated that he saw the deceased walking towards the shrubbery where the body was found, with his note-book in his hand, as if sketching the monument. A verdict was found of Insanity.

At the Worship Street Police Court, Susan Nunn, a showily-dressed young woman of thirty, was charged with *Robbing Young Children of their Clothes* in the streets of St. George's-in-the-East. A swarm of little girls and boys, "estimated by the gaoler to be nearly fifty in number," and varying in age from six to thirteen, appeared under the care of their parents or friends to establish two or three score of cases. The prisoner had been placed in a room with several other women, and a number of the children brought in: they all consecutively and without the slightest hesitation identified Nunn as the person who robbed them. The officers arrested her by stratagem. Six cases were proved, and she was sent to Newgate for trial.

A woman named Elizabeth Bainbridge, was *Murdered* on the 20th, near Bury St. Edmunds. She was a married woman, but for some years had lived apart from her husband. She was about 30 years of age, and appears to have borne an exemplary character. Her parents, with whom she had resided since her separation from her husband, are in comfortable circumstances, living at a small farm, and are much respected in the neighbourhood. On the afternoon of the day on which she met with her death, she had been on a visit at her brother's house, the Harrow Inn. She left there between 3 and 4 o'clock to return to her father's, about a mile and a-quarter distant; George Carnt, a man who had been lodging at her brother's for some days past, following her, as is believed, across the fields. It is evident, from the tattered condition of her dress and the state of the ground near the pond where the body was discovered, that a fearful struggle must have ensued between the victim and her murderer. It is conjectured that a refusal to comply with some improper overtures on his part led to a struggle, and that in a moment of revenge he forced her into the pond, where, from the shallowness of the water and the position in which she was found, she must have been held down with considerable violence in order to destroy her life. The pond is in a very lonely situation, and the banks are thickly studded with bushes. On the following day an inquest was held on the body. It presented the appearance of a fine healthy woman of ordinary stature, possessing rather pleasing features, and, with the exception of a slight bruise on the side of the head, there was nothing to indicate that she had met a violent death. Both arms, however, bore marks of having been tightly gripped, evidently inflicted while the poor creature was being held under the water. The evidence of the woman's father, of an officer in the constabulary, of a servant in the inn, and of the surgeon who had examined the body, made a strong case of suspicion against Carnt, who was committed to the county gaol, for trial at the next assizes.

Three children named Daniel Smith, John Watson, and Richard Haines, two of them under nine, and the third under eleven years of age, were brought before the Lord Mayor on the 20th, charged with having *Attempted to Pick Pockets*. They had been followed by a lad, who, to his surprise, saw one of them introduce a piece of stick into the pocket of a gentleman, open the pocket, and upon looking in and ascertaining that it contained nothing, push the stick into the pocket of another customer, while the two others followed closely in readiness to receive whatever luck should turn up. The smallest of the boys said, "Don't you believe a word he says, my lord. It's all nothing but out and out lies." The Lord Mayor: What did you carry that

stick for? Boy: What for? why, to keep away any boys that might want to whack me, to be sure. The police said that the borough, however, where the children lived, was crowded with little creatures who were regularly brought up to the business of alternately begging and robbing. The eldest of the boys said he had neither father nor mother, but he lived with a woman in Mint Street, to whom he paid a penny a night for his bed, and he grubbed about for his victuals in the day. The Lord Mayor: I shall cause inquiries to be made about you, and send you to the House of Occupation. Boy: Don't do that. If you let me go you shan't have me any more, I'll promise you. The Lord Mayor: No. You shall have some protection. As for the other two, they shall be whipped in the presence of their parents, who are here, and discharged.

Several *Poor Orange Venders* were brought before the Clerkenwell Police Court on the 20th, charged by Mr. James, the clerk to the Holborn Union, and several parish officers, with obstructing the streets and creating a nuisance by their cries. Mr. Combe, the magistrate, after hearing some of the cases, in which it was merely proved that the accused had called out "Two a penny oranges," and carried their baskets before them, asked what law was there to prevent parties selling their fruit in the street? Mr. James said they were in the habit of standing two or three together, and surely that was an obstruction. Mr. Combe: Certainly not. Placing their baskets upon the footway must be proved against them so as to cause obstruction, but there was no law to prevent parties selling oranges in the street on Sunday. Mr. James: They ought to walk on the carriage way. Mr. Combe: Oh, no! the foot pavement is free for everybody, and there is no act of parliament to compel people to walk on the carriage way. An overseer of the parish said the calling out of oranges on Sunday was an intolerable nuisance. Mr. Combe: They may call oranges all over the country if they like. Overseer: I am an overseer, and the inhabitants expect protection from me. Mr. Combe: You are not an act of parliament; you are an overseer. What nuisance is it to call out "Two a penny oranges?"

A young man was charged with *Selling his Fruit and Assaulting a Policeman*. The officer saw the prisoner selling his fruit, but there was no evidence of any obstruction, and on the officer taking him into custody he resisted and struck him. Mr. Combe said that the constable had no right to interfere with the prisoner. As he had said before, they had no right to meddle with poor persons for selling oranges. If not in the commission of an illegal act the police had no right to interfere with any one; if they did so they ought to expect resistance and assault. The charges accordingly were dismissed.

William Bristol, a young ruffian, was tried on the 21st, at the Middlesex Sessions, for having *Attempted to Steal from a person unknown*. The prisoner in company with a notorious thief and prostitute, had been detected by a police officer one evening, in Gray's Inn Lane, putting his hand into the pocket of a person passing by, but before he had time to take anything his companion gave the alarm and they ran away, but the man was captured. From the evidence given by the police officer it appeared that the prisoner was a member of a gang of daring thieves, and the "deputy" or sub-landlord of a notorious den in Fox Court, Gray's Inn Lane, which was known as the "Thieves' Kitchen," and which was the rendezvous of burglars, pickpockets, prostitutes, and pot stalers; a regular receptacle of stolen property, and where nightly could be seen thieves, prostitutes, and beggars, of all ages and of both sexes, huddled together indiscriminately, there being in some instances eight or ten men, women and children, all in one bed together. Some short time before, the officer had been on duty near Fox Court, and on contriving to peep into the "Kitchen" through a window, he saw the prisoner in a room with a line tied across it, and from this line was suspended a coat, in the pockets of which were placed pocket-handkerchiefs. A dozen little boys surrounded the prisoner, and each in turn tried his skill in removing a handkerchief without moving the coat or shaking it. If he performed the manœuvre with skill and dexterity, he received the congratulations of

the prisoner; if he did it clumsily or in such a manner as would have led to detection, had the operation been performed in the usual manner in the street, the prisoner beat them with severity, having on the occasion in question knocked down and kicked two of the boys for not having exhibited the requisite amount of tact and ingenuity in extracting the handkerchief. The learned judge said he regretted that the court had not the power of passing such a sentence as would rid the country of the prisoner, but sentenced him to be kept to hard labour for eighteen calendar months.

Iacchino Guiccioli, who stated himself to be a *Natural Son of the late Lord Byron*, was placed before the Marylebone police magistrate on the 25th, very nearly naked, and shivering from head to foot; charged with being *Drunk*. He told the magistrate he had but just returned from the Archipelago, and had fallen in with some land sharks, who had stripped him of all his worldly goods and garments. The magistrate cast a pitying glance at the unfortunate man and dismissed the case.

On the 27th an inquest was held in Horsemanor Lane Gaol, touching the death of George Foster, who committed *suicide* by hanging himself in one of the cells in which he was confined under remand from the Southwark Police Court. The prisoner was charged with neglect of and cruelty to his child. The jury returned the following verdict:—"That the deceased did destroy himself by hanging himself, but that the jury consider they have not sufficient evidence as to his state of mind."

A well-dressed man, who gave the name of Clarke, but who is known to the Mendicity Society as a begging-letter writer of the name of Bath Joss, was charged on the 27th, at the Marlborough Street Police Court, with having attempted to obtain money from the Marquis of Anglesey by *false and fraudulent representations*. The Marquis's secretary stated that during the previous week several letters were received by the Marquis purporting to come from one Robert Clarke, and asking for pecuniary assistance. The letters were sent to the Mendicity Society for investigation. Captain Wood, of the Mendicity Society, called at Uxbridge House, and it was arranged that a letter should be written to the applicant, Clarke, to be called for at the Post-office in the Blackfriars Road, as requested by the applicant. The secretary wrote a letter, enclosing a shilling, and stating that the money was in aid of the applicant's present wants, but if the case turned out to be one worthy of consideration further assistance should be given. A mendicity constable went with another constable to Blackfriars Road, and kept watch at the post-office. A woman called and asked if there were any letters for Mr. Robert Clarke. The post-office keeper said there was a letter, but as it was a registered letter it could only be delivered to the person to whom it was addressed. The woman, who was the wife of the prisoner, said she would inform Mr. Clarke, who would probably call in the course of the day. Shortly afterwards the prisoner came into the shop, and representing himself to be Robert Clarke, the letter was given to him. The constable recognised the prisoner as an old acquaintance; and when the prisoner left the shop he followed him. The prisoner opened the letter and went down a by-street. Apparently suspecting something, he threw the letter away and ran off, but was pursued and secured. He was committed to prison for two months as a rogue and a vagabond.

A singular case of *Affiliation* has occurred at Whitehaven. A woman appeared before the magistrates to affiliate, not, as in ordinary cases, a child, but in this case two children upon the same father, the woman having been delivered of twins! The magistrates conferred together upon this rather uncommon case. The clerk suggested it to be actually necessary to make two distinct orders upon the putative parent, as in case one of the children died, the other would be left unprotected for. In answer to a question from the magistrates, the woman said the children had been duly baptised and christened, the one named William and the other Nicholas. The bench awarded 1s. 6d. a week for each child, distinguishing them by name, with the usual costs.

Mrs. Sloane has been apprehended and brought to London. The statement that she had left this country immediately after the examination of Mr. Sloane, turns out to have been correct. Since the finding of the true bill by the Grand Jury against Mr. Sloane, the police have been indefatigable in their exertions to trace her whereabouts. In consequence of the reports that she was residing at Boulogne, two superior officers of that force proceeded to that port, where, however, they did not succeed in finding her; but they learnt that she had left for England. They immediately returned to this country; and on the morning of the 28th, early information reached the Lord Mayor that they had succeeded in the object of their search, and had apprehended her. It appears that, on the police officers arriving at Boulogne, they ascertained that Mrs. Sloane was actually residing there, and in consequence of the representations made to the French authorities, an order was issued that she should quit France by the next packet sailing for Folkestone. The police officers also returned in the same packet, and on their arrival at Folkestone, took her into custody, and brought her to London. She was immediately conveyed to Westminster-hall, and introduced into the judge's room, when Mr. Justice Erie attended for the purpose of taking the surrender and signing the order of committal. On her being introduced to the Judge, she was unable to stand, and was accommodated with a chair. The necessary evidence having been given, Mr. Justice Erie asked the prisoner if she was prepared with bail? she feebly said she was not. The Judge then signed the order of committal, and she was conveyed to Newgate. She was dressed in an old black silk bonnet and thick black veil, the lower part of her face being covered; she also wore an old and faded black silk cloak; and altogether her appearance was most pitiable.

John Moules, a young man, was charged on the 27th, at the Clerkenwell police-court, with having committed a *Murderous Assault* upon police-constable Hayes. The prosecutor was in so weak a condition and in such pain that he was allowed a seat while he gave his evidence. It appeared that on last Sunday night week, about 12 o'clock, the policeman was on duty in College Street, St. Pancras, when he found the prisoner in a state of intoxication, and was good-naturedly assisting him towards his place of abode, when he suddenly turned upon him and gave him a tremendous kick in the belly. He fell down and became insensible. A gentleman who witnessed the outrage stopped the prisoner, and gave him into the custody of an officer, who took him to the station-house, while the prosecutor was carried away for medical assistance. Mr. Smelly, a surgeon, said he was called upon to attend the injured officer, whom he found in considerable pain and injured severely on the abdomen. His life was then in great danger, but he had now materially recovered, but was unable to perform his duty. The prisoner said nothing in his defence, and was fully committed for trial.

NARRATIVE OF ACCIDENT AND DISASTER.

THERE have been *Disastrous Floods in Cumberland*. On New Year's night, a violent gale from the south west was accompanied with heavy rain. The effect was that the waters of Ullawater Lake (augmented by the downpouring upon the mountain range amid which it is situated) were forced into the channel of the Eamont and thence into the Eden. The Caldew and Petteril also rose far beyond their wonted volume; the latter, in particular, so much overflowed its wonted bounds, that the fields, right and left, and the high road to Warwick on the eastern side of the Petteril Bridge, were laid under water, in some places several feet in depth, cutting off all communication with the city on that side except on horseback, or in carriages, carts, or other high-wheeled vehicles. All the low and level grounds bordering the Eden for miles, both above and below Carlisle Bridge, were covered with a body of water which had the appearance of a vast lake. When the tide of the Solway began to retire, the flood also began to fall. Many

sheep and cattle were lost; more would have perished had they not been taken off from elevated spots, to which they had found their way, by persons in boats.

On Christmas night, a *Dreadful Occurrence* took place near Kilrush, in the county of Limerick. Bridget Haugh dressed herself in man's clothes, and, having blackened her face, went to her father-in-law's house to have some diversion. Her brother-in-law was taking care of the house, as his father was not at home; he had a loaded gun in his hand, and when he saw, as he thought, the man blackened, he presented his gun at his sister-in-law and fired, and lodged the contents of it between her shoulders. She died at once. There was an inquest held on her body, and the verdict returned was manslaughter against Michael Haugh, her brother-in-law.

A *Canoe with nineteen naked Savages* was picked up on the 7th of September, by the Jeremiah Garnett, Captain Daly, on her voyage from Shanghai to Liverpool. They had, thirteen days before, been blown out to sea from the islands of St. David's, which lie off New Guinea. One of the poor wretches died the same evening. Captain Daly landed the others at St. David's from whence they had been driven.

An accident happened on the *North Western Railway* on the 4th. Near the Boxmoor station an express-train ran into a goods-train, which had drawn up on account of the lameness of its engine. The driver and guard of the express-train saw the goods-train when nearly a thousand yards from it; but their pace was great—thirty-five miles an hour, and the rails were slippery from a shower that had just fallen; so they could not do more than slacken their rate to about eight miles an hour at the moment of coming in contact with the standing carriages. The driver and the stoker of the express-train leaped off their engine at the instant of collision: the first escaped without material hurt, but the second entangled his foot, fell on the road, and was taken up insensible; he revived under the application of stimulants, but has been dangerously bruised. Twelve or fourteen passengers were injured, some of them severely: one lady lost her teeth.

In the course of erecting some large granaries at the King's Cross terminus of the *same Railway*, an iron girder was lifted by shears to the top of a column that is to form one of the supporters of the roof. At the moment the girder was at its greatest height, the shears slipped, a gyre-rope gave way under the vibratory strain, and the ponderous mass fell into a canal, carrying everything with it in its course. James Kendal, carpenter, was killed on the spot, and Green has since died in the University Hospital. A coroner's inquest on the body of Kendal found that the cause of death was accidental.

Several *disasters at Sea* took place in the channel during the heavy gale on the night of the 8th. A schooner was wrecked on the Nass Sands, and every soul on board perished; the name is unknown. The brig Hazard, from Messina, drove ashore. The sloop Anna Maria, from Bulla, foundered in the gale; the crew were saved.

Two fatal accidents have taken place on the *Eastern Counties Railway*. On Wednesday the 8th, a special train was engaged by a son of Professor Haviland of Cambridge, to hasten him to the side of his father's deathbed. The train started from Shoreditch at 5.50 A.M., at such a distance after the Hertford luggage-train as that it would overtake it somewhere about the Ponder's End station. At 5.55 the electric telegraph was put in motion to clear the line in front of the special-train; and after nine minutes of calling the Tottenham Road station sent its answer of obedience. But ten minutes of similar calling on the Ponder's End station proved vain; and at 6.14 the message was passed onwards direct to the Waltham station. It appears that the collision must have occurred in this ten minutes during which the attention of Ponder's End station was vainly solicited. Vincent Lodwick was the night-inspector at the Ponder's End station: his duties were "to attend to the telegraph, the gates of the level crossing, the signals, the trains and their shunting." Within the quarter of an hour after six o'clock, three ordinary trains, and the special train, arrived at Ponder's End. Two of these accomplished "shuntings." While one of the

shuntings was going on, the special-train ran up, and crushed Lodwick so that he died in a few hours afterwards. He had not heard the electric bell; he had no possible time to run six hundred yards back on the line and place explosive signals behind the Hertford train and before the express-train; and he had not, as he should have done, sent the guards of the waiting trains to do it. The express-train had approached at twenty miles an hour, and then "run on easily," probably not much under ten miles an hour. An inquest was held, and the jury found a verdict of manslaughter against Roland Baxter, the driver of the express-train; and they added this expression of their general opinion:—"The jury cannot separate without expressing their unanimous opinion, that the duties assigned to the deceased, who was killed during their proper performance, were more multifarious than a person in his station of life and with his emoluments could reasonably be expected to perform, and that greater precautionary measures, by means of the electric telegraph, might have been adopted. They think it right also to add, that the regulations of the Eastern Counties Railway Company appear to require modification, and that punctuality should be more strictly enforced." In the other case, James Wilson, the driver of a goods-engine, had been killed on the 7th, by his own engine, while it was under the care of his stoker at the Ingatstone station. Wilson had gotten off his engine, and his stoker, Henry Hampshire, was with it shunting a truck, when Wilson was crushed; nobody having seen him approach. The stoker considered himself acting under the orders of the guard of his train; but the guard asserted that in some respect he did not act on the orders given. The coroner's jury returned a verdict of manslaughter against Hampshire.

A Little Chimney Sweeper has Perished at Manchester in the flue of a manufactory. It appeared at the inquest that there was a great want of caution in the engineer and the master sweeper: the flue had not been sufficiently cooled and ventilated, and the poor boy was suffocated by the heated gases, as well as burnt by falling on the hot soot. The coroner's jury directed that a copy of the depositions be sent to the Watch Committee, with a request that the parties concerned should be prosecuted for using climbing-boys contrary to law.

A young man named Crook, a nailmaker at Birmingham, *Accidentally Shot his Wife* on the 9th. Having returned home in the evening from his work, he affectionately saluted her, and asked her to get him a nice cup of tea. She was busy in this duty, stooping before the fire toasting some bread, when her husband took up a gun that had just before been placed against the wall by Lockley, their fellow tenant in the house, who had been shooting birds in the garden. As Crook lifted the gun the charge exploded, and his wife sank quietly forward as if fainting; Mrs. Lockley ran and clasped her in her arms, and found her dead—the shot had entered her brain. The poor husband, who had been married only a fortnight, became frantic with grief; tearing his hair and uttering self-accusations. A coroner's inquest was held, and found that this lamentable occurrence was entirely accidental.

A most *Melancholy Shipwreck* has taken place near the Land's End. Early on the morning of Saturday, the 11th, the brig, *New Commercial*, of Whitby, in a thick fog and strong gale, struck on a ledge of rocks adjoining to the headland of Cape Cornwall, and immediately went to pieces, but the people on board,—the Master, Sanderson, his wife, and eight men, got upon the rocks. They were discovered from the shore as soon as day broke, but no assistance could then be possibly rendered them. In this condition they remained until about nine o'clock, when they were all washed off by one wave, and seven of them perished. Of the remaining three—one, a mulatto, contrived to get on a portion of the floating wreck, and for some hours, clear of the broken waters, till five fishermen, belonging to Sennen, a small fishing cove close to the Land's End, determined, with that resolute spirit for which these men are distinguished, to launch their boat through the breakers, and at length, after encountering great risk, they rescued the poor mulatto from his perilous situation. The master and his wife, when they were carried off the

ledge, were thrown upon the Little Brisson Rock. The master first gained a footing, and saw his wife struggling in the waves, but sufficiently near to enable him to stretch out his hand and pull her in. While the Sennen fishermen were occupied in rescuing the mulatto, her Majesty's revenue cutter *Sylva*, commanded by Mr. Forward, was seen working round the Land's End, having been ordered to the spot by Captain Davies, the commander of the coast guard of this district. On reaching the point Mr. Forward launched his boat, and attempted, with a crew of four men, to get near the rock, but the attempt was fruitless; and it was only with great difficulty that he regained the cutter. It was now growing late, and nothing more could be attempted in the way of rescue for the day, so Mr. Forward hoisted his colours and hove to his craft, to encourage the poor sufferers, who were now to be left to spend the wretched night without food or shelter, exposed to the wind and rain upon the desolate rock. On Sunday morning the wind and sea abated a little, and all hands were on the alert. At one o'clock four boats were seen approaching from the Sennen Cove—three manned by fishermen and one by the coast guard; at the same time Captain Davies arrived, having embarked in a preventive boat with five men, taking rockets with him. The cutter's boat also was manned by Mr. Forward, so that six boats were quickly on the spot. By this time the people upon the cliffs could not have numbered less than 5000 or 6000; and as each boat arrived at the spot, the cliffs rang with the cheers of the multitude. The sea ran so high that no boat could approach the rock, and Captain Davies therefore proceeded to use his rockets. The first discharge failed; the line which was thrown having been cut by a sharp ledge upon which it fell. Another rocket was discharged, and this time the cord fell upon the rock, close to the unfortunate pair. The husband was seen to fasten the line around the waist of his wife, and to encourage her to take the fearful leap, while she lingered and hesitated to jump into the foaming waters; at last, however, his persuasions prevailed. They took an affecting leave of each other, and, amid the breathless expectation of all, she made the awful plunge from a height of about twelve feet. At this moment three immense waves broke in rapid succession, perilling the safety of all. For a time the boats were entirely hidden from the view of the spectators, and the loud cry broke forth from thousands of voices, "They are gone." But soon again the boats were seen above the waves, and the cliffs once more rang with approving cheers. The cord was drawn with great judgment, and after about three minutes the poor woman was taken into one of the boats; but the blows from the waves were more than her exhausted frame could bear. No attention that could be shown her was spared. The men took off their own clothes to cover her, and used every effort to restore her. She breathed, but by the time the boat reached the cove life had fled. After the master had persuaded his wife to leave him, he fastened the cord round his own waist, and was drawn, greatly exhausted, into one of the other boats. It is impossible to speak too highly of the conduct of those who were employed on this occasion. All who witnessed it agree in declaring that a more gallant and humane act has seldom been recorded.

Mr. Bent, a green-grocer of Newington, driving his grocery cart along the road at Newington Causeway, was *Killed* by being thrown out of the vehicle, one of the wheels having gone into a hole. It appears that, pending a dispute between conterminous parishes as to their boundaries and liabilities to keep the roads in repair, this road has been neglected till it has been worn into such ruts and chasms that carriages cannot drive along it without danger. A coroner's inquest was held on the 13th, and, after hearing evidence as to the liabilities of the contending parties, found a verdict of "Manslaughter against Mr. Pocock, chairman, and the five trustees of the south district board of St. George, Southwark."

A *Fire* broke out in the public-house kept by Caunt, the pugilist, in St. Martin's Lane, just after the inmates had retired to rest at two o'clock in the morning of the 15th. Caunt was in the country. Mrs. Caunt and a

niece slept on the second floor, just over the room first on fire; in one of the attic rooms slept her children, and Ruth Lowe, a relative; in separate attics were the barman and other servants. Mrs. Caunt and her niece escaped down stairs; the fire had laid hold of the staircase when the barman discovered it, so there was no retreat from the attics except over the roof. He got everybody on the tiles except Ruth Lowe and two of the three children with her; these, as he could not see them through the smoke in their room, he hoped had escaped earlier, or by means of the fire-escape; but when the fire was extinguished, their bodies were found in the room—they had been suffocated by the smoke.

On the 17th two men were killed in a Sewer at Islington. The commissioners are driving a large tunnel-sewer from Church Street to Cross Street, at a depth of twenty-four feet, and under the tunnel containing the New River, which is at a depth of twelve feet. A Mr. Cox desired to make a drain into the new sewer, and applied to the commissioners for authority, which they refused him. Nevertheless, he set a man at work to make the drain; this man, in the course of his operations penetrated the tunnel of the New River; the waters of the river burst into the sewer when six men were there and carried away George Ellis and William Bone, the others escaping with extreme difficulty. The body of Ellis was recovered at the mouth of the great sewer where it enters the Thames; that of Bone has not been recovered.

Mr. Draidwood, the superintendent of the London fire-engine establishment, has made his *Annual Report*, from which it appears that the fires during the past year have been 868—an increase of 30 beyond those of the preceding year. The buildings totally destroyed or considerably damaged were 247—ninety less than the year before; those slightly damaged 621—39 more than the year before. The chimneys on fire were 70, the "calls for assistance" were 1038, the "false alarms" 91. The "fatal fires" were 17, and the number of lives lost 18. Nearly a hundred houses were seriously damaged by exploding fireworks.

The United States mail steam-ship *Atlantic*, which left Liverpool for New York on the 28th of December, has been *driven back* to Cork harbour. She met with uninterrupted gales from the West, but sped her way with power and safety till the 6th instant, when she was equidistant from Cape Clear and New York—1400 miles from each; on that day her main shaft broke, and her machinery became useless. She was put under canvas, and tried to reach Bermuda; but the winds continuing adverse, she turned home on the 11th, and arrived in Queenstown harbour on the 22nd. The Liverpool agents of the owners of the United States mail-steamers, have chartered the British mail-steamer the *Cambria* to proceed to Cork at the earliest possible moment, and take on board the cargo, and such of the passengers as choose, to carry them to New York. From the arrangements of the mail service, and the delay that must occur before the *Cambria* can join the *Atlantic* and proceed on the voyage to Cork, coupled with the fact that the disabled vessel did not sight a single outward-bound vessel on the whole of her run out and home, the news of her safety will not arrive in America till a month after her expected arrival in New York. Throughout the Union, therefore, there will be almost a certain belief that she has been lost on the voyage.

Two Fires, one of them very destructive, broke out in London on the 27th. The large premises belonging to Messrs. Bousfield and Sons', wholesale clothiers in Houndsditch, (a firm who employed 1600 hands) were almost entirely destroyed, with loss of property to the amount of above 30,000*l*. The cause of the fire has not yet been discovered. The other fire was at the New Houses of Parliament. It was discovered about two o'clock in the afternoon, in a story of the clock-tower on the side facing Westminster Bridge. For a time it caused great alarm, but was soon extinguished without any serious damage.

A singular accident happened lately at the *Eddystone Lighthouse*. On the morning of the 13th of December, James Dillon, who has been connected with this light-house for the last 19 years, being about to leave his

situation to take another, a man named William Graham, who had been engaged on the Breakwater, was sent to relieve him. Graham had been landed at the lighthouse, and Dillon had just entered the boat, in which were two other men, to row to the yacht *Trinity*, not far distant, when two very heavy seas, one coming over the flat, and the other over the *Sadler Rock*, careered towards one another; they met near the boat with fearful violence, the sea boiled with agitation, the boat was capsized, and the three poor fellows were left struggling in the waves. Intelligence of the circumstance was communicated by the men in the lighthouse to the people on board the *Trinity* yacht, who came to the rescue of the drowning men as soon as possible, and picked up two of the sufferers; but before they arrived at the scene of the disaster the men in the lighthouse had succeeded in getting James Dillon out of the waves, with which he had been buffeting a quarter of an hour: he was nearly dead. This is the first time such an accident has occurred since the erection of this invaluable lighthouse; and what makes it still more singular is, the fact that it was the last trip which Dillon was to make to the shore from his old habitation. He was placed on board the yacht, which was not able to effect a landing until the 20th of December, when Dillon was at last taken on shore and put under medical treatment. He has since entirely recovered, and has gone to Hasbrough to enter on his new situation.

SOCIAL, SANITARY, AND MUNICIPAL PROGRESS.

AN important meeting, connected with the subject of *Education*, has been held at Edinburgh. Dr. Gunn, an eminent and successful teacher, had been recently nominated by government to the office of inspector of dissenting schools in Scotland. That appointment the Free Church Election Committee thought proper to *revo*. This extraordinary step against a respected member of their own section of the Presbyterian Church gave rise to a public dinner, given to him at the Waterloo Rooms, and attended by the leading promoters of education in Edinburgh, lay and clerical, and by many who sympathise with them, some even from England. Mr. Sheriff Gordon presided; and the whole proceedings of the meeting were an emphatic expressing of esteem for Dr. Gunn's character, and approbation of his conduct.

The first soiree of the *Printers' Dramatic Society* was held at Auderton's Hotel on Saturday evening, the 28th ult., and was attended by above seventy persons, (including a fair proportion of ladies), chiefly in connexion with the printing profession. Mr. W. H. Wills, who presided on the occasion, described the origin and rise of the society, and explained its object to be to assist the funds of the charitable institutions of the printing trade from the proceeds of amateur dramatic performances. To commemorate the success of the society, it had been determined to hold this social meeting. The party were entertained throughout the evening by the vocal and dramatic efforts of a number of amateurs, male and female, in a style which, in many instances, would have done no discredit to regular professionals. Some madrigals and glees were charmingly sung, and altogether, the vocal department was most creditably sustained. Several appropriate sentiments were given during the proceedings, and a vote of thanks to the chair closed a pleasant evening's entertainment.

The business of the Executive Committee of the *Great Exhibition* was on the 30th of December formally transferred from Palace Yard to the Building in Hyde Park. Professor Cowper gave a lecture, in the building, on the following day, when a great number of the members of the Society of Arts assembled to inspect it. He gave a most interesting account of its construction, and conclusively demonstrated its perfect safety.—A meeting of the council of appeal of the Metropolitan Commissioners was held on the 21st inst. at the rooms of the Society of Arts. Some preliminary discussion took place as to certain points of arrangement of the objects in

the Exhibition, turning upon the proper application of the terms "wall" and "counter" space, and upon the construction and dimension of counters, and it was agreed that a letter should be addressed by the honorary secretaries to the executive committee, requesting a more exact definition of the phrases, to be given with official authority, to rectify errors, and prevent any future misapprehension of their technical meaning. The appeals were then one by one considered, and some of them immediately adjudicated upon, whilst a greater number were referred to the re-consideration of the respective sectional committees, to be reported upon at the next meeting of the council on the 28th instant.

An important step towards a system of *Local Education*, has been taken at Manchester. A large and influential meeting was held on the 6th, to consider a scheme proposed by the Rev. Mr. Richson, for promoting education in Manchester and Salford by means of local rates. Mr. Richson bases his plan upon the fact that there is a vast amount of unoccupied school-room within these towns, which might be turned to useful account. Its leading points are stated to be these: The right of free education to be secured to every inhabitant of the two boroughs; the cost to be levied by local rates, which are never to exceed fivepence in the pound per annum; and the management is to be given to committees elected by the Municipal Councils out of their own members. A guarantee is given that the religious convictions of "all parties are to be respected and equally protected" by the arrangements that, in all *existing* schools admitted into union, "no creed or formula shall be taught to the children to which their parents or lawful guardians may in writing object;" and in all *new* schools, "no distinctive creed whatever is to be taught within the ordinary school-hours, although the daily reading of the Scriptures is to be provided for;" "the management of the latter class of schools is to be in the hands of exclusively lay persons." But the official features of the plan are the fundamental principles, "that the assistance of her Majesty's Inspectors is to be obtained in estimating the educational wants of any locality; and that no school is to be erected by the District Committees, and no land to be purchased for such purpose, without the sanction of the Committee of Privy Council on Education." The meeting adopted a resolution in favour of the plan, and appointed a general committee and a sub-committee to carry it into effect. The committee includes the names of the Bishop of Manchester, Mr. Heywood, M.P., Mr. Kershaw, M.P., the Dean of Manchester, the Rev. Hugh Stowell, and several other clergymen, both churchmen and dissenters.

A public meeting was held at Manchester on the 8th, for the *Establishment of a Free Library and Museum in that Town*. The chair was occupied by the Mayor, with whom the plan originated, and who has for some time exerted himself to obtain its accomplishment. He was supported by the Bishop and the Dean of Manchester, and there was a large assemblage of the most influential inhabitants. Resolutions for immediately carrying the scheme into effect were unanimously passed.

The committee of the *Association for Promoting the Relief of Destitution* in the Metropolis, and for improving the condition of the poor by means of parochial and district visiting, under the superintendence of the Bishop of London and the clergy, have made a report of the progress of the various provident societies in connexion with the association. During the past year, the deposits of the poor so aided were, 36 societies, 28,552 depositors, and the amount 13,366l. In 1845, there were only 12 societies, 3744 depositors, and the amount 1451l.

The *Annual Report* of Mr. Simon, the medical officer of the City of London, to the Commissioners of Sewers, published recently, is an interesting and valuable document. The following are some of its leading facts and suggestions. The rate of mortality for the City population of 125,000 has been just below 22 deaths (21.92) out of every 1000 living persons, in the year ending Sept. 28; in the preceding year it had been 30 in 1000. Some large share of the reduction has been due to circumstances beyond human control; but a sensible diminution of the causes of disease has been effected by the Commission, and a considerable portion of the improvement may be

ascribed to sanitary works effected under its auspices. Over the country under the survey of the Registrar-General, the extreme rates of mortality are 14 per 1000 the lowest, and 33.5 per 1000 as the highest; the low average belonging to a district in Northumberland, the high one to Liverpool. For the whole south-east division of England the rate is 19 per 1000. Mr. Simon asserts that "few competent persons will doubt that the mortality of London might speedily be reduced to the level of any district mortality yet recorded by the Registrar-General;" and he concludes his reasons for this belief by the statement, that during the last year "there was one sub-district of the City of London Union—one comprising from 12,000 to 13,000 inhabitants—in which, after including a due proportion of deaths which had occurred in the union workhouse at Mile End, the mortality stood at only 15 in the thousand; one in which, if those extramural deaths had been excluded, the local death-rate for the year would have been only 13.32." A detailed consideration of the sickness and mortality of his reports discloses some points of interest in respect to the ages at which death occurs, the particular causes of death, and the very important local differences of death-rate. The City of London appears to be peculiarly fatal to infant life. Of the whole 3799 deaths last year, 1318 occurred under the age of five years; of the whole 2762 deaths this year, 1032 occurred under the age of five years. In the City of London Union, the deaths of infants under five years old was 1-2.66 of the whole deaths, though their class numbers only 1-11.09 of the whole population: so that they died at more than four times (4.17) the rate which should have befallen them as participants in the average mortality of their district. This rate is not caused by inappropriate diet, for it is highest during the first year of birth, while the child depends for nourishment on its mother. Inasmuch as the few days of these children are passed chiefly within doors, their high mortality gives the least fallacious index of the unwholesomeness of the dwellings in which they die, and affords the correctest material to judge the sanitary condition of a district. Upwards of 1200 of the deaths in the past two years have been due to cholera and epidemic causes which were unavoidable; a large number beyond were referable to local and removable causes. It is notable that "the proportionate mortality from scarlatina, measles, and whooping-cough, is greatest where the general death-rate is greatest." Among infants, too, under similar circumstances, other diseases not commonly accounted specific, assume a frequency and mortality warranting the belief that they are of endemic and avoidable origin. The hydrocephalus, convulsions, diarrhoea, bronchitis, and pneumonia, often referred to the irritation of teething, "prevail in district localities, with so marked a proportion to the causes of other endemic disease, that we may be sure of their partial and considerable dependence on those local causes." The local differences of death-rate are strikingly exemplified by comparison of the healthiest with the unhealthiest wards of the city. In Cordwainers' Ward not a single death, and in Cornhill Ward only two deaths, occurred from epidemic, endemic, or infectious diseases; in the ward of Cripple-gate Without there were 299, of Bishopsgate Without, 329, of Farringdon Without, 845. The local predilections of cholera are marked and obstinate; they are not identical with those of fever. Many of the worst fever-nests were unaffected by it, while it visited spacious and airy houses along the main thoroughfare of the City, and inhabited by opulent tradesmen, members of the professions, and officers of assurance companies,—as along the lines of Fleet Street, Ludgate Hill, Farringdon Street, and New Bridge Street. The conditions of its local preference seem to be these:—"A peculiar condition of soil, of which dampness is one sure and invariable character, and organic decomposition (promoted by dampness) probably another. Its local affinities have much analogy to those of ague, and often appear identical in their range with the sphere of malarious infection." These conditions are exactly supplied by Farringdon and New Bridge Street—the line of the Old-bourne (whence Holborn) or river Fleet, now converted into a great sewer, and by the districts on the other side of London Wall from Bishopsgate to Aldersgate—a district described by Stow

as in olden times "moorish, rotten ground, impassable but for cawswaies purposely made to that intent"—"a fenue or moore, made maine and hard ground by divers sluices." In the second division of his report, Mr. Simon offers suggestions under the head of drainage, water-supply, offensive and injurious trades, burial-grounds, and the habitations and social condition of the poor. With respect to drainage, Mr. Simon, upon the authority of Stow, supported by professional observation of the nature of the prevalent diseases in those localities, thinks it highly probable that some of the sanitary defects of Chipplegate and Bishopsgate "depend less on defective house-drainage than on a still marshy undrained condition of the ground itself; and that these defects, including the liability to cholera, would be removed by an efficient application of subsoil drainage." He therefore recommends the adoption of measures to relieve the parts where the subsoil drainage is imperfect, and for protecting the house-foundations, and sewers, and subsoil adjacent to the river, from being soaked or flooded by the tide. He considers how far the offensive exhalations from sewers, which are not and cannot be entirely prevented by the best sorts of stench-traps, can be nullified by chemical means: he believes chemical means are not available to abolish the annoyance, but that the observance of some good cardinal principles would greatly abate it. The third and last division of his report gives a connected series of suggestions for embodiment in the act of parliament under which the commission has its powers.

The War Office has adopted a measure calculated to encourage *Intelligence and good Conduct in Private Soldiers*, by affording them the means of obtaining situations as clerks in the several military offices on foreign stations. A circular has been issued to the generals or other officers in command, containing the following instructions:—"That, on the occurrence of a vacancy among the clerks in the several military offices within your command, you will apply to the commanding-officer of any regiment on the station, to recommend to you a steady and intelligent soldier capable of filling the same. After a period of probation not exceeding three months, this soldier, if confirmed as fit for the situation, shall be removed from his regiment and be attested for general service, in order that while holding his office he shall continue to be a soldier in the army, and liable, if removed from his appointment for irregularity or incapacity, to be ordered to military duty with any regiment then on the station. Any man so confirmed in his appointment will have the rank and pay of serjeant, with clothing, rations, lodging, and fuel, and light, or with money allowances in lieu thereof; and will have the chance of rising in some of the offices, by succession, to the senior clerkship, in which event he will be entitled to the rank, pay, and allowances of serjeant-major. The service, as clerk, of any soldier confirmed in the appointment, will be allowed to reckon towards pension as non-commissioned officer."

The seventh anniversary meeting of the *Union News Ragged School* was held on the 21st at the Hanover Square Rooms, Lord Dudley Stuart in the chair. The report for the last year gave an interesting account of the progress of the school. The following are some of its chief points:—The income of the school had enabled the committee to liquidate the debt owing to the late treasurer, and also to effect much good in the school by engaging a more competent master for the week-day classes, and in establishing a shoemaker's class in addition to a tailoring class; and they hoped that an increased subscription would soon permit them to commence a day school and an infant school, for which there was not at present sufficient funds. The attendance on Sundays for the past year had been, for the six summer months, 81; for the six winter months, 146; average for the year, 113; namely, 70 boys and 43 girls. The decreased number was probably owing to the stricter discipline which was now kept, and which prevented idlers from entering only for the purpose of annoying the others and having what they called "a lark." The number of children whose names had been placed on the books after an attendance of three Sundays was 370. Of these 110 could read in various degrees of proficiency; 146

could read imperfectly, and 114 could not read at all; while many knew not how to spell their own names. The total number that had passed through the school was 636, out of which there were 169 who had only attended once during the year. The average attendance for the week evenings had been 33 boys and 37 girls; total, 70. The rule was more strictly enforced, which gave value to the weekly evening instruction, by making admission to the school dependent upon good behaviour on Sundays. The children so admitted were those really desirous of learning; and, consequently, were not disturbed by the misconduct of others, who came with very different intentions when all comers were promiscuously admitted. Here the report contained details tending to disprove the supposition that parents able to avail themselves of other sources of education, and to pay the charge of it, availed themselves of the ragged schools. Many instances had occurred of girls having obtained situations from the school. There were on the books the names of ten girls between the ages of seven and ten years who, when admitted, could not hold a needle, and were now able to work very neatly. The library, though scanty, was valued by the scholars, and donations of books would be thankfully received. The number of Bibles sold to the children during the last year was 23; of prayer books, 5; and of hymn books, 7; besides a great number of small publications at a halfpenny each. The committee of the Ragged School Union, although the government still refused to encourage emigration among the attendants at these schools, had raised a special fund to aid the different schools in effecting so desirable an object. Still the funds were inadequate for so important an object. The report here gave an account of the successful progress of a boy belonging to this school, who had been enabled to emigrate, and who was the fourth scholar who had been sent out from the school.

Mr. W. Locke, the honorary secretary of the Ragged School Union, entered into many details respecting the progress of the system, describing the founding of schools in different parts of the country, and the advantages which had been derived from them to the district; as in Aberdeen, Dublin, and other places. There were now from 90 to 100 ragged schools in existence, and about 150 paid teachers. London alone had about 1000 voluntary teachers, and, not only that, but a large number of highly influential persons actively employed themselves on behalf of these schools. He related instances of some who had received education in them, and had emigrated, and were now earning 4s. 6d. per day wages; and when he pictured the state of comparative prosperity to which these poor creatures had been raised through the means and agency of ragged schools, he exhorted the meeting to remember that those unfortunate children had been the very scum and refuse of society, picked, as it were, out of the gutters and kennels. The schools, he said, were all generally flourishing, and nothing was wanted but increased funds. The following gentlemen were appointed the committee for the year:—Messrs. Barnard, C. Compton, Dart, Godsell, Luke J. Hansard, Harvey, Hepburn, D. D. Hepham, Lowe, Murray, C. W. Priestly, Short; Mr. J. G. Priestly being the secretary.

The *Cultivation of Cotton in India* was the principal subject which engaged the attention of the annual meeting of the Manchester Commercial Association on the 21st. Two gentlemen, Mr. Mackay and Mr. Lees, the one sent out by the Manchester Chamber of Commerce and the other by the above association, are now in India, actively employed in the necessary inquiries and experiments. Mr. Lees, who has taken up his position on the south-eastern coast of the Peninsula; has made detailed reports respecting the fitness of the climate, the amount of taxation and other burdens on cultivation, the cost of carriage, the willingness of the natives to engage in a new species of cultivation, and the prospects of profit; and, from the information gathered from these reports, there was reason to believe (in the words of Mr. Aspinall, the chairman of the meeting) "that from the district of Tutocorin, within 50 or 60 miles of Cape Comorin, up to Madras, there was absolutely a cotton California."

The *National Public School Association*, recently

founded at Manchester, on the basis of the late Lancashire Public School Association, held its annual meeting on the 22nd; and Mr. Cobden and Mr. Milner Gibson, having accepted invitations to be present, there was a very large attendance of members and friends of both sects. Mr. Cobden, in moving the first resolution,—“That the present aspect of the educational question gives high testimony to the value of the efforts of this association, and promises a complete and speedy triumph,” addressed the meeting at great length in support of the principles of the association. He contended for the necessity of separating religious education from secular instruction, and that if there was a time when it was especially desirable to try the experiment it was the present. “We have arrived,” he said, “at that period when all the world is agreed that secular education is a good thing for society. All agreed that it is a good thing that English boys and girls should be taught to read and write and spell, and as much grammar as they can possibly imbibe. There is no difference of opinion about putting the elements of knowledge into the minds of every child in this land, if it can be done. But while we are united on that point, can any one who moves in society for a moment conceal from himself that we have also arrived at a time when we have probably more religious discord impending over us than at any other period of our history? When I speak of religious discord, I don’t mean merely the dissensions between the Roman Catholics and Protestants; I will not allude to them except so far as they lead to schisms and controversies in the internal state of other religious bodies. But I think there is, no doubt, at this moment looming in the distance, and not in the very remote distance either, a schism in the Church of England itself. You have two parties in that Church, the one perhaps stronger than the other in numbers, but the other far more strong in intellect and logic, which are going to divide the church. Then I see the Wesleyan body also torn asunder by a schism which the most sanguine can hardly hope to see healed. I do not think several other religious bodies are perfectly tranquil in their internal organisation. Now, while we have the prospect of those great internal dissensions in religious bodies, and while we are all agreed that secular education is a desirable thing, would it be desirable if it could be effected, if it were practicable—which I believe it is not—that our national system of education should be one united and bound up with the religious organisations, and by which the schisms which prevail in the churches must necessarily be transferred with increased virulence to the schools? For bear in mind, that what you see now pervading the churches in Scotland, where you have an irreconcilable dispute with regard to the appointment of masters to the parochial schools of Scotland—a dispute between the old kirk and the free kirk—recollect, if what I say be correct, when you have an impending schism in the Anglican church, you will have precisely the same difficulty in the appointment of masters. In one parish the high church party will predominate, and will dwell upon the necessity of the master observing all the old forms of our church, and enforcing all the old ritual and observances prescribed by the Liturgy and Canons; and, on the other hand, you will have the low church party dwelling upon the more vital essence of religion, and encouraging the discontinuance of those forms which the other party regard as of greater importance. And depend upon it, that while these discords pervade the church, you will have them in the schools also; you will have to fight the battle again and again to reconcile the various religious bodies, and in the end you will find yourselves obliged to return to the secular system which has been adopted in the United States and in Holland.” Mr. Cobden proceeded to show the increasing application of these principles in the formation of schools throughout the country, and concluded by advising the association to pursue its own course steadily, showing no opposition to anybody, but inviting the concurrence of every one.—Mr. Milner Gibson afterwards addressed the meeting in seconding the resolution, and it was carried unanimously.

The executive committee, in anticipation of the immense addition to the Population of London during

the Exhibition, and with a view to the necessary precautions on that account, have been in communication with the city police, to ascertain the exact traffic of foot-passengers and vehicles under ordinary circumstances. Their inquiries have given the following remarkable results:—The number of vehicles which pass daily Bow Church, Cheapside, is not less than 13,796, which contain not fewer than 52,092 persons; and within the same period of time there are not fewer than 67,510 foot passengers. Of this number of carriages it may be considered that the greatest number in one hour is about 1103, and of foot passengers in the same space of time about 5750, giving a total number of persons who pass Bow Church, Cheapside, in and with vehicles and on foot about 119,602 persons per day. The number of vehicles which pass daily to Aldgate by the Minorities is 9332, containing not fewer than 20,804 persons; and during the same period the number of foot passengers is 58,430. Of the carriages the greatest number in one hour may be computed at 795; of foot passengers in the same period, 4600: the total number of persons, therefore, who pass through Aldgate by the Minorities is 79,234 per day. During the month of May, the number of persons who enter the city daily on foot and in carriages is little short of 400,000.

PERSONAL NARRATIVE.

ON New Year’s Day, the Queen made a liberal Distribution of gifts to the poor of Windsor, of food, clothing, and coals, to the value of 2500; gifts made the more acceptable by her Majesty’s kindly presence at their distribution. The band of the Horse Guards performed a serenade on the New Year’s morning.

The good effects of the Queen’s beneficence to the Poor in the neighbourhood of Balmoral are thus described by a local newspaper—the Arbroath Guide:—“The Queen, the Queen-mother, the Prince, and their interesting family, have, like summer birds, taken wings and fled to a more genial clime. Their residence amongst us, however, has done much good. A school has been founded and a school-house built at Strathgirnnoch, on the Abergeldie estate, and male and female teachers are to be placed there and provided for. The poorer description of children in the district, and those at a distance from the parochial school, are to be the pupils; and the whole at our gracious Queen’s expense. A number of neat cottages are also in course of erection near Balmoral, and at Knock, on the Birkhall estate. The mansion of the last-mentioned property is to be enlarged for Prince Albert.”

The Queen has granted the dignity of a *Baronet of the United Kingdom* to Major-General Walter Raleigh Gilbert, G.C.B.; to Mr. James Matheson, of Lewis, in the county of Ross, and of Alchanly, in the county of Sutherland; and to Mr. Richard Tufton, of Appleby Castle, in the county of Westmoreland, Skipton Castle in the county of York, and Ilthfield Place, in the county of Kent. General Gilbert served with distinction in the war of the Peninsula; Mr. Matheson was formerly head of the great firm of Eastern traders—Matheson, Jardine, and Co.; Mr. Tufton is the inheritor of the vast estates of the late Earl of Thanet.

Colonel Hugh Rose, Consul-General for Syria, has been appointed Secretary of Embassy at Constantinople.

Cardinal Wiseman has received autograph letters of congratulation from the Queens of Spain and Portugal; completing the number of the Catholic Sovereigns of Europe who have addressed his Eminence on occasion of his appointment.

The *Order of the Garter*, has been conferred upon the Marquis of Normanby, in consideration of his important services as Ambassador in Paris, and in several other high offices of State.

The Queen has granted Pensions on the Civil List of 100*l.* a-year each to Mrs. Belzoni, the aged widow of the celebrated traveller; and to Mr. Poole, the author of Paul Pry, and of several contributions to periodical literature, who is a great sufferer from bodily infirmities.

The Queen has appointed Sir James Emerson-Tennent, Knt., to be Governor of St. Helena.

The trustees of the *Owen's College, Manchester*, have appointed Dr. Edward Frankland, Ph. D., F.C.S., to the chair of Chemistry.

Lord and Lady Camden made a *Public Recantation of the Protestant faith* at Rome on New Year's Day, and were received into the Roman Catholic Church, a ceremony at which Lord and Lady Feilding were present.

The Rev. Mr. Dodsworth entered the Roman Catholic Church on New Year's Day.

The Rev. Sir Frederick Ouseley, Bart., and Sir John Harrington, Bart., both of Oxford, have, it is stated, seceded from the Established Church. Sir John Harrington was Mr. Bennett's churchwarden.

Father Gavazzi, an Italian priest, has been delivering, at the Princess's Concert-room, a series of lectures on *The Abuses of Popery*, which have excited much attention. His first oration, which was delivered on Sunday, the 6th inst., had for its subject the part which the Italian clergymen were called upon to play in the great drama now in course of performance in his native land; the second oration dwelt on the present position and attitude of the Papedom, and the corrupt elements of which it was composed; and the third, on Sunday, the 19th, treated of the "Holy Inquisition." He speaks in Italian with extraordinary force and eloquence; and his lectures have attracted crowded assemblages, comprising not only the exiled Italians in London, but many English auditors.

Obituary of Notable Persons.

MR. DAVID WEBSTER ORIALDSTON, the well-known theatrical manager, died on the 29th December, at his residence, Brixton.

MR. WILLIAM NICHOLSON, the eminent singer, died on the 29th December, after a short illness. He was a sound musician, of pure and cultivated taste, and especially distinguished as a performer of sacred music.

MR. MAXWELL, the Irish novelist, and author of many humorous sketches in the periodical literature of the day, died on the 29th December, at Musselburgh, near Edinburgh.

MRS. MARCIA FERGUSON LANE FOX, granddaughter of the late and niece of the present Duke of Leeds, died at Hornby Castle, on Christmas day. Miss Fox had been in a declining state of health for some months past. She was in her twenty-first year.

VISCOUNT ALSFORD, M.P. for Bedfordshire, died on the 2nd inst., at Ashbridge Park, in his 36th year.

CAPTAIN G. W. BINGHAM, R.A., died on the 10th of October, at Ceylon, where he was acting in command of the Royal Artillery at that station. He had nearly completed twenty-six years' service.

GENERAL BENN died at Aleppo on the 11th December, after a short illness. He died a Mussulman, and thus received all the honours due to his rank.

MAJOR GRAMM, the Governor of Tobago, died on the 14th December, of paralysis.

VISCOUNT DA TORRE DE MONCORVO, who has so worthily

filled for many years the important office of Ambassador of Portugal at this Court, died on the 11th inst., after a painful illness.

CAPT. SIR HENRY MARTIN BLACKWOOD, in command of her Majesty's ship *Vengeance*, 84, at Portsmouth, died suddenly on the 7th, in his 50th year.

PRINCE PAUL ALEXANDER LEOPOLD, of Lippe Detmold, died on New Year's day, in the 56th year of his age. He is succeeded by the Crown Prince Paul Frederick Leopold, aged thirty, a major in the Prussian army.

GENERAL SIR JAMES WILLOUGHBY GORDON, G.C.B., G.C.H., the Quartermaster-General to the Forces, died on the 4th. He had held the above situation nearly forty years.

JOHN WILMOT, Esq., the eminent horticulturist, and President of the Market Gardeners' Society, died on the 2nd inst., at the Union Hotel, Cockspur-street.

T. S. DAVIES, Esq., F.R.S., London and Edinburgh, and F.A.S., died at Broomhall College, Shooter's Hill, on the 6th inst., in the 57th year of his age.

MR. GEORGE DEWEY, one of the partners in the banking firm at Charing-cross, died suddenly on Sunday the 5th. He had attended Divine service, and remained to partake of the sacrament; after which he returned to his residence in Wilton-crescent. On entering the drawing-room, he sat down in an arm chair, and was about to partake of some luncheon, when he raised his hand suddenly to his head, and exclaiming, "Oh, my God!" sunk down in an unconscious state. Medical assistance was instantly sent for, but he had ceased to live before the arrival of the family surgeon. He was in his 49th year.

DR. HAVILAND, Regius Professor of Medicine at Cambridge, died on the 8th, at his residence in that city, in his 68th year.

THE REV. LORD WILLIAM SOMERSET died at Clifton on the 14th inst., in the 67th year of his age. He was son of the fifth, and uncle to the present duke of Beaufort.

FIELD-MARSHAL THOMAS GROSVENOR died at his house, Mount Ararat, near Richmond, on the 20th inst., in his 87th year. He was the son of Thomas Grosvenor, Esq. (who was brother to the first Earl Grosvenor), and consequently first cousin of the late Marquis of Westminster.

HIS GRACE THE DUKE OF NEWCASTLE, K.G., died at Clumber Park, Nottinghamshire, on Sunday, the 12th inst., after a long and painful illness. He was born on the 30th January, 1785, and succeeded to the family honours as the fourth duke, on the death of his father, in 1795.

THE MARQUIS OF HASTINGS died in Dublin on the 17th, at the age of 19.

LORD BUNORREBT, the eldest son of the Earl of Westmoreland, died on the 22nd inst., in the 27th year of his age.

LORD ROBERT TAYLOR died at the barracks, Fermoy, on the 19th, in consequence of the breaking of a blood-vessel on the lungs. It appears that his lordship was walking in the town of Fermoy, when he saw a man beating a dog. On remonstrating with him, the man struck Lord Robert a blow, which he instantly returned, and then said, "I am choking with blood." After lingering some days, he died without pain or suffering. Lord Robert was the second son of the Marquis of Headfort, and had only recently exchanged from the Guards to the 49th Regiment.

LORD DALMENY, eldest son of the Earl of Rosebery, died on the 23rd inst., at Dalmeny Park, Linlithgowshire, in his 42nd year.

REAR-ADMIRAL RYE died on the 18th inst., aged 88. He was one of the few survivors of the battle of the Nile, which took place while he was Lieutenant of the *Orion*.

COLONIES AND DEPENDENCIES.

THERE is nothing very notable in the Colonial news of the month, but the last mail from India seems to indicate a strong renewal of the old agitation against the judicial courts of the East India Company. The cholera in Jamaica is not yet known to have abated; but the packet which left England at the commencement of the month took out not only ample stores and remedies, but six surgeons from the Admiralty, and three medical inspectors from the Board of Health. It is very sad that such provisions should have succeeded instead of anticipating the event provided for, and it will be well if we apply the warning to our sanitary affairs at home.

The *Bombay* mail has brought accounts to the 17th of December. They are politically unimportant, tranquillity prevailing throughout our Indian empire. The health of the troops in the Punjab and Upper Provinces is but little improved. According to the published returns for the week ending the 21st November, there were 1204 men in hospital out of the 7448 composing the garrison of Lahore; nearly half of one regiment (the 1st European Fusiliers) were on the sick-list; and in the 4th Punjab Infantry, 406 out of 894 were in hospital.

A Court-martial on Major Bartleman, of the 44th Native Infantry, had found him "guilty of conduct

unbecoming the character of an officer and a gentleman, in having at Barrackpore, in pursuance of an endeavour to seduce the affections of Mrs. Shelton, wife of Lieutenant Shelton, 38th Light Infantry, written to her on or about the 22nd of August, 1860, a highly unbecoming note." The Court had sentenced him to be cashiered, but had recommended him to mercy on the ground of Major Bartleman's long services, and on the ground that his fault, "however reprehensible, has still not always been considered as necessarily subversive of military discipline." Sir Charles Napier had confirmed the sentence, with sharp animadversions on the recommendation to mercy, an endeavour by the Court "to

throw upon the Commander-in-chief the odium of refusing that which its own sentence renders impossible for him to grant without insulting the officers of the Bengal Army in general and those of the 44th in particular."

Sir W. Gomm arrived at Calcutta and assumed command of the Indian Army on the 6th of December. Sir Charles Napier was at Loodiana on the 30th of November, and was expected at Bombay about the end of the year. During his eighteen months' administration, forty-five officers of the Bengal Army have been brought to trial, of whom fourteen have been cashiered, six dismissed, seven have lost rank, five have been suspended, and ten reprimanded; only two have been honourably acquitted, one simply acquitted, and four pardoned or their sentence commuted.

The accounts from Ceylon are to the 12th of December. The new Governor, Sir George Anderson, met the Legislative for the first time on the 4th. His address made a favourable impression. He spoke with satisfaction of the prevailing tranquillity, and of the prospect of a prosperous revenue; and expressed his hope of being able, at no distant period, to lessen the burdens of the people by lessening taxation; "the imperative duty," he said, "of all governments." It is generally understood in the island, that the governor has received orders to reside frequently in Kandy, instead of making Colombo always his residence. Almost all the Europeans reside there, on coffee estates, and most of the European capital has been expended there. This province is also the latest of our native possessions. These reasons combined, added to the coolness and salubrity of the climate, point it out as the most eligible seat of government.

The intelligence from the *Cape of Good Hope* is important. In consequence of an apprehended inroad of the Kaffirs, Sir Harry Smith proceeded rapidly to King William's Town, and was unexpectedly present at a Kaffir meeting held there on the 26th of October. A number of chiefs were assembled, but the celebrated Sandilli was absent. The chiefs protested that they preferred being under the British rule, and having their property protected, to living like monkeys in the bush. Sandilli's brother said that he had not come because a fall from his horse had hurt him and made him unable to rise. Sir Harry Smith answered—That was a lie; Sandilli was afraid. "But," said Sir Harry, "tell him I do not wish to hurt him; let him come in as my son; I will protect him." On mentioning the rumours that were spread abroad in the colony, Sir H. Smith wished to know who had thus alarmed the colonists; he understood they had originated with the native Gaika tribes. He was surprised that they should be such fools as to believe in such a fool—a boy prophet who was covered all over with grease, and as black as a coal. "I, they were not happy, continued his Excellency, and wanted war, he would make war (holding up a long stick with a brass knob at the end, called generally the stick of peace). "I will make war, and bring my troops from Cape Town in four days, as I came myself; and I will drive you all over the Kai, and get Krili to drive you to the Umzimvoobo, and I will be there too—I was there once; and you know it—and then get Faku to drive you further; and then you will be scattered over the earth as beasts of the field and vagabonds. But the good I will protect and assist, and be their father. I will kill every one that will not fight on my side. There is a God above; he knows all things." There were about 350 Kaffirs in all; and the meeting separated peaceably, his Excellency inviting the chiefs into the house. The chiefs were very humble, and came forward at His Excellency's request to shake hands with him, as a token of peace and allegiance to the Queen, as British subjects. A few days after this meeting, Sir Harry Smith issued a proclamation deposing Sandilli from his rank and authority as a chief, and appointing Mr. Charles Brownlee, commissioner for the Gaika tribe, to assume the direct control of Sandilli's tribes, under the instructions of Colonel M'Kinnon, the chief commissioner of British Kaffraria.

The *West India Mail* has brought intelligence from the different colonies to the end of December. In

Jamaica the cholera was committing fearful ravages on the north side of the island—particularly at Montego Bay and Falmouth. On the south side it was abating, and had almost entirely disappeared from Kingston. In the agricultural districts in all parts of the country the greatest mortality had taken place, whole properties having become almost entirely depopulated. The injury that must result to the agricultural interest is incalculable. Crops on the ground, some of which promised to yield abundantly, cannot be taken off for the want of labour. The Boards of Health of the different places were meeting regularly for the purpose of adopting measures for the relief of the sufferers and to prevent the spread of the scourge. The legislature stood adjourned to the 14th of January. The council, as well as the house had decided on memorialising her Majesty, praying for the introduction of African immigrants.

In *British Guiana*, the Court of Policy had been engaged on several important measures, but stood adjourned to the 13th of January. Among other business transacted, bills establishing a new department of the public service, the office of Auditor-General of Accounts, for the examination of the litigated accounts of the courts of justice, and of all public accounts generally, and providing for the holding of inferior criminal courts in Essequibo by one of the puisne judges, were advanced a stage. An ordinance had also been passed for constituting boards of health for Georgetown and New Amsterdam, to guard against the contingency of a visit from cholera.

A serious military riot had taken place at *Berberie*. The police arrested some soldiers, and took them to the station-house; a body of the companions of the prisoners came down on the station-house, attacked the police, and the inhabitants who joined them, and were only prevented from effecting a rescue by the arrival of the Commander-in-chief and the officers of the corps. Many persons received serious wounds.

The accounts from the other colonies are unimportant. In most of them sanitary measures had been adopted in anticipation of the cholera.

Throughout the *Australian Colonies* there is a growing agitation against the transportation system. In New South Wales, large meetings upon the subject have been held, both at Sydney and in the interior. In Van Diemen's Land there have been meetings in all the districts of the island, at which the public feeling has been strongly and unanimously expressed. The course of action agreed to by all the meetings is to remonstrate with the Colonial Office against the continuance of transportation, and the system of misrepresentation of colonial sentiment in the imperial parliament which had been systematically pursued by Earl Grey; and also to pledge themselves, in example of the people of the Cape, not to employ convicts. Meanwhile, the government partisans and pro-transportation party was not inactive. An attempt had been made to get up a petition in favour of the continuance of transportation in a modified form, but the manoeuvre was promptly met by the anti-transportation association issuing an address, cautioning the colonists against attaching their names to any document of the kind until it had been printed and publicly discussed.

The session of the legislative council of *New South Wales* was adjourned on October 2nd. During its sittings the principal acts passed were those for establishing and endowing a university for Sydney, for improving the organisation of the police, for regulating the corporation of Sydney, and for confirming certain presbyterian marriages. The result of the transportation debate was the adoption of measures with the view of pledging the Secretary of State that convictism should not be resumed.

The news that *Port Philip* was to be erected into a distinct and independent colony had been joyfully received at Melbourne. It was not decided whether the event should be commemorated by illuminations, or by the establishment of an orphan or female emigration asylum, or of a college. A cathedral church has been founded, and it is proposed to erect a town-hall in Melbourne, at a cost of 2000l.

John Wroe, the founder of a sect called the "Beardies," from their partiality to hairy barbarism, has arrived in Melbourne. He is described as a man of eighty years of age, but hale and strong; and announces that he has a divine mission to preach in the colonies. He commenced operations by preaching in the "Sanctuary" on Sunday, the 16th September, whither all the members of this new sect resorted.

A species of Thuggism, it appears, exists among the blacks of the Darling, by which numerous wayfarers and stragglers, as well as shepherds in isolated situations, have been sacrificed. An aboriginal had made revelations which led to the discovery and exhumation of five bodies, all of white men, and each in the last stage of decomposition, the identity of their persons being completely obliterated. The squatters of the colony had been completely startled by a recent land purchase. For the first time since the passing of the Crown Land Sales Act, the power thereby given of purchasing by private contract 20,000 acres, or more, at the minimum price, had been brought into play by W. J. T. Clarke, Esq., who bought up a tract of 20,000 acres of land at Mount Macedon, including the principal stations of several eminent squatters, utterly destroying the tenure of these parties, who must either purchase or abandon their stations. The squatters are resolved to litigate the matter, conceiving that the imperial act (5 and 6 Vict., c. 36) only empowers the governor to sell any block of "unsurveyed land" comprising 20,000 acres, or more, and that the land in dispute does not come within that definition.

The Adelaide Journals show the rapid progress of South Australia. As exhibiting the growing commercial importance of the port of Adelaide, the following analysis is made of the shipping on the 25th of October last. The ships and vessels from British, extra-colonial and foreign ports, amount to 12,750, and are manned by 556 officers and seamen. The vessels employed in the coasting trade of the colony are 955 tons, navigated by 84 men; and the vessels employed by the local government are 730 tons, with 47 men. The last-mentioned service includes a steam-tug, which is of incalculable advantage to the mercantile interests of the colony by expediting and facilitating the larger arrivals and departures. At the port only the population numbered about 6000 souls. The Burra Burra had published their half-yearly report of the mining association, and declared a dividend, making 3 dividends of 200 per cent. for the year. It is stated that at no time have the mines been in a more flourishing condition, or have the general prospects of the company afforded such ground for congratulation.

From New Zealand the principal article of news is the death of the celebrated native chief, Hoko, the ever active enemy of the Europeans, which took place in August last. The following letters, the last written by him to the governor, will be read with interest; they are characteristic of the old chief, who, on the eve of death, charged the young men to "sit in peace for ever," as war was a game at which all parties were losers.

Kaikohu, 30th of the days of May, 1850.

O Friend the Governor!—Salutations to you. Your loving or affectionate letter has reached me. Lo! this is my loving letter to you. Yes, my illness is great, but do not be dark or sorrowful: this is not the permanent place for the body. The thought is with God as regards us both, or we are at the disposal of God. My words to you will not be many more, as I am very ill. Present my love to your companion, Lady Grey. Salutations to you and to your companion.—From your loving friend,
(Signed) HOKA WIREMU HOKA POKAL.

Tautoro, 4th of the days of July, 1850.

O Friend the Governor!—Your letter of the 1st of July has reached me; I have seen it. Are you not willing to have a vessel sent hither, so that I may ship some cattle for you? If the vessel comes, and a letter from you, I will send you four head of cattle. It will not be safe to ship the cattle on board Kanara's vessel, as I got myself into difficulty on a former occasion in sending you my pigs. I went to Pahiia, and conversed with the Major, but he would not provide a vessel. I therefore say to you, arrange this matter yourself, because your love to me is very great; but as regards my love to you, it has not been openly shown, or you have not had any token of my love to you. This is the reason why I say let me give you four head of cattle, as a proof of my love to you.—From your friend,
(Signed) HOKA WIREMU HOKA POKAL.

PROGRESS OF EMIGRATION AND COLONISATION.

A Female Emigration Association has been formed at Hobart Town, Van Diemen's Land. At a preliminary meeting (held on the 26th of August last) a committee was appointed, with power to add to their number, for organising the Association. It is called the Tasmanian Female Emigration Association, and it was resolved, "that its primary object shall be to co-operate with the association formed in England by the Right Hon. Sidney Herbert; that a home be at once provided for the purposes of this association; that the home shall, so far as may be consistent with the primary object of this association, be made available for all female emigrants of good character; and that subscription lists be opened to receive the contributions of the colonists for carrying out the objects of this association." A general meeting of the committee was held on the 2nd of September, when Lady Denison, Lady Pedden, and Mrs. Nixon, were named patronesses; steps were also taken to form a ladies' committee, to engage a suitable building, and to make the other necessary arrangements. The committee numbers no less than 54 influential gentlemen; and on the 20th of September the amount of 161*l.* 16*s.* of annual subscriptions had been contributed by 35 individuals.

The following statement has been published respecting the Emigration from the River Clyde in the year 1850, from which it appears that it has nearly equalled that of 1849, which far exceeded any previous year. The total numbers emigrating from the Clyde in 1850 were 14,206, and their destinations were—

To the United States	11,220
To Canada	2,388
To the Australian Colonies	300
To Port Natal	121
To other Ports	167
	14,206

The greater portion of the Scotch emigrants were small farmers and tradesmen, particularly working engineers, and, generally speaking, they were able to secure a comfortable passage, and take some little means with them. The great majority of the Irish emigrants went out under apparently very wretched circumstances, but nevertheless there were some of them known to carry out amongst their rugs sums varying in amount from 10*l.* to 50*l.* and upwards. The emigrants for Australia, Canada, and the Cape were of a vastly superior class to those going to the States. The amount of money taken to the States by these emigrants was nearly 40,000*l.*, to Canada about 10,000*l.*, and to Australia about 2,000*l.* The number of emigrants from the Clyde in 1849 was 14,986, of whom the destinations were as follows, viz.:—

To the United States	10,636
To Canada	2,381
To Australia	691
To the Cape of Good Hope	124
To the East and West Indies, &c.	114
	14,986

We have the peculiarity now that the emigration continues regularly throughout the winter, although it was formerly confined to the summer. The emigration from the Clyde during the last seven years has been at the following rate:—

1844	3,508	1848	10,085
1845	3,445	1849	14,986
1846	2,820	1850	14,206
1847	7,728		

A meeting of the friends of the Ragged Schools was held at the Juvenile Refuge in Westminster, on the evening of the 17th, for the purpose of taking leave of 11 boys, selected from the various ragged schools in the metropolis, who are about to be sent out to Australia, at the cost of the Ragged School Union. The ceremony took place in the presence of the children, 100 in number, taught in the Refuge, who were regaled with tea and cake in company with the friends who attended. The eleven intending emigrants were arranged on a form on the left of the chair, and were neatly and cleanly attired. Each was provided with a capacious chest, for the purpose of containing their clothes and other necessaries, which had been supplied by the Ragged School Union. Mr. Gent, of the Ragged School

Union, gave some particulars respecting the boys. Of the eleven, who were all well recommended, three were from the school held in that place; three from the school in Grotto Place, Marylebone; two from the school in John Street, Mint; two from North Street, Mile-end; and one from the Ann Street Dormitory. Five of these would be lauded at Port Adelaide, the other six at Port Philip. The cost of sending them out would be upwards of 200*l*., the whole of which had been raised and paid over to the parties who would send them out.

NARRATIVE OF FOREIGN EVENTS.

THE great incident of the month in continental politics is the split between Louis Napoleon and the French Assembly. It is possible that good may come of it, on the principle of the old proverb about rogues falling out; but it requires a large amount of hopefulness to discover any kind of prospect of good for Franco just now. One thing is certain however, and as certainly was not anticipated by either of the combative parties in the recent strife—the Republican form established in 48 has received singular and unexpected reinforcement from the very measures devised to overthrow it. Even M. Thiers perceives it now to be the only system with a chance of durability in it, and M. Louis Napoleon has surrendered for the present his fitful Imperial dream.

There has been a curious clash of another kind between two angry foreign potentates, which it is impossible not to regard with yet greater satisfaction. Decrepit old Austria has shaken her fist at lusty young America, and received for her pains what the slang of the ring would denominate a "regular smasher." It seems that the late President of America had dispatched a diplomatic agent to Hungary during the troubles, accredited to obtain trustworthy reports of the state of the country and its prospects of resistance; and that Prince Schwartzburg discovering this fact among the official papers published at Washington (wherein, also, the Austrian rule was called an "iron" one, and Kossuth an "illustrious" person), straightway let off an explosive mission against the American government, broadly hinting at retaliation, and affirming that if the agent in question had been discovered he would most probably have been hanged as a spy. To this Mr. Webster responds, that America had owed its existence as a nation to precisely the sort of resistance stigmatised by Austria as rebellion. That the father of the nation, Washington, had been exactly in the position of Kossuth. Further, that America most strongly sympathises in consequence, and means to continue to do so, with every struggle that has for its object the wresting of power from despotic governments. Also, that the dominion of the Republic, in the name of which he writes, is spread over the most rich and fertile region on the globe, and is of an extent in comparison with which the possessions of the House of Hapsburg are but a patch on the earth's surface. And finally, that supposing Prince Schwartzburg should have thought proper to treat any American as a spy, his highness might assuredly have looked for immediate hostilities to be waged by the utmost exertion of the power of the Republic, military and naval!

This is language that one cannot but feel is not only likely to be beneficial in Austria but also much nearer home. It is true that America has a broader ditch between herself and her adversaries than is possessed by the older countries of the earth, and can the better afford to be prompt and loud in the expression of her anger. But the example is a noble one not the less; because the feeling of self-assertion is real and well-founded, and there is no doubt, that, if need were, the words would take the form of deeds as strong and brave.

The political intelligence from France during the past month consists of the progress of a "ministerial crisis," a series of party struggles and changes of administration, which has not yet come to a close. It arose out of the dissensions between the President and General Changarnier, whose assumption of power, it appears, Louis Napoleon could no longer brook. His determination to dismiss Changarnier from the command of the army, a measure adverse to the will of the Assembly, led to the resignation of the ministry, which took place on the evening of the 3rd inst., after a meeting of the Assembly, in which General Changarnier's proceedings had been the subject of debate. Some days afterwards a conference took place between the President and a body of the leading parliamentary chiefs, in which they demanded the maintenance of Changarnier in his command, a demand with which the President peremptorily refused to comply. The President then appointed a new ministry, consisting of M. Drouyn de l'Huys, for Foreign Affairs, General St. Jean d'Angely for War, M. Dodes for Marine, M. Magne for Public Works, and M. Boileau for Commerce. Of the old Cabinet, Baroche, Fould, Rouher, and Parrieu retained office. The post occupied by Gen. Changarnier was abolished; and Gen. Baraguy d'Hilliers was appointed to the command of the first military division, and Gen. Perrot of the National Guard.

The ministers met the Assembly on the 10th, and they, on the one hand, and Changarnier on the other, were loudly greeted by their respective partisans. M. de Remusat called upon the new ministers to come forward and explain why the old administration had withdrawn, and why they had replaced it. He called upon the Assembly to retire into their bureaux and devise measures commanded by the gravity of circum-

stances. M. Baroche entered into ministerial explanations in the midst of noisy interruptions; and, after a stormy debate, a ballot took place on M. Remusat's proposition, which was carried by 330 to 273. In the bureaux a committee was appointed, of which M. de Broglie was chairman; and on the 14th this committee made a report to the Assembly, recommending a resolution to the effect that "the Assembly, while acknowledging that the Executive power has made use of an incontestable right, but blaming the use which the present Cabinet has made of this right, declares that the former Commander-in-Chief has preserved all the esteem and confidence of the Assembly."

On the 15th a debate commenced on this report of the committee, which did not terminate till the evening of the 18th, when a coalition having taken place between the Conservative majority, the Republican party of General Cavaignac, and the Mountain, the ministers were defeated by a majority of 417 votes against 278, an absolute majority of 139. When the general debate had closed, the President of the Assembly read the several amendments. M. St. Beuve demanded the priority of his amendment, which was as follows:—"The Assembly declares that it has not confidence in the ministry, and passes to the order of the day." This amendment having been carried, the ministry had nothing for it but to resign.

For several days, various attempts were made to form a new ministry, but without success; till, on the 23rd, the Assembly and the public were startled by a message from the President, containing the following passages:—"In order not to prolong a painful difference, I accepted, after the late vote of the Assembly, the resignation of a ministry which had given to the country, in the cause of order, the most marked pledges of

its devotedness. Wishing, however, to form a Cabinet with a chance of duration, I could not take its elements from a majority having its origin in such exceptional circumstances; and, with regret, I found myself utterly unable to find a combination amongst the members of the minority, notwithstanding its importance. In this conjuncture, and after vain attempts, I resolved to form a transition ministry, composed of special men, not belonging to any fraction of the Assembly, and who have decided to devote themselves to affairs without any party views. The honourable men who accept this patriotic task will have a right to the gratitude of the country. The administration will consequently continue as previously. Prejudices will disappear at the remembrance of the solemn declarations of the message of November 12th. The real majority will be reconstituted; harmony will be re-established, without the two powers having sacrificed anything of the dignity which constitutes their force. France wishes above all for repose; and she expects from those to whom she has given her confidence a conciliation without weakness, a tranquil firmness, and an impossibility in what is right." The message was listened to in deep silence. There was no interruption of any kind. The uppermost feeling seemed surprise, although something of this kind was expected. Nevertheless the house was thin; but, when the circumstances got wind, many representatives thronged in from the *coulouirs*. The new ministry, whose names were published in a supplement to the *Moniteur*, is as follows:—General Randon, War; Waiss, Interior; Germiny, Finance; Magne, Public Works; Brennier, Foreign Affairs; Royer, Justice; Vaillant, Marine; Giraud, Public Instruction; Schneider, Agriculture and Commerce. Not one of the new ministers is a representative of the Assembly,—a circumstance which is hitherto without a parallel in the constitutional history of France.

There has been a *Duel* between two editors of Paris journals. An article having appeared in the *Corsaire*, reflecting on M. Hugo, one of the editors of the *Evenement*, M. Hugo (who is the son of the celebrated Victor Hugo) challenged M. Viennot, one of the editors of the *Corsaire*. In consequence of the disparity of their ages, it was agreed that M. Viennot's son should fight in his father's place. They fought with swords in the wood of Meudon, and M. Hugo was slightly wounded. The duellists and their seconds were tried before the Tribunal of Correctional Police. Viennot and his two seconds were fined 100 francs each; and M. Hugo's two seconds, one of whom was Alexandre Dumas, were fined 200 francs each. M. Dumas said in his defence, that he only consented to act as second to M. Hugo on the express wish of his father, M. Victor Hugo, that he should fight.

Considerable agitation in the Assembly has been excited by the *Arrest of M. Mauguin, one of the members, for Debt*. M. Mauguin urged his non-liability to arrest as a member of the Assembly, and demanded to be taken *en référé* before the president of the Civil Tribunal. The president declared that the arrest was legal, the constitution of 1848 not having reproduced the provision of the charter of 1830, by which members of the legislative body were protected from arrest during the session, and for six weeks preceding and following it. In the Assembly M. de Larochefjacquelin put questions to the Minister of Justice respecting the arrest of M. Mauguin, and proposed to the Assembly to order his immediate liberty. He considered that the arrest in question was a violation of the constitution, which declared all members of the legislature inviolable. M. Rouher, Minister of Justice, declared that the Assembly might make a new law to regulate such a matter in future, but could not now interfere in the decision of a judge without establishing a dangerous precedent. After some discussion, the Assembly decided the question in its own favour, by adopting the motion of M. de Larochefjacquelin.

On the 27th a discussion took place in the Assembly respecting a credit of 488,000*fr.* for expenses relative to the London Exhibition. M. Scholcher had asked that the jury charged with examining the articles intended for the Exhibition should be selected by the manufacturers. M. Benoist requested M. Scholcher to withdraw

his amendment, the plan he proposed being impracticable for want of time; and he concluded by assuring him that the jury appointed was composed of most impartial and competent men. M. Scholcher acceded to the request. The discussion then turned on the best and least expensive means of conveying the productions to and from London; and Messrs. Raudot and Dahirel opposed the bill, because the Minister of Commerce, M. Schnoider, would not pledge himself that the expenses should not exceed 488,000*fr.* The credit was ultimately voted by 603 to 70.

Spain also had a ministerial crisis. It was suddenly announced that General Narvaez had resigned on the 10th, and that the Queen had accepted his resignation. His motive was understood to have been that he felt himself unable to contend with the Court intrigues got up against him. On the same night he left Spain for Bayonne. The other Ministers also resigned, and have been replaced by a new Cabinet, consisting of M. Bravo Murillo, President of the Council and Minister of Finance; M. Beltran de Lis, Minister of Foreign Affairs; M. Ventura Gonzalez Romero, of Justice; M. Fermin Artea, of the Interior; M. Bustillos, of Marine; General Mirasol, of War. The Duke of Rivas having refused the Foreign Department, M. Beltran de Lis, who had been appointed Minister of Public Works, consented to accept it. It is stated that, the Queen having at first declined to accept Narvaez's resignation, he assembled his colleagues, and said to them, that, if the Queen persisted in her refusal, he was determined to blow out his brains. Terrified at these words, and the manner in which they were uttered, the Ministers hastened to the palace, and with difficulty prevailed on the Queen to accept his resignation.

The accounts from *Germany* remain confused and indistinct. The conferences at Dresden still proceed, but little or nothing is known of their proceedings. One account says that the new Executive Council will be composed of eleven votes, instead of seventeen; and that of these eleven, Austria and Prussia will have two each, the four minor kingdoms one each, and the thirty petty states the remaining three votes between them. By this process, says the same account, "the whole of the component parts will have a direct voice in the Executive; and if each series can agree among themselves, the fractional voice will have the greater weight, as it is understood that resolutions are to be adopted by absolute majorities." It is also believed that the Plenary Council will be entrusted with legislative powers, and be composed of plenipotentiaries nominated *ad hoc* by each of the thirty-six states of the confederation. "It is admitted at last by the Ultra-Constitutional journals, that all attempts at a nearer approach to unity at the present time are impracticable, and that years are requisite to pave the way to the realisation of that which has hitherto proved to be a mere dream."

The first trial by jury took place at *Vienna* on the 15th inst. The Minister of Justice, M. von Schmerling, and a crowded audience, attended this ceremony. The culprit—a girl accused of incendiarism and other offences—was found guilty, and sentenced to three years' hard labour.

On the 18th inst., the anniversary of the *Coronation* of the King of Prussia, the King held an extraordinary levee, and conferred various orders of knighthood on about 250 persons: M. Manteuffel was decorated with the order of the Red Eagle—first class. At the festival subsequently held in the palace, the King proposed the following toasts in the following characteristic speech: "Gentlemen, fill your glasses, for three toasts. The first draught we drink to the past, in which the princes and people of Prussia, bound together in faithful concord, have achieved such great things; the second to the present, especially to the whole people in arms, who, by their prompt rising up, have again proved that the disaster of the year 1848 has not infected the hearts of the people. To you, gentlemen, whom I have decorated with orders for your devoted loyalty, and have the pleasure to-day to receive as my guests, this draught is also devoted. The third is for the future. Few of us will outlive the next fifty years, but we all desire

that they may be years of pure blessing for this royal house and this brave people. Once again, gentlemen, 'The Past, the Present, and the Future.'

It will be remembered that, some months ago, several Circassian cavalry soldiers deserted from the Russian army in Poland and came over to Prussia to serve in the war which, they heard, was about to commence. They were ordered to deliver up their arms and surrender till the Prussian authorities should decide as to sending them back. This they refused; and on force being used they shut themselves up in a farm-house, where they made an heroic defence, in which several Circassians and Prussians were killed. The survivors were at length made prisoners, and have been put on their trial on the 20th inst., at Bromberg, for resistance to the armed authorities. The jury returned a verdict of guilty, and the court sentenced them to two years' imprisonment in a fortress—a leniency giving great satisfaction to the crowded audience, who felt a strong sympathy for the men. The Circassians returned thanks to the judge, saying that sentence of death would in Prussia be more welcome to them than pardon in Russia. But at the expiration of their imprisonment they will, it is feared, be claimed by the Czar, and Prussia has bound itself by treaty to deliver up deserters.

Advices from *Berne* of the 21st inst. inform us of an insurrection which has broken out at Interlaken. A band of insurgents attacked the Government-house on the 20th inst. They were opposed by the troops, and an engagement ensued, in which the rioters were repulsed. The Stadtholder, Dr. Müller, was seriously wounded. Interlaken and the neighbouring passes have been occupied by the Bernese troops.

The accounts from *Rome* mention the case of a man who was brought to trial after eighteen months' confinement. As he was being conducted up to the tribunal he broke from his gaolers and threw himself out of a high window which happened to be open on the staircase, falling with such violence on the pavement as to be killed on the spot. He was a carpenter from Palo, whose crime was that of having marched with the Roman Legion into Lombardy, and subsequently aided in the defence of Rome against the French. Some of the Roman soldiers who recently fought with and wounded the French, in pothouse squabbles, have been condemned by a French court martial to fine and imprisonment for various terms.—The removal of General Changarnier from the command of the army of Paris, and the appointment of General Baraguay d'Hilliers to that of all the troops of the first military division, have produced great uneasiness in the ecclesiastical circles, since the sentiment is so freely expressed by the latter officer, on his return to the Legislative Assembly, with respect to the Roman question, have disposed them to class him amongst the enemies of the Church, or, at any rate, only amongst her lukewarm supporters.

The *Turkish* intelligence contains an account of the *Punishment of a Rebellious Pasha*. Some disturbances in Bosnia having been suppressed, Omer Pasha, the Seraskier, made his triumphal entry into Bosnia Serai on the 17th of December. Mahmud, the rebellious Pasha of Tuzla, rode on a miserable saddle affixed to the back of a peasant's sorry jade. After him rode the other prisoners, the muselmans, the cadis, &c., each horse being attached to the saddle of its predecessor. Four Nisams (Christians), dressed as jesters, with cap and bells, and performing all kinds of antics, led on the mournful procession. After this Mustapha Pasha Babic was led on foot through the streets, and it is said that the sad spectacle drew tears from the eyes of many of the Turks who stood round. Mahmud Pasha had escaped to Vinkovze, in Slavonia, but for some reason unknown he returned to Tuzla, and voluntarily surrendered himself to the Seraskier, who has treated him as above mentioned, and paid the arrears of his troops with the 18,000 ducats which he found in the fallen despot's possession.

New York papers have been received, down to the

15th instant. They contain the Annual Report of the Secretary of the Treasury, Mr. Corwin, which forms a supplement to the President's message on the opening of Congress, and is the basis of the President's financial recommendations. In the Senate, Mr. Benton had introduced a bill embodying a magnificent scheme for carrying a treble road from St. Louis on the Mississippi to the Bay of San Francisco on the Pacific coast of California. The line would include a railroad, a plank-road, and a common highway, with military posts; the Indian titles would be bought, and a tract of 100 miles wide be granted for settlers and public purposes. The line would be 1600 miles in direct length; there would be one branch of 300 miles to Santa Fé, and another branch to Oregon of 500 miles: the whole amount of land granted would be 150,000,000 acres. In the House of Representatives, a Government measure for the reduced postage had been made a special order of the day for early discussion. A resolution had been adopted by the House of Representatives to refer to the Committee on Naval Affairs a proposition that the President should give notice to Great Britain of a desire to withdraw the squadron at present stationed on the West Coast of Africa to co-operate with us in suppressing the slave-trade.

The Anglo-Norman steamer had blown up, on the Mississippi, with three hundred persons on board: nearly a hundred were killed. Three editors of newspapers, M. Senator Junius Beebe, and a number of leading citizens, were among those who perished.

The steamer *Knoxville*, bound for Nashville, while pushing from the Levee, on the 13th December, burst all her boilers; killing and wounding about twenty persons, and damaging boats lying alongside.

The annual report of commerce and navigation gives the following aggregate of the number of steam-boats built in the United States since 1824, twenty-five years, in periods of five years each.—From 1824 to 1829, 194; from 1829 to 1834, 304; from 1834 to 1839, 504; from 1839 to 1844, 522; from 1844 to 1849, 909; total, 2492. Two-thirds of these are built in the West, one-sixth of them in Ohio. The largest number of steamers built at one place are built in Pittsburg and its neighbourhood.

A correspondence has been read in the Senate between the Austrian Minister and the United States Government, touching the appointment by the latter of an agent to the *de facto* Government of Hungary during the struggle of that country with Austria. The Austrian Chargé, in his letter, assumes a very solemn tone, and treats the matter as one of the very highest importance. He very gravely remarks that the circumstance is one which the Austrian Government cannot overlook; that he solemnly protests against it as contrary to the comity of nations, and as a violation of the American doctrine of non-intervention. He further intimates that unless full satisfaction is afforded, ulterior measures will be resorted to. The reading of this bellicose document in the Senate caused considerable merriment.

The accounts from *Peru* are very distressing; bands of brigands from the interior were infesting the city of Lima and neighbourhood, committing the most outrageous robberies and murders, and the Government had not the power to put them down. A perfect panic existed among the inhabitants who had property of any value at stake, and they were barricading their houses, determined to defend themselves as well as they could against these ruffians.

The latest accounts from *California* attach immense importance to the recent discoveries of gold in the quartz rocks. If the amount of gold thus to be obtained turn out half as much as, it is said, every one believes, mining may be regarded as being yet in its infancy. The rapid progress of the city of San Francisco is one of the greatest wonders of modern times. Already its population amounts to 50,000. The place was never intended by nature as the site of a large town. Large hills and bluff rocks cover the principal parts, but man is doing what nature had not done—levelling enormous sand banks, and filling up immense cavities. Miles of rock, at least 40 feet high, are being levelled. The streets are being planked, and a planked road for four miles is going on. Wharves are extended into the bay, one of which is 2000 feet in length, and cost about 250,000 dollars. There are ten others nearly finished,

and altogether there are about two miles of wharf way, at a cost of 2,000,000 dollars. Harbours are constructed in which a 74 can lie. Piles are driven in 15 feet of water, and houses erected upon them in which a large proportion of the inhabitants reside and have their

warehouses. In short (says a letter from which we take these particulars) any person who may leave the town for a month will scarcely know it again on his return, so rapid are the changes, so wonderful the march of improvement!

NARRATIVE OF LITERATURE AND ART.

THE remarkable feature in the literature of the past month has been the extraordinary influx of tracts on the question of the Papal Aggression. Their number makes it hopeless even to print their titles. From a city or county meeting to Mr. Ridgway's shop has been always a not unnatural transition; but the connection of platform and pamphleteering oratory has probably never had such curious and ample illustration as in the present Anti-Papal excitement. Let us add that platform oratory never proposed to itself a higher or worthier aim than that which animated a recent meeting in Manchester, to establish, for the benefit of the workingclasses of that great town, a free public museum and library. There were incidents connected with it which could not have been paralleled in any other city or country in the world. Its principal promoter was the Mayor of Manchester; and he produced to the meeting, no less a sum than between six and seven thousand pounds, already subscribed, and exclusively the result of the private contributions of the merchants of the town, aided by a donation from the overseers of the township! No sooner was the proposal started, than it was nobly completed. The matter had been in agitation not many months; yet, before the 1st of July in the present year, a library of reference containing eight thousand books will have been opened, freely accessible to all, and a supplementary or lending library of five thousand volumes more will have been collected in the same building, for the use of artisans and their families at home. Nor is it the least gratifying part of this extraordinary achievement to reflect that such exertions could only have been called forth by a class of men in all respects eminently deserving of them. There was not a speaker at the meeting who did not bear eager testimony to the marked improvement in the feeling of the working classes during the last few years, and to a singular increase in their desire for education, and the means of intellectual pursuits.

The current of general publication during the month has set less exclusively than usual in the direction of what is commonly termed light literature, and is so often literature of distressing heaviness. The *Memoirs of the Dukes of Urbino*, by Mr. Dennistoun of Dennistoun, a goodly work in three large octavos very abundantly illustrated, exhibits the quality of enthusiasm and zeal for a subject which is so desirable in an author; and the slight but expressive engravings of the Raffaele portraits (executed by Italian gravers) are quite exquisite. In connection with this book may be mentioned a new edition of Sir Charles Eastlake's *Handbook of Italian Art* by Angler, with upwards of a hundred outlines from the pictures of old masters, executed by Mr. George Scharf, which though necessarily minute, supply really a very vivid and interesting comment to the eye on the schools of Art respectively described.

To the department of history an agreeable contribution has been made by Mr. Manners Sutton, in the *Leicester Papers*, which deal chiefly with the men and manners, native and foreign, of the latter years of William, and the whole of Anne's reign, and to the general reader are principally interesting for several characteristic letters of Prior and Stepney. One of the manuscripts left by the late Lord Holland has also been published by his son, with the title of *Foreign Reminiscences*. It is slight in texture, but contains shrewd observation, and anecdotes remarkably well told. An elaborate volume on the traces of the *Roman Wall* between the Tyne and the Border, by an enthusiastic and intelligent North Country clergyman and antiquarian, is a contribution to history somewhat more remote. For another contrast to which, upon the extreme modern side, let us add that Mr. Archibald Prentice has published *Historical Sketches of Manchester* during the last half-century.

Travellers and tourists have been active in their way. *Across the Atlantic*, is a rapid but keen glance at the manners and abodes of our transatlantic cousins. The *Golden Horn*, is an intelligent ramble in parts of Asia Minor and the less trodden country east of the Jordan, by a son of the Bishop of Gloucester. The *Bridal and the Bridle*, describes a honeymoon trip on horseback through the East. *Life in the Arctic Regions*, is an account of the last unsuccessful expedition in search of Sir John Franklin, by the second in command of the small but stout little ship fitted out by Lady Franklin herself.

In general literature we have to mention a tory survey of *England as it is*, by Mr. Johnston; a translation of

Fourier's *Passions of the Soul*, by the Rev. Mr. Morell; a republication by Lord Mahon, from his history, of the account of the rising of *The Forty Five*, with curious original letters, descriptive of the character of Charles Edward; a narrative of the *Second Sikh War*, by General Thackwell's aide-de-camp; a republication, in single volumes, of the works of Sir James Macintosh, and those of Joanna Baillie; a volume on the order and physical structure of the *Planetary System*, by Doctor Nichol; new editions of Mr. Hogarth's *Memoirs of the Opera*, of Coleridge's *Table Talk*, and of Sir Humphry Davy's *Salmonia and Consolations in Travel*; a translation by an evidently superior hand of the *Professor's Wife* of Berthold Auerbach; a volume of original and somewhat startling investigation on *Social Statics* by Mr. Herbert Spencer; a new novel by Mrs. Marsh called *Time the Avenger*; a companion discovery to the *Historic Doubts* of Archbishop Whately, in the shape of *Historic Certainties*, having the same witty purpose, and very evidently by the same hand; and (to single out the one book relating to the Papal Controversy most worthy of mention for its vigour and originality) a volume entitled "*The Idol demolished by its own Priest*," by Mr. Sheridan Knowles, the author of "*Virginus*."

There only remains to be mentioned a volume of poetry by Mr. Chauncey Hare Townshend, called *Sermons in Sonnets, with a Text on the New Year*, a collection of poetical *Stories that might be True* by Miss Dora Greenwell, and the first volume of a new and valuable edition of *Robert Burns* by Mr. Robert Chambers.

The attention of the theatrical world, during the month, has been chiefly occupied with Mr. Macready's farewell performances at the Haymarket. They are now very nearly brought to a close, and in a few days this great actor will leave the stage for ever.

There is now on view at Mr. Hogarth's gallery in the Haymarket, a painting by Mr. Maclise, of which the subject is taken from Lord Byron's tragedy of *Werner*; and the principal figure is a full-length portrait of Mr. Macready, as the hero of the piece. A line-engraving of this picture is in preparation.

A new comedy in five acts, entitled *The Old Love and the New*, has been produced at Drury Lane. A three-act drama, called *All that Glitters is not Gold*, at the Olympic; and a melo-drama (taken from the French) called *Belphegor the Mountebank*, at the Adelphi; all of them with success.

COMMERCIAL RECORD.

BANKRUPTS.

From the Gazette of Dec. 31.—F. YOUNG, Silver Street, Golden Square, cheesemonger.—E. TARKY, Sherborne, draper.—J. GINN, Sudbury, builder.—J. HUGHES, Huccoby, Lincolnshire, beast-jobber.—J. SIMONS, Wittoft, Warwickshire, horse-dealer.—J. HALEY and W. THOMPSON, Manchester, cotton-manufacturers.—W. ATKINSON, jun. Goole, shipwright.—E. LAKE, Okehampton, druggist.

Jan. 3.—E. POWWELL, Ipswich, shipowner.—E. and G. GODBOLT, College-place, King's-road, Chelsea, carpenters.—F. MARTIN, Reading, plumber.—J. C. C. MILLAR, Clifton Street, Finsbury, surgeon.—W. S. MEYWEATHER, West Ham, Essex, brick-maker.—W. PITCHER, Pershore, Worcestershire, corn-dealer.—P. TOOLE, elsewhere P. O'TOOLE, Liverpool, provision-dealer.—E. HALL, Salford, Lancashire, smallware-manufacturer.

Jan. 7.—M. and L. ROWLANDSON, Whitechapel-road, drapers.—R. HILLS, Downham, Isle of Ely, grocer.—J. BARTON, King Edward-road, Hackney, insurance-broker.—C. LIGHTFOOT, Torquay, Hvery-stable-keeper.—G. F. ALLWAY, Sheffield, hostler.—AMY ROYSTON, Chorlton-upon-Medlock, Lancashire, brewer.—J. D. HAWWOOD, Liverpool, frommenger.

Jan. 10.—T. TOYNER, University Street, Tottenham Court-road, horse-dealer.—A. WILLIAMS, South Island-place, Clapham-road, Hvery-stable-keeper.—A. MOORE, South Wharf, Paddington, stone-merchant.—J. SMITH, Kent-place, Old Kent-road, cheesemonger.—W. C. CHANWELL, Ely, potato-merchant.—C. G. JONES, Elizabeth Street, Hans-place, victualler.—H. CROSSY, Burnley, Hwandraper.—J. T. ROLLASON, Birmingham, china-dealer.

Jan. 14.—T. COX, Cambridge, chemist.—H. G. and J. MONTGOMERY, Nayland, Suffolk, builders.—E. MOORE, Brighton, victualler.—W. B. HARRISON, Sunderland, draper.—J. H. SPENCER, Sunderland, miller.

Jan. 17.—J. J. KELLE and R. J. BLADE, Riches Court, Lime Street, merchants.—J. PENFOLD, Marlborough-place, Old Kent Road, grocer.—P. MARCHE, Curtain-road, cabinet-manufacturer.—T. NEWELL, Llanstiffraid, Montgomeryshire, horse-dealer.—W. WALKER, Preston, chemist.—J. JOWETT and Co., Preston, stonemasons.

Jan. 31.—J. BELL, Leyburn, Yorkshire, draper.—J. BLAIN, Liverpool, stationer.—W. H. CATTON and C. CATTON, Mill-street, Yorkshire, dyers.—L. P. GODWIN, King-street, Bolton, importer of watches.—F. G. JONES, New-yard, Great Queen-street, medical and general Hture-dealer.—J. LEMMON, Northwich, printer.—T. LEACH, jun., Weston-super-Mare, Somersetshire, builder.—J. HARRISON, Salford, Yorkshire, shoemaker.—J. ROBINSON, Stanwix, Cumberland, cattle-dealer.—P. VAN DEN ENDE, Street, Kent, wholesaler.—W. WALKER, Preston, Lancashire, chemist.

Jan. 31.—J. M. DODD, and, Phoenix-street and Denmark-street, shoe, Hshoe-maker.—G. E. GALLOWAY, St. John's-street, Hwsh-machine-maker.—J. GRAHAM, Ardwick, Lancashire, joiner.—J. JOHNSON, Chatterley, Warwickshire, wine-merchant.—S. LEE, Loughborough, Leicestershire, bookseller.—J. H. LUMMAN, Malden, Essex, draper.

Jan. 31.—J. HAYWARD, Oxford Street, Whitechapel, watch-maker.—R. J. JOHNSON, Woolwich, plumber.—W. WATERMAN, Sheffield, grocer.—M. M. DONKILL, Liverpool, licensed victualler.—S. H. WATSON and J. KINGSTON, Rochdale and Burnley, Lancashire, merchants.—W. THOMPSON, Newcastle-upon-Tyne, grocer.

BANKRUPTCIES ANNULLED.

Jan. 7.—R. GANTON, Kingston-upon-Hull, bootmaker.

Jan. 14.—J. CURZ, East Winch, Norfolk, grocer.

Jan. 17.—J. ROWBOTHAM, Sutton, Cheshire, silk-manufacturer.

THE STOCK AND SHARE MARKETS.

The slight rise which was felt in the market at the close of the past month has been maintained during the present. Three per cent. Consols did not sink to 96, with which our report closed (never having been lower than 96), and the latest price at the time of our going to press was 96½. At the opening of the month, the resignation of the French Ministry caused a sympathy in our market with that of Paris, and advancing prices received a check; but it was transient. After the opening of the bank books for private transfer on the 6th January, the re-investment of dividends was not so extensive as usual.

The Railway stock market was quiet during nearly the whole month. Towards the close a slight rise took place in the few transactions which were completed. Although, therefore, the amount of business has not been large, the market tendency has been firmness.

THE
HOUSEHOLD NARRATIVE
OF CURRENT EVENTS.

1851.]

FROM THE 29TH JANUARY TO THE 25TH FEBRUARY.

[PRICE 2d.]

THE THREE KINGDOMS.

THE Whig Ministry of 1846 has fallen. It has taken but three weeks of the first session following the death of Sir Robert Peel to put the policy of that great statesman into apparent peril. It is now that the country feels in its nearest interests the most deplorable public loss of our time. On the last night when Sir Robert Peel and Lord John Russell sat together in the House of Commons, the Premier avowed that it was by Sir Robert's support his Ministry had been sustained through all the perils of '48 and '49. It has not long survived the loss of those helping offices, of that guiding care.

It is not to be denied that the Ministry has fallen ingloriously. Their budget is a confessed and melancholy failure. It satisfied no friend, and conciliated no enemy. Without adding anything to the means of staying off a protectionist policy, it subtracted from the means of carrying out and completing the commercial policy. It was as little fair as it was generous. Sir Charles Wood even flippantly avowed that he had chosen to be rather unjust than just, in one part of the assessment proposed under it, because he did not choose to subject himself to the annoyance which justice would have been sure to occasion him. From the first moment that this notable plan was propounded, its contemptuous rejection was a matter of certainty. Men have not made up their minds to be saddled with the Income-tax, and all its inequalities, as though they were simply beasts of burden. Their reason desires to be satisfied that, in this matter of direct taxation, they are undergoing the temporary inconvenience for some certain ultimate advantage. It is quite clear what the course of Sir Robert Peel's reasoning was in the matter. Against every fiscal burden, he balanced so much expansion of each man's means to bear it. His object was the relief of industry and trade to the utmost conceivable extent, because he knew that the not distant re-payment from such sources back to the National Exchequer would be tenfold. No man was more sensible of the claims of the public creditor; but while duties and imposts still remained to obstruct employment and dishearten enterprise, he would have ridiculed the folly of flinging a million of surplus to the relief of the National Debt. There are but two intelligible modes of effecting such relief. There is Mr. Disraeli's for a sinking fund, the outlay of five millions a year, and re-imposition of the old burdens. There is Sir Robert Peel's for filling the National Exchequer by unrestricted freedom to National Enterprise. Sir Charles Wood has not had the courage boldly to encounter either; and he leaves not a man in the state to regret his downfall.

But the truth must be told in this as in other things. Bad as the budget was, it is not the budget by which Ministers have fallen. Signs and portents appeared within a few days of the meeting of Parliament which foreboded what has come to pass. The Ecclesiastical Titles Bill, however short of its professed design, succeeded thoroughly in disaffecting the Irish Roman Catholics; and some twenty Free-traders, bent upon protecting the Pope, went about it in the Irish fashion of voting for protection to Agriculture. But for this Mr. Disraeli's minority would have fallen considerably short of last year's. As it was, the policy which our greatest statesman so recently and solemnly bequeathed to the continued care and support of the House of Commons, received but the scanty support of a majority of fourteen members of that House. Nobly, did Sir James Graham, however, represent and vindicate his deceased chief; and, in a speech as impressive and remarkably eloquent as any statesman ever delivered within those walls, warn his old associates on the Conservative bench, that they might convulse the country, might endanger property, might shake to their foundations every institution of the State, but that they could not, with the help of any power now existing in England, permanently enhance by force of law the price of bread. Significantly enough, when the question which Mr. Disraeli would have passed off for that of merely relieving land of some millions of taxes, was revived a few nights after in the House of Lords under its older and plainer designation of Protection to British Industry, Lord Stanley sat ominously silent. He heard Lord Hardwicke first protest that the manufacturers were thriving on the ruin of every other interest in the country, and then proceed to describe how these same thriving manufacturers, having multiplied production beyond all reasonable bounds, had utterly failed to find a market, either here or abroad. Yet the Protectionist leader continued silent. He heard not only Lord Hardwicke, but Lord Malmesbury and the Duke of Richmond, threaten a coming invasion of French industry more appalling than French cannon or steel; and still said not a word. Probably he had better reasons for remaining silent when Lord Wodehouse rose, and, in one of the neatest and best arguments ever delivered on the question, put the simple truth before his fellow peers. He disposed of Mr. Disraeli's debate in the half-dozen words in which he said that the interest of each class of the community was dependent on the general prosperity of the country, and that particular interests could never be consulted or preferred except to the detriment of the rest. He reminded the House that traders both in silk and cotton had formerly clamoured for restriction to save them from ruin, just as loudly as the farmers were clamouring now; and he asked whether cultivators of the soil were to be the only class in the realm incapable of overcoming their difficulties without help from the public purse, modified as those difficulties were from day to day by infinite circumstances, and by the prominent and permanent fact that for British agricultural produce there was the best market in the world, that of domestic consumption. He overthrew Mr. Disraeli's statistics by acutely separating the agricultural from the non-agricultural land subject to parochial taxation, and by showing that the former represented but forty-five per cent. of the whole. He declared that such had been

the reduction in price of articles consumed in his own county of Norfolk, that, though the wages of the agricultural labourer were less, his comforts were considerably more, than they had been for many years past. Finally, he earnestly warned the tenant-farmer class not to be led away by any such delusion and snare as the least prospect of a return to Protection.

These truths are of the last importance at present, as probably Lord Stanley felt at the time, and since has had stronger assurance of. He cannot take office either on Mr. Disraeli's cautious pretence, or Lord Granby's more frank avowal. He cannot, on behalf of a section of the community alleged to be suffering, and never known within living memory to have been doing anything else, demand the reversal of a policy from which, to all other sections of the community, increased trade, increased commerce, increased employment, increased consumption, decreased expenditure, general tranquillity, and a large financial surplus, have confessedly arisen. He knows perfectly well that the very importation of foreign corn and flour so bitterly complained about, implies a consumption paid for by increased employment of the people; and that he might as well seek to restore the heptarchy as to bring back restriction. It is not necessary that what passed between the Queen and himself should be explicitly stated, events satisfy Mr. Disraeli's insolent questionings. It is enough that office has been within his grasp, and that, as yet, neither a party nor a policy has enabled him to take it. It will probably turn out that he really possesses neither; and that there will be imposed upon him and his followers much castigation, exercise devout, humbler indulgence of extravagant speech, and a posture recumbent for a considerable time longer, before either he or they can hope to resume any permanent share in a government which must henceforth be carried on for the general welfare of every class, and without exclusive regard to the particular interests of any.

Should the reconstruction of a Free-trade Ministry, by junction of the Whigs with Sir James Graham and his friends, lead to the reconstruction of the Ecclesiastical Titles Bill into a measure better justifying, by effective provisions, the hostility inseparable from legislating on the subject at all, it will not be matter for regret. If, indeed, the explanation of the effect of the bill by the Attorney-General had turned out to be correct, a better measure could hardly have been devised. It would, in that case, not simply have made amenable to punishment and fine the assumption of territorial titles, and the assignment or conveyance of property to trusts under such titles; but would have secured the nullity of all such temporal interference, in the usurped characters expressed by those titles, as that of Synods protesting against education, and obstructing the ordinary course of civil government. But the bill itself fails to bear out Sir John Romilly's construction of it. "I attack the territorial title," said Sir John, "because the present constitution of the Roman Church makes such a title necessary to the Ecclesiastical exercise of the Episcopal office: by prohibiting the former, therefore, I effectually stop every evil that can follow on the latter." This is not so clear. For what are the provisions of the bill? The first clause prohibits the assumption of ecclesiastical titles taken from the name of any place or district within the United Kingdom, and subjects offenders to a penalty of 100*l*. The second clause declares all acts done or documents signed under any such territorial title to be null and void. The third clause substitutes the Crown, in place of the bearer of any such titles, as administrator of property conveyed in trust to the latter. And the fourth compels offenders against the act to give evidence on oath of their own share in any of the prohibited proceedings. Of these clauses, it is obvious that the Attorney-General had hoped to check what is called the Synodical action of the Roman Catholic church by means of the second. But surely a clause so easy of evasion generally, could not be made stringent against Synods particularly. Suppose Dr. MacHale to have flung all his virus into the proceedings of a Synod, and to be afterwards content to sign the decree, diffusing and giving effect to the poison, with the name of "John, Archbishop of the Roman Catholics in Tuam." It is just as certain that the decree would lose nothing of its potency as that Archbishop John would escape the mulct and penalty.

The error arises from the supposition that Romish bishops cannot be constituted without territorial titles; whereas in every circumstance and particular of authority within their church, they are independent of the territorial part of their title. Assuming, then, that the bill fails in this very important respect, it seems to us unwise to have extended its provisions to Ireland so far as the mere interdiction of usurped titles forms part of it. There will be continual difficulty, and unceasing exasperation, in resolving to proscribe by the external agencies of law what cannot be proscribed in the minds of the great body of the population. On the other hand, it is perfectly within the province of the legislature to apply to both countries the precautions framed by this bill against the endowment in either kingdom of any branch of the Romish church. Here the design of the Pope is fairly confronted and thrust back. One of the great uses of a hierarchy is to facilitate the acquisition of property. As his Holiness has chosen to ignore the law in creating his bishops, the law returns him but a compliment in kind when it demands, as its condition of intercourse with the holy men, that they should put off the titles so defiantly usurped. But this fair and reasonable restriction is at once an effective bar to the retention of property for the uses desired; and thus one of the greatest uses of the hierarchy is at once estopped. Supposing this bill, then, to give place to any other attempt to legislate on the part of the new administration, it might yet be desirable, in retaining that part of its disqualifying effect, to attempt to extend it also to such abuses of authority on the part of the bishops, as might be held interferences with the province of temporal legislation and the policy of the State. With any such precaution, the mere assumption of titles would have no alarm for us; and with the power of the Synod, or of any other organisation which may seem needful to the Catholic Church for management of its own affairs, we should not dream of meddling.

One thing is quite certain, that it will not do to evade this question by way of smoothing the difficulties of a ministerial crisis. It will have to be fairly met, and so disposed of as to satisfy the English people. The measure as it stands is denounced by the organ of the Romish priests as the most absolute delusion and trick that ever was tried to be palmed upon the gullible and unsuspecting; but that kind of pretence is too stale to pass for a reality. When the *Tablet*, with a quite amazing assumption of philosophical indifference, protests that Lord John's bill fills it with concern only because it is inefficient, and denounces protestant feeling that can declare itself contented with such an abortion, as "the most contemptible, ludicrous, rotten, asinine, weak, paltry, blind, wretched, miserable humbug that ever disgraced humanity," its calmness is too like Sir Anthony Absolute's to reveal anything but secret rage. We may be sure that a part of the bill has been well aimed, or the cry of assumed indifference would not be so piercing. Nay, it is not difficult to gather, from what this journal says of the possibility of even

its paltry provisions "seriously incommencing the administration of our trust funds," that the real strength of the bill lies in the direction we have pointed out, and that what remains to give it greater efficiency will have to be found in that direction also. Meanwhile our statesmen may learn from the same source what chance there is of any retrogression on the part of Rome to render needless a less stringent legislation. Lord John Russell threw out a sort of hope that his Holiness might retreat from his demands, if no further notice were taken of them; as Billy Lackaday in the farce delays answering the bell that he may tire the people in the parlour into waiting on themselves. But no such disposition is likely to show itself at the Flaminian or any other gate. Hear what the *Tablet* says of the present determination existing in the Vatican with respect to the Irish Hierarchy: "A weak and easy priest chosen at this moment to fill up a vacant diocese in Ireland, might give a veto to the Castle on the side of the Colleges, and turn a 'minority of thirteen' into something very like a majority. Accordingly we may be sure that in Ireland no less than in England vacancies will not be filled, up without the fullest assurance that the new bishop can be depended on to go all prudent and necessary lengths in opposition to government intrigues. If the election of the clergy does not give this security, some other method of attaining it must and will be found out in Rome; and if Lord John Russell has small fancy for Dr. Cullen's appointment to Armagh, perhaps he may have just as little occasion to rejoice in the appointments that will follow." Whatever party of statesmen may now succeed in reconstructing the administration, they can hardly say, after this, that they have not had ample warning of where the real danger lies against which it will be their duty to protect both the English and Irish people, both the Catholic and Protestant laity.

Uncertain as all the promises of the session have suddenly become, and premature as further comment may prove to be on the immediate and shifting changes and negotiations of the hour, the hope is at least permitted us that none of the turns of the political wheel may intercept such reforms already within sight as that of some scheme for a General Registry of Deeds, and the proposition for the removal of Smithfield. Lord John Russell's promise of a bill next session for the Extension of the Franchise is meanwhile become a piece of history. The country counts upon that, and looks forward to it, as an advantage already won. Out of all the present loss or deconstruction of the Whigs, this, at any rate, is a popular gain secured, which no future combinations or coalitions of parties will have strength any longer to resist. Though the late premier thought fit to oppose a motion for further reform so reasonable as that of Mr. Locke King, whose successful division led to the existing crisis, he had yet the wisdom as well as courage of which, in coming danger, the noble instincts never seem to desert him to throw out an anchor of safety against the evil of his own opposition. It saved him the allegiance of reformers at the very moment of his resistance to reform, and will the better enable him now to construct an administration, should the chance still present itself, powerful where its predecessor was weak, in the sympathy and good wishes of the people.

NARRATIVE OF PARLIAMENT AND POLITICS.

PARLIAMENT assembled on Tuesday, the 4th inst., the Session being opened by the Queen in person, with the usual formalities. Her Majesty was attired in a white satin brocade, embroidered with gold wore a tiara of diamonds, and appeared in excellent health and spirits. The royal speech was as follows:—

"MY LORDS AND GENTLEMEN,

"It is with great satisfaction that I again meet my Parliament, and resort to your advice and assistance in the consideration of measures which affect the welfare of our country.

"I continue to maintain the relations of peace and amity with Foreign Powers. It has been my endeavour to induce the States of Germany to carry into full effect the provisions of the treaty with Denmark which was concluded at Berlin in the month of July of last year. I am much gratified in being able to inform you that the German Confederation and the Government of Denmark are now engaged in fulfilling the stipulations of that treaty, and thereby putting an end to hostilities which at one time appeared full of danger to the peace of Europe.

"I trust that the affairs of Germany may be arranged by mutual agreement, in such a manner as to preserve the strength of the Confederation and to maintain the freedom of its separate States.

"I have concluded with the King of Sardinia articles additional to the treaty of September, 1841, and I have directed that those articles shall be laid before you.

"The Government of Brazil has taken new and I hope efficient measures for the suppression of the atrocious traffic in slaves.

"GENTLEMEN OF THE HOUSE OF COMMONS,

"I have directed the Estimates of the year to be prepared and laid before you without delay. They have been framed with a due regard to economy, and to the necessities of the public service.

"MY LORDS AND GENTLEMEN,

"Notwithstanding the large reductions of taxation

which have been effected in late years, the receipts of the revenue have been satisfactory.

"The state of the commerce and manufactures of the United Kingdom has been such as to afford general employment to the labouring classes.

"I have to lament, however, the difficulties which are still felt by that important body among my people who are owners and occupiers of land. But it is my confident hope, that the prosperous condition of other classes of my subjects will have a favourable effect in diminishing those difficulties, and promoting the interests of agriculture.

"The recent assumption of certain ecclesiastical titles conferred by a Foreign Power has excited strong feelings in this country; and large bodies of my subjects have presented addresses to me, expressing attachment to the Throne, and praying that such assumptions should be resisted. I have assured them of my resolution to maintain the rights of my crown, and the independence of the nation, against all encroachment, from whatever quarter it may proceed. I have, at the same time, expressed my earnest desire and firm determination, under God's blessing, to maintain unimpaired the religious liberty which is so justly prized by the people of this country. It will be for you to consider the measure which will be laid before you on this subject.

"The administration of justice in the several departments of Law and Equity will no doubt receive the serious attention of Parliament; and I feel confident that the measures which may be submitted, with a view of improving that administration, will be discussed with that mature deliberation which important changes in the highest courts of judicature in the kingdom imperatively demand.

"A measure will be laid before you providing for the establishment of a system of registration of deeds and instruments relating to the transfer of property. This measure is the result of inquiries which I have caused to be made into the practicability of adopting a system of registration calculated to give security to titles, and to diminish the causes of litigation to which they have hitherto been liable, and to reduce the cost of transfers.

"To combine the progress of improvement with the

stability of our institutions, will, I am confident, be your constant care. We may esteem ourselves fortunate that we can pursue, without disturbance, the course of calm and peaceable amelioration; and we have every cause to be thankful to Almighty God for the measure of tranquillity and happiness which has been vouchsafed to us."

In the HOUSE OF LORDS, the Earl of EFFINGHAM moved *The Address* in a speech of considerable length. The address was seconded by Lord CREMORNE.—Lord STANLEY said that though he was not altogether satisfied with some parts of the speech, it was not his intention, or the intention of those with whom he acted, to call on the house to negative or alter the address. After making some remarks on the part of the speech relating to Foreign Affairs, he said that the allusion to agricultural distress afforded a basis for some criticisms. Last year, her Majesty stated that she had heard with regret the "complaints" which had proceeded from a certain portion of the owners and occupiers of land; but added, that cheapness and plenty had bestowed an increased enjoyment of the necessities and comforts of life upon the great body of the people. This year, however, they were told that her Majesty lamented "the difficulties which are still felt by that important body"—no longer a small fraction, whose interests were to be separated from those of the mass, "who are owners and occupiers of land." It is a melancholy satisfaction to the general class to have the extent and reality of its distress, and the reasonableness of its complaints, thus acknowledged by the government. The sympathy, however, should in consistency have been more active. They were told that there was great and general prosperity throughout the country, and that the manufacturing classes were largely profiting; but that concurrently with this general prosperity of the great bulk of the people, one class—and that the most important of all interests—was suffering severely. They were informed also, that, notwithstanding the large reductions of taxation which had been effected in late years, the state of the revenue was satisfactory; which meant, he supposed, that there was at the disposal of the government a very large surplus applicable for the remission of taxation. If, then, all interests in the country, with the exception of the most important, are prospering, and if it were possible to apply any relief in the shape of remission of taxation, he asked her Majesty's government, what is the interest in favour of which such remission of taxation might be most fitly and justly adopted? Lord Stanley did not deny that in certain parts of the country, and with regard to certain productions, the condition of the agricultural interest is prosperous—as near manufacturing towns, where the profits are more derived from stock than from wheat; but he retained a deep impression of the impolicy of the measure of 1846 as a whole. He would not deceive or delude the producer of this country by holding out any false hopes. He would therefore say, that he believed the present prices are permanent; he believed they are the effect of recent legislation; he believed that at those prices the production of this country must be materially diminished; that with that decrease of production the comfort and happiness of the most important portion of the population would also be greatly diminished; and that the diminution of the amount of real capital would render the people less able to sustain that enormous weight of taxation which they had hitherto borne. Lord Stanley then proceeded to the subject of the Papal Aggression. This, he said, was no question of religious controversy; and he trusted that in neither House of Parliament would it be treated as a question of the comparative purity of the doctrines of the Reformed and of the Roman Catholic faith. With that subject we have nothing to do. But the question was, should the Roman Catholic prelates, with the head of the Roman Catholic Church, be permitted to exercise in this country a mischievous interference, not with trifles, or shadows, or ideas, but with substantial realities and with the government of the country? A noble Lord, holding a responsible office under the crown, had written a letter which had attained great celebrity: that noble Lord could not but have been well aware of the nature of the flame he was about to kindle in the country; he could hardly have taken such a step

without having deliberately counted the cost, and calculated the magnitude of the struggle on which he was about to enter. He must mean to vindicate the supremacy of the crown, to vindicate the rights of the bishops and the clergy, to vindicate the undivided sway of her Majesty and of parliament over the domestic concerns of this country, and to put down any interference with the administration of this realm and the authority of its Queen and parliament. The government ought to consider temperately, but firmly, all the difficulties of the relation in which the Roman Catholic subjects of this country stand to the crown. In the year 1829 there were certain securities introduced into the great measure of Emancipation, which it was supposed would be an effectual security to the Protestant Church against Roman Catholic aggression. It would be the duty of the government deliberately to examine those securities; and if there are any of them which, whilst they are offensive to the Roman Catholics, yet give no real security to the interests of Protestantism—any which are incapable of being enforced, and only lie encumbering the statute-book as a dead letter—he would say, "Sweep them off at once, and don't leave yourselves the odium of having enacted them when you derive no benefit from enforcing them." But if there are any cases in which the law, however well intended, does not reach the point it was meant to touch—if it does not reach this encroachment upon our liberties by the see of Rome, which at the time of the passing of the act of 1829 was never contemplated—then he said that it would be no violation of the civil or religious liberties of the Roman Catholics that those securities should be made, as they had always been intended to be, effectual. Let them look the whole case in the face boldly, but dispassionately—not contenting themselves with trifling legislation, but legislating unflinchingly to the extent which the imminence of the danger called for.—The Duke of RICHMOND spoke briefly on the confirmation given to his anticipations, and justifying his conduct as a consistent opponent both of Catholic Emancipation and of Free Trade from the first mooted of either of those measures to the present moment. On the subject of agricultural distress he said that he had spent a great deal of money in improvements; but, unless protection was restored, he would never spend another shilling in that way, for he was not one who liked sending good money after bad.—The Earl of WINCHELSEA said that England had never been so degraded as at the present moment, when she had been insulted by the bishop of Rome. He only hoped the government measure would be such as to sustain those Protestant principles which had made England great and free.—Lord CAMOYS said that he was a Roman Catholic, as his forefathers had been for centuries, but at the same time he was an Englishman, and the rights and liberties of England were as dear to him as to any of their lordships. He admitted the spiritual supremacy of the Queen over the established church to the fullest extent that the most orthodox member of that church could desire, and he acknowledged the supremacy of the Pope over the Roman Catholic population of this country in spiritual matters; but as to any other assumption of power over this country on the part of the Pope, or any undue exercise of his spiritual power over its population, against any such assumption he felt it to be his duty to protest.—The Marquis of LANSDOWNE called the attention of the house to the peculiar nature of the act of usurpation lately committed by the Pope against the royal supremacy, and remarked on the absurdity of the arguments of those apologists who wished to make it appear that the Pope only intended in his letter apostolic to assert his spiritual influence over members of the Roman Catholic faith. He had no doubt that the proposed measure on the subject would be discussed with all due deliberation by the house.—After some observations from Lord ROMEY, who expressed his disappointment that the speech had not contained stronger expressions respecting the Protestant religion, the address was agreed to unanimously.

On Thursday the 6th, Earl Fitzwilliam asked Lord Minto if there was any truth in the allegation that he had, directly or indirectly, encouraged the Pope in his recent act of aggression.—The Earl of Minto had no

hesitation in declaring that the allegation in question was wholly unfounded. The subject had never been mentioned, or even hinted at, during his Italian mission.

On Friday the 7th, the Earl of Minto, in reply to Lord Stanley, entered into some further explanations touching his entire ignorance of the Pope's intention to invade the independence of the English Church.

On Monday the 10th, the Marquis of LANDSDOWNE moved an address to the crown to the effect that the house deeply regretted the misfortune of the Earl of SHAFESBURY's inability from infirmity any longer to execute the duties of his important office, as *Chairman of their Lordships' Committee*, a post which he had filled for thirty-six years; that his necessary absence was a most serious loss, not only to the house in particular, but to the public at large; and that the house earnestly begged leave to recommend his lordship's eminent services to her Majesty's most gracious consideration.—The motion was agreed to.

On Tuesday the 11th, Lord ASINGER, in presenting a petition against *Papal Aggression* from the county of Surrey, called the attention of the house to the spread of Popery throughout the country, and to the disastrous effects which invariably resulted from the two great engines of the Roman Catholic priesthood—the celibacy of the clergy and the practice of confession.

On Thursday the 13th, Lord CAMPBELL presented a bill to simplify procedure in criminal trials, and stated that he had been induced to propose such a measure because the obscurity of the present enactment was such as to bring discredit on the administration of justice. He intended to ask leave to refer the bill to a select committee.—Lord BROUGHTON withdrew his County Courts bill and brought in a new one. The noble lord also gave notice of two other bills on the same subject.—The Earl of CARLISLE presented a petition from the Women of Sheffield, praying for the enfranchisement of women by a law giving them electoral privileges.

On Friday the 14th, Lord MONTAGUE drew attention to the importance of establishing a communication by *Railway between Halifax and Quebec*, and urged the house not only to advance this great national object, but to take care that neither the colonial nor the home government stood in the way of its accomplishment.—Lord STANLEY supported the object, and counselled prompt and energetic action, as best suited to the interests of the country and the honour of the government.—Earl GREY, in reply, admitted the importance of the work, and said the subject was occupying the serious attention of her Majesty's government.

On Tuesday the 18th, the Earl of HARDWICK presented a number of petitions complaining of *Agricultural Distress*, and then entered into the subject at considerable length. He quoted letters and local statistics in proof that Cambridgeshire is in great agricultural distress; tried to establish from more general political facts that our exports to the European Continent and to America have been least when we imported most corn, and largest when we excluded corn and protected home agriculture; angrily ridiculed the suggestions made in some quarters, that noble lords should grow cabbages and kitchen-stuff for the profitable supply of the towns; and complained that the landowners are not allowed to grow tobacco.—The Duke of RICHMOND declared, that if the farmers are any more taunted with the fewness of agricultural paupers, they will discharge the immense masses of labourers whom in charity they now employ to a quadruple degree beyond the wants of the land; and if they do this—remember that crime follows idleness.—The Earl of STRATHMORE vouched the reduction of rents in Suffolk; the Earl of WINCHILSEA averred unprecedented and alarming numerousness of unemployed labourers; and the Earl of MALMESBURY criticised Sir James Graham for his exaggerations of the condition of Cumberland, with its holdings unchanged and rents punctually paid.—The Earl of GRANVILLE, Lord WODEHOUSE, and Earl FITZWILLIAM contended for free trade; admitting the distress of Cambridgeshire—the harvest in the Fens having been notoriously disastrous; re-establishing, by fresh proofs, the fact of general prosperity; and quoting the *Journal des Débats* to show that our free-trade example is now producing imitative legislation throughout Europe and America,

and is deemed by the leading men in France a policy of which it is "quite impossible there should be any change." The subject then dropped.

On Monday the 20th, Lord LANSDOWNE called the attention of the house to the *Arrangement of Business in the Court of Chancery*, and asked the Lord Chancellor if the government intended to fill up the third Vice-Chancellorship.—The Lord CHANCELLOR replied that the government had not intended to fill up the third Vice-Chancellorship until after they had introduced their proposed comprehensive measure for Chancery reform; but there was so much business before the existing courts, much of which arose, not out of arrears, but from new causes, that it was most probable the government would be forced to fill up the vacant Vice-Chancellorship without waiting to pass their proposed bill.—Lord CRANWORTH bore testimony to the absolute necessity of filling up the vacant office, and could not see that the appointment would in the slightest degree interfere with any arrangement which might be contemplated by the government with reference generally to the Court of Chancery.—Lord STANLEY asked whether the proposed measure would be introduced in that or the lower house.—The Lord CHANCELLOR could not answer that question.

On Monday, the 21st, the Marquis of LANSDOWNE made a statement of the circumstances which had caused the resignation of the ministry, and subsequent occurrences. He said that, on Saturday last, in consequence of divisions in the lower house, the government had been induced to resign. On the same day Lord Stanley was invited to attend at Buckingham Palace, and, after an audience with her Majesty, stated that he was not then prepared to form a government. Lord John Russell had then been requested to reconstruct an Administration,—a task in which he was still engaged. Such was the condition of affairs; and, in conclusion, he could only say that he spoke as a member of a government which in fact existed no longer, and that he was its representative only for the purpose of making this communication to the house. The noble lord concluded by moving that the house at its rising should adjourn to Friday.—Lord STANLEY said it was not his intention to make any comment on what had fallen from Lord Lansdowne. He could only say that he had on Saturday the honour of a lengthened audience with her Majesty, in which he fully and unreservedly expressed his opinion on the state of the country. Nothing could exceed the graciousness and kindness of her Majesty; but he should ill respond to that kindness were he in the present state of affairs to reveal anything that had passed on the occasion. He should, however, be prepared to state fully what had passed as soon as the present crisis was over.—Their lordships then adjourned.

In the HOUSE OF COMMONS, on Tuesday, the 4th inst., the *Address*, in answer to her Majesty's Speech, was moved by the Earl of KILDARE, and seconded by Mr. PETO.—Mr. ROEBUCK expressed the pain he felt at finding an administration calling itself liberal about to take a backward step, and at a time, too, when the minister put into the mouth of the Sovereign congratulations upon the prosperous state of the country, the result of the removal of restrictions. He briefly reviewed the history of Catholic Emancipation, and the principles on which that measure was founded, which, he contended, were violated by legislation against religious distinctions granted by a bishop, called the Pope. He charged Lord John Russell with dealing falsely with the country. This so-called territorial aggression was no new thing; it began years ago, and had been sanctioned by the noble lord himself; so far from being an aggression, it was a retrogression on the part of the Pope. Where was the aggression upon her Majesty's prerogative because Dr. Wiseman chose to call himself a cardinal, and put on a large hat and red stockings? This was an exercise of spiritual authority, and the noble lord had heretofore declared that the Pope's spiritual power must be left untouched. The Roman Catholics had been led to believe by the acts of the legislature and of the executive government that

what had been done could be done legally, and all had been planned and published years ago. After they had been thusured on, was it wise or worthy of the noble lord, so long the advocate of civil and religious liberty, to add a cry which had its source in some of the vilest passions, and lend the sanction of his great name to the old puritanical bigotry of England?—Sir R. INGLIS replied to Mr. ROEBUCK, insisting that no country in Europe would have submitted to such an act as that by which the Pope had usurped the prerogative of the Sovereign, and treated the people as a nation of heretics. Resistance to such aggression was not new in our history, though he admitted too large concessions had been made by the present ministers in Ireland and the colonies. He appealed to the extraordinary unanimity of the nation upon this subject, and trusted that the government would not be deterred from acting up to the spirit of Lord John Russell's letter to the Bishop of Durham.—Mr. J. O'CONNELL vindicated the act of the Pope in substituting a regular hierarchy for vicars apostolic, which, though not sanctioned by, was known to, the government of this country.—Mr. ANSTEV, as a Catholic, not of the Court, but of the Church of Rome, was not ashamed to call this act of the Pope an aggression. It was an aggression upon the Roman Catholic laity, who had struggled against subjection to the undue power of their prelates.—The Earl of ARUNDEL and SURREY would oppose any attack on the liberty of the Roman Catholic Church, from whatever quarter, but temperately and constitutionally: if persecution should be imposed, he trusted that his co-religionists knew how to suffer with firmness and dignity.—Mr. FAGAN altogether dissented from the assertion in the Speech that certain ecclesiastical titles had been conferred by a foreign power: they had been conferred by the Pope as spiritual head of the Church, and not as Sovereign of the Roman States.—Mr. HUMER remarked, that a stranger, judging the House by its talk, would take it for an assembly of ecclesiastics. He endeavoured to call attention to the paragraphs of the Speech not ecclesiastical. The settlement in Denmark by no means gratified him, ending as it does with the occupation of the free city of Hamburg by the troops of Austria against the solemn protest of its rulers and people. His approval of the paragraphs referring to legal reform was the more lively as he believes the expenses entailed on the country by the Court of Chancery to be "more oppressive than the ordinary taxation." Regretting that the general prosperity has not reached the whole of the agricultural class, he thought the present a good opportunity for giving to that important part of the community their constitutional rights in the choice of Parliamentary Representatives. The Bible monopoly should be abolished. The Queen should disband her useless and unnecessary armies, and, like Queen Elizabeth, rely on her subjects as her guards.—Colonel SINTHOUR hoped, to God that some hail-storm or some visitation of lightning might descend to defeat the ill-advised project in Hyde Park. When the foreigners come, he warned the people of this metropolis to "beware of thieves, pickpockets, and whoremongers—take care of your wives and daughters, take care of your lives and property."—Mr. BANKES, on the part of the agricultural interest, thought it his duty to make some remarks upon that part of the Speech which referred to the condition of that interest, whose "difficulties," it was said, would be diminished by the "prosperity of other classes." He contended that if the producers of the food of our labouring classes were foreigners, it was a fallacy to suppose that increased consumption could benefit British farmers, who were desponding and alarmed. Agriculture must have relief, and the only shape in which it could be afforded was by a fixed duty on foreign corn.—Lord J. Russell justified the course pursued by the government in respect to foreign affairs, and in allusion to the suggestions of Mr. Bankes, observed, that although a temporary fixed duty upon foreign corn, adopted in 1840 or 1841, might have prepared the agricultural interest for an inevitable change, he did not believe it could have been maintained as the foundation of a permanent system.

On the subject of the *Papal Aggression*, Lord John reproached Mr. Roebuck for the low motives he

sometimes imputed to public men, and avowed that he had written the letter to the Bishop of Durham because he entertained the sentiments he then expressed, and could not refrain from giving publicity to them. He enumerated the concessions made to the Roman Catholics, the liberality, and even favour, with which they had been treated by the present government. In this state of things, the Roman Catholics having no reason to complain, the court of Rome suddenly thought proper to divide the whole country into dioceses, creating an archbishop of Westminster, of all places, and proclaiming to the people that English counties were to be "governed" by Roman Catholic prelates. With respect to the measure necessary to check this proceeding, his opinion was that the authority of Parliament would be sufficient, and it was not his intention to go beyond the occasion in the measure he should propose, which would embrace the whole of the United Kingdom.—Mr. DISRAELI said, that as it was vain to expect any measure to be proposed by government for the relief of the agricultural distress, he himself should do so on Tuesday next; "and (said he) if I do not succeed in producing a proposition for applying a remedy to this evil—a remedy entitled to the sanction of Parliament, and the confidence of the country—I now undertake never again to bring forward any motion connected with this great subject." With respect to the Papal aggression, he took Lord John Russell's letter to be the manifesto of a cabinet, and he believed that when that letter was written, much more was contemplated than the mere preventing the assumption by Cardinal Wiseman of a territorial title. That the aggression was "insidious," he did not agree with; on the contrary, the Pope had only frankly done what the noble lord had said there was no harm in doing, and what had long ago been done in Ireland with the noble lord's full consent. Unless, then, the premier was prepared to attempt the solution of the great problem of the reconciliation of the claims to allegiance of the English throne with the demands of obedience made from the papal chair, unless he was prepared to undertake this great task, he would have done much better in leaving the whole matter alone. The Address was then agreed to.

On Wednesday the 5th, Lord J. Russell moved a resolution expressive of the appreciation of the house of the long services, extending over a space of forty-nine years, of *The late Mr. Ley*, the clerk of the house.—Mr. HUME, while agreeing cordially with the resolution, expressed his opinion that the vacancy had been most improperly filled up, by the appointment of a gentleman utterly inexperienced in and utterly ignorant of the practices and customs of the House of Commons.—Lord J. Russell defended the appointment, stating that, in his conscientious opinion, the selection of Sir Denis Le Marchant was an excellent one. As for want of experience, a Speaker, a far more important official, could necessarily have no experience when first appointed to the chair.

Mr. BROTHERTON proposed a regulation, instructing the Speaker to *Adjourn the House* punctually every night at twelve o'clock, no matter what business may be under discussion. He attributed the recent great mortality of members to late hours, and urged the adoption of his plan for the present session as a trial.—Sir G. GREY opposed the motion, which was negatived by 108 to 32.

Lord D. STUART inquired whether, among the negotiations entered into with foreign powers, any attempt had been made to rescue *Kosuth and his Fellow-Captives* from the prison in which they were kept by the Turks, not willingly, but under terror of the menaces of Russia.—Lord PALMERSTON was sorry to say that the communications which had been interchanged with Constantinople for the release of Kosuth from Kutayah, had not been attended with any successful result.

On Thursday the 6th, Lord John Russell, in answer to a question from Mr. Ward, said it was his intention to carry out the resolution of last session respecting the *Dish of Abjuration*, with a view to the relief of a certain class of her Majesty's subjects. He then moved the following resolution:—"That the house will not proceed

upon any Motion for an Address to the Crown to which opposition is offered, but in a committee of the whole house, except with respect to matters which have been previously submitted to a select committee." He pointed out the incongruity of the existing practice with the general rules of the house, and the inconveniences attending it, as exemplified last session in the case of the Post-office. Objections to the resolution were suggested by Mr. Herries, Mr. Goulburn, and other members, and it was ultimately withdrawn until Tuesday next.

On Friday the 7th, Lord John Russell moved for leave to bring in a Bill "to prevent the Assumption of certain Ecclesiastical Titles in respect of places in the United Kingdom." In illustration of the aggressive spirit of the papal power, he referred to recent acts of the papacy in Ireland, where an archbishop had been appointed in an unusual manner, and a synod convoked by the Pope, to which powers were assigned of a nature unprecedented for many centuries in any section of the United Kingdom. From that synod an address had emanated, not limited to spiritual subjects, but promulgating very violent opinions respecting education and the occupancy of property. Passing to the continent, he adduced, as specimens of the same tendency, various circumstances that had occurred in Sardinia and Belgium. Reverting to England, he explained the scope of the letters missive published in September last, to be the formal division of the country into sees, over which a Roman Catholic archbishop and twelve bishops were appointed. This act had been done without any leave being asked or intimation given to the British government; though it was of a nature which, according to all precedent, and the invariable courtesy of nations, could never be accomplished without previous negotiations, and must be viewed as an intrusion and an insult. Instancing from French and Austrian history the pretensions of the Roman spiritual power to interfere with things temporal, and the resistance that had been offered to those pretensions, he arrived at the conclusion that, even throughout Catholic nations, no bill or missive of the Pope was allowed to take effect for any temporal or secular purpose without the sanction of the home government. In Protestant countries the prohibition was more strict; and in none would such an insult have been permitted as was attempted to be passed upon the crown of England. In the letters missive and the addresses of Cardinal Wiseman, the church and the independence of England were absolutely ignored, and terms used which, though they had been excupated as merely formal, could be interpreted into nothing but an assumption of territorial authority, and of a title inconsistent with that of Queen Victoria. Lord John, in reference to the story concerning Lord Minto, stated, that certainly the Pope said at one interview, "pointing to a table in the room, 'There is something there that regards you;' but Lord Minto did not look at the paper, or make any observation whatever on the subject." "Neither the Pope nor any other person said, 'Here is a paper that we would wish you to take and peruse, and submit it to your government;' if anything was said at all, it was only, 'That is a project that concerns you.'" When a private individual of the Roman Catholic persuasion told Lord John himself that there was such a project, he said he should "not approve of it," and said nothing more; and he did not dream of the possibility of what has happened. "I did not believe," said Lord John, "that it could be intended so to insult the Queen. I may have been like the foolish Italian shepherd, who said—

*"Urben, quam dicunt Roman, Meliboe, putavi,
Stultus ego, hinc nostro similem;"*

I may have thought most trustingly and imprudently that the Court of Rome would observe such relations, such discretion, such courtesy in her conduct with the state of England, as all other states that are friendly observe towards each other, and as she herself has observed towards every other state in Europe." Approaching the existing question, Lord J. Russell stated, that when the contingency first arose, the opinion of the law advisers of the crown was taken to the effect that the assumption of the prelate titles could not be

successfully impeached; and that though the introduction of the letter apostolic fell under the penalties enacted by certain statutes, these had lain dormant for a very long period, rendering the success of any prosecution very doubtful. Two plans, modelled upon the practice of other countries, had been proposed for new acts. One was to enact that no bulls or writings from Rome of a nature prejudicial to the kingdom should be allowed to enter it; another, to subject all such writings to the scrutiny of some civil authority, without whose sanction they could not obtain currency. After explaining the inconvenience that might result from the adoption of either of these plans, Lord John referred to the principles laid down when the Emancipation Act was passed, and accepted then by the Roman Catholic clergy, that no titles should be assumed in the hierarchy of that church bearing any aspect of rivalry with the Protestant establishment. This principle it was now designed to carry out. In order to protect the Catholic laity from aggression, and to guard against the absorption of endowments, the measures he designed to introduce would forbid the assumption by Roman Catholics of any titles taken from any territory or place within any part of the United Kingdom, and would contain clauses rendering void any acts done by any parties under those titles, and annulling any bequest made to them, which should at once fall into the power of the crown to administer according to its discretion. This measure, he contended, would repel the offered insult, and secure the independence of the kingdom. In concluding his speech, Lord John made a pointed allusion to Dr. Wiseman. "It has been given by the Pope a title which belongs to the Government of Rome to confer, and has been honoured by an election which has placed him in the band of the Sacred College, I should think that if he has any regard for the welfare of this country—if he has any regard for the peace and stability of the Roman Catholic community—the best course he can take will be to renounce the title which he has assumed in this country, and rather do that which I believe it was his original intention to do, and which he assured me it was his original intention to do—namely, reside at Rome. But if other counsels should prevail, and if he should be able to instil notions of conquest, of ambition, or of revenge, into the Court of Rome, we may then probably, though we can well know the end, look for a long and arduous struggle."—Mr. ROXBURGH contrasted the vast premises laid down by Lord J. Russell, alleging invasion and insult, with the insignificance of the measure he had founded on them. He controverted the applicability of the comparisons drawn from Catholic countries, referring as a better example to the United States, where the Catholic religion was not acknowledged, and yet the Pope was not feared. The best answer to a usurping bishop was, "We know you not;" the best repellent of insult was ridicule; and the best safeguard against future danger, to spread education amongst the people. The measure of the government he believed not to be inspired by fear of the papacy, but was a truckling to prejudices out of doors, and the opinions of members on the opposition benches.—Mr. JOHN O'CONNELL would support the measure, as being temperate, though he thought it would prove inefficient and paltry.—The measure was opposed by Mr. ROCKE, Mr. MOORE, and Mr. BRIGHT.—Mr. DISRAELI announced his intention of voting for it, though it would utterly disappoint the country.—Sir R. INGLIS was more inclined to thank the Prime Minister for his letter and his speech, than for the measure, which would prove insufficient. The debate was adjourned to Monday following.

On Monday, February the 10th, the adjourned debate on the proposed bill to prevent the Assumption of certain Ecclesiastical Titles was resumed.—The ATTORNEY-GENERAL explained the scope and effect of the measure. The offence which it was intended to meet consisted in the introduction of a bull, by which certain persons were authorised by the Pope to assume the titles of bishops in England, with jurisdictions defined by territorial limits. The act of the court of Rome was resented by the country because, first, it was an insult offered to the British crown; secondly, it was an injury inflicted upon

certain classes of its subjects. With respect to the insult, he thought it would be sufficiently repelled by the opinion expressed throughout the country and in that house, and by words introduced in the bill. The injury—which affected the Roman Catholic classes of the community—was of a twofold nature, spiritual and temporal. With the spiritual effect of the bill the house had nothing to do; but its effect in temporal matters would be to give to the bishops having territorial jurisdiction & power of dealing with religious endowments made by parties who had not intended that they should be so administered; and whilst he was not aware that, in respect to spiritual matters, vicars apostolic, who were bishops *in partibus*, had less authority than territorial bishops, it was important to stop persons dependent upon the Pope of Rome from interfering with the rights of British subjects. The bill, therefore, in the first place, extended the provisions of the Roman Catholic Relief act, which imposed a penalty of 100*l.* upon the assumption of the title of any existing see, to that of any title whatever from any place in the United Kingdom. But it did not stop there. In order more effectually to prevent the assumption of territorial titles, the bill would make every act done by persons assuming such titles, by virtue of them, absolutely void; and in addition, in order to hinder parties from making gifts to persons assuming such titles, the bill would declare the endowment of such pretended sees illegal, and the gifts would be forfeited to the crown, to be disposed of as her Majesty saw fit—a course which was deemed better than that of declaring such gifts void, since the crown could distribute them equitably. By thus preventing persons from assuming territorial titles, and preventing the existence of the dioceses or sees themselves, the bill would effectually remedy the mischief complained of, and it was very desirable that it should not be extended to cases which might not arise, or which the existing law was competent to reach, or which, being of a spiritual character, could not be effectually dealt with by legislation, and must be left to the good sense and judgment of the Roman Catholics themselves.

—Lord Ashley met the argument that the proceeding of the Pope is necessary to the development of the Roman Catholic religion. He granted that the act of 1829 gave full right and privilege to the Roman Catholics to diffuse, extend, and promote their religion; he allowed that the Roman Catholics have full power to convert their vicars apostolic into bishops; he knew perfectly well the detriment we should receive from the constitution of such a hierarchy, although it appears to be in perfect conformity with the concessions made in 1829. But no one has proved that territorial titles are necessary to the exercise of episcopal functions. They are worldly and material affairs of high importance, but the office of a bishop is spiritual altogether. In nothing was this distinction more clearly shown than in the very appointment of a Protestant bishop in Jerusalem, which Dr. Wiseman had quoted on the other side. Instead of being styled "Bishop of Jerusalem"—which would be a territorial and therefore an aggressive title—he was styled in his deed of consecration, "Alexander, Bishop of the United Church of England and Ireland, resident in Jerusalem." This distinction between territorial and personal dignity has been observed by nations in matters of civil sovereign rule, as well as in these instances of ecclesiastical government. The revolutions of 1830 in France and Belgium placed on the throne kings who were specifically entitled "King of the French," and not "of France," and "King of the Belgians," not "of Belgium": there was the testimony of two nations as to the importance of a territorial title. The territorial office is unrestricted; the personal one is restricted to those alone who yield it submission; and this office is sufficient for all the purposes of spiritual rule. Lord Ashley quoted Mr. Hallam's impartial historic testimony on the aggressive opposition of the canon law to the civil laws of every realm; its declarations that "the laws of kings are not preeminent over the ecclesiastical law, but are subordinate to them," and that "oaths disadvantageous to the interests of the church are not to be considered as oaths, but rather as perjuries." Lord Ashley concluded with an impressive warning to those within our own church who, he believed,

had invited this attack, against the further results of their proceedings, amongst which might be, he feared, a collision betwixt the clergy and the laity, which would go very far to purify the church.—Mr. PAGE WOOD discussed the legal bearings of the subject, international and domestic. He especially dwelt upon the distinction between the personal and territorial jurisdiction marked by Lord Ashley; showed that the word "diocese" has from the time when Cicero himself used it (speaking of the diocese of Cilicia) meant a local district, including every inhabitant in it, and that a Bishop of Westminster is therefore a widely different thing from a Bishop in Westminster; he added illustrations founded on the personal and territorial jurisdiction in Turkey of the consular agents of the Levant Company; and followed out the English law of the subject explained by the Attorney-General, by referring to the principle that it is an indictable offence to hold even a court-leet, the smallest jurisdiction known to our law, without a delegation of authority from the crown or by parliament. In reference to Dr. Wiseman's implied excuse that every instrument has its proper form, he stated that the instrument by which Pope Gregory the Sixteenth enlarged the English vicariates spoke throughout not of a Roman Catholic Church in England, but merely of the members of the Roman Catholic faith in England. He referred with pleasure to an encyclical letter, in which the four chief Patriarchs of the East had repudiated with astonished indignation the insulting aggression of the Bishop of Rome.—Sir GEORGE GREY replied to the three charges brought against the government—namely, giving titles of honour and respect, such as "your Grace," to Roman Catholic prelates; addressing these prelates by titles prohibited by law; and lastly, that a member of the government had a previous knowledge of the intentions of the court of Rome. He did not deny the first, and declined offering an excuse for it. He did deny the second charge, and declared that the letter of Mr. Disraeli, in which it was preferred, was full of blunders. He also corrected an error on the part of Lord St. Germans with reference to this point, which had crept into the work of Dr. Twiss. With regard to the last charge—that, prior to the promulgation of the bill, a direct communication upon the subject had been made by the Pope to Lord Minto—Sir George referred to the distinct denial of his lordship; and with respect to the statement of Abbate Hamilton, quoted by Mr. Roebuck, he admitted that the abbate had written upon the subject to Lord Minto, who, in return, had acknowledged that he had received an intimation of an intention to confer upon Dr. Wiseman archiepiscopal rank, but repeated that down to the promulgation of the bill he had been in total ignorance of any design to establish a hierarchy. In conclusion, he vindicated the manifestation of public feeling from the imputation of bigotry: it was a national demonstration against an attempt to force upon us a foreign domination, which our ancestors had successfully withstood.—Mr. P. HOWARD moved the adjournment of the debate, which after some discussion, and an adverse division, was agreed to.

Mr. ANSTEE moved for leave to bring in a bill for the repeal of enactments imposing certain *Disabilities on her Majesty's Roman Catholic subjects*, which, upon a division, was refused by 175 against 35.

On Tuesday, the 10th, Mr. DISRAELI moved his resolution on *Agricultural Distress*, in the following terms:—"That the severe distress which continues to exist in the United Kingdom among that important class of her Majesty's subjects the owners and occupiers of land, and which is justly lamented in her Majesty's Speech, renders it the duty of her Majesty's Ministers to introduce without delay such measures as may be most effectual for the relief thereof." He observed that the fact, admitted in the speech from the throne, that, concurrently with the general prosperity of the country, there was a continued depression of a particular class, well deserved, not only the consideration of the government, but the deliberation of Parliament, in order to ascertain the nature and sources of that particular distress. He then referred to the anticipations which had been formed five years ago as to the future prices of agri-

cultural produce, and the effects of the change of system upon landed property. The result had been the reluctant recognition of continued distress among the agricultural classes, after attempts in past years, on the part of the government, to represent the depression of prices as exceptional and temporary, and to prove that what had happened could not possibly recur. He did not mean to build upon these results a proposition to retrace our steps; but if all the estimates upon which changes of system had been founded were wrong, and all the calculations erroneous, and if a most important class continued depressed amid the general prosperity, it was the duty of Parliament to investigate the subject in a charitable spirit, and to adopt the course which reason and policy dictated. He vindicated the character and conduct of British farmers from the stigma of sloth and want of skill, and characterised the outcry against rent, and the plea that this was a landlords' question, as economical fallacies, tending to arm one agricultural class against another. The object of his motion was not to dispute the fact of the general prosperity of the country, or to attack the new commercial system, but to adapt the condition of the owners and occupiers of land to that system. He should make no attempt to bring back the abrogated system of protection; if that system was to be restored, it must be done by a very preponderating opinion out of doors. What, then, was the reason why the cultivator of our soil could not compete with the foreign producer? It was the amount of taxation to which he was liable, and which had been allowed to press unequally upon him in consequence of the artificial state in which agriculture was formerly placed. The great mass of our general taxation was supplied from three sources—external imposts, inland revenue, and local contributions. Nearly one-half of the first was raised by not permitting the cultivators of the soil to produce a particular crop, or loading it with a peculiar impost; two-thirds of the inland revenue were raised by a colossal tax upon one crop of the British agriculturists; while of the 12,000,000*l.* of local contributions, 7,000,000*l.* was paid by them, and the whole was levied upon a very limited class. Mr. Disraeli entered into the details of these several burdens, urging at much length the hardships they inflicted upon the landed interest; and with respect to the last, referred to the proposal he made last session for relieving the land in the matter of local taxation—a question which had been since much advanced. He urged, in addition, the severity with which the tithe fell upon owner and occupier, not merely in the commutation, but in the incidence of the charge itself, which Mr. McCulloch thought justified an adequate countervailing duty upon foreign corn. All these facts proved that the British farmer was overweighted. But it was said that the land enjoyed exemptions. The amount of these exemptions Mr. Disraeli endeavoured to show was comparatively small or illusory, and he opposed to these exemptions the land tax. It was only by that powerful instrument, the property and income tax, that our present financial system was upheld, and from the returns of that tax, it appeared that at least one-half was levied from the owners and occupiers of land—from owners whose rents were reduced, and from occupiers without profits. What these classes required was only severe justice; they did not shrink from competition, but they asked not to be forced into it manacled. He desired no legislation that was not consistent with the welfare of all her Majesty's subjects, not excluding one particular class which it was now acknowledged had been treated with injustice.—The CHANCELLOR of the EXCHEQUER observed that Mr. Disraeli had brought forward no clear or definite proposition. Sir Charles justified the opinions he had expressed in past years respecting the effects of the change in our commercial policy; he had never concealed his apprehensions of the difficulties which agriculture, like manufactures, might experience upon the withdrawal of protection, but he thought still that it would revive and stand upon a sounder foundation than before. The anticipations of the advocates of free trade had not proved more exaggerated than the gloomy forebodings of its opponents. The distress alleged to exist among our agriculturists was paralleled in France, notwithstanding its large exports of corn to

this country and its importing none. The diminished price of meat here was the result of increased production, and cattle were produced at a cheaper rate. In Ireland as well as England the numbers of able-bodied paupers were rapidly diminishing. Wages, in relation to prices, were higher than during the war. In almost all the articles of a poor man's consumption the fall of prices during the last ten years had greatly exceeded the fall of wages. While the labouring classes were thus benefited, there had been no reduction of rents commensurate with the diminution of prices. Sir Charles then reviewed the several burdens alleged to fall peculiarly upon the land, and the objections which Mr. Disraeli had offered to other remedies than his own. Assuming that Mr. Disraeli asked to be relieved from the Customs duty on tobacco, and the Excise duty on malt, hops, and spirits, he asked him, how would he provide for the public expenditure? It could only be by re-imposing those duties which, with so much advantage to the country, had been repealed. Sir Charles read statements of our foreign trade, showing an increase of our exports perfectly unexampled, and asked whether it was possible that a legislation which had produced such results could be wrong? No protected interest ever lost protection without transient suffering; agriculture had not been the only interest protected; the others had recovered from their depression, and now flourished beyond precedent; the application of capital and improved processes of cultivation would produce the same result in agriculture, and enable the British farmer successfully to compete with foreigners.—Mr. G. BARKLEY and Mr. SANDARS briefly supported the motion, and the debate was adjourned.

On Wednesday, the 12th of February, the adjourned debate on the *Papal Aggression* was resumed in a thin House.—Mr. P. HOWARD opposed the bill, as an arrogant interference with the right of private property.—Mr. NAPIER supported it, as not only a just and wise, but a merciful measure.—Mr. KEOGH objected to the operation of the measure in Ireland; and Mr. ANSTY contended that it ought not to be extended to that country.—Colonel THOMPSON supported the bill; to the surprise of Mr. HUMF, who said that, up to that moment he had regarded the gallant Colonel as one of the most resolute and consistent friends of religious liberty.—Lord J. RUSSELL replied to various objections made by the opponents of the bill; and the house adjourned at six o'clock.

On Thursday, the 13th, the debate on the *Agricultural Question* was resumed by the Marquis of GRANBY, who repeated the usual Protectionist assertions and arguments.—Sir JAMES GRAHAM replied to them; and stated a number of facts to show that the alleged distress among the landlords, the farmers, and the labourers, does not exist; and he arrived at the conclusion, that the day for recalling Protection, or for any attempt to enhance the price of food, is past. "And why," he exclaimed, "do I say so? I say there is not a ploughboy who treads the heaviest clay in England who does not feel practically his condition improved within the last three years; and he knows the reason why. I tell you there is not a shepherd on the most distant and barren hill of Scotland who does not now have daily a cheaper and a larger mess of porridge than he ever had before; and he also knows the reason why. I tell you again there is not a weaver in the humblest cottage in Lancashire who has not fuller and cheaper meals, without any fall in his wages, than he had before; and he knows the reason why. Now I must tell you the whole truth: the time has arrived when the truth fully must be spoken. I will speak of another class still. There is not a soldier who returns to England from abroad who does not practically feel that his daily pay is augmented, that he has a cheaper, larger, and a better mess, and that he enjoys greater comforts; and he also knows the reason. Now, sir, I entreat my honourable friends who sit below me to be on their guard. You may convulse the country—you may endanger property—you may shake our institutions to the foundations—but I am satisfied there is no power in England which can permanently enhance, by force of law, the price of bread. Now, that is my honest and firm conviction. The peace of this

country, my own possessions, are as dear to me as to any honourable gentleman who sits on the benches below me; but I feel we have arrived at the period when it is necessary to speak the truth, and I have spoken it without reservation." From these observations, which were made amid loud and reiterated cheers, Sir James Graham passed to an examination of the views propounded by Mr. Disraeli. He contended that the real object of the motion was the reimposition of the tax on corn, and warned the supporters of Free Trade to be on their guard, for a serious conflict was at hand.—The motion was supported by Mr. Booker, Mr. Cayley, Colonel Duane, Lord Jocelyn, Mr. B. Cochrane, and Mr. Muntz; and opposed by Mr. Labouchere, Mr. Cardwell, Mr. Cobden, and Lord John Russell. On the division, the numbers were, for the motion, 267; against it, 281; majority, 14.

On Friday, the 14th, the debate on the *Papal Aggression* was concluded. Mr. FREDERICK PREL objected to the measure. The bill seemed to him unable to claim the merit of being a permanent and comprehensive settlement of the questions agitated; and especially he doubted if it would not wholly fail as a weapon to prevent or control synodical action: it would only afford another illustration proving how utterly powerless the heavy arm of temporal power is in dealing with the voluntary submission of the mind—with those questions of imaginary sentiments, as they have been called, which reside within the precincts of the conscience.—Mr. MILNER GIBSON said, that this was the first time since he had been in parliament that he had been invited to impose civil disabilities on account of religious convictions. The proposers of this bill could not be sincere when they declared it to be founded on a principle, and yet limited its operation to the United Kingdom. But throughout the country this question had not been taken up, as was pretended, on the ground of an alleged invasion of the temporal rights of the Sovereign, but on theological grounds, and in the spirit of bigotry. He had no confidence in the Downing-street divinity of the first minister, whom he accused of "aggression" upon Protestantism; nor could he see with what propriety the topic of what was called Puseyism had been imported into the question. Characterising this bill as a retrograde step, for which no reasonable cause had been given, but in favour of which much clap-trap had been spoken from the ministerial benches, he regretted the junction of the dissenters in the agitation, defended the Irish Catholic bishops from the charge of having generally interfered with the government scheme of education, and found fault with the Archbishop of Canterbury and the Bishop of London for having given advice as to the preparation of the present measure. He expressed his certainty that the proposed law would be nugatory, and concluded by announcing his determined opposition to the bill.—Mr. BAOTHSARON had abstained from any part in the agitation, and should abstain from any part in the debate; except to quote from letters by Roman Catholic constituents at Salford—where, as St. Manchester, Catholics are among the most influential citizens—to the effect that, "unless government will protect us, [the Catholic laity,] all our charity-land and other property will pass into the control of the Court of Rome."—The other speakers against the bill were, Mr. Fagan, Mr. Sadleir, Mr. Seilly, Mr. Scholesfield, with Mr. Baring Wall; the last-named gentleman declaring it the maximum of persecution, because no persecution is so grating as bit-by-bit persecution, to be dealt out according to the mental reservation with which it is submitted to. In favour of the bill, Sir James Duke, who was also a strong defender of the Premier, Mr. G. A. Hamilton, Mr. Cumming Bruce, Mr. Fox Maule, Mr. Muntz, and Colonel Sibthorp; the last in duty to his Sovereign, on whose attachment to the Church he places implicit reliance. The House divided about midnight. The numbers were, for the introduction of the bill, 395; against the introduction, 63; majority for ministers, 332.

On Monday the 17th, in a Committee of Ways and Means, the CHANCELLOR of the EXCHEQUER made his *Financial Statement*. He began by stating the probable estimate of receipt and expenditure up to the 6th

of April next, and for the subsequent year. The probable surplus on the 5th of April next he calculated at 2,521,000*l.* He estimated the total income for the ensuing year at 52,140,000*l.*, and the entire expenditure at 50,247,176*l.*; which would leave a surplus on the 6th April, 1852, of 1,892,000*l.* As regarded the income tax, he said that if its renewal were refused, the deficiency in the revenue would amount to 3,600,000*l.* He then defended his own conduct as regarded the income tax, and after pointing out that the alternatives of the course he suggested were either a "deficit," a reduction of expenditure, or the imposition of new taxes, he urged all those who favoured the system which the present ministry had been so long endeavouring to carry out to give him their support. He then proceeded to say, that if the house should agree to renew the income tax, the first claim upon him would, he conceived, be the reduction of our debts. Twenty years of peace had added twenty-seven millions to those debts. Last year, however, he had been enabled—and he stated it with pleasure he could hardly express—to pay off the two millions which had been borrowed in 1848, and he was now able to contemplate a nearly similar reduction. His idea was, that there should be a reserve of about one million surplus, and this the proposals he was about to make would enable him to retain. He then proceeded to the remission of taxation; and first adverted to the window tax, as a tax which, affecting the health and morals of the poorer class, deserved the first consideration. This tax brought 1,856,000*l.*, and its total repeal would of course absorb the whole surplus. Such repeal was therefore impossible. But he proposed to abolish the window tax in so far as it affected the number of windows in a house. As a substitution for such part of that tax as he could not resign, he proposed to impose a house tax, to be levied, not upon the size of the house, but upon its value. He proposed that his enactment should apply to all new houses, and that there should be a modification of the present system as regarded existing houses. All existing houses not of the annual value of 20*l.* were to be exempted from tax. All houses of the value of 20*l.* and upwards were to pay as house tax two-thirds of what they now pay as window tax. Houses of more than 20*l.* value, which do not now pay window tax, were also to pay according to the above rate. The rate of duty would be lower than that of the old house tax, and would be 1*s.* in the pound; but dwelling-houses which were partly used as shops, houses where beer was sold to be drunk on premises, and farm-houses occupied by tenants, would pay 9*d.* in the pound. This would exempt 120,000 houses which now pay window tax, and would cause about 30,000 to pay 12*s.* a year, and the relief would include the great majority of farm-houses. By this alteration he expected to lose 700,000*l.* Secondly, he proposed to equalise the duties on foreign and colonial coffee, and to reduce them to a uniform duty of 3*d.* By this he expected to lose 176,000*l.* Thirdly, he proposed to reduce the duty on foreign timber to half its present amount, and thereby he would sacrifice 286,000*l.* Fourthly, he proposed to reduce the only tax which was unfairly borne by the agriculturists, namely, that on seeds, of which clover and grass seeds paid nearly the whole. The duty was now 5*s.* the cwt. on foreign seeds, and 2*s.* 6*d.* on colonial seeds. He intended to impose a uniform duty of 1*s.* per cwt. on all foreign seed. By this he should lose 30,000*l.* Fourthly, he would partially relieve the county localities of the charge of pauper lunatics. He proposed to charge 150,000*l.* a year on the general revenue, for the purpose of reducing the expense of maintaining a pauper lunatic to that of supporting an ordinary pauper. His intended reductions, together with that which, by the present law, would be made in the sugar duties (380,000*l.*), would amount to 1,622,000*l.*; but he did not expect actually to lose so much, as the increase in the customs would partly make up the loss on sugar; and, after other calculations, he estimated the total loss to the revenue from the contemplated changes at 1,280,000*l.* This would leave a surplus of 962,000*l.* for the ensuing year (as one half-year's payment of the present window tax will be due in April next), and of 812,000*l.* for future years. He then adverted to the complaints of

the owners and occupiers of land, whom he declined to relieve to any further extent, and concluded by moving the resolution for continuing the income tax for three years, and also for continuing the stamp duties in Ireland.—A number of members made critical remarks on this financial scheme.—Mr. HUME complained that the window tax was not to be repealed unconditionally, and that the military establishments were not to be reduced.—Viscount Duncan and Mr. Wakley enforced the claims of the payers of the window tax; Alderman Sidney, Sir B. Hall, and Lord Dudley Stuart, those of the payers of income tax; Mr. Hodges, Mr. Frewen, and Mr. Hope, complained that hop-growers are still denied any help in their distress.—Mr. Newdegate, Mr. Frewen, Sir William Jolliffe, and Mr. Banks, expressed their sense of the mockery of relief which is offered to distressed agriculture generally. Mr. WAKLEY closed the conversation with the declaration of his firm conviction that the proposal on the subject of the window tax would be so hostilely received that Sir C. Wood would find it impossible to carry it out.—Mr. HENRIES suggested, and Lord JOHN RUSSELL assented, that the further discussion should take place on Friday following.

On Tuesday, the 18th, the CHANCELLOR of the EXCHEQUER announced his intention of introducing a *Savings Bank Bill*.

In answer to Mr. HUME, Sir G. GREY stated that the trustees of the *British Museum* had taken measures for the better accommodation of the public.

In reply to Mr. KROGH, Lord J. RUSSELL was unable to say whether any Roman Catholics were placed on the *Dublin University Commission*.

Mr. P. SCROPE brought forward his motion for a select committee to consider the expediency of assimilating the *Poor Laws* of England, Scotland, and Ireland, and promoting the productive employment of able-bodied paupers. The hon. member's argument was cut short by the house being counted out.

On Wednesday the 19th, a petition against the window tax, presented by Lord DUNCAN, was refused; the petitioners having expressed "surprise" at the statement made in the house by the Chancellor of the Exchequer, and any reference to the debates in a petition being informal.

Sir G. GREY obtained leave to introduce a bill, which was read a first time, to amend the law relating to the *expenses of prosecutions*. The object of the bill is to subject those expenses to the regulation of the Secretary of State for the Home Department, to empower magistrates in quarter sessions to pay the clerk of the peace by salary instead of fees, to restore to the quarter sessions within the district of the Central Criminal Court the jurisdiction recently taken away from them, and to facilitate criminal proceedings in towns and cities being counties of themselves, but not for assize purposes.—Mr. F. MACKENZIE was afraid the bill, if extended to Scotland, would there tend to increase expense.—Mr. HUME approved of the bill, which would greatly facilitate proceedings, and lessen the expense.—Mr. S. WORTLEY called attention to the necessity of having the depositions put in shape by some functionary, without, however, creating the office of a public prosecutor.—Mr. HENLEY was afraid that the employment of barristers in getting up the cases would increase the expense. Something, however, must be done to prevent the miscarriage of prosecutions.

Sir G. GREY obtained leave to bring in a bill for the *removal of Smithfield Market*. After stating the proceedings taken by the parliamentary committee of 1849, and by the government commission subsequently appointed, and the communications which had passed between the commission and the Corporation of London, from which it appeared that the latter, having submitted a plan of its own, of which the commissioners took no notice, declined entertaining the plan of the commissioners, the right hon. baronet explained the provisions of the bill, which enables the crown to appoint five "Metropolitan Cattle-market Commissioners," with power to establish and regulate a cattle and a meat market (the former not within five miles from St. Paul's), and to exercise a control over slaughterhouses. Ample time would be given for its consideration.—Mr. BUCK, on the

part of the farmers, expressed his gratitude to the government.—Mr. A. STAFFORD objected to the immense amount of patronage, and the large discretionary powers, given by the bill, and to its wholesale interference with public charters and private property.—Mr. S. WORTLEY, as the only member connected with the City then present, suggested that the rival plan of the Corporation should be referred to the same committee.—Mr. ELLIS hailed the bill, on behalf of the graziers. The bill was then read a first time and referred to the Select Committee of Standing Orders.

On Thursday the 20th, it was resolved, on the motion of Sir G. GREY, that no bill connected with the *supply of water* to the metropolis should be considered till at least one week after the Easter recess, to give time for the preparation of a bill on the same subject by the Board of Health.

In answer to Sir D. L. EVANS, Lord SEYMOUR expressed his hope that the provisions of the *Extramural Interments Act* would soon be brought into practical operation.

Mr. SLANEY moved for "a Select Committee to consider the *law of Partnership*, and the propriety of limitations of liabilities, with the view to encourage useful enterprise, and the additional employment of labour."—At the suggestion of Mr. LABOUCHERE, the motion was modified by the substitution of the words "the expediency of facilitating the limitation of liability," for the words "the propriety of limitations of liabilities;" and in this amended form the motion was unanimously adopted.

Mr. LOCKE KING moved for leave to bring in a bill to make the *Franchise* in counties in England and Wales the same as that in boroughs, by giving the right of voting to all occupiers of tenements of the annual value of 10*l*. The hon. member explained that he did not intend to interfere with the provisions of the Reform Bill, but only to extend to inhabitants in one locality the franchise which that bill gave to the same class of inhabitants in another locality. The measure proposed by him was small and comparatively insignificant, and would tend to strengthen rather than to weaken the Monarchy and the House of Lords. It was only applying to England the principle recognised by the legislature last year in regard to Ireland,—the principle, namely, of placing the borough and county franchise on the same footing. The argument then used, that the county constituencies had decreased, was equally applicable to this country. In 1843, the total number of county electors in England was 484,073; in 1850, it was only 461,413; in the boroughs, on the contrary, there was an increase of 50,000. Addressing himself to the Protectionist benches, Mr. King said, that, after what had recently occurred at an election, in not the least aristocratic part of England, he might fairly claim the support of the hon. gentlemen who had, up to a recent period, supported Protection; for he believed it would be found that those who had only very lately repudiated the principle of Protection would find it exceedingly difficult to re-obtain their seats unless they appealed to constituencies with an extended suffrage. He knew something of the farmers of this country, and could testify that when they had once formed an opinion it was very difficult to shake it. They had been so taught and tutored to cling to Protection, that they would not be induced to give it up at a moment's notice for any one; and, though hon. gentlemen might attempt to persuade them that it was not a question of rent, they would continue to maintain, that, if it was not a case of Protection, it must be one of rent. He rejoiced greatly at the admission made by the hon. member for Buckinghamshire on behalf of his party, which completed the triumph of the hon. member for the West Riding. He hoped the hon. member for Buckinghamshire, with the enlarged views which he had recently adopted, would not attempt to coalesce with the electors who had been created under the 60*l*. Chances clause, to answer a political purpose. He trusted the hon. member would go with them for an extended suffrage, and that they would no longer hear anything about what he believed he might say had now been partially renounced—he meant the re-establishment of the dangerous doctrines of Protection. In conclusion, he observed that his motion stood on a

more favourable footing this session than in the last, when a bill was passed which extended a similar franchise to Ireland; and if the principle was sound in that case, he claimed for this country what had been conceded to the sister kingdom.—Lord JOHN RUSSELL, in opposing the motion, admitted that he had on a former occasion acknowledged that he thought some extension of the franchise desirable, and he still considered it desirable that a measure should be introduced for a further extension of the suffrage. I can see no reason (said Lord John) why, after this session has passed, and at the commencement of the next session, there should not be laid before this house by the government a proposal in respect to this question of parliamentary reform. Certainly, if I am a member of the government at that time, I shall deem it my duty to lay my views on this subject before the House of Commons. I know perfectly well that those views would not altogether meet with the approbation of the hon. member for Montrose and of other gentlemen who agree with him. But I have so often stated the difference of opinion which exists between us, that it ought to create no surprise in his mind at finding that I have come to a practical conclusion essentially distinct from that proposal which he has laid from time to time before the house. I do, however, think it is desirable, considering that by next session twenty years will have elapsed since the passing of the Reform Bill—that we should then consider whether there are not great numbers of our people not possessed by that act of the franchise, who are not only fully qualified to exercise the suffrage, but whose exercise of the suffrage would tend to the improvement of the character of this house. I am, myself, perfectly satisfied with the experience we have had of that act. I believe that the representation since 1832 has been such as to give confidence to the people at large, which confidence they would not have had in a house of commons in which were members for Old Sarum and for Gatton, and in which were not members for Manchester, and Leeds, and Birmingham. I am, therefore, perfectly satisfied that the influence of that Reform bill, loudly as it was denied at the time that it could be so, has been salutary; and, therefore, in any changes we may take, we ought to consult the spirit of that Reform act—we ought to consult the temper and the genius of the people of these united kingdoms, and not attempt to construct any fanciful edifice based upon any new theory of our own, but, building upon the old foundation, continually endeavour to improve the symmetry and add to the convenience of the ancient habitation.—Mr. HUME insisted that the motion should be accorded to upon the grounds of policy and justice. Lord John Russell, the advocate of free trade and liberal measures, should desire to extend the basis of the representation in order to neutralise the opposition of the landed interest.—Mr. CORDELL had heard with pleasure the pledge given by Lord John Russell that he would bring in a measure for improving the system of representation, the faults of which had been exemplified in recent elections; and he hoped the noble lord would address himself to the task with the conviction that the people would be disappointed with a measure not commensurate with the existing evils. With respect to the motion, he remarked the noble lord made no objection to the class of persons proposed to be admitted to the franchise. It did not follow that 10l. householders would not be as independent as the 50l. tenants-at-will; they would probably be more so, since they would be less under the control of their landlords.—The house then divided, when the motion was carried (against the government), by 100 against 52.

On Friday the 21st, on the opening of the house, it was crowded with excited members, anxious to learn the ministerial determinations with regard to the budget: expectation had been increased by the understood determination of the Protectionist party to move an amendment. After some business of minor importance, the order for going into Committee of Ways and Means on the Income-tax was read.—Lord JOHN RUSSELL rose and said: "Sir, I have to request that this order of the day shall be postponed to Monday. On Monday next I shall state the reasons to the house why I have made this request."—After a short pause, Mr. HENNESSY said: "I wish to ask the noble lord, if it is intended positively

to proceed with the Committee of Ways and Means on Monday next?"—Lord JOHN RUSSELL: "I cannot state positively; it is intended, at present, to do so on Monday; but on Monday next I will state the reasons why I postpone it now, and the course I intend to take." A noise of conversation instantly pervaded the house: some unimportant motions were agreed to in dumb show, and at six o'clock the house broke up.

On Monday the 24th, Lord JOHN RUSSELL made a statement similar to that made in the Lords by the Marquis of Lansdowne. His explanation was brief. Adverting to the results of Mr. Disraeli's and Mr. Locke King's motions—the first giving the government a majority of only fourteen upon a vital question, the second leaving them in a minority—he said he had come to the conclusion that they were not in a position to conduct satisfactorily the business of the country in that house during the session. He had therefore, with the concurrence of his colleagues, tendered their resignation to her Majesty, who had accepted it, and informed him of her intention to send for Lord Stanley, to take the charge of forming a government. He (Lord John) had since been informed by her Majesty that Lord Stanley had stated that he was not then prepared to form a government, and her Majesty had asked him (Lord John) to undertake the charge of re-constructing one. He had thought it his duty to attempt the task, and had assured her Majesty that he would undertake it. In the meanwhile he asked the house to adjourn until Friday.—Mr. DISRAELI expressed his conviction that it would be found, when Lord Stanley gave his explanation in his place in parliament, that in saying that Lord Stanley had informed her Majesty that he was not then prepared to form an Administration, Lord J. Russell had made a statement to the house which, on further consideration, he would acknowledge was not founded upon what had really occurred.—Lord JOHN RUSSELL felt assured that Lord Stanley's explanation would bear out what he said.—Mr. MORPHEUS hoped that Lord J. Russell, as leader not only of a great party in that house, but of a great principle, would not forget that that principle was now in his hands.

PROGRESS OF BUSINESS.

House of Lords.—Feb. 4th. The Session opened by the Queen. Address agreed to.

7th. Law of Evidence Bill read a second time. Bill to Transfer the Business of Bankruptcy to the County Courts, introduced by Lord Brougham.

13th. Bill for Simplifying Procedure on Criminal Trials introduced by Lord Campbell. County Courts Extension Bill introduced by Lord Brougham.

20th. Bill for Regulating the Court of Chancery announced by the Lord Chancellor.

21st. Bill for the Appointment of an Additional Vice-Chancellor brought in and read a first time. Criminal Procedure Bill read a second time. Bill for the Registration of Assurances of Titles in England and Wales brought in and read a first time.

24th. Statement by the Marquis of Lansdowne of the resignation of Ministers; and adjournment of the House to Friday.

House of Commons.—Feb. 4th. Address in answer to the Queen's speech agreed to.

5th.—Writ for Dungarvon superseded.—Midnight Sittings, Mr. Brotherton's motion negatived by 104 to 82.

11th.—Ceylon Committee.—Sunday Trading; leave for a Bill granted to Mr. Williams.

14th.—Irish Prerogative Court; leave for a Bill granted to Mr. Keogh.

17th.—Passengers' Act Amendment Bill read a second time.—Municipal Councils in Counties; leave for a Bill given to Mr. Anstey.—Valuation of Rateable Property in Ireland; leave for a Bill given to Mr. W. Somerville.

18th.—Compound Householders' Bill read a second time.—Expenses of Prosecutions' Bill read a first time.—Smithfield Market Removal Bill read a first time and referred to Private Bills Committee.

20th.—Law of Partnership; Select Committee granted to Mr. Stanley.—Mr. Locke King's motion for extending the Franchise carried against ministers by 100 to 52.—Passengers' Act Amendment Bill, and Mills and Factories (Ireland) Bill, considered in committee.

21st.—Discussion on the Budget postponed at the desire of Lord John Russell, who promised explanation on Monday.

24th.—Statement by Lord John Russell that ministers had resigned, and that he had been requested to form a new administration. Adjournment to Friday.

THE *Ministerial Crisis* consequent on Lord John Russell's resignation (see *Narrative of Parliament*) appears to have come to a termination by the accession of Lord Stanley. On Tuesday, the 25th, Lord John Russell having given up the task of forming a ministry, Lord Stanley was again sent for by her Majesty, and agreed to undertake the government. Names are mentioned of some of the chief members of the new ministry, but merely by rumour, nothing certain being known on the subject.

The Duke of Wellington has had occasion to explain his views in adopting the *Roman Catholic Relief Bill* in 1829. Mr. Thompson, of Dublin, in the name of a body of Protestant inhabitants, lately addressed a letter to the Duke, reminding him of certain words spoken by him in Parliament on that occasion, and calling upon him to make them good. The Duke is alleged to have said:—"If I am disappointed in my hopes of tranquillity after a trial has been given of the measure, I shall have no scruple in coming down to Parliament and calling for the necessary powers to enable the government to take the steps suited to the occasion." Mr. Thompson interprets this to be a promise, under present circumstances, to call for the repeal of the bill. The Duke has made a reply, in which he reminds Mr. Thompson that when he advocated the measure of relief he was at the time the First Lord of the Treasury and the Minister of the Crown, conducting the business of the Government in the House of Lords. He then goes on to say:—"If any doubt could be entertained of the meaning of the expressions used by the speaker in that character, such should have been sought for by a diligent and accurate examination of the context of the expressions; and words should not have been added in a parenthesis 'in other words' which, according to the published record, do not appear to have been used, and positively were not used by the speaker. If such examination and discussion should not have produced a clear understanding of the meaning of the speaker, who was the minister at the time and speaking in that character, his speeches upon the introduction to the house, and upon other stages of the same bill, should have been examined and considered. If that had been done, he believes that no individual, with common fairness, could have made such examination, and entertain the opinion that the minister who had addressed those speeches to the house, who had stated that the continued opposition to the Roman Catholic Relief Act was effete; that an administration could no longer be framed on the principle of considering as an open question all propositions for the relief of the disabilities of the Roman Catholics; that an administration could not be framed on the principle of refusing to consider measures of relief which should be satisfactory to the Sovereign and the Parliament, composed of individuals enjoying the confidence of the public in their capacity for conducting the business of the departments at the head of which they should severally be placed; that in the meantime Government and Parliament itself were exposed to great difficulties in consequence of the existing state of the law; that Mr. Daniel O'Connell, supposed to be disqualified by law to take his seat in the House of Commons, had been elected and returned as member for the county of Clare, in a severely contested election in which he had been candidate against Mr. Vesey Fitzgerald, one of the members of Her Majesty's administration, who was well known in the country, had large property in it, and had for years, and at repeated elections, been returned to Parliament as its representative; that the same inconvenience and embarrassment were to be expected in case a vacancy should be occasioned, whether by the appointment to office, or the elevation to the peerage, or by the death of any member of Parliament for an Irish county; and still more extensive embarrassment in case of a general election in consequence of a dissolution of Parliament. For this state of things there was no remedy, excepting that one with which former governments had been charged without ground—viz., that of forcing the people to rebellion, which no government could adopt which was sensible of the enormity of the evils resulting from civil war in any country. The man who urged

these arguments could not have in his mind an intention eventually to propose to the house to repeal the law, and of which he was by these arguments urging the adoption, and ultimately to pass. Such examination and discussion would have been a fair course of proceeding. But it appears that the Protestants residing in Dublin, who have signed the address to the Duke of Wellington, have considered it preferable to alter the printed record of what the Duke did say in the House of Lords: and, in other words, inserted by themselves, and never used by the Duke of Wellington, to endeavour to show that the Duke declared in Parliament the intention of eventually proposing to Parliament the repeal of the Relief Act after it should have become the law." His Grace then desires Mr. Thompson to inform "the Protestant inhabitants of Dublin," that although in the service of Her Majesty, in the capacity of Commander-in-Chief of Her Majesty's Land Forces, he is not called to Her Majesty's Council; that in the capacity of Commander-in-Chief it is no part of his duty to receive, take into consideration, and submit to Parliament, the proposition of measures to relieve the inconveniences and evils of which Her Majesty's subjects in Ireland may complain, as resulting from the operation of any law. He points out that this duty devolves on the Lord-Lieutenant of Ireland; and suggests to the Protestants of Dublin that they should adopt this, the natural course, in order that their complaints may be taken into consideration, as he positively and distinctly declines to interfere in them in any manner whatever.

The *Two Houses of Convocation* met in the Jerusalem Chamber on the 5th, and their proceedings attracted more than ordinary attention. The Archbishop of Canterbury, with the Bishops of Oxford, Chichester, and Bath and Wells, were present in the Upper House; in the Lower House were Archdeacons Thorpe and Harrison, Dean Lyall, and Dr. Mill, the Hebrew Professor at Cambridge. In both Houses a petition was presented from the clergy and laity of the province of Canterbury, lamenting the suppression of the synodal action of the "Church of England" for the last hundred and fifty years; whence (it is said) has resulted her grievous injury in the weakening of the bonds of love and unity among churchmen, the growth of unsound doctrine, and the great increase of error, superstition, heresy, schism, ungodliness, immorality. This decay of true religion having been forcibly brought under attention by the recent aggressive measures of the Pope, her Majesty is implored to restore to the Church the freedom of her synodal action as in former times. The petition was presented to the Upper House by the Bishop of Chichester; to the Lower House it was presented by Archdeacon Thorpe. In the latter assembly, a discussion was raised on the question of competency to receive the petition; and a demand was made of a formal conference with the Upper House on the point. The conference was had, and the Archbishop of Canterbury delivered the opinion that the Lower House was legally competent. The Lower House accordingly was commencing a discussion of the petition, when the proper officers entered with a formal prorogation of both Houses, under the signature of the Archbishop.

It is announced that the Pope has conferred the dignity of Cardinal on the Most Rev. Dr. Cullen, "Lord Archbishop of Armagh, Primate of all Ireland, and Apostolic Delegate." It is also announced that the Very Rev. Tobias Kirby, president of the Irish College at Rome, has been appointed coadjutor Bishop of Dro-more to the Right Rev. Dr. Blake.

The bill brought into Parliament by Lord John Russell to counteract the *Papal Aggression*, has been published. It is entitled "A Bill to prevent the assumption of certain ecclesiastical titles in respect of places in the United Kingdom." It consists of four sections. The first section recites the 24th section of the Emancipation Act, by which it was enacted that persons other than those authorised by law assuming the title of any archbishopric or bishopric in England or Ireland, should forfeit one hundred pounds. It then recites that it may be doubted whether this extends to the assumption of a title from any place in England or Ireland, not being the see of any bishop or archbishop recognised by law;

but the attempt to establish, under colour of authority from the use of Rome or otherwise, such pretended sees, is illegal and void, and the assumption of ecclesiastical titles in respect thereof is inconsistent with the rights intended to be protected by the Emancipation Act; and that it is expedient to prevent the assumption of such titles. It is then enacted, that any person assuming such titles shall forfeit one hundred pounds for each offence, to be recovered by the Attorney-General. The second section makes void all deeds executed under such prohibited titles. The third section enacts, that where any property is given for the endowment of any archbishopric, bishopric, or deanery, designated as of any place in the United Kingdom, except those of the Established Church, or referring to the maintenance of any such prohibited sees, or vested in any person by a prohibited title, or in any chaplain or subordinate of such person, or in any person described in reference to such person, it shall without office found vest in her Majesty, to be disposed of under the sign manual. The fourth section requires all persons liable to penalties under the act to answer notwithstanding such liability.

The Hon. Stuart Knox has been returned without opposition for Dungannon.

Mr. Barrow has been returned for South Nottinghamshire, in opposition to Lord Newark.

Colonel Gilpin has been elected for Bedfordshire, in opposition to Mr. Houghton.

NARRATIVE OF LAW AND CRIME.

ON the 1st inst., a young woman, named Harriet Vickers, applied for her discharge. Her case was a singular one. She resided with her sister, and followed no business. In the course of last year, a person named Scott, calling himself a lieutenant in the Navy, came to lodge at her sister's; and one day, when in company with a man named Davis, he asked her to put her name to a piece of paper which he told her was a receipt for 60*l.* that he had just paid to Davis. She consented, and signed the paper. A short time afterwards, Scott told her that the receipt she had witnessed was incorrect, and got her to put her name to another piece of paper in lieu of the former one she had signed. These papers turned out to be bills of exchange for 60*l.* each; one of which got into the hands of Mr. Philip Meyfus, of Dury-street, St. James's, and the other into those of Mr. Joseph Joel, of the Strand. Both of these parties sued her, and obtained judgment against her; and she, having no means of paying the bills, offered 20*l.*—all she had, arising from a bequest from her mother, but it was refused; she was arrested, taken to prison, and compelled to petition the Court for her discharge. These bills formed the only debts in the schedule. Mr. Commissioner Law instantly rendered the small measure of justice in his power by ordering Harriet Vickers to be discharged forthwith.

An investigation took place at the Kent Petty Sessions on the 3d inst., respecting the *Treatment of the Patients in a Lunatic Asylum* at West Malling, belonging to Dr. Maddock. The proceedings were instituted by the Commissioners in Lunacy. The complaint, framed under the act of parliament of the 8th and 9th Victoria, cap. 59, was against Dr. Maddock, the proprietor, and Mr. Perfect, the medical officer of the establishment, and charged them with having made false entries in the medical visitation book, and falsely represented that there were no persons in the asylum who were under restraint, when, in point of fact, it had been the constant practice for a considerable period to subject a great number of the patients, both male and female, to almost continual restraint. Two male and a female attendant were examined, and from their evidence it appeared that it had been the constant practice to restrain the patients; some of them by spring body-belts and handcuffs, others by iron leg-hobbles, and some were fastened to staples fixed in the floor. Other patients, in addition to the iron belt, had gloves attached to straps, by which the hands were fastened to the sides. Some of the patients when in bed, were also secured by leg-

hobbles, which were strapped to the bedstead. Similar restraint was made use of with the female patients; and it was stated that in July, 1849, one of them was fastened by her ankle to a staple in the floor, and that in the spring of 1850 another female patient was confined by means of a strait-waistcoat and leg locks, or hobbles. It appeared in the course of the evidence that upon the occasions when the establishment was visited by the magistrates, or by the Commissioners in Lunacy, Dr. Maddock ordered all the patients to be released, and all the instruments of coercion to be put out of sight. The witnesses, however, admitted that some of the patients had been violent and dangerous, and that Dr. Maddock treated the patients generally with humanity. The magistrates called upon both the defendants to enter into recognizances of 200*l.*, with two sureties in 100*l.* each, for their appearance at the next Kent assizes.

In the Insolvent Debtors' Court, on the 3d inst., the case of *Henry Francis Leigh*, a clerk to the India Board of Control, was heard under the Protection Act. There was no opposition. The schedule contained the names of several bill discounters, and the insolvency was attributed to accommodation bills. The case was before the court in November, and had been adjourned for the purpose of effecting a settlement with the creditors, which had not, however, been carried out. Mr. Commissioner Phillips observed that the insolvent had fallen into the hands of an abandoned race—bill discounters. It was really enough to make him shed tears to behold the schedules he did. Here was the case of a young man with ample means, who had been speculated upon—who, with liabilities in the whole amounting to 15,000*l.*, had only received consideration for about 1000*l.* He thought it was a case for the Legislature, and that they should consider whether the usury laws had not been hastily repealed. He was glad the young man was not opposed, and should give him protection for an extended period, in the hope that some arrangement might be made with the creditors. Never again, did he hope, would the insolvent put his name to a bill. Protection was granted to the 31st March.

Mr. and Mrs. Sloane were tried before the Central Criminal Court on the 5th inst. The case excited great interest, and the court was crowded. Mr. Sloane entered with an agitated step; his wife followed, in such a state that she could hardly walk, and on her leaning against the dock she was allowed to have a seat. She is described as a "sallow-complexioned, plain-looking, little woman, from thirty to forty years of age, with nothing either strikingly prepossessing or repulsive in her expression." Sloane is described as "tall, and like a gentleman in dress and manner; his features are regular, his hair and complexion dark, his cheeks sunken, and the face generally rather careworn in character. He wears spectacles, and appears to be from thirty-six to thirty-eight years old." He turned several times to his wife, as if for the purpose of encouraging her; and it appeared to be at his request that a chair was brought for her. When asked to plead to the indictment, he did so without hesitation, but in a tone which betrayed the full consciousness of his degraded position. He then leaned forward, and appeared to tell his wife what to say; for, in a broken voice, she immediately repeated the words which he had used, "Not guilty as to the first two counts, but guilty as to the rest." The indictment seems to have been framed with the usual multiplicity of counts, framed to meet every possible circumstantial variety of facts that might come out. The counts to which the prisoners pleaded guilty were those which variously charged the assaults: those to which they pleaded not guilty embodied the charges of starvation. The defence against these latter charges was, that the counts were not good in law, on the ground that Jane Wilbred, being sixteen years of age, could not be considered as an infant of tender years. This defence was sustained, the Court observing that there was no evidence to show that any sort of duress was practised to restrain the girl or prevent her from going out. The jury, therefore, under the direction of the Court, found a verdict of Not Guilty on these counts. In giving judgment on the other counts, Justice Coleridge, after commenting with indignation on the conduct of the prisoners, sentenced them to imprison-

ment for two years. They heard the sentence without apparent emotion.

Three boys, the eldest fourteen, and the youngest nine years old, were charged on the 7th, at the Southwark Police Court, with attempting to pick the pockets of several persons in the gallery of the Victoria Theatre. The officer who took them described their great expertness, and said he had ascertained that they had all been brought up in the "Thieves' Kitchen," in a court in Gray's Inn-lane, where they were taught the art and mystery of picking pockets. The Magistrate said he had no doubt they were expert young thieves, but he thought that the youngest had been led away by the others, and he should discharge him, and send an officer with him home to his parents. The other prisoners were committed for a month to the Brixton House of Correction.

A most horrible Murder has been perpetrated at Nempnett, near Bristol. For many years past the village shop at Nempnett has been kept by an aged couple, named William and Sarah Wilkins. On Saturday morning, the 8th inst., two men, one named Wiles, a blacksmith, who has recently worked in the village, and the other named Smith, a labourer, called at the shop, and Wiles asked for a loaf of bread. Mrs. Wilkins was in the act of reaching it for him, when the ruffian struck her a violent blow on the head with a thick stick which he had taken into the shop with him. The poor old woman immediately fell to the earth insensible. Wiles then rushed at the husband, who was eating his breakfast in a settle at the upper end of the shop, and dealt him several heavy blows with the same weapon, and beat him with it on the head, then with a spade that was lying near, until life appeared to be extinct. Smith all the time stood at the door, for the purpose, it is supposed, of giving the alarm should any person approach the spot. Wiles proceeded to plunder his victims, and from the pocket of the old woman he took eight shillings in silver, a half-crown piece, and a knife.

It appears that they were then disturbed, as the only further depredation they committed before making off was to take a few papers of tobacco and a loaf of bread from the shop. Some neighbours entering about half an hour afterwards found the old couple lying weltering in their blood, and the place in confusion. An outcry was of course instantly raised, and a messenger despatched for medical assistance. The old man's skull was fractured, and his body covered with bruises and wounds, and the injuries his wife had sustained were nearly equal in their extent and character. The former died about ten o'clock the same evening, but Mrs. Wilkins recovered sufficiently to give her evidence. The two men were apprehended at Blagdon, with some of the property in their pockets. Smith made a confession, and the prisoners were committed for trial at the assizes.

On the night of Sunday, the 9th, a man named Stevens died in a cell at the Police Station in Vine Street. He had been seen in the Quadrant, and it was supposed he had been drinking, as, after inquiring for an omnibus, he fell down insensible, and was carried by the police on a stretcher to the station, where he was laid on his side on the floor of the cell. About one in the morning, he got worse, and Mr. Tothill, the surgeon, was sent for, but before he arrived the man was dead. At the inquest on the body, the Coroner asked the inspector who took the charge whether he was not aware that there was a positive order of the commissioners, that persons taken to the station-house in a state of insensibility should immediately have the attendance of a medical man? The inspector replied that he knew of none such. The surgeon, on being appealed to, said there was such an order. The Coroner: Then here is an inspector of police who does not know what his orders are. A juror: Was it not very improper to lay him on the floor with nothing under his head? The surgeon: Certainly it was. The jury returned a verdict that "the deceased died of apoplexy, but they knew not what caused it; and that the police had been guilty of great neglect in not getting medical assistance."

William Smyth, a surgeon, in good practice, residing in Vauxhall Walk, was charged on the 10th, at Lam-

beth Police Court, with an Assault on Mary Ann Hall, a girl thirteen years of age. The evidence disclosed scenes of the most disgusting profligacy. It appeared that the prisoner, who is a married man and nearly 60 years of age, but separated from his wife, had in his confidence two strumpets, whom he induced to invite to his house a number of girls whose ages ranged from sixteen to eighteen years. Once within his reach, the prisoner commenced by plying his victims with spirits or wine; and the names of seven or eight were mentioned whom he thus succeeded to ruin. The magistrate exclaimed, that in the whole course of many years' experience it had not been his misfortune to hear disclosed such a scene of abominable profligacy, which made one doubt whether we lived in a civilised or barbarous state of society. An application to be admitted to bail was indignantly refused.

The case of the Birds, convicted at the Exeter Assizes of Assaults on the girl Parsons which caused her death, was decided on the 12th, by fourteen of the fifteen Judges in the Exchequer Chamber. The Court was nearly equally divided, the numbers being eight against six. The larger number have determined that the Birds could not have been convicted at the first trial of the assaults proved against them at the second; that they have not therefore been twice "in peril" on the same charge; and that the conviction in the second trial must stand good. Sentence will be passed on them at the next assizes. The eight Judges who formed the majority were, Justices Williams, Wightman, Coleridge, and Patterson, of the Queen's Bench, Justices Erle, Talford, and Creswell of the Common Pleas, and Chief Baron Pollock; the minority of six were, Mr. Justice Maule of the Common Pleas, Barons Parke, Alderson, and Martin, Chief Justice Jervis of the Common Pleas, and the Lord Chief Justice Campbell. The Judges gave their opinions individually. Lord Campbell declared, that though he readily yielded to the opinions of the majority, he could extract from those opinions no certain rule for the future; and he feared that without the intervention of Parliament, "notwithstanding our best efforts to be unanimous, we ourselves, as well as others, may again find it difficult to anticipate the result of our deliberations." He therefore hoped that the legislature would speedily repeal or explain the enactment which had caused such confusion.

A striking instance of the efficiency of the Detective Police occurred on the 12th, in the capture of a man charged with the commission of a desperate murder at Warrington, in Lancashire, a short time since. The prisoner is an Irishman, named Lyons, and after his commission of the crime with which he stands charged, information was forwarded to the Dublin police-officers, by some of whom the fellow was known, to the effect that he had enlisted into the service of the East India Company. One of the Dublin officers, named Kavanagh, was immediately set upon his track, and soon traced him to London, where he ascertained that he had arrived by the mail train at four o'clock on the above morning. Kavanagh at once communicated with Mr. Mayne, the chief commissioner, who immediately directed inspector Field, of the Detective Force, to assist the Dublin officer. Mr. Field, with sergeant Thornton, of the Detectives, soon traced the prisoner to a public-house in Charles-street, Westminster, where the officers succeeded in apprehending him just as he was sitting down to dinner. He was sent down to Warrington in custody of Kavanagh, the Dublin officer. He would have been sent to Wexley barracks the same day preparatory to his embarkation for the East Indies, had not the officers succeeded in effecting his apprehension.

Jane Wilbred, the victim of the cruelty of the Sloanes, has been admitted into the Metropolitan Convalescent Institution, Sackville-street, whose object is to afford a short change of air to poor persons who cannot be restored without it. She is now in the institution's asylum at Carshalton, with every prospect that in a short time she will be completely restored and fit for service.

A case, curiously illustrative of *The Profits of Mendicancy*, has occurred at the Isle of Wight Borough Court. A vagrant, named David Brooks, pretending to

be deaf and dumb, was brought up in custody, having been found lying drunk on the pavement on Sunday evening. He wrote on his slate, in a good firm hand, that the landlords and landladies of the town had behaved in a shameful way to him, by refusing him a bed, but that if he was liberated for this time he would leave the town directly. On searching his pockets, the constable turned out a Prayer-book, and some written prayers and cards, which he offered to the notice of the humane and benevolent; and amongst the collection appeared several memorandum books, by which it was clearly proved that he kept a daily entry of his collections and expenditure, as well as the "Beggars' Directory," containing the names and residences of the charitable throughout the kingdom, with the roosting-places for the night. Some idea may be formed of the amount of money collected by these vagabonds, when it appears from this man's cash-book, that the islands of Jersey and Guernsey furnished him with the sum of 10*l.* 3*s.* 6*d.* for twelve days' trouble in collecting it. Ryde contributed 20*s.* during the previous week, and in several other towns the sums varied from 5*s.* to 3*s.* the day. Cirencester is marked down "Not charitable," no sum being entered opposite the name. To other places where little cash was given or to be expected, it was marked "No go;" and several fourpenny beds were noted down as "small and uncomfortable."

A case illustrative of the *Tendencies of the Game Laws* came before the County Court at Holbeach, Lincolnshire, on the 13th. A young fisherman, named Gee, sued a Mr. Elliff, an opulent farmer, residing in Holbeach Marsh, for 50*l.*, as compensation for injuries sustained from being purposely shot by the defendant. On the 7th of December, the plaintiff went upon some land belonging to a Mr. Wooley, and killed a hare. He was about going away from the spot, when he saw the defendant (Mr. Elliff) in an adjoining field. Defendant followed him, and on nearing him, he pointed a double-barrelled gun close to Gee's head, and vowed he would mark him. He kept walking up with the plaintiff, when he suddenly lingered behind, and the plaintiff distinctly heard a percussion-rap explode, and the contents of one of the barrels lodged in the ground. The plaintiff then addressed Elliff, and said, "Surely you don't mean to shoot me in this lonely place?" He replied, "I do mean to shoot you." After accompanying him about a quarter of a mile, he stopped, and having taken a deliberate aim, fired, and the shot of the second barrel struck him in the right hand and arm, inflicting serious wounds. The defendant then exclaimed, "Now I can take you; I have marked you, so I shall know you again, and I will go back and look for the hare." The plaintiff then contrived to crawl on to Holbeach, enduring the most excruciating agony, when he was taken into custody for trespassing in pursuit of game, and was committed to Spalding gaol for one month. Mr. Wilkinson, a surgeon, attended the wounded man in prison. There were from thirty to forty shot wounds on his right arm and hand; and great fears were entertained of lock-jaw setting in. The injuries he had sustained had entirely prevented him doing any work since. The Rev. Mr. Morton, a magistrate, before whom the case was first brought, stated that he asked defendant why he committed so rash an act as to shoot Gee, when he replied that he had merely done so to "mark him." The judge (Mr. J. D. Burnaby) said, the act of the defendant in firing at Gee was wholly unjustifiable. In calculating damages he did not consider the loss of time for the month's imprisonment, because plaintiff had rendered himself liable to that by trespassing in pursuit of game, but considered the acute pain endured in gaol, and the probable loss of time to come; and he gave a verdict for plaintiff for 50*l.* and costs.

An action, at the instance of the *Crown* against the *London Dock Company*, was decided in the Court of Exchequer on the 18th, after a trial of eleven days' duration. There were many charges of alleged evasion of duties, and fraudulent abstraction of goods to the amount of many thousand pounds. The principal charge was for having attempted to defraud the revenue of duties on 250 cwt. of sugar and 8000*lbs.* of cocoa. The verdict of the jury, virtually, negating the charges,

was as follows: "We find for the Crown as regarding the two boxes of Havannah sugar, and for the Dock Company as regarding the remainder; also that there was no intention to evade the duty." The verdict was accompanied with a strong recommendation to the Dock Company "to be stricter with regard to their subordinate officers, as many irregularities had occurred at the docks."

The notorious *Captain Routledge*, who was committed to prison on the charge of *Swindling Bill-discounting Transactions*, (see "Household Narrative" for January, page 8), has died in gaol.

Mulcharey and O'Shea, Irishmen, have been committed for trial by the Marlborough Street magistrate, for having in their possession a steel mould for making *Spurious Half-crowns*. They ordered the mould of Mr. Sounes, a die-engraver of Rupert Street, and also directed him to engrave copies of notes of the Bank of Ireland. Mr. Sounes informed the police, and acted in concert with them; and thus the culprits were captured as they carried away the mould.

An action against the printer of the *Times* for a *Libel* was tried before Lord Campbell, at the Guildhall, on the 19th. The escape of Hackett, the burglar, from the Model Prison, near Holloway, will be recollected. Immediately after that occurrence, the daily newspapers contained a biographical note of Hackett, describing his numerous feats in escaping from prison: one of these feats had been an escape from the lock-up of the Marlborough Street police-court, and it was in the description of this that the libellous passage occurred, as follows:—"The authorities instituted an inquiry, and it turned out that a turnkey had received a large sum of money to effect his (Hackett's) liberation; and he was discharged." Wilks is the dismissed turnkey. He now sought damages, both on account of the general defamation, and on account of a specific refusal of employment which he pretended had been caused by the words just quoted. For the defence it was proved, that the Government authorities did inquire into the conduct of Wilks in relation to the escape, and did dismiss him three days afterwards; but it was not proved that Wilks received the money of corruption. It was also proved that the refusal of employment, alleged as special damage, occurred after the dismissal, and before the appearance of the article in the *Times*. Lord Campbell directed the jury, that as the truth of the libel was not established, the verdict must be for the plaintiff; but the damages might be moderate, for the discreditable attempt to prove special injury had failed. The jury gave the plaintiff a verdict for one farthing damages.

Mr. Francis Edmund Knowles, late Commissary-General, committed suicide during the night of Sunday the 16th, at the house of a relative in Grosvenor-square. He was found dead in his bed on Monday morning, having swallowed a large quantity of prussic acid. Mr. Knowles had for some time suffered from low spirits, and imagined he had an organic disease: he had been advised to resign his office in consequence of his state of health. He had lately lost a daughter, who was burned to death; five or six years ago a son died in Sierra Leone; another son had recently gone there: these things preyed much on his mind. His despondency had been particularly noted of late. Mr. Knowles's surgeon stated to the coroner's jury that his patient had no organic affection. The verdict was, "That the deceased died from hydrocyanic acid, taken by himself while in a state of insanity."

At Lancaster Assizes, on the 19th, Samuel Donaldson, formerly actuary of the Ulverstone Savings Bank, was tried for appropriating to his own use the money of the depositors. There were two charges; one of having by false pretences obtained large sums from the Lancaster Banking Company, and the other of having got money from the cashier of the savings bank on the false pretence that depositors in the Ambleside branch bank wished to withdraw their deposits. It appeared that Donaldson, by means of false statements and fictitious accounts, had been defrauding the savings bank from 1817 to 1849. He was authorised to draw from the Lancaster Bank the money required to make repayments to depositors each week; and as he obtained this money without stating to the bank for what purpose he wanted it, Mr.

Justice Cresswell held that the first charge was at an end—there was no false pretence. The jury, on the second charge, found the prisoner guilty, but with a strong recommendation to mercy, on account of the gross negligence with which the accounts of the bank had been kept.

An action at the instance of Lieut. Weaver against *The Daily News*, for an alleged libel, tried at the Court of Queen's Bench on the 24th, involved the question of the liability of newspapers for the contents of their police reports. The plaintiff had appeared before one of the police courts, and complained of the report of the case published in that paper, as being libellous. The defendants substantiated the correctness of the report. In his charge to the jury, Lord Campbell laid down the law of the case as follows:—"If the publication complained of be a fair account of proceedings at a police court, then I am of opinion that in point of law the defendant is entitled to your verdict. But if it be a garbled account—if anything be omitted that ought to have been stated, or much more, if anything be introduced that did not take place—then it is libellous, and the law will punish it." The jury found a verdict for the plaintiff, damages one farthing, which, Lord Campbell stated, would not give the plaintiff his costs.

Ellen Fennell, a young woman with a child in her arms, was charged, at Clerkenwell Police Court, on the 24th, by a police officer, with *Selling Greens on the Pavement*, under the following circumstances:—On Sunday morning last, that officer saw the prisoner in Whitecross-street, St. Luke's, carrying out some greens on the foot pavement and offering them for sale. For this, which was all her offence, he took her into custody and brought her before the magistrate. The magistrate dismissed the complaint, saying that there was no law to prevent persons selling fruit or greens in the street, or to authorise the police taking them into custody for doing so.

NARRATIVE OF ACCIDENT AND DISASTER.

Two British vessels have been *Lost* on the coast of South America, and part of one of the crews *Murdered by Savages*. They were the *Gloicester* and *Prince Albert*, both of London. The *Gloicester* sailed for Batavia about two years ago, and information having been received that she was seized at San Francisco for debts alleged to have been incurred by the master, the *Prince Albert* was sent out in order to recover the seized vessel. Nothing further was heard of the ships until tidings were received that both had been lost. The *Gloicester* was overtaken by a storm near San Francisco, was driven ashore, and became a total wreck. The *Prince Albert* arrived in Magellan's Straits on the 2nd of October, and was driven ashore by a violent gale. Some of the crew having left her to procure fresh water, during their absence the wreck was surrounded by the natives (Patagonians), who made an attack upon the captain and crew. The captain was knocked down, and a portion of the assailants stood over him with long knives in their hands, while another party ransacked the ship. Two of the crew were murdered, and an apprentice was stretched bleeding upon the deck. The rest of the crew were secured by the natives, who presently became like maniacs from drinking the spirits on board. The captain with the surviving seamen got clear of the ship, leaving the wounded apprentice and the mate on board prisoners. After six days' suffering, during which time they subsisted entirely upon raw shellfish and water, they succeeded in reaching Sandy Point, about 150 miles from the wreck. Here they procured the assistance of an American steamer, the commander of which proceeded to the wreck, in the hope of rescuing the two men left in her. The natives still held possession of the *Prince Albert*, perceiving which the steamer opened its fire upon them, and compelled the savages to abandon their prize. The mate and the apprentice were both alive, the latter fast sinking, however, from the effects of his wounds. The captain of the American vessel returned to Sandy Point, and subse-

quently conveyed the crew to Valparaiso. After the departure of the steamer the natives set fire to the wreck.

Mr. Richard Shuttleworth Streetfield, of the Rocks, Uckfield, near Lewes, was *Killed* by his fowling-piece going off accidentally on the 29th of January. He had been shooting during the day over his estate, the Rocks, along with the Earl of Sheffield, Sir Thomas Marryon Wilson, and Sir Henry Shiffner. On their return home, and while Mr. Streetfield was emptying his pockets of game, his gun fell over his shoulder backwards to the ground, on reaching which it went off, and the contents entered his heel. Medical aid was immediately procured, and the case at first presented no dangerous symptoms, but lock-jaw supervened, and he expired a few days afterwards. Mr. Streetfield was the possessor of extensive estates in Sussex. He was about 50 years of age, and last year was High Sheriff of the county.

On the 3rd inst., a *Serious Accident* happened to Captain Sir Everard Home, and several officers and men of the Calliope, in Devonport harbour. The vessel was being taken out of harbour into the sound, when the captain not being properly attended to, she gained way on the men, and on their walking back to give each hawser an equal strain the captain "ran away," carrying every one before it. The captain was most seriously hurt in the head, and also in one of his legs. One of the assistant surgeons had his leg or thigh broken, and a quartermaster was dangerously injured. Six or eight other men were more or less severely hurt. The ship was again placed at her moorings in Hamoaze.

A fatal *Railway Accident* occurred between Rugby and Leicester on the 16th, by the bursting of one of the tubes of the engine. The driver, named Wilkinson, in endeavouring to escape, fell between the tender and the next carriage, and was crushed to death. He has left a widow and six children, but, fortunately for them, had insured his life for 500*l.* in the Railway Insurance Company's office.

Binstead, the seat of Lord Downes, near Ryde, in the Isle of Wight, was totally *Consumed by Fire* on the 17th. His lordship and family were crossing from Portsmouth, and saw the conflagration from the deck of the steamer: they were going to Binstead for a short time, the house having been prepared for their reception.

A *Fire*, involving the loss of property to the value of many thousand pounds sterling, took place on the morning of the 18th, at three o'clock, on the premises occupied by Messrs. E. Wigan, White, and Company, hop factors, of Duke-street and Tooley-street, Southwark. Their warehouse was totally destroyed, and a number of adjoining buildings very seriously damaged by fire and water. Messrs. Wigan were insured to the amount of 50,000*l.* In a long room on the ground floor, which escaped uninjured, were deposited 60,000*l.* worth of bills, and other securities.—Two more destructive fires have since occurred: one on the morning of the 20th, in Red Lion-street, Clerkenwell, on the premises of a japanner, where much damage was done; and the other on the same night, at some warehouses in East-cheap, occupied by a cheese-factor and a spice-merchant, where the quantity of property consumed will amount, it is stated, to several thousand pounds' worth.

On the 20th, as the parliamentary train from London to Manchester came near Alderley, an accident occurred, by which the engineer was *Killed*, and many of the passengers were more or less injured. Five of the carriages were dashed to pieces. An inquiry is now being entered upon as to the origin of this calamity.

SOCIAL, SANITARY, AND MUNICIPAL PROGRESS.

THE Quarterly Return of Births, Marriages, and Deaths, by the Registrar-General, comprises the Births and Deaths during the quarter ending Dec. 31; and the Marriages are those of the quarter ending Sept. 30, 1850. In their general character the returns are favourable; while fewer lives have been lost by epidemic diseases, the marriages and births have increased.

The *Marriages* were 37,496, or more by 10,000 than

were registered in the summer quarter of 1842; and 2400 more than have been returned in the summer quarter of any previous years. Except in the eastern and south-eastern counties, the increase of marriages has been general in all the great divisions of the country. In London the increase has been considerable; in Berkshire, Buckinghamshire, Oxfordshire, Northamptonshire, and Bedfordshire, it has probably kept pace with the population; in Wiltshire, Dorsetshire, and Cornwall, in Gloucestershire, Shropshire, and Staffordshire, the increase has been still more marked; in Leicestershire, Nottinghamshire, Derbyshire, Cheshire, Lancashire, and the West Riding of Yorkshire, however, the greater part of the excess has arisen. Northumberland, Cumberland, and South Wales exhibit nearly the same increase as the Midland Counties. Among the counties in which the marriages have decreased, or have not sensibly increased, may be named—Kent, Hampshire, Suffolk, Norfolk, Devonshire, Lincolnshire, the East and North Ridings of York, Westmorland, and North Wales. The marriages at Brighton increased from 133 in the summer of 1847, and 113 in 1848, to 177; at Cheltenham, from 90 to 105; at Clifton, from 88 to 115. At Wolstanton, Burslem, and Stoke-upon-Trent, among the Potteries, the multiplication of marriages is remarkable. In the iron districts of Dudley, Walsall, Birmingham, and Merthyr Tydfil, the advance was slow or inconsiderable. At Coventry, as well as Spitalfields, Whitechapel, the seats of the silk trade, the marriages increased rapidly, as they did also at Leicester, Nottingham, and Derby, at Stockport, and Macclesfield. At Manchester, the marriages rose from 1097 to 1442; at Preston from 159 to 281; Halifax, from 215 to 313; Leeds, from 118 and 359 to 483; Newcastle-on-Tyne, from 293 to 315; Carlisle, from 39 to 53; Merthyr Tydfil, from 160 to 213.

In the purely agricultural counties, marriage then still went on slowly, but steadily—in all the iron and coal field—at but a slightly increasing rate; while in all the counties peopled by the workers in lace, silk, wool, and cotton, the number of marriages—of new families established—has increased at a rate of which there are few examples in the returns of the last 100 years; and the general result is an aggregate increase in the marriages of the whole country during the summer quarter of the year 1850.

The *Births* in the quarter following, which ended on December 31, 1850, were also the greatest number ever registered in the autumn quarters of any previous year. 146,268 children were born in the three months. The births are in general most numerous in the spring quarter, and were so in the spring of 1850. They have since greatly exceeded the numbers registered in previous years in all the divisions of the kingdom, whether agricultural or manufacturing, in counties ravaged by cholera, and in counties left unscathed by that plague.

In regard to the *Increase of Population*, the excess of births registered over deaths in the quarter is 54,245. The usual excess is 40,000 more births than deaths; the excess in the last quarter of 1845 was 50,690; in 1847, when influenza was epidemic, only 24,000; in 1849, when the cholera epidemic was rapidly declining, 38,000.

In the last quarter of the year 1850, 56,971 *Emigrants* left the ports of the United Kingdom at which there are government emigration officers; 3836 departed from Irish ports; 1903 from Glasgow and Greenock; and 51,232 from three English ports—namely, 1702 from Plymouth, 4282 from London, and 45,248 from Liverpool. During the whole of the year 1850 the births were 593,567, the deaths, 369,679; and consequently the excess of births over deaths was 223,888 in England. In the same year 280,843 emigrants sailed from the shores of the United Kingdom; 214,606 (many of them of British birth) from England; 15,154 from Scotland; and 51,083 from Ireland. The number of births and deaths in Scotland and Ireland is unknown; and the census alone can disclose at what precise rate the population increases; but we know that the new births more than replace the vast armies of peaceful emigrants that every year assemble without much noise, and led, apparently by the same kind of divine instinct that directs other migrations, leave their native land to seek homes in the prepared for them all over the world.

With respect to *Public Health*, the Registrar-General states, that its comparatively favourable condition is evident from the reduced mortality. 92,023 deaths were registered; and allowing for the probable increase of population, the rate of mortality is lower than it has been in any of the last quarters of the years 1839-50, except 1845. The comparatively good health of several districts is ascribed by the registrars to the employment and the improved condition of the people. Hull was the only town in which any appearance of epidemic cholera was observed. In that district and Sculcoates, so fatally visited by cholera last year, several persons died of cholera in the quarter. At present this district may be considered healthy. After the great epidemic of cholera in 1832 a second outbreak followed in 1833, and was fatal in towns that had before been spared. It is a subject of congratulation, and is perhaps ascribable to the better circumstances of the people, and to some of the sanitary measures in progress, that the country escaped a second visitation in 1850. The mortality in the autumn quarter was at the rate of 2323 per cent. per annum in 117 town districts; and 1824 per cent. per annum in 506 districts, comprising small towns and country parishes. The towns, to every four deaths from what may be called natural causes, lost, in a favourable season, one life by the poisons generated in crowded, dirty houses, in the churchyards, in slaughter-houses, in undrained streets, and sewers.

Nearly *Two hundred Model Life-boats* have been forwarded to the Admiralty from all parts of the country, including Ireland, to compete for the prize of 100 guineas liberally offered by Rear-Admiral the Duke of Northumberland for the best model life-boat, and an additional 100 guineas for a life-boat that should be built according to the prize model. It appears that the Duke of Northumberland is in correspondence with the Royal National Shipwreck Institution, Great Winchester-street, and has promised to communicate the result of his decision to that society. It is stated that the above Institution has expended nearly 6000*l.* on life-boats at different periods, and is always endeavouring to increase the number of its life-boat establishments on various parts of the coasts of the United Kingdom.

The following arrangements for the *Great Exhibition* have been determined on. Season tickets will be issued, not transferable, the price of which will be for a gentleman, 3*l.* 3*s.*, and for a lady, 2*l.* 2*s.* The Commissioners reserve to themselves the power of raising the price of the season tickets, after the first issue is exhausted, should circumstances render such a course advisable. On Thursday, the 1st of May, being the first day of the Exhibition, season tickets only will be available, and no money will be received at the doors. On the second and third days, Friday and Saturday, the price will be upon each day, for one admission only, 1*l.* On Monday, the 5th of May, and the fourth day of the Exhibition, the admission will be reduced to 6*s.*, and the same price continued for the succeeding seventeen days. On and after Monday, the 26th of May, or the twenty-second day of the Exhibition, the charges for admission will be on Mondays, Tuesdays, Wednesdays, and Thursdays, in each week, 1*l.*; on Fridays, 2*s.* 6*d.*, and upon Saturdays, 6*s.* To prevent confusion, no change will be given at the doors; but there will be an office close by the entrance at which money may be exchanged. The Exhibition will be open daily, Sundays excepted. Should experience render any alteration in these arrangements necessary, the Commissioners reserve to themselves the power of making such modifications as may appear desirable, of which due notice will be given to the public.

At the last meeting of the *Chancery Reform Association*, many cases were brought forward of injustice and injury, amounting to ruin, through the delays and denials of the law. Mr. J. S. Hicks, of Bath, stated by letter, that his father, Mr. Charles Hicks, an eminent surgeon, left a fortune of 200,000*l.*, besides landed property: it is now in Chancery, and all that remains between the writer of the letter and his paternal fortune is the report of the Master, now three years over-due. Mr. I. Houghton, a great land-agent and farmer of Berkshire, mentioned the case of a man who has

70,000*l.* in Chancery, and who, at the age of ninety, is a pauper. Other speakers gave instances of a similar description.

Mr. Henry Beaufoy, of Lambeth, has made an additional gift of one thousand guineas to the City of London School, for prizes to be distributed among the pupils. This is the fifth gift of equal amount by Mr. Beaufoy, who has besides lately spent 10,000*l.* in building Ragged Schools in Lambeth. The birthday of Mr. Beaufoy is that of William Shakspeare, and the terms of the deed regulating the distribution of the prizes declare that they are to commemorate the birth and genius of Shakspeare, and especially to encourage among the pupils a taste for the study of his works.

By *Returns from the Poor-law Board*, presented to the House of Commons, it appears that there was spent for the relief of the poor in England and Wales in the six summer months ending last Michaelmas, nearly 200,000*l.* less than in the same period of 1849; and that on the 1st January last there were relieved 71,183 fewer paupers than on the 1st January, 1850. The amelioration was not confined to the manufacturing counties; the reduction of paupers was 6 per cent. in Bedfordshire, 4 per cent. in Berkshire, 8 per cent. in Devonshire, 4 per cent. in Dorsetshire, 10 per cent. in Kent and the East Riding of Yorkshire. The greatest decrease was in Warwickshire—22 per cent.

During the half-year ending 30th June, 1850, 31,760,503 passengers were carried on the Railways of the United Kingdom. Within the same period, 90 persons were killed—10 passengers, 54 railway servants, 26 trespassers; 5 persons committed suicide; 68 received hurts not of a fatal nature. The larger proportion of the killed are set down as having suffered "owing to their own misconduct or want of caution."

An association has been formed for *Promoting the Repeal of the Taxes on Knowledge*. This was done at a meeting of gentlemen desirous to support the freedom of the press, among whom were Messrs. J. Hume, Cobden, Bright, Milner Gibson, Scholfield, and Ewart, held at the Exchange Hotel, New Palace Yard. The chair was taken by Mr. Milner Gibson, and the following resolution was passed unanimously. Moved by Mr. Cobden, seconded by Mr. Scholfield:—"That whereas heavy taxes are laid on paper, foreign books, advertisements, and newspapers; and whereas all taxes which impede the diffusion of knowledge and obstruct the progress of education are highly injurious to the public interest, and are most impolitic sources of revenue; and whereas the penny stamp, in particular, almost prohibits newspapers to working men, the persons now present, desirous of liberating the press from all taxation and from all control, except that of a court of law, form themselves into a society to be called 'An Association for promoting the Repeal of the Taxes on Knowledge.'" The remaining resolutions referred to the appointment of the officers and committee of the association.

The commission for inquiring into the administration of affairs of the *University of Dublin* has been completed, and consists of the following members:—Dr. Whateley, Archbishop of Dublin; Dr. Wilson, Bishop of Cork; the Earl of Rosse; Lord Chief Justice Blackburne; Dr. Longfield, one of the Commissioners of the Encumbered Court; and Mr. Cooper, of Mark-tree Castle (well known for his astronomical researches), formerly representative for the county of Sligo. The inquiries will commence in the course of the ensuing month.

PERSONAL NARRATIVE.

THE QUEEN, Prince Albert, and the Royal Family left Windsor for Buckingham Palace on the 12th, for the season.

A Chapter of the Order of the Garter was held at Buckingham Palace on the 19th, when the Marquis of Normandy was elected a *Knight of the Order*, and received the investiture from her Majesty, with the usual ceremonies.

Prince Albert has transmitted through Col. Phipps, a cheque for 25*l.* as a donation to the funds of the "Jerusalem Literary Society." It is stated to be in

contemplation, as soon as a sufficient number of subscribers be enrolled, to publish a journal of scientific research, the pages of which to be open to contributions on all subjects relating to the Holy Land.

The Right Hon. Sir John Cam Hobhouse, Bart., is created a *Peer*, by the title of Baron Broughton de Gyllford, in the county of Wilts.

The Queen has nominated the Duke of Cambridge to be *Grand Master of the Order of St. Michael and St. George*, in room of the late Duke his father.

Lieut.-Col. F. Abbott, C.B., lately of the Bengal Engineers, has been appointed *Lieutenant-Governor of the East India Company's Seminary at Addiscombe*. Lieut.-Col. Abbott had served many years in India, and was particularly mentioned for his services in the Sutlej campaign of 1845-6.

Mr. David Robert Ross, is appointed *Lieutenant-Governor of the island of Tobago*.

The following official appointments have been made for the *Australian Colonies*:—Sir Charles Augustus Fitzroy is re-appointed *Captain-General and Governor-in-Chief of New South Wales*, *Captain-General and Governor-in-Chief of Van Diemen's Land*, *Victoria*, and *South Australia*, and *Governor-General of all the colonies of Australia*, including the colony of Western Australia.—Sir William Thomas Denison is re-appointed *Lieutenant-Governor of Van Diemen's Land*; Sir Henry Edward Fox Young, *Lieutenant-Governor of South Australia*; Charles Joseph La Trobe, Esq., *Lieutenant-Governor of the (new) colony of Victoria*.

The following *Diplomatic Appointments* are announced.—The Earl of Westmorland, recently her Majesty's Envoy Extraordinary and Minister Plenipotentiary at Berlin, is appointed to the same functions at Vienna. Rear-Admiral Sir Edmund Lyons, Minister Plenipotentiary to the Swiss Confederation, is appointed Envoy Extraordinary and Minister Plenipotentiary at the Court of Stockholm. Mr. Arthur Charles Magenis, now acting Minister Plenipotentiary at Vienna, is appointed Minister Plenipotentiary to the Swiss Confederation. The Hon. Henry George Howard, Secretary of Legation at the Court of Lisbon, is transferred to the Court of Vienna. The Queen has appointed Charles Sturt, Esq., to be Colonial Secretary; Boyle Travers Finniss, Esq., to be Colonial Treasurer and Registrar-General; and George Frederick Dashwood, Esq., Lieutenant R.N., to be Commissioner of Police and Police Magistrate for the colony of South Australia. And her Majesty has also appointed Richard F. Newland, Esq., to be Stipendiary Magistrate at the Port of Adelaide, in the same colony.

Obituary of Notable Persons.

LIEUT.-COL. MURPHY, who only left England in September last to take the command of the Royal Artillery at Hong Kong, died on the 21st of December, shortly after his arrival at that unhealthy station. He had been nearly forty-one years in the service.

VICOUNT FREDERICK ADOLPHE DE GARDENVILLE, of Athies, mousquetaire gris in the service of Louis XV., and Knight of the Order of St. Louis, has just died, aged 117, at his country house, near Homburg. This officer was born on the 28th of January, 1738, and had retired to Homburg after the dissolution of the army of Condé.

SPONTINI, the celebrated composer, author of *La Vestale* and *Fernand Cortez*, died on the 24th ult., at Majolati, near Ancona, where he had gone to pass the winter, in the hope of re-establishing his health. He was in the seventy-second year of his age.

THE COUNTESS BROCKE and WARWICK died on the 30th ult., at the town residence of the Earl of Warwick, in Carlton Gardens, after a long and painful illness, in her sixty-fifth year.

SIR FRANCIS LAWLEY, BART., died on the 30th ult., at his seat in Warwickshire, in his sixty-ninth year. The baronetcy passes to his brother, Lord Wenlock, who will also inherit his large landed property.

THE HON. CAPTAIN HENRY HOWARD died on the 25th ult., at Beachamp, in Gloucestershire, aged forty-three. He was son of the Earl of Suffolk. He formerly represented Cricklade in Parliament on Liberal principles.

THE REV. DR. PVE SMITH died at Guildford on the 7th inst. JOHN JAMES AUDUBON, the celebrated naturalist, died in New York on the 27th of January, at the age of seventy-six.

MARY WOOLSTONCRAFT, the daughter of Godwin, widow of Percy Bysshe Shelley, and mother of the present Sir Percy Bysshe Shelley, Bart., died on the 1st inst., at her residence in Chester-square, at the age of fifty-three.

Mrs. KATHERINE WISEMAN, mother of Cardinal Wiseman, died on the 7th inst., at the house of her daughter, the Countess of Gabrielli, at Fano, in Italy, after a short illness.

NICHOLAS VANSHUTTART, BARON BEXLEY, died on the 8th, at his seat in Kent, in the eighty-fifth year of his age. He was son of Henry Vansittart, Governor of Bengal; he graduated at Christchurch College, Oxford, and adopted the bar as his profession. In 1804 he went as Minister Plenipotentiary to Denmark. Entering the Irish and Home departments of public service, he was for several years Chancellor of the Exchequer; and in 1823 he gained his Peerage. He married, but has died childless, and the title is extinct.

FLORINDA, DOWAGER VISCOUNTESS CASTLEMAINE, died on the 9th, at Moydrum Castle, near Athlone, at the age of eighty-eight. She was sister to the late and aunt to the present Earl of Clancarty.

LIEUT.-COL. W. H. DAVIES died on the 11th inst., aged

seventy-five years. He entered the army in 1799. In 1806 he served with the 47th Regiment in South America. Afterwards he served in the Peninsula, and was present at the sieges of Cadix, Tarragona, and Tarifa.

COLONEL COCK, C.B., died on the 17th inst. He belonged to the East India Company's service, Bengal Presidency, and for his services in the East was in 1828 nominated a Companion of the Bath.

MAJOR-GENERAL JAMES POWELL, Commandant of the 2nd Battalion of the Royal Artillery, died at Dover on the 17th inst.

MR. GEORGE THOMSON, of Edinburgh, died on the 18th inst., at his residence in Leith Links, at the age of ninety-two. Mr. Thomson's early connection with Burns is universally known, and his collection of Scottish Songs, for which many of Burns' finest pieces were originally written, has been before the public for more than half a century. His kindness of heart and other excellent qualities will long be remembered.

COLONIES AND DEPENDENCIES.

SIR CHARLES NAPIER is at last on his way home from India, and has left, for a parting gift to the army he lately commanded, a severe lecture against a large class of its officers for habitual and even criminal laxity in regard to pecuniary obligations. The discipline and efficiency of the forces generally he states to have been seriously impaired by these moral delinquencies in their chiefs who should have set them a better example. Such a public reproach, well founded, and addressed to men who live by the reputation of honour, cannot be heard with indifference, or without a beneficial result; nor could a great soldier, himself of the highest character and courage, have left behind him in India a proof of either that will more surely redound to his ultimate good name, however much he may suffer for it in immediate popularity.

The long-agitated question of the Clergy Reserves in Canada has at last been settled by Lord Grey's prudent and sensible resignation of them to the uncontrolled disposition of the local legislature. The principle on which he has acted in doing this is frankly stated in his despatch, and will be met by the best order of colonists with eager and grateful recognition. The question, Lord Grey remarks, is one "so exclusively affecting" the people of Canada, that its decision ought not to be withdrawn from the Provincial Legislature.

The Overland Mail from Bombay brings accounts from thence to the 17th, from Calcutta of the 8th January, and Hong Kong of the 30th December. Sir C. Napier had arrived at Bombay, and was to leave in the packet of the 3rd. Sir Charles Napier, before retiring from the command of the Indian army, issued a *farewell address*, dated from his head-quarters at Ferozepore on the 15th of December—a very remarkable document, which has attracted great attention both in India and at home. It denounces with great severity the habits of extravagance which have taken root among the officers, and especially their ruinous vice of getting deeply into debt. The following are some of its features:—"Promising that he is not now speaking as a rich man to the poor, for he has 'known poverty,' and has 'lived for years on less than half what every ensign in this army receives,'" Sir Charles proceeds to state, that he has not sought for the information on which he speaks, but has had it forced upon him by men of high rank in both the Queen's and the Company's services, who are labouring for the honour of the service. One Brigadier writes to him—"At a Court of Requests, held on the 6th inst., there were fifty-three cases, and (with the exception of four of trifling amount) all against subalterns—amount to 4875 rupees." Again, the same officer writes—"Decrees of Execution General are not unfrequent, and the efficiency of the officers seriously affected by their pecuniary embarrassments." Among the causes of this demoralisation, one is, "that some young men get commissions without having had such education, or perhaps a vulgar one, which is worse."

"These officers are not aware that honesty is inseparable from the character of a thoroughbred gentleman. A vulgar man, who 'enjoys a champagne tiffin and swindles his servants,' (as a Brigadier writes to me, when speaking of those majors, and referring to an officer under his immediate command,) may be a pleasant companion to those who do not hold him in contempt as a vulgar knave, but he is not a gentleman."

These young men just escaped from school and college, and are mainly to be dishonourable.

These officers are not aware that honesty is inseparable from the character of a thoroughbred gentleman. A vulgar man, who 'enjoys a champagne tiffin and swindles his servants,' (as a Brigadier writes to me, when speaking of those majors, and referring to an officer under his immediate command,) may be a pleasant companion to those who do not hold him in contempt as a vulgar knave, but he is not a gentleman."

in debt makes them grow callous to the proper feelings of a gentleman."

The expenses caused by the constant marching of regiments are great burdens on the officer; and Sir Charles hopes that now, in time of peace, the marching of regiments will be avoided. The extravagance of messes can and ought to be controlled by the commanding officers of regiments.

"The pay of an ensign is sufficient for his just expenditure; and the commanding-officer is, and can alone be, responsible that this rule of right and just economy is never infringed. What officer will go to a mess committed and tell his private misfortune, or his difficulties? Yet this is what those people (who say that the commanders of regiments ought not to interfere with the mess) want. They are over-bearing tyrants, who want to set aside the private affairs of officers, and to make those officers who cannot afford such extravagance pay for these persons' selfish enjoyments, which they want to indulge in at other men's expense. That is the real object of those who wish to prevent the interference of commanding-officers. But the rules of both Queen's and Company's services give commanding-officers the right to interfere, and the Commander-in-chief will take care to hold him responsible that the ensign has his rights."

Sir Charles concludes with these valedictory words—

"To-day I am Commander-in-chief: a week hence I shall be no more to the Armies of India than a private gentleman. But the Armies of India must ever be much and dear to me. For nine years my whole energies, such as they are, have been devoted to the honour and glory of the Company's troops. I may say that I have become as much identified with the Armies of the three Presidencies as if I had risen from their ranks. I have jealously guarded their honour, and I have fought at their head. I now leave them for ever. But in the retirement of private life, although no longer able to serve them, the destinies of the Indian Armies will ever occupy my thoughts. I here take leave of them, hoping that this order will be of use, as the last which I can issue to the Armies of India."

The latest advices from Ceylon are to January 15th. Sir George Anderson had adjourned the Legislative Council, on the 20th December, after voting the necessary supplies: the financial statement, presented by the Colonial Secretary, showed the revenue for the first three quarters of 1850 to amount to 311,470l. 10s. 9d., against 307,170l. 2s. 9d. for the like period of 1849; whilst the expenditure had been 291,793l. 3s. 6d.,

against 312,537*l.* 1*s.* 6*d.* in 1849. Sweeping reductions were talked of: amongst other changes, one of the Puisne Judges was to be dispensed with, the offices of Civil Engineer and Commissioner of Roads were to be amalgamated as of old, and several Staff appointments were abolished. The weather, which had long been adverse to the preparation and shipment of the crops, had changed, and exporters were busy.

Accounts from *Jamaica* state that cholera was fast disappearing from the colony, and the only parish now afflicted to any extent is Lucia. A serious riot had occurred in the parish of St. David during an election for a member of the House of Assembly. A hired band of ruffians was in attendance, and a fearful riot ensued. The Court-house was almost entirely demolished, the police and other persons cut and wounded, some of whom would not survive. Mr. M'Lean, the coroner of the parish, was killed; and the sheriff, Mr. Lyons, obliged to fly for his life. A detachment of troops had been sent to the district, and some of the ringleaders arrested on a charge of wilful murder.

There are advices from the *Cape of Good Hope* to the 26th of December. The excitement respecting the position of affairs on the frontier continued unabated. Sir Harry Smith was on the spot, evidently determined to make a strict investigation as to the causes originating this renewed spirit of turbulence among the Caffres. Sandilli, the chief suspected of organising the movement, had, it was said, escaped into the bush, and would not attempt to come into the presence of the governor to explain his conduct. Sir Harry Smith had entered into arrangements with the other tribes to support him, if necessary, in maintaining peace, and at the interviews he had had with them, the whole of the proceedings were considered to have terminated most satisfactorily.

The "Clergy Reserves" in *Canada* have been placed

by the Home Government at the disposition of the Colonial Legislature. This fact has been communicated in a despatch from the Colonial Office to the Earl of Elgin. The dispatch of the Earl of Elgin communicating the address of the Canadian Assembly on the subject was received in July last, after the session of the Provincial Legislature had already closed, and on the eve of the close of the Imperial session; it was therefore reserved for mature consideration by the government. Earl Grey's despatch in answer is dated the 27th of January. Its substance is as follows:—Her Majesty has been pleased to receive the address "very graciously." Lord Elgin will inform the House of Assembly, that while her Majesty's servants "greatly regret" that a subject of so much difficulty should, after an interval of some years, have again been brought under discussion, "it has appeared to them, on mature deliberation, that the desire expressed by the Assembly in this address ought to be acceded to." They will accordingly be prepared to recommend to parliament, that an act should be passed giving to the Provincial Legislature full authority to make such alterations as they may think fit in the existing arrangements with regard to the clergy reserves, provided that existing interests are respected." Great as would be the advantages of leaving undisturbed the existing arrangement devoting a portion of the public lands to the creation of a fund for the religious instruction of the inhabitants of the province, "still the question is one so exclusively affecting the people of Canada, that its decision ought not to be withdrawn from the Provincial Legislature, to which it properly belongs to regulate all matters concerning the domestic interests of the Province." It has appeared to her Majesty's government "impossible for them, consistently with the principles on which they have always held that the government of Canada ought to be conducted," to advise refusal of the prayer. They have acted on that conclusion with the less difficulty from observing that the Assembly in their address recognise the claims of present incumbents of the fund, and have not asked authority to interfere with the incomes during the lives of the parties enjoying them.

NARRATIVE OF FOREIGN EVENTS.

THE great topic of the day in Paris is the President's reduction of his establishment at the Elysée. As soon as the Assembly refused him his "dotation" he shrewdly announced that his expensive receptions were at an end; and, as we write, there are one and twenty of his saddle and carriage horses in the course of sale by auction at the stables in the Rue de Montaigne. This is a new way of fighting the Assembly, and seems to indicate that Louis Napoleon has new and better advisers.

The other great continental event is the steady march of Austria in the direction of extreme absolutism. Russia is helping her to swamp the German Confederation by forcing her non-German provinces into it, and wicked schemes against Switzerland and Piedmont are to be Russia's return in kind. There have been all sorts of protestings from England and France during the last month or two, but the issue remains to be seen. It will be a most important one, in its influence over the whole civilised world.

The chief article of news from *France*, during the month, has been the rejection, by the Assembly, of the President's Dotation Bill. On the 10th, M. Anthony Thouret having moved that 1,800,000*fr.* be paid to the President of the Republic as *frais de représentations*, Messrs. Clay and Lemulier proposed that this credit be paid out of the salaries of the members.—The Minister of Justice, M. Boyer, stated, on the part of the government, that the Cabinet would not enter into the debate, but that it referred the Assembly to the motivation of the bill. Referring to the credit of last year, he protested that to the government this question was not one of money, but of political order.—M. Dufongereais, rising in opposition to the bill, detailed the grievances of the Assembly against the President.—M. de Montalembert had hoped that the good sense of members would have induced them to hush the schism between the Assembly and the Executive. He opposed the preferment of such a grant on principle, but he was of opinion that the demand, if once made, ought to meet with compliance.—M. Piscatory

opposed the bill. He protested that the Assembly was by no means hostile to the President, and he declared that the vote which he felt confident would be pronounced was a mere warning on the part of the legislative body.—On a division the numbers were—for the bill, 204; against it, 396. The bill was accordingly rejected by a majority of 192 votes.—In consequence of this refusal to make him a provision, the President has commenced a rigid economy in his household and personal expenses. He has discontinued his "receptions," and the sale of a number of his saddle and carriage horses has been advertised. A proposal of a national subscription for him having been made by some of his friends, he has decidedly declined all such assistance.

Accounts from *Naples* of the 3rd bring the termination of the trial of the members of the *Unità Italiana*, which has been going on for some months. Three have been condemned to death; namely, MM. Fuscatano, Settembrini, and Agrosti; M. Risco Pivanti and the

A few days have been condemned to the galleys for life. *M. de la Poerle*, formerly a member of the Cabinet, to 24 years' imprisonment, and the others to shorter terms of imprisonment. All the prisoners are deputies, or in the higher ranks of society. The King has rejected the sentences of those condemned to death, and commuted their punishment to imprisonment in the galleys for life.

A letter from Rome, dated the 31st of January, gives an account of an *Exploit of Banditti*, which looks more like romance than reality, though its truth seems authenticated. "On the 25th of this month, the theatrical corps of *Forluni-Popoli* was playing the 'Death of Caesar.' *Forluni-Popoli* is a small town of about 4000 inhabitants, enclosed by a high wall, entered by two gates, and scarcely three miles from the town of *Forlì*, of which it is a kind of suburb. By eight in the evening, the hour when the theatres open in Italy, all movement has disappeared from the streets, windows are closed, and the inhabitants have retired to their homes, the coffee-houses, or the theatres. This absence of activity in the streets, which every one remarks at Rome, is still more complete in small towns. It may then be understood how at *Forluni-Popoli*, and particularly on an evening when the theatre was open, the streets should be so deserted as to make possible the occurrence now to be related. The first act of the piece had terminated, and the curtain had just fallen, when suddenly it rose and disclosed—instead of the actors who had disappeared—ten brigands of the band *Dil Pisatore*, who armed with muskets and carbines, levelled them so as to command the entire range of the pit and boxes. At the same moment another party consisting of thirty brigands, made their appearance on the floor of the house, the issues of which were guarded and armed with clubs and pistols, menaced the spectators. A moment of stupor, during which no one dared move, elapsed when the chief of the brigands advanced to the foot lights, and, exhibiting the keys of the two gates of the town said, 'Gentlemen, you see by these that you are entirely in our power; any resistance on your part would lead to disasters which I should be the first to deplore; but which it depends on you to avert. Listen then to what I have to say. I am about to call out the names of several among you as I pronounce a name, let him who hears it step forth from his box and repair to his house, in company with one or two of my friends who will assist him to bring hither all his household, and that without deluding us of a penny.' This and the orator displayed a paper, and commenced reading the fatal roll. Submission was inevitable. A dozen carabinieri formed the sole police of *Forluni-Popoli*. Six of these were in the theatre and had been seized by the brigands. The spectators surprised in their own house had ventured a vain resistance. The *Berg-master* was the first victim. Some time was, of course, required for this operation, which did not terminate before a quarter to twelve. It was, probably, to shorten the agony of the pit and boxes that two brigands went from

spectator to spectator, collecting handfuls of watches, purses, chains, rings, and even umbrellas. When the harvest was gathered, and the booty had been heaped up on the stage the brigands allowed the curtain to fall and quietly withdrew, carrying all with them. The money thus obtained amounted to 7000 Roman piastres or about 40,000 francs and the bijoux, objects of art, &c. to double that sum. The next day an Austrian detachment set out in pursuit of the band, which probably had dispersed by that time in the mountains or passed the Tuscan frontier. Their number is supposed to have been about three or four hundred. It is probable that they were in league with some of the inhabitants. However this may be private houses and public treasures all have been plundered with the exception of the *Monte di Pietà*, the fastening of which resisted all the attempts made to break it.

In Germany, congresses and conferences continue among the diplomatists of the various powers, but little is known of their result.

Both France and England have protested against the demand of Austria for the admission of the whole of the possessions into the German Confederation. The two Powers have it is said communicated notes to the Cabinet of St. Petersburg with a view to bring it over to their opinion.

Baron Montefel suddenly left *Drissna* on the 18th the day on which the sitting of the conferences was resumed for Berlin where he had an immediate audience of the King and intended to return on the 19th to *Drissna*.

Mr. Hassenpflug the Prussian minister is in the midst of perplexity from want of money. A project for a loan has been abandoned as none of the Frankfurt banker would negotiate it.

The Diet of the kingdom of *Hanover* was opened on the 12th inst. with a message from the King which is chiefly occupied with the part taken by *Hanover* in the late events in Germany.

The intelligence from *New York* which is up to the 15th inst. is unimportant. In the Senate the *California* bill Little Hall was ordered to be engrossed. General Cass has been re-elected to the Senate by the Legislature of Michigan. In the House of Representatives Mr. Gilbert gave notice of a bill to establish a *Mineral* in California. The Naval Committee of the Senate had put their veto upon the extension of any new steam lines of communication across the Atlantic under the patronage of Government for the present session.

By the accounts from California it appears that the aggregate amount of shipments of gold dust together with the quantity in private hand shows that the yield of the mines for 1850 was not less than between nine and ten millions sterling.

NARRATIVE OF LITERATURE AND ART.

THE past month will be memorable, in the annals of Art, as that in which the first artist of the stage the last of that generation of great actors which includes the names of *Kemble*, *Kean*, *Young*, and *Miss O'Neill*, bade adieu to the scene of his triumphs. It was an occasion never likely to pass from the remembrance of those who witnessed or took part in it. And now Mr. Macready will live hereafter in dramatic history not simply as the most complete intellectual actor of his time, but as the man who singly supported the higher drama of England at a time when all other support seemed to have passed from it. What we agree to call our national stage was never at so low or hopeless an ebb as when he opened Covent Garden fifteen years ago, but yet, with scant sympathy at first, he steadily, bravely, and completely worked out his design of applying to the pure text of our noblest drama the ablest acting and the most perfect accessories. His any playgoer of that day forgotten the extraordinary excitement that it last attended every announcement of a new Shakespearean revival! And does any one suppose that that civilising influence passed wholly away with Mr. Macready's departure from Drury Lane, who has since visited Mr. Phelps's small, crowded theatre, and seen the quiet, intelligent, apprehensive enjoyment of its crowded pit of young men, artists, and their wives, not a few of them comparing their printed copy of the Shakespearean
